GENERAL NOTICES

General Notices

General Statements

The General Notices provide the basic guidelines for the interpretation and application of the standards, tests, assays, and other specifications of the Indian Pharmacopoeia (IP), as well as to the statements made in the monographs and other texts of the Pharmacopoeia.

A monograph is to be constructed in accordance with any general monograph or notice or any appendix, note or other explanatory material that is contained in this Pharmacopoeia and that is applicable to that monograph. All statements contained in the monograph, except where a specific general notice indicates otherwise and with the exceptions given hereafter, constitute standards for the official articles. An article is not of pharmacopoeial quality unless it complies with all of the requirements stated.

Exceptions to the General Notices do exist, and where they do, the wording in the individual monograph or an appendix takes precedence and specifically indicates directions or the intent. Thus, the specific wording of standards, tests, assays and other specifications is binding wherever deviations from the General Notices exist. Likewise, where there is no specific mention to the contrary, the General Notices apply.

Name. The full name or title of this book, including addenda thereto, is Indian Pharmacopoeia 2022, abbreviated to IP 2022. In the texts, the term "Pharmacopoeia" or "IP" without qualification means the Indian Pharmacopoeia 2022 and any amendments and thereto.

Official and Official Articles. The word 'official' wherever used in this Pharmacopoeia or with reference thereto, is synonymous with 'pharmacopoeial', with 'IP' and with 'compendial'. The designation IP in conjunction with the official title on the label of an article is an indication that the article purports to comply with IP standards.

The following terms are used where the articles for which monographs are provided are to be distinguished.

An official substance is a single drug or a drug entity or a pharmaceutical aid for which the monograph title includes no indication of the nature of a dosage form.

An official preparation is a drug product (dosage form) and is the finished or partially finished preparation or product of one or more official substances formulated for use on the patient.

An article is an item for which a monograph is provided, whether an official substance or an official preparation.

Official Standards. The requirements stated in the monographs apply to articles that are intended for medicinal use but not necessarily to articles that may be sold under the same name for other purposes.

An article is not of Pharmacopoeial quality unless it complies with all the requirements stated in the monograph. This does not imply that performance of all the tests in a monograph is necessarily a prerequisite for a manufacturer in assessing compliance with the Pharmacopoeia before release of a product.

Pharmacopoeial requirements for articles used in veterinary medicine are established on the same basis as those used in human medicine. It should be noted that no requirement in the pharmacopoeia can be taken in isolation. A valid interpretation of any particular requirement depends upon it being read in context of the monograph as a whole, the specified method of analysis, the relevant General Notices and where appropriate the General Monographs.

Where a preparation that is the subject of a monograph in the Indian Pharmacopoeia is supplied for use in veterinary medicine, the standards of Indian Pharmacopoeia apply unless otherwise justified and authorized.

The active pharmaceutical ingredients (drug substances), excipients (pharmaceutical aids), pharmaceutical preparations (dosage forms) and other articles described in the monographs are intended for human and veterinary use (unless explicitly restricted to one of these uses). It may be noted, however, that in the event of doubt of interpretation in any text of Veterinary monographs of IP, Indian Pharmacopoeia Commission (IPC) should be consulted.

The requirements given in the monographs are not framed to provide against all possible impurities, contaminants or adulterants; they provide appropriate limitation of potential impurities only.

A preparation must comply with the requirements specified, throughout its shelf-life assigned to it by the manufacturer. For opened or broached containers, the maximum period of validity for use will be as may be stated in the individual monograph. Nevertheless, the responsibility for assigning the period of validity shall be with the manufacturer.

Added Substances. An official substance, as distinguished from an official preparation, contains no added substances except when specifically permitted in the individual monograph. Unless otherwise specified in the individual monograph, or elsewhere in the General Notices, suitable substances may be added to an official preparation to enhance its stability, preserve its properties, usefulness or elegance, or to facilitate its preparation. Such auxiliary substances shall be harmless in the amounts used, shall not exceed the minimum quantity required to provide their intended effect, shall not impair the therapeutic efficacy or the bioavailability or safety of the preparation and shall not interfere with any of the tests and assays prescribed for determining compliance with the official

standards. Particular care should be taken to ensure that such substances are free from harmful organisms. The freedom to the manufacturers to add auxiliary substances imposes on them the responsibility of satisfying the licensing authorities on the purpose of the addition and the innocuity of such substances. No substance shall be added to conceal any defect or damage or deficiency in the substance or formulation.

Alternative Methods. The tests and assays described are the official methods upon which the standards of the Pharmacopoeia are based. Alternative methods of analysis may be used for control purposes, provided that the methods used are shown to give results of equivalent accuracy and enable an unequivocal decision to be made as to whether compliance with the standards of the monographs would be achieved if the official methods were used. Automated procedures utilising the same basic chemistry as the test procedures given in the monograph may also be used to determine compliance. Such alternative or automated procedures must be validated and are subject to approval by the authority competent to authorised manufacturer of substance or product.

In the event of doubt or dispute, the methods of analysis of the Pharmacopoeia are alone authoritative and only the result obtained by the procedure given in this Pharmacopoeia is conclusive.

Meanings of Terms

Alcohol. The term "alcohol" without qualification means ethanol (95 per cent). Other dilutions of ethanol are indicated by the term "ethanol" or "alcohol" followed by a statement of the percentage by volume of ethanol (C_2H_6O) required.

Desiccator. A tightly-closed container of suitable size and design that maintains an atmosphere of low moisture content by means of silica gel or phosphorus pentoxide or other suitable desiccant.

Drying and ignition to constant weight. Two consecutive weighings after the drying or igniting operations do not differ by more than 0.5 mg, the second weighing following an additional period of drying or of ignition respectively appropriate to the nature and quantity of the residue.

Ethanol. The term "ethanol" without qualification means anhydrous ethanol or absolute alcohol.

Filtration. Unless otherwise stated, filtration is the passing of a liquid through a suitable filter paper or equivalent device until the filtrate is clear.

Freshly prepared. Made not more than 24 hours before it is used.

Label. Any printed packing material, including package inserts that provide information on the article.

Negligible. A quantity not exceeding 0.50 mg.

Solution. Where the name of the solvent is not stated, "solution" implies a solution in water. The water used complies with the requirements of the monograph on Purified Water.

Temperature. The symbol ° used without qualification indicates the use of the Celsius thermometric scale.

Water. If the term is used without qualification it means Purified Water of the Pharmacopoeia. The term 'distilled water' indicates Purified Water prepared by distillation.

Water-bath. A bath of boiling water unless water at another temperature is indicated. Other methods of heating may be used provided the required temperature is approximately maintained but not exceeded.

Provisions Applicable To Monographs and Test Methods

Expression of Contents. Where the content of a substance is defined, the expression "per cent" is used according to circumstances with one of two meanings:

— per cent w/w (percentage, weight in weight) expressing the number of grams of substance in 100 grams of final product,

— per cent v/v (percentage, volume in volume) expressing the number of millilitres of substance in 100 millilitres of final product.

The expression "parts per million" refers to the weight in weight, unless otherwise stated.

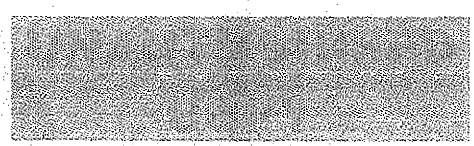
Where the content of a substance is expressed in terms of the chemical formula for that substance an upper limit exceeding 100 per cent may be stated. Such an upper limit applies to the result of the assay calculated in terms of the equivalent content of the specified chemical formula. For example, the statement 'contains not less than 99.0 per cent and not more than 101.0 per cent of $C_7H_6O_2$ implies that the result of the assay is not less than 99.0 per cent and not more than 101.0 per cent, calculated in terms of the equivalent content of $C_7H_6O_2$.

Where the result of an assay or test is required to be calculated with reference to the dried, anhydrous, ignited substance, or the substance free from solvent, the determination of loss on drying, water content, loss on ignition, content of the specified solvent, respectively is carried out by the method prescribed in the relevant test in the monograph.

Expression of Concentrations. The following expressions in addition to the ones given under Expression of Content are also used:

— per cent w/v (percentage, weight in volume) expressing the number of grams of substance in 100 millilitres of product,

— per cent v/w (percentage, volume in weight) expressing the number of millilitres of substance in 100 grams of product.



Usually, the strength of solutions of solids in liquids is expressed as percentage weight in volume, of liquids in liquids as percentage volume in volume, of solids in semi-solid bases (e.g. creams) and of gases in liquids as percentage weight in weight.

When the concentration of a solution is expressed as parts of dissolved substance in parts of solution, it means parts by weight (g) of a solid in parts by volume (ml) of the final solution; as parts by weight (g) of a gas in parts by weight (g) of the final solution.

When the concentration of a solution is expressed in molarity designated by the symbol M preceded by a number, it denotes the number of moles of the stated solute contained in sufficient Purified Water (unless otherwise stated) to produce 1 litre of solution.

Abbreviated Statements. Incomplete sentences are employed in parts of the monographs for directness and brevity (for example, Iodine Value. Not more than ……; Relative Density. …….to……..) Where the tests are abbreviated, it is to be understood that the test method referred to in brackets provides the method to be followed and that the values specified are the applicable limits.

Weights and Measures. The metric system of weights and measures is employed in the Pharmacopoeia. All measures are required to be graduated at 25° and all measurements in tests and assays, unless otherwise stated, are to be made at that temperature. Graduated glass apparatus used in analytical operations shall comply with the requirements stated in Chapter 2.1.6.

Monographs

General Monographs

General monographs on dosage forms include requirements of general application and apply to all preparations within the scope of the Introduction section of the general monograph, except where a preamble limits the application. The requirements are not necessarily comprehensive for a given specific preparation; additional requirements may sometimes be given in the individual monograph for it.

Production. Statements given under the heading Production relate to particular aspects of the manufacturing process and are not necessarily comprehensive. However, they are mandatory instructions to manufacturers. They may relate, for example, to source materials, to the manufacturing process and its validation and control, to any in-process testing that is to be carried out by the manufacturer on the final product either on selected batches or on each batch prior to release. All this cannot be verified on a sample of the final product by an independent analyst. It is for the licensing authority to verify that the instructions have been followed.

The absence of a section on Production does not imply that attention to features such as those given above is not required. An article described in a monograph of the Pharmacopoeia is to be manufactured in accordance with the principles of good manufacturing practice and in accordance with the requirements of the Drugs and Cosmetics Rules, 1945. The general principles applicable to the manufacture and quality assurance of drugs and preparations meant for human use apply equally to veterinary products as well.

Manufacture of Drug Products. The opening definitive statement in certain monographs for drug products is given in terms of the active ingredient(s) only. Any ingredient(s) other than those included in the statement, must comply with the general notice on Excipients and the product must conform to the Pharmacopoeial requirements.

Official preparations are prepared only from ingredients that comply with the requirements of the pharmacopoeial monographs for those individual ingredients for which monographs are provided.

Excipients. Any substance added in preparing an official preparation shall be innocuous, shall have no adverse influence in the therapeutic efficacy of the active ingredients and shall not interfere with the tests and assays of the Pharmacopoeia. Care should be taken to ensure that such substances are free from harmful organisms.

Individual Monographs

Drug products that are the subject of an individual monograph are also required to comply with the tests given in the general monographs.

Titles. The main title for a drug substance is the International Non-proprietary Name (INN) approved by the World Health Organization. Subsidiary names and synonyms have also been given in some cases; where included, they have the same significance as the main title.

The main titles of drug products are the ones commonly recognised in practice. Synonyms drawn from the full non-proprietary name of the active ingredient or ingredients have also been given. Where, however, a product contains one or the other of different salts of an active molecule, the main title is based on the full name of the active ingredient. For example, Chloroquine Phosphate Tablets and Chloroquine Sulphate Tablets.

Chemical Formulae. When the chemical structure of an official substance is known or generally accepted, the graphic and molecular formulae are normally given at the beginning of the monograph for information. This information refers to the chemically pure substance and is not to be regarded as an indication of the purity of the official material. Elsewhere, in statement of purity and strength and in descriptions of

processes of assay, it will be evident from the context that the formulae denote the chemically pure substances.

Where the absolute stereochemical configuration is specified, the International Union of Pure and Applied Chemistry (IUPAC) *R/S* and *E/Z* systems of designation have been used. If the substance is an enantiomer of unknown absolute stereochemistry, the sign of the optical rotation, as determined in the solvent and under the conditions specified in the monograph, has been attached to the systematic name. An indication of sign of rotation has also been given where this is incorporated in a trivial name that appears on an IUPAC preferred list.

Atomic and Molecular Weights. The atomic weight or molecular weight is shown, as and when appropriate at the top right hand corner of the monograph. The atomic and molecular weights and graphic formulae do not constitute analytical standards for the substances described.

Definition. The opening statement of a monograph is one that constitutes an official definition of the substance, preparation or other article that is the subject of the monograph. In certain monographs for pharmaceutical preparations the statement is given in terms of the principal ingredient(s).

In monographs on vegetable drugs, the definition indicates whether the subject of the monograph is, for example, the whole drug or the drug in powdered form.

Certain pharmaceutical substances and other articles are defined by reference to a particular method of manufacture. A statement that a substance or article is prepared or obtained by a certain method constitutes part of the official definition and implies that other methods are not permitted. A statement that a substance may be prepared or obtained by a certain method, however, indicates that this is one possible method and does not imply that other methods are not permissible.

Statement of content. The limits of content stated are those determined by the method described under Assay.

Category. The statement of category is provided for general information only and is indicative of the medical or pharmaceutical basis for recognition in the Pharmacopoeia. It generally represents an application of the best known pharmacological action of the article or of its active ingredient. The statement under the heading 'Category' are also subject to regulations under the D&C Act 1940 and rules theirunder. In the case of pharmaceutical aids it may indicate the more common usage of the article. The statement is not intended to limit in any way the choice or use of the article nor to indicate that it has no other activity or use.

Usual strength. The statement on the usual strength(s) of a preparation given in the individual monograph indicates the strength(s) usually marketed for information of the pharmacist and the medical practitioner. It does not imply that a strength other than the one(s) mentioned in the individual monograph meeting all the prescribed requirements cannot be manufactured and marketed with the approval of the appropriate authority.

Description. The statements under the heading Description are not to be interpreted in a strict sense and are not to be regarded as official requirements.

Solubility. Statements on solubility are given in Chapter 2.4.26 and are intended as information on the approximate solubility at a temperature between 15° and 30°, unless otherwise stated, and are not to be considered as official requirements. However, a test for solubility stated in a monograph constitutes part of the standards for the substance that is the subject of that monograph.

Residual solvents. The requirements, guidance and information on residual solvents for pharmaceutical use are given in the chapter entitled Residual Solvents (5.4).

All IP articles are subject to relevant control of residual solvents, even when no test is specified in the individual monograph. If solvents are used during production, they must be of suitable quality. In addition, the toxicity and residual level of each solvent shall be taken into consideration and the solvents limited according to the principles defined and the requirements specified in Chapter 5.4. Residual Solvent, using the general methods presented therein or other suitable methods.

Test Methods

References to general methods of testing are indicated by test method numbers in brackets immediately after the heading of the test or at the end of the text.

Identification. The tests given under the heading Identification are not necessarily sufficient to establish absolute proof of identity. They provide a means of verifying that the identity of the material under examination is in accordance with the label on the container.

In certain monographs alternative series of identification tests are given; compliance with either one or the other set of tests is adequate to verify the identity of the article.

When tests for infrared absorption are applied to material extracted from formulated preparations, strict concordance with the specified reference spectrum may not always be possible, but nevertheless a close resemblance between the spectrum of the extracted material and the specified reference spectrum should be achieved.

Tests and Assays

The tests and assays are the official methods upon which the standards of the Pharmacopoeia depend. The requirements are not framed to take into account all possible impurities. It is

not to be presumed, for example, that an impurity that is not detectable by means of the prescribed tests is tolerated. Material found to contain such an impurity is not of pharmacopoeial quality if the nature or amount of the impurity found is incompatible with good pharmaceutical practice.

Pharmacopoeial methods and limits should be used merely as compliance requirements and not as requirements to guarantee total quality assurance. Tests and assays are prescribed for the minimum sample available on which the attributes of the article should be measured. Assurance of quality must be ensured by the manufacturer by the use of statistically valid sampling and testing programmes.

Tests. Unless otherwise stated, the assays and tests are carried out at a temperature between 20° and 30°.

Where it is directed that an analytical operation is to be carried out 'in subdued light', precautions should be taken to avoid exposure to direct sunlight or other strong light. Where a procedure is directed to be performed 'protected from light' precautions should be taken to exclude actinic light by the use of low-actinic glassware, working in a dark room or similar procedures.

For preparations other than those of fixed strength, the quantity to be taken for a test or an assay is usually expressed in terms of the active ingredient. This means that the quantity of the active ingredient expected to be present and the quantity of the preparation to be taken are calculated from the strength stated on the label.

Other Tests. In the monographs on dosage forms and certain preparations, under the sub-heading 'Other tests' it is stated that the article complies with the tests stated under the general monograph of the relevant dosage form or preparation. Details of such tests are provided in the general monographs.

Limits. The limits given are based on data obtained in normal analytical practice. They take into account normal analytical errors, of acceptable variations in manufacture and of deterioration to an extent that is acceptable. No further tolerances are to be applied to the limits for determining whether or not the article under examination complies with the requirements of the monograph.

Quantities. Unless otherwise stated, the quantities to be taken for assays, limit tests and other tests are of the substance under examination.

In tests with numerical limits and assays, the quantity stated to be taken for testing is approximate. The amount actually used, which may deviate by not more than 10 per cent from that stated, is accurately weighed or measured and the result of analysis is calculated from this exact quantity. In tests where the limit is not numerical but usually depends upon comparison with the behaviour of a reference in the same conditions, the stated quantity is taken for testing. Reagents are used in the prescribed amounts.

Quantities are weighed or measured with an accuracy commensurate with the indicated degree of precision. For weighings, the precision is plus or minus 5 units after the last figure stated. For example, 0.25 g is to be interpreted as 0.245 g to 0.255 g. For the measurement of volumes, if the figure after the decimal point is a zero or ends in a zero, e.g. 10.0 ml or 0.50 ml, the volume is measured using a pipette, a volumetric flask or a burette, as appropriate; in other cases, a graduated measuring cylinder or a graduated pipette may be used. Volumes stated in microlitres are measured using a micropipette or microsyringe.

The term 'transfer' is used generally to indicate a quantitative operation.

Apparatus. Measuring and weighing devices and other apparatus are described in the chapter entitled 'Apparatus for Tests and Assays'. A specification for a definite size or type of container or apparatus in a test or assay is given merely as a recommendation.

Unless otherwise stated, comparative tests are carried out using identical tubes of colourless, transparent, neutral glass with a flat base, commonly known as Nessler cylinders.

Reagents and Solutions. The reagents required for the tests and assays of the Pharmacopoeia are defined in the various chapters showing their nature, degree of purity and the strengths of the solutions to be made from them. The requirements set out are not intended to imply that the materials are suitable for use in the test concerned; reagents not covered by monographs in the pharmacopoeia shall not be claimed to be of IP quality.

The term 'analytical reagent grade of commerce' implies that the chemical is of a high degree of purity wherein the limits of various impurities are known. Where it is directed to use a 'general laboratory reagent grade of commerce' it is intended that a chemically pure grade material, not necessarily required to be tested for limiting or absence of certain impurities, is to be used.

Indicators. Where the use of an indicator solution is mentioned in an assay or test, approximately 0.1 ml of the solution shall be added, unless otherwise directed.

Reference Substances. Certain monographs require the use of a chemical reference substance or a biological reference preparation or a reference spectrum These are authentic specimens chosen and verified on the basis of their suitability for intended use as prescribed in the Pharmacopoeia and are not necessarily suitable in other circumstances.

IP Reference Substances, abbreviated to IPRS are issued by the Indian Pharmacopoeia Commission (IPC). They are the official standards to be used in cases of arbitration.

Biological Reference Substances, also abbreviated to IPRS and Standard Preparations of antibiotics are issued by

agencies authorised by the IPC. They are standardized against the International Standards and Reference Preparations established by the World Health Organization (WHO). The potency of these preparations is expressed in International Units.

Reference spectra are published by the IPC and they are accompanied by information concerning the conditions used for sample preparation and recording of the spectra.

Test Animals. The animal experiments are carried out in accordance with the provisions of 'The Prevention of Cruelty to Animals Act, 1960' and 'CPCSEA Guidelines' so as to prevent the infliction of unnecessary pain, suffering and prevention of cruelty to animals. Unless otherwise directed, animals used in a test or an assay shall be healthy and are drawn from a uniform stock, and have not previously been treated with any material that will interfere with the test or the assay.

Rounding Rules for Calculation of Results. The observed or calculated values should be rounded off to the number of decimal places that is in agreement with the limit expression. Numbers should not be rounded up or down until the final calculations for the reportable value have been completed. Intermediate calculations (e.g., slope for linearity) may be rounded for reporting purposes, but the original (not rounded) value should be used for any additional required calculations. Acceptance criteria are fixed numbers and are not rounded.

When rounding is required, consider only one digit in the decimal place to the right of the last place in the limit expression. If this digit is 4 or smaller, it is eliminated and the preceding digit is left unchanged. If this digit is 5 to 9, it is eliminated and the preceding digit is increased by 1.

Table 1 – Illustration of Rounding Numerical values for comparison with Requirements

Pharmacopoeial Requirement	Unrounded Value (per cent)	Rounded Result (per cent)	Conforms
Assay limit	97.96	98.0	Yes
≥ 98.0 per cent	97.92	97.9	No
	97.95	98.0	Yes
Assay limit	101.55	101.6	No
≤ 101.5 per cent	101.46	101.5	Yes
	101.45	101.5	Yes
Limit test	0.025	0.03	No
≤ 0.02 per cent	0.015	0.02	Yes
	0.027	0.03	No
Limit test ≤ 3 ppm	3.5 ppm	4 ppm	No
	3.4 ppm	3 ppm	Yes
	2.5 ppm	3 ppm	Yes

Storage. Statements under the side-heading 'Storage' constitute non-mandatory advice. The articles of the Pharmacopoeia are to be stored under conditions that prevent contamination and, as far as possible, deterioration. Precautions that should be taken in relation to the effects of the atmosphere, moisture, heat and light are indicated, where appropriate, in the individual monograph.

Specific directions are given in some monographs with respect to the temperatures at which Pharmacopoeial articles should be stored, where it is considered that usage at a lower or higher temperature may produce undesirable results. The storage conditions are defined by the following terms:

- Store in a dry, well-ventilated place at a temperature not exceeding 30°
- Store in a refrigerator (2° to 8°). Do not freeze
- Store in a freezer (-2° to -18°)
- Store in a deep freezer (Below -18°)

Storage conditions not related to temperature are indicated in the following terms:

- Store protected from light
- Store protected from light and moisture

Where no specific storage directions or limitations are given in the monograph or in the D&C rules 1945 or by the manufacturer, it is to be understood that the storage conditions include protection from moisture, direct sunlight, freezing and excessive heat (any temperature above 40°).

Storage Containers. The requirements, guidance and information on containers for pharmaceutical use are given in the chapter entitled Containers (6.2).

In general, an article should be packed in a well-closed container i.e. one that protects the contents from contamination by extraneous solids, liquids, moisture or vapours and from loss of the article under normal conditions of handling and storage and preserves the properties of the drug. Containers, unless otherwise specified, or of the nature such as capsule shall, foils of strips etc, shall allow examination of the contents inside. Closures used shall also of suitable properties and quality to protect the drug from any contamination and shall not be the source of contamination by themselves. Notices as may be needed in respect of Radiopharmaceuticals may also be incorporated.

Where, additionally, loss or deterioration of the article from effervescence, deliquescence or evaporation under normal conditions of storage is likely, the container must be capable of being tightly closed, and re-closed after use.

In certain cases, special requirements of pack have been indicated in some monographs under Storage, using expressions that have been defined in chapter 6.2.

Labelling. The labelling of drugs and pharmaceuticals is governed by the Drugs and Cosmetics Rules, 1945. The statements that are given in the monographs under the side-heading 'Labelling' are not comprehensive. Only those that are necessary to demonstrate compliance or otherwise with the monograph have been given and they are mandatory. For example, in the monograph on Betamethasone Sodium Tablets the labelling statement is "The label states the strength in terms of the equivalent amount of betamethasone".

ACTIVE PHARMACEUTICAL INGREDIENTS AND DOSAGE FORMS

General Requirements

The Pharmacopoeia provides monographs of active pharmaceutical ingredients (that are used as active substances or excipients) and dosage forms (consisting of active substances that may be combined with excipients). Additionally, the general requirements including the processes for the preparation of many of them and the tests of a general nature applicable to article described in the monograph are given in the following pages. In addition to define the active pharmaceutical ingredients and dosage forms, this section presents the general principles involved in the production of some of them.

The requirements for compliance with tests given under active pharmaceutical ingredients are indicated in each monograph of the pharmaceutical substances. All active pharmaceutical ingredients comply with the requirements of general monograph, unless otherwise indicated.

The requirements for compliance with the tests given under each dosage form are indicated in each monograph of a drug product under the heading 'Other tests'. These tests are mandatory and are additional to the tests given in the individual monograph.

Active Pharmaceutical Ingredients

Pharmaceutical Substances

Active Pharmaceutical Ingredients (APIs) are any organic or inorganic substances that are used as active substances or excipients for the production of medicinal products for human or veterinary use. They may be obtained from natural sources or produced by extraction from raw materials, fermentation or synthesis.

This general monograph does not apply to biological and biotechnological products, oligonucleotides, products of fermentation and semi-synthetic products derived there from, to crude products of animal or plant origin or herbal products.

Active Pharmaceutical Ingredients may be used as such or as starting materials for subsequent formulation to prepare medicinal products. Depending on the formulation, certain substances may be used either as active substances or as excipients. Solid substances may be compacted, coated, granulated, powdered to certain fineness, or processed in other ways. A monograph is applicable to a substance processed with an excipient only where such processing is mentioned in the monograph.

Polymorphism. Individual monographs do not usually specify crystalline or amorphous forms, unless bioavailability is affected. All forms of an active substance comply with the requirements of the monograph, unless otherwise indicated. Where a substance may show polymorphism, this may be stated under description in order to draw this to the attention of the user who may have to take this characteristic into consideration during formulation of a preparation.

Production

Active Pharmaceutical Ingredients are manufactured by procedures that are designed to ensure a consistent quality and comply with the requirements of the individual monograph or approved specification. The manufacture of active substances must take place under conditions of good manufacturing practice.

The provisions of chapter 5.5.Impurities, apply to the control of impurities in active pharmaceutical ingredients. If solvents are used during production, they are of suitable quality. In addition, their toxicity and their residual level are taken into consideration as mentioned in chapter 5.4. Residual Solvents. If water is used during production, it is of suitable quality. The identity of elemental impurities derived from intentionally added catalysts and reagents is known, and strategies for controlling them should be established.

If substances are produced or processed to yield a certain form or grade, that specific form or grade of the substance complies with the requirements of the monograph. Certain functionality-related tests may be described to control properties that may influence the suitability of the substance and subsequently the properties of dosage forms prepared from it.

Powdered substances. These may be processed to obtain a certain degree of fineness.

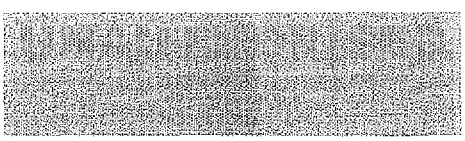
Compacted substances. These are processed to increase the particle size or to obtain particles of a specific form and/or to obtain a substance with a higher bulk density.

Coated active substances. These consist of particles of the active substance coated with one or more suitable excipients.

Granulated active substances. These are particles of a specified size and/or form produced from the active substance by granulation directly or with one or more suitable excipients.

If substances are processed with excipients, these excipients comply with the requirements of the relevant monograph or, where no such monograph exists, the specifications approved by regulatory authority shall comply.

Where active substances have been processed with excipients to produce, for example, coated or granulated substances, the processing is carried out under conditions of good manufacturing practice and the processed substances are regarded as intermediates in the manufacture of a medicinal product.



Description. The statements under the heading Description are not to be interpreted in a strict sense and are not to be regarded as official requirements. They are given for information.

Solubility. The statements on solubility are given under chapter 2.4.26 and are intended as information on the approximate solubility at a temperature between 15° and 30°, unless otherwise stated, and are not to be considered as official requirements. However, a test for solubility stated in a monograph constitutes part of the standards for the substance that is the subject of that monograph.

Identification

Where under Identification an individual monograph contains alternative series of identification tests; compliance with either one or the other set of tests is adequate to verify the identity of the article.

Certain monographs contain a cross-reference to a test prescribed in the Tests section of the monograph. It may be used to simplify the work of the analyst carrying out the identification and the prescribed tests.

Tests

Polymorphism. If the nature of a crystalline or amorphous form imposes restrictions on its use in preparations, the nature of the specific crystalline or amorphous form is identified, its morphology is adequately controlled and its identity is stated on the label as mentioned in chapter 2.5.11.

Related substances. Unless otherwise prescribed or justified and authorized, organic impurities in active substances are to be reported, identified wherever possible, and qualified as indicated in chapter 5.5. Impurities. Specific thresholds may be applied for impurities known to be unusually potent or to produce toxic or unexpected pharmacological effects.

For DNA reactive impurities, the requirements of ICH Guideline- M7 Assessment and Control of DNA Reactive (Mutagenic) Impurities in Pharmaceuticals to Limit Potential Carcinogenic Risk must be complied with for active substances to be used in medicinal products for human use, in cases defined in the scope of the guideline.

If the individual monograph does not provide suitable control for a new impurity, a suitable test for control must be developed and included in the specification for the substance.

Heavy metals. Unless otherwise prescribed or justified and authorized, heavy metal tests apply to the active pharmaceutical ingredients as mentioned in chapter 2.3.13.

OR

Elemental impurities. Permitted daily exposures for elemental impurities as mentioned in chapter 5.10 apply to the medicinal product. Individual monographs on active pharmaceutical ingredients do not contain specifications for elemental impurities unless otherwise prescribed.

Residual solvents. The residual solvents are limited according to the principles defined in chapter 5.4, using specified general method or another suitable method after validation. Where a quantitative determination of a residual solvent is carried out and a test for loss on drying is not carried out, the content of residual solvent is taken into account for calculation of the assay content of the substance, the specific optical rotation and the specific absorbance.

Microbiological quality. Individual monographs give acceptance criteria for microbiological quality wherever such control is necessary. Table 5– Acceptance criteria for microbiological quality of non-sterile substances for pharmaceutical use, under chapter 2.2.9. Microbial Contamination in Nonsterile products, gives recommendations on microbiological quality that are of general relevance for substances subject to microbial contamination. Depending on the nature of the substance and its intended use, different acceptance criteria may be justified.

Sterility. If intended for use in the manufacture of sterile dosage forms without a further appropriate sterilization procedure, or if offered as sterile grade, the active pharmaceutical ingredients complies with the test for sterility as mentioned in chapter 2.2.11.

Bacterial endotoxins. The active pharmaceutical ingredients complies with the test for bacterial endotoxins if it is labelled as a bacterial endotoxin-free grade or if it is intended for use in the manufacture of parenteral preparations or preparations for irrigation without a further appropriate procedure for the removal of bacterial endotoxins. The limit, when not indicated in the individual monograph, is determined in accordance with chapter 2.2.3.

Pyrogens. If the test for pyrogens is justified rather than the test for bacterial endotoxins and if a pyrogen-free grade is offered, the active pharmaceutical ingredients complies with the test for pyrogens in accordance with recommendations of chapter 2.2.8. The limit and test method are stated in the individual monograph or approved by the competent authority. Based on appropriate test validation for bacterial endotoxins and pyrogens, the test for bacterial endotoxins may replace the test for pyrogens.

Additional properties. Control of additional properties (e.g. physical characteristics, functionality-related characteristics) may be necessary for individual manufacturing processes or formulations. Grades (such as sterile, endotoxin-free, pyrogen-free) may be produced with a view to manufacture of preparations for parenteral administration or other dosage forms and appropriate requirements may be specified in an individual monograph.

Assay. Unless justified and authorised, contents of active pharmaceutical ingredients are determined using methods specified in individual monograph.

Labelling. Where appropriate, the label states that the active pharmaceutical ingredient is

— intended for a specific use;
— of a distinct crystalline form;
— of a specific degree of fineness;
— compacted;
— coated;
— granulated;
— sterile;
— free from bacterial endotoxins;
— free from pyrogens;
— containing gliding agents.

Where applicable, the label states:

— the degree of hydration;
— the name and concentration of any excipient.

Capsules

Capsules are solid dosage forms in which the drug or a mixture of drugs is enclosed in Hard Gelatin Capsule Shells, in soft, soluble shells of gelatin, or in hard or soft shells of any other suitable material, of various shapes and capacities. They usually contain a single dose of active ingredient(s) and are intended for oral administration. Capsules may also be used for other applications such as dry powder inhalers, suppositories etc. The consistency of soft shells may be adjusted by the addition of substances such as Glycerin or Sorbitol. Excipients such as opaque fillers, anti-microbial preservatives, sweetening agents, flavouring agents, processing aids and one or more colouring agents permitted under the Drugs and Cosmetic Rules, 1945 may be added. Capsules may bear surface markings.

The contents of capsules may be filled with powder, granules, pellets, beads, tablets, paste, liquid or paste-like consistency. They consist of the medicament(s) with or without excipients such as vehicles, solvents, diluents, lubricants, fillers, wetting agents and disintegrating agents. The contents should not cause deterioration of the shell, but the capsules are attacked by the digestive fluids thereby releasing the contents.

Production

During manufacture, packaging, storage and distribution of capsules, suitable means shall be taken to ensure their microbial quality; acceptance criteria for microbial quality are given in chapter 2.2.9.

Tests

Content of active ingredients. Determine the amount of active ingredient(s) by the method described in the Assay and calculate the amount of active ingredient(s) in each capsule. The result lies within the range for the content of active ingredient(s) stated in the monograph. This range is based on the requirement that 20 capsules, or such other number as may be indicated in the monograph, are used in the Assay. Where 20 capsules cannot be obtained, a smaller number, which must not be less than 5, may be used, but to allow for sampling errors the tolerances are widened in accordance with Table 1. The requirements of Table 1 apply when the stated limits are between 90 and 110 per cent. For limits other than 90 to 110 per cent, proportionately smaller or larger allowances should be made.

Table 1

Weight of Active ingredients in each Capsules	Subtract from the lower limit for samples of			Add to the upper limit for samples of		
	15	10	5	15	10	5
0.12 g or less	0.2	0.7	1.5	0.3	0.8	1.8
More than 0.12 g and less than 0.3 g	0.2	0.5	1.2	0.3	0.6	1.5
0.3 g or more	0.1	0.2	0.8	0.2	0.4	1.0

Uniformity of weight (2.5.3). This test is not applicable to capsules that are required to comply with the test for Uniformity of content for all active ingredients.

Weigh an intact capsule. Open the capsule without losing any part of the shell and remove the contents as completely as possible. To remove the contents of a soft capsule the shell may be washed with *ether* or other suitable solvent and the shell allowed to stand until the odour of the solvent is no longer detectable. Weigh the shell, the weight of the contents is the difference between the weighings. Repeat the procedure with a further 19 capsules. Determine the average weight of capsule contents. Not more than two of the individual weights deviate from the average weight by more than the percentage deviation shown in Table 2 and none deviates by more than twice that percentage.

Table 2

Average weight of capsule contents	Percentage deviation
Less than 300 mg	10
300 mg or more	7.5

Uniformity of content (2.5.4). This test is applicable to capsules that contain less than 10 mg or less than 10 per cent w/w of

active ingredient. For capsules containing more than one active ingredient carry out the test for each active ingredient that corresponds to the aforementioned conditions.

The test should be carried out only after the content of active ingredient(s) in a pooled sample of the capsules has been shown to be within accepted limits of the stated content.

NOTE — The test is not applicable for capsules containing multivitamins and trace elements.

Determine the content of active ingredient in each of 10 capsules taken at random using the method given in the monograph or by any other suitable analytical method of equivalent accuracy and precision. The capsules comply with the test if not more than one of the individual values thus obtained is outside the limits 85 to 115 per cent of the average value and none is outside the limits 75 to 125 per cent. If maximum of three individual values are outside the limits 85 to 115 per cent of the average value repeat the determination using another 20 capsules. The capsules comply with the test if in the total sample of 30 capsules not more than three individual values are outside the limits 85 to 115 per cent and none is outside the limits 75 to 125 per cent of the average value.

Disintegration. The disintegration test is not applicable to prolonged-release capsules. For Hard Gelatin Capsules, Soft Gelatin Capsules and Hard Cellulose Capsules for which the dissolution test (2.5.2) is included in the individual monograph, the test for Disintegration is not required.

Hard Gelatin Capsules

Hard gelatin capsules have shells consisting of two prefabricated, cylindrical sections, each of which has one rounded, closed end and one open end. Hard gelatin capsules contain the medicament(s) in the form of powders, pellets or granules, semisolids or liquids etc. Where two mutually incompatible drugs are present in the mixture, one of the drugs can be put as a tablet or pellet or in small capsule and then encapsulated with the other drug in a larger capsule.

Production

Hard gelatin capsules shells are made by a process that involves dipping shaped pins into gelatin solutions, after which the gelatin films are dried, trimmed, and removed from the pins, and the body and cap pieces are joined.

Tests

Disintegration. Comply with the disintegration test (2.5.1). Unless otherwise directed in the individual monograph use *water* as the medium. If the capsules float on the surface of the medium, a disc may be added. If the capsules adhere to the disc, attach a removable piece of stainless steel woven gauze with mesh aperture of 2.0 ± 0.2 mm to the upper plate of the basket rack assembly and carry out the test omitting the discs. Operate the apparatus for 30 minutes unless otherwise directed.

Soft Gelatin Capsules

Soft gelatin capsules made from gelatin (sometimes called softgels) or other suitable material require large-scale production methods. The soft gelatin shell is somewhat thicker than that of hard-shell capsules and may be plasticized by the addition of a polyol such as *sorbitol* or *glycerin*. The ratio of dry plasticizer to dry gelatin determines the "hardness" of the shell and may be varied to accommodate environmental conditions as well as the name of contents. Like hard shells, the shell composition may include approved dyes and pigments, opacifying agents such as *titanium dioxide*, and preservatives. Flavours may be added and up to 5 per cent sucrose may be included for its sweetness and to produce a chewable shell. Soft gelatin shells normally contain 6 per cent to 13 per cent of water.

Production

Soft gelatin capsules shells are usually formed, filled with medicament and sealed in a combined operation on machines. In some cases, shells for extemporaneous use may be prefabricated. The shells which are thicker than those of hard capsules are formed to produce capsules which are spherical, oval or cylindrical with hemispherical ends.

Soft gelatin capsules also may be manufactured in a bubble process that forms seamless spherical capsules. The shells may sometimes contain a medicament. They may contain a preservative to prevent microbial contamination.

The contents of soft capsules usually consist of liquids or solids dissolved or dispersed in suitable excipients to give a paste-like consistency. With suitable equipment, powders, granules and other dry solids also may be filled into soft-shell capsule. There may be partial migration of the constituents from the capsule contents into the shell and vice versa because of the nature of the materials and the surface in contact.

Tests

Disintegration. Comply with the disintegration test (2.5.1). Unless otherwise directed in the individual monograph use *water* as the medium. The disc may be omitted if the capsule adhere to the disc or if it is likely to be attacked by the contents of capsules. Operate the apparatus for 60 minutes unless otherwise specified in the individual monographs.

If any capsules fails to disintegrate, repeat the test on further 6 capsules. In the repeat test with additional capsules, if any

of the capsules have not disintegrated, repeat the test on a further 6 capsules, replacing *water* in the vessel with *0.1 M hydrochloric acid* or *artificial gastric juice*. The capsule pass the test if all the six have disintegrated.

Prolonged-release Capsules

Prolonged-release Capsules are hard or soft capsules in which the contents or the shell, or both, contain auxiliary substances or are prepared by a special process designed to modify the rate at which the active ingredients are released.

Tests

Dissolution (2.5.2). The test should be designed to demonstrate the appropriate release of the active substance(s). The manufacturer is expected to give specifications for drug release at 3 or more test-time points. The first point should be set after a testing period corresponding to a dissolved amount of typically 20 per cent to 30 per cent. The second point should define the dissolution pattern and should be set typically 45 per cent to 55 per cent release. The final point should ensure almost complete release that is generally understood as more than 80 per cent release.

NOTE — Above specification are non-mandatory.

Carry out the test as per the manufacturer's specification for the indicated test-times.

Gastro-resistant Capsules

Gastro-resistant Capsules are delayed-release capsules that are intended to resist the gastric artificial juice and to release their active substance or substances in the intestinal fluid. Usually they are prepared by filling capsule with granules or with particles covered with a gastro-resistant coating or in certain cases, by providing hard or soft capsules with gastro-resistant shell.

Tests

Disintegration. Comply with the disintegration test (2.5.1). Use the apparatus as described under disintegration test, using one capsule in each tube. Operate the apparatus for 2 hours without the discs in *0.1 M hydrochloric acid*. No capsule should show sign of disintegration or of rupture permitting the escape of the contents. Replace the medium in the vessel with *mixed phosphate buffer pH 6.8*. When justified and authorized, a buffer solution of pH 6.8 with added pancreas powder (for example, 0.35 g of *pancreas powder* per 100 ml of buffer solution) may be used. Add a disc to each tube and operate the apparatus for a further 60 minutes

Dissolution (2.5.2). For capsules filled with granules or particles already covered with an enteric coating, the dissolution test is carried out to demonstrate the appropriate release of the active substance(s).

Hard Cellulose Capsules

Hard Cellulose Capsule Shells are soluble containers for incorporation of drugs and food products, usually in the form of powders, pellets or granules, semisolids or liquids etc and are commonly intended for oral administration. The shells are acted upon by digestive fluids and the filled contents are released. They are composed of *Hydroxypropylmethyl-cellulose* or any other cellulose derivatives and *water*.

Hard Cellulose Capsules have shells consisting of two prefabricated, cylindrical sections, each of which has one rounded, closed end and one open end. Where two mutually incompatible drugs are present in the mixture, one of the drugs can be put as a tablet or pellet or in small capsule and then encapsulated with the other drug in a larger capsule.

Production

Hard Cellulose Capsules shells are made by a process that involves dipping shaped pins into cellulose solutions, after which the cellulose films are dried, trimmed, and removed from the pins, and the body and cap pieces are joined.

Tests

Disintegration. Comply with the disintegration test (2.5.1). Unless otherwise directed in the individual monograph use *water* as the medium. If the capsules float on the surface of the medium, a disc may be added. If the capsules adhere to the disc, attach a removable piece of stainless steel woven gauze with mesh aperture of 2 ± 0.2 mm to the upper plate of the basket rack assembly and carry out the test omitting the discs. Operate the apparatus for 30 minutes unless otherwise directed.

Storage. Store at a temperature not exceeding 30°.

Labelling. The label states (1) the name of any added antimicrobial preservative. (2) The label states the common name of the color used.

Creams

Creams are homogeneous, semi-solid or viscous preparations that possess a relatively fluid consistency and are intended for external application to the skin or certain mucous membranes for protective, therapeutic or prophylactic purposes especially where an occlusive effect is not necessary. They are semisolids usually consisting of solutions or dispersions of one or more medicaments in suitable bases*. They are formulated using hydrophilic or hydrophobic bases to provide preparations that are essentially miscible with the skin secretion.

In recent times the term cream has been restricted to products consisting of oil-in-water emulsions or aqueous microcrystalline dispersions of long-chain fatty acids or alcohols that are water-washable and more cosmetically and aesthetically acceptable. Creams can be used for administering drugs via the vaginal route.

The base should not produce irritation or sensitisation of the skin, nor should it retard wound healing; it should be smooth, inert, odourless or almost odourless, physically and chemically stable and compatible with the skin and with incorporated medicaments.

Creams may contain suitable antimicrobial preservatives unless the active ingredients or the bases themselves have sufficient bactericidal or fungicidal activity. They may contain other suitable auxiliary substances such as antioxidants, stabilisers, thickeners and emulsifiers.

If a cream is specifically intended for use on large open wounds or on severely injured skin it should be sterile.

Creams should not normally be diluted; if dilution is necessary, care should be taken to prevent instability and, in particular, microbial contamination.

Production

Creams should be packed in well-closed containers fitted with closures that minimise contamination with micro-organisms. When practicable, creams should be packed in collapsible tubes of suitable metal or plastic.

During manufacture, packaging, storage and distribution of creams, suitable means shall be taken to ensure their microbial quality; acceptance criteria for microbial quality are given in Chapter 2.2.9.

Tests

Creams comply with the requirements of tests stated under the individual monographs and with the following requirements.

Uniformity of weight. Comply with the test for contents of packaged dosage forms (2.5.6).

Sterility. When the cream is labelled as sterile, it complies with the test for sterility (2.2.11).

Storage. Store at temperatures below 25° unless otherwise directed. Do not freeze.

Labelling. The label states (1) that the cream is sterile, where necessary; (2) the name and concentration of any added antimicrobial preservative; (3) the storage conditions.

* The term bases as a synonym for base in some of the monographs means a carrier, composed of one or more excipients, for the active pharmaceutical ingredient(s) in semi-solid and solid preparations.

Ear Drops

Otic Drops; Otic Solutions

Ear Drops are aqueous or oily solutions or suspensions of one or more medicaments intended for instillation into the outer ear. They may contain suitable auxiliary substances such as buffers, stabilising agents, dispersing agents, solubilising agents and agents to adjust the tonicity or viscosity of the preparation. However, if buffering agents are used in preparations intended for use in surgical procedures, care should be taken to ensure that the nature and concentration of the selected agents are suitable. Where the active ingredients are susceptible to oxidative degradation, a suitable antioxidant may be added but care should be taken to ensure compatibility between the antioxidant and the other ingredients of the preparations. Any additive in the preparation should not adversely affect the intended medicinal action nor, at the concentrations used, cause undue local irritation. Certain Ear Drops may be supplied in dry, sterile form to be constituted in an appropriate sterile liquid immediately before use.

Aqueous preparations supplied in multiple application containers contain suitable antimicrobial preservatives at appropriate concentrations except when the product itself has adequate antimicrobial properties. The antimicrobial preservatives should be compatible with the other ingredients of the preparation and should be effective throughout the period of use of the Ear Drops. Containers for multiple application preparations should permit the withdrawal of successive doses of the preparation. Such containers should normally hold not more than 10 ml.

During development of a formulation of ear drops containing an antimicrobial preservative, the need for and the efficacy of the chosen preservative shall be demonstrated by the test for efficacy of antimicrobial preservation (2.2.2).

During manufacture, packaging, storage and distribution of ear drops, suitable means shall be taken to ensure their microbial quality; acceptance criteria for microbial quality are given in Chapter 2.2.9.

Ear Drops intended for use in surgical procedures or for application to injured ear, are sterile. Such preparations should not contain antimicrobial preservatives and should be packed in single dose containers.

Production

Sterile Ear Drops are prepared using methods designed to ensure their sterility and to avoid the introduction of contaminants and growth of micro-organisms. Methods of sterilisation that may be used in the manufacture of Ear Drops are described in Chapter 5.3.

Description. Ear Drops that are solutions are practically clear and practically free from particles when examined under suitable conditions of visibility. Ear Drops that are suspensions may show a sediment that readily disperses when shaken. The suspension remains sufficiently dispersed to enable the correct dose to be removed from the container.

Tests

Uniformity of volume. Comply with the test for contents of packaged dosage forms (2.5.6).

Particle size. This test is applicable only to Ear Drops that are suspensions. Introduce a suitable volume of the Ear Drops into a counting cell or onto a microscope slide, as appropriate. Scan under a microscope an area corresponding to 10 µg of the solid phase. Scan at least 50 representative fields. Not more than 20 particles have a maximum dimension greater than 25 µm, not more than 10 particles have a maximum dimension greater than 50 µm and none has a maximum dimension greater than 100 µm.

Sterility. Where the label indicates that the Ear Drops are sterile, it complies with the test for sterility (2.2.11). Droppers supplied separately also comply with these tests. Remove the dropper out of the package using aseptic precautions and transfer it to a tube containing suitable culture medium so that it is completely immersed. Incubate and carry out the tests for sterility on the medium.

Storage. Ear Drops should be packed in well-closed containers. If the preparation is sterile, store in sterile, tightly-closed, tamper-evident containers. Containers should be made from materials that do not cause deterioration of the preparation as a result of diffusion into or across the material of the container or by yielding foreign substances to the preparation.

The container and package of a single application preparation should be such as to maintain sterility of the contents and the applicator up to the time of use. Containers for multiple application preparations should be fitted with an integral dropper or with a screw cap made of suitable material incorporating a dropper and plastic or rubber teat. Alternatively, such a cap assembly may be packed separately.

Labelling. The label states (1) the names and concentrations in percentages, or weight or volume per ml, of the active ingredient(s); (2) the names and concentrations of any added antioxidant, stabilising agent or antimicrobial preservative; (3) that, for multiple application containers, the contents should not be used for more than 1 month after opening the container; (4) that, for multiple application containers, care should be taken to avoid contamination of the contents during use; (5) that the preparation is NOT FOR INJECTION; (6) that, where applicable, the preparation is sterile; (7) the storage conditions.

Eye Drops

Ophthalmic Drops

Eye Drops are sterile, aqueous or oily solutions or suspensions of one or more medicaments intended for instillation into the conjunctival sac. They may contain suitable auxiliary substances such as buffers, stabilising agents, solubilising agents and agents to adjust the tonicity or viscosity of the preparation. However, if buffering agents are used in preparations intended for use in surgical procedures care should be taken to ensure that the nature and concentration of the selected agents are suitable. Where the active ingredient is susceptible to oxidative degradation, a suitable antioxidant may be added but care should be taken to ensure compatibility between the antioxidant and the other ingredients of the preparation. Any additive in the preparation should not adversely affect the intended medicinal action nor, at the concentrations used, cause undue local irritation. Certain Eye Drops may be supplied in dry, sterile form to be constituted in an appropriate sterile liquid immediately before use.

Aqueous preparations supplied in multiple application containers contain suitable antimicrobial preservatives at appropriate concentrations except when the product itself has adequate antimicrobial properties. The antimicrobial preservatives should be compatible with the other ingredients of the preparation and should be effective throughout the period of use of the Eye Drops.

If the preparation does not contain an antimicrobial preservative it should be packed in single application containers. Eye Drops intended for use in surgical procedures should not contain antimicrobial preservatives and should be packed in single application containers.

Eye Drops are prepared using methods designed to ensure their sterility and to avoid the introduction of contaminants and growth of micro-organisms. Methods of sterilisation that may be used in the manufacture of Eye Drops are described in Chapter 5.3.

Containers. Eye Drops should be packed in tamper-evident containers. Containers should be made from materials that do not cause deterioration of the preparation as a result of diffusion into or across the material of the container or by yielding foreign substances to the preparation.

The container and package of a single dose preparation should be such as to maintain sterility of the contents and the applicator up to the time of use. Containers for multiple application preparations should be fitted with an integral dropper or with a sterile screw cap of suitable materials incorporating a dropper and plastic or rubber teat. Alternatively, such a cap assembly may be packed separately after it is sterilised. Containers of multiple application preparations should permit the withdrawal of successive doses

of the preparation. Such containers should normally hold not more than 10 ml.

Description. Eye Drops that are solutions are practically clear and practically free from particles when examined under suitable conditions of visibility. Eye Drops that are suspensions may show a sediment that readily disperses when shaken. The suspension remains sufficiently dispersed to enable the correct dose to be removed from the container.

Tests

Uniformity of volume. Comply with the test for contents of packaged dosage forms (2.5.6).

Particle size. This test is applicable only to Eye Drops that are suspensions. Introduce a suitable volume of the Eye Drops into a counting cell or onto a microscope slide, as appropriate. Scan under a microscope an area corresponding to 10 µg of the solid phase. Scan at least 50 representative fields. Not more than 20 particles have a maximum dimension greater than 25 µm, not more than 10 particles have a maximum dimension greater than 50 µm and none has a maximum dimension greater than 100 µm.

Sterility. Comply with the test for sterility (2.2.11). Droppers supplied separately also comply with these tests. Remove the dropper out of the package using aseptic precautions and transfer it to a tube containing suitable culture medium so that it is completely immersed. Incubate and carry out the test.

Storage. Store in sterile containers sealed so as to protect from micro-organisms.

Labelling. The label states (1) the names and concentrations in percentages, or weight or volume per ml, of the active ingredients; (2) the names and concentrations of any added antimicrobial preservative; (3) that, for multiple application containers, the contents should not be used for more than 1 month after opening the container; (4) that, for multiple application containers, care should be taken to avoid contamination of the contents during use; (5) that the preparation is NOT FOR INJECTION; (6) the conditions under which the preparation should be stored.

Eye Ointments

Ophthalmic Ointments

Eye Ointments are sterile, semi-solid preparations of homogenous appearance intended for application to the eye. They may contain one or more medicaments dissolved or dispersed in a suitable basis. Bases, which are usually non-aqueous, may contain suitable auxiliary substances such as stabilising agents, antimicrobial preservatives and antioxidants. The base selected must be non-irritant to the conjunctiva, allow the drug to diffuse throughout the secretions of the eye and retain the activity of the medicaments for a reasonable period of time under the stated conditions of storage.

Eye Ointments are prepared using methods designed to ensure their sterility and to avoid the introduction of contaminants and growth of micro-organisms. Methods of sterilisation that may be used in the manufacture of Eye Ointments are described in Chapter 5.3.

Containers. Eye Ointments should be packed in small, sterilised collapsible tubes of metal or of suitable plastic fitted or provided with a nozzle of suitable shape to facilitate the application of the product without contamination and with a cap. The content of such containers is not more than 5 g of the preparation. Eye Ointments may also be packed in single application containers of such a shape as to facilitate administration without contamination; such containers may be individually wrapped. Other requirements concerning containers are given in Chapter 6.2.

Tests

Uniformity of weight. Comply with the test for contents of packaged dosage forms (2.5.6).

Particle size. Gently spread a small quantity of the Eye Ointment as a thin layer on a microscope slide. Scan under a microscope an area corresponding to 10 µg of the solid phase. Scan at least 50 representative fields. Not more that 20 particles have a maximum dimension greater than 25 µm, not more than 10 particles have a maximum dimension greater than 50 µm and none has a maximum dimension greater than 100 µm.

Sterility (2.2.11). Comply with the test for sterility.

Storage. Store at temperatures below 30° unless otherwise directed. Do not freeze.

Gels

Gels are homogeneous, semi-solid preparations usually consisting of solutions or dispersions of one or more medicaments in suitable hydrophilic or hydrophobic bases. They are normally prepared with the aid of suitable gelling agents. They are intended to be applied to the skin or certain mucous membranes for protective, prophylactic or therapeutic purposes. Gels may contain suitable added substances such as antioxidants, stabilisers and antimicrobial preservatives.

During manufacture, packaging, storage and distribution of gels, suitable means shall be taken to ensure their microbial quality; acceptance criteria for microbial quality are given in Chapter 2.2.9.

Gels specifically intended for use on large open wounds or on severely injured skin should be sterile.

Containers. Gels should be packed in suitable well-closed or, if the preparation contains water or other volatile ingredients, suitable tightly-closed containers. The containers should be fitted with closures that minimise contamination with micro-organisms. To the extent possible, collapsible tubes of suitable metal or plastic should be used.

Storage. Store at temperatures below 30° unless otherwise directed. Do not freeze.

Labelling. The label states (1) that the gel is sterile, where necessary; (2) the storage conditions.

Tests

Uniformity of weight. Comply with the test for contents of packaged dosage forms (2.5.6).

Sterility. Gels labelled as sterile comply with the test for sterility (2.2.11).

Granules

Requirements for granules to be used for the preparation of oral solutions or suspensions are given in the general monograph on Oral Liquids.

Definition

Granules are preparations consisting of solid, dry aggregates of powder particles sufficiently resistant to withstand handling. They are intended for oral administration. Some are swallowed as such, some are chewed and some are dissolved or dispersed in water or another suitable liquid before being administered.

Granules contain one or more active substances with or without excipients and, if necessary, colouring matter authorized by the competent authority and flavouring substances.

Granules are presented as single-dose or multi-dose preparations. Each dose from a multidose preparation is administered by means of a device suitable for measuring the quantity prescribed. For single-dose granules, each dose is enclosed in an individual container, for example a sachet or a vial.

Where applicable, containers for granules comply with the requirements of Containers for Pharmaceutical Products (chapter 6.2)

Several categories of granules may be distinguished:

— effervescent granules;
— coated granules;
— modified-release granules.
— gastro-resistant granules;
— immediate-release granules.

Production

In the manufacture, packaging, storage and distribution of granules, suitable means shall be taken to ensure their microbial quality; acceptance criteria for microbial quality are given in Chapter 2.2.9.

Tests

Uniformity of content (2.5.4) Unless otherwise prescribed or justified and authorised, single-dose granules with a content of active substance less than 10 mg or less than 10 per cent of the total mass comply with test for uniformity of content of single-dose preparations. For granules containing more than one active ingredient, carry out the test for each active ingredient that corresponds to the aforementioned conditions.

Uniformity of container contents. Granules supplied in multidose containers comply with the test for contents of packaged dosage forms (2.5.6).

Effervescent Granules

Effervescent granules are uncoated granules generally containing acid substances and carbonates or hydrogen carbonates which react rapidly in the presence of water to release carbon dioxide. They are intended to be dissolved or dispersed in water before administration.

Tests

Disintegration (2.5.1) Place one dose of the effervescent granules in a beaker containing 200 ml of *water* at 15-25°; numerous bubbles of gas are evolved. When the evolution of gas around the individual grains ceases, the granules have disintegrated, being either dissolved or dispersed in the *water.* Repeat the operation on 5 other doses. The preparation complies with the test if each of the 6 doses used disintegrates within 5 minutes.

Coated Granules

Coated granules are usually multidose preparations and consist of granules coated with one or more layers of mixtures of various excipients.

Production

The substances used as coatings are usually applied as a solution or suspension in conditions in which evaporation of the vehicle occurs.

Tests

Dissolution (2.5.2). Where required, the requirements for this test are given in the individual monograph.

Modified-release Granules

Modified-release granules are coated or uncoated granules which contain special excipients or which are prepared by special procedures, or both, designed to modify the rate, the place or the time at which the active substance or substances are released.

Modified-release granules include prolonged-release granules and delayed-release granules.

Production

A suitable test is carried out to demonstrate the appropriate release of the active substance(s).

Tests

Dissolution (2.5.2). Where required, the requirements for this test are given in the individual monograph.

Gastro-resistant Granules

Gastro-resistant granules are delayed-release granules that are intended to resist the gastric artificial juice and to release the active substance(s) in the intestinal fluid. These properties are achieved by covering the granules with a gastro-resistant material (enteric-coated granules) or by other suitable means.

Production

A suitable test is carried out to demonstrate the appropriate release of the active substance(s).

Tests

Dissolution (2.5.2). Where required, the requirements for this test are given in the individual monograph.

Immediate-release Granules

Definition

Granules are preparations consisting of solid, dry aggregates of powder particles sufficiently resistant to withstand handling. They are intended for oral administration. Some are swallowed as such; some are dissolved or dispersed in water or another suitable liquid before being administered.

Granules contains one or more active substances with or without excipients and, if necessary, coloring matter authorized by the competent authority and flavouring substances.

Granules are presented as single-dose or multi-dose preparations. Each dose of a multi-dose preparation is administered by means of a device suitable for measuring the quantity prescribed. For single-dose granules, each dose is enclosed in an individual container, for example a sachet or a vial.

Where applicable, containers for granules comply with the requirements of Materials used for the manufacture of containers and Containers.

Several categories of granules may be distinguished:

— Effervescent granules;

— *Coated granules.*

Production

In the manufacture, packaging, storage and distribution of granules, suitable measures are taken to ensure their microbial quality; recommendations on this aspect are provided in the text on microbial contamination in nonsterile products (2.2.9).

Tests

Uniformity of content (2.5.4). Unless otherwise prescribed or justified and authorized, single-dose granules with a content of active substance less than 10 mg or less than 10 per cent of the total mass comply with test for uniformity of content of single-dose preparations. If the preparation has more than one active substance, the requirement applies only to those substances, which correspond to the above conditions.

Uniformity of weight (2.5.3). Single-dose granules except for coated granules comply with the test for uniformity of weight of single-dose preparations. If the test for uniformity of content is prescribed for all active substances, the test for uniformity of weight is not required.

Uniformity of container contents. Granules supplied in multidose containers comply with the test for contents of packaged dosage forms (2.5.6).

Storage. All types of granules should be stored in airtight container to prevent unusual and other changes before packing, unless otherwise stated in the individual monograph.

For Immediate Release Granules, if the preparation contains volatile ingredients or the contents have to be protected, store in an airtight container.

Inhalation Preparations

Inhalation Preparations are liquid or solid preparations intended for administration as vapours or aerosols to the lung in order to obtain a local or systemic effect. They contain one or more active substances that may be dissolved or dispersed in a suitable vehicle.

Inhalation Preparations may, depending on the type of preparation, contain propellants, cosolvents, diluents,

antimicrobial preservatives, solubilising and stabilising agents, etc. These excipients do not adversely affect the functions of the mucosa of the respiratory tract or its cilia. Suspensions and emulsions are readily dispersible on shaking and they remain sufficiently stable to enable the correct dose to be delivered. Inhalation Preparations are supplied in single-dose or multidose containers.

Inhalation Preparations intended to be administered as aerosols (dispersions of solid or liquid particles of active ingredient(s) in a gas) are administered by one of the following devices: a nebuliser; an inhaler (pressurised metered-dose inhaler, non-pressurised metered-dose inhaler or powder inhaler).

Several categories of Inhalation Preparations may be distinguished: preparations to be converted into vapour; liquid preparations for nebulisation; pressurised metered-dose preparations for inhalation; non-pressurised metered-dose preparations for inhalation; inhalation powders.

Production

Inhalation preparations should be manufactured in conditions designed to minimise microbial and particulate contamination.

During the development of a preparation that contains an antimicrobial preservative, the effectiveness of the preservative selected, shall be determined as described in chapter 2.2.2. Effectiveness of antimicrobial preservatives.

In the manufacture, packaging, storage and distribution of preparations for inhalation, suitable measures are taken to ensure their microbial quality; recommendations on this aspect are provided in chapter 2.2.9. Microbial contamination in Nonsterile products.

Uniformity of delivered dose of a multidose inhaler must be ensured within a device (intra-inhaler) and between devices (inter-inhaler). For intra-inhaler testing, the uniformity of delivered dose tests are described in the Tests sections of the various preparation categories in this monograph. For inter-inhaler testing, a suitable procedure is to take 10 inhalers and collect a single dose from each inhaler, collecting the dose at the beginning (from 3 inhalers), middle (from 4 inhalers) and end (from 3 inhalers) of the number of doses stated on the label. Other inter-inhaler testing procedures are possible, where justified.

Storage. Avoid storage under extremes of temperature and in an environment with undue fluctuations in temperature.

Labelling. The label states (1) the name(s) of the active ingredient(s); (2) the total amount of the active ingredient(s) in the container except in the case of metered-dose preparation for inhalation); (3) that the container should be shaken before use; (4) the other instructions for use; (5) the date after which the preparation is not intended to be used; (6) the conditions under which it should be stored; (7) a warning that the container is under pressure and that it must not be punctured, broken or incinerated even when apparently empty; (8) the statement "Warning. Keep away from children".

In the case of metered-dose aerosols and pressurized metered dose inhalers, the label states in addition (1) the total number of deliveries available from the container; (2) the amount of active ingredient(s) released each time the valve is actuated.

In the case of dry powder inhalers the label on the container states (1) the date after which the dry powder inhaler is not intended to be used; (2) the conditions under which the powder for Inhalation should be stored. Where the powder for Inhalation is supplied in a capsule, the label also states; (3) the quantity of the active ingredient contained in each capsule; (4) that the capsules are intended for use in an inhaler and are not to be swallowed.

Information on use of the preparation provided in the pack shall include (1) the direction for correct use of the aerosol; (2) a warning that the container may explode if punctured, exposed to excessive heat or direct sunlight; (3) the directions for the disposal of the used or partly-used container.

Preparations to be converted into vapour

Preparations intended to be converted into vapour are liquids, solutions, suspensions, emulsions, or semi-solid or solid preparations. They are usually added to hot water and the vapour generated is inhaled.

Liquid preparations for nebulisation

Liquid preparations for nebulisation are solutions, suspensions or emulsions intended to be converted into aerosols by nebulisers.

Liquid preparations for nebulisation in concentrated form are diluted to the prescribed volume with the prescribed liquid before use. Liquid preparations for nebulisation may also be prepared from powders by reconstitution in the prescribed liquid.

The pH of liquid preparations for nebulisation is not lower than 3 and not higher than 10.

Liquid preparations for nebulisation supplied in multi-dose containers may contain a suitable antimicrobial preservative at a suitable concentration except where the preparation itself has adequate antimicrobial properties.

Liquid preparations for nebulisation supplied in multi-dose containers that do not contain an antimicrobial preservative, and where the preparation itself does not have adequate antimicrobial properties, are sterile and are supplied in containers preventing microbial contamination of the contents during storage and use.

Liquid preparations for nebulisation supplied in single-dose containers are sterile and preservative-free, unless otherwise justified and authorised.

Nebulisers are devices that convert liquids into aerosols by high-pressure gases, ultrasonic vibration, and extrusion through a mesh or other methods. They allow the dose to be inhaled at an appropriate active-substance delivery rate over an extended period of time involving consecutive inhalations and with a particle size that allows deposition of the preparation in the lungs.

Nebulisers may be breath-triggered or use other means to synchronise or modify the nebuliser operation with the patient's breathing.

Production

The active substance delivery rate, the total active substance delivered and the particle per droplet-size distribution are determined using the methods described in Preparations for nebulisation: characterisation. Where justified and authorised, different apparatus and procedures may be used.

Tests

Prepare the liquid preparation for nebulisation as directed in the instructions to the patient.

Uniformity of content (2.5.4). The test is applicable to Nebulisers that contain less than 10 mg or less than 10 per cent of active ingredient. For Nebulisers containing more than one active ingredient, carry out the test for each active ingredient that corresponds to the above conditions.

The test for uniformity of content should be carried out only after the content of active ingredient(s) in a pooled sample of the nebulisers has been shown to be within accepted limits of stated content.

Uniformity of weight (2.5.3). This test is not applicable to Nebulisers that are required to comply with the test for Uniformity of content for all the active ingredients.

Weigh individually the contents of 20 containers, emptied as completely as possible, and determine the average weight; not more than two of the individual weights deviate from the average weight by more than 10 per cent and none deviate by more than 20 per cent.

Aerodynamic assessment of nebulised aerosols

For liquid preparations for nebulisation that are suspensions, determine fine-particles mass using an apparatus and procedure described in preparations for nebulisation: characterization. Where justified and authorised, a different apparatus and procedure may be used.

Pressurised metered-dose preparations for inhalation

Pressurised metered-dose preparations for inhalation are solutions, suspensions or emulsions supplied in containers equipped with a metering valve and which are held under pressure with (a) suitable propellant(s), which can act also as a solvent.

The delivered dose is the dose delivered from the inhaler. For some preparations the dose has been established as a metered dose. The metered dose is determined by adding the amount deposited on the inhaler to the delivered dose. It may also be determined directly.

Production

The size of aerosol particles to be inhaled is controlled so that a consistent portion is deposited in the lungs. The fine-particle characteristics of pressurised metered-dose preparations for inhalation are determined using the method described in Preparations for inhalation: aerodynamic assessment of fine particles.

Tests

For breath-triggered pressurised metered-dose inhalers, the test conditions described below may need to be modified to ensure that actuation occurs for the inhaler under test.

Prepare the inhaler as directed in the instructions to the patient.

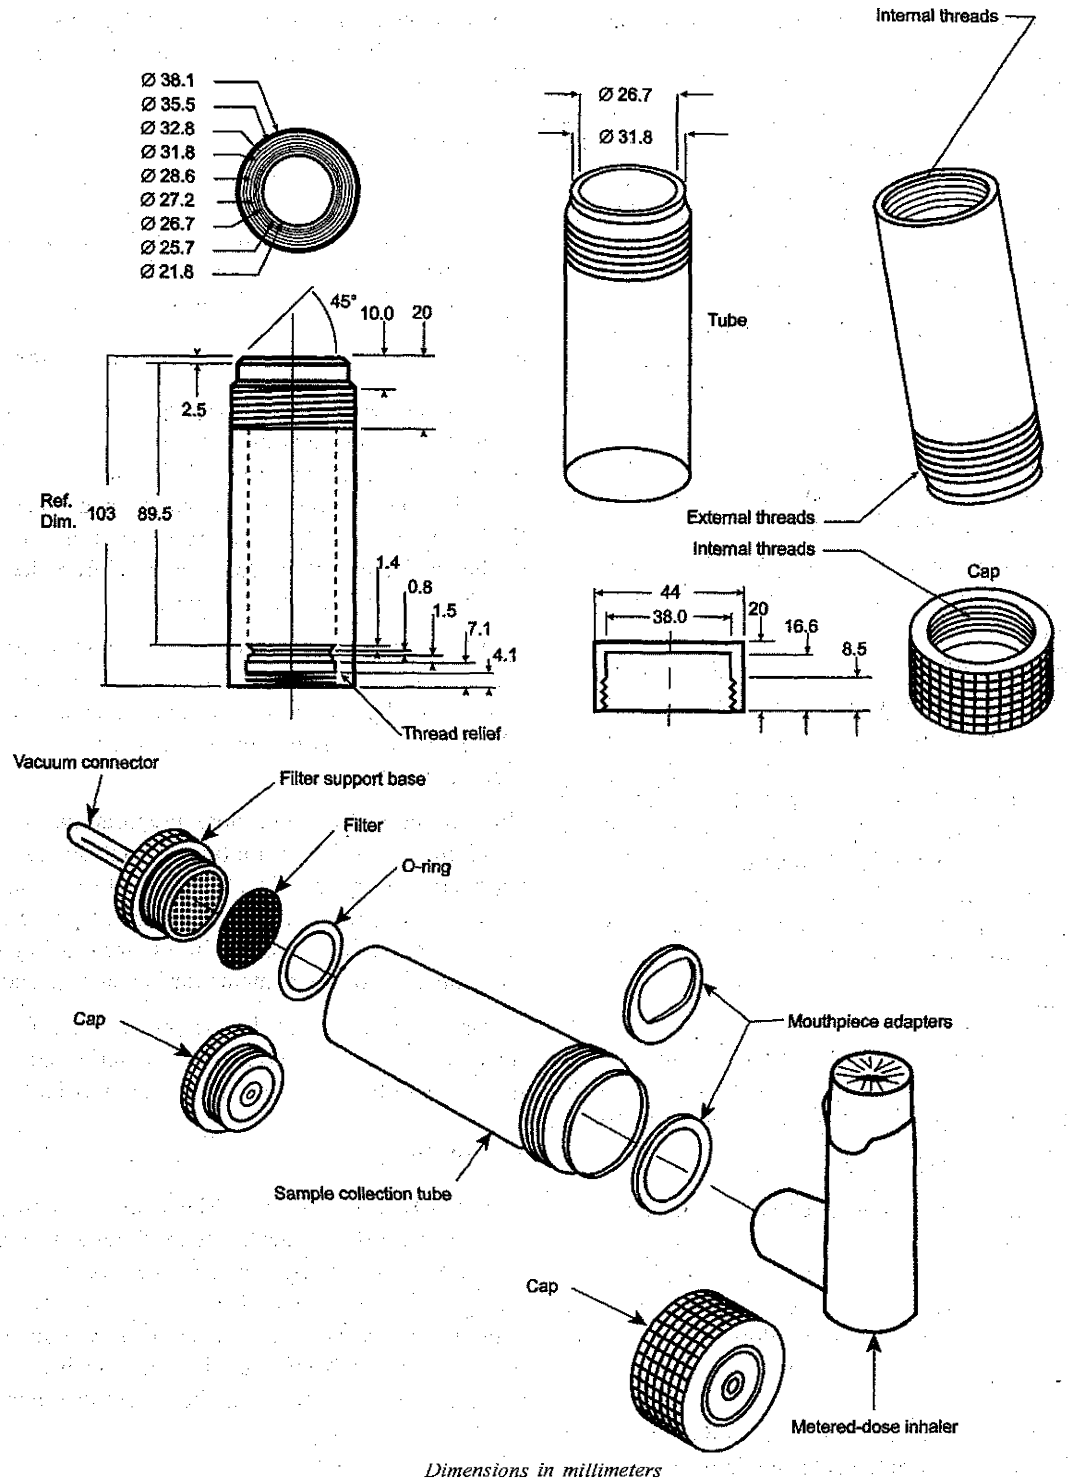
Uniformity of delivered dose

Pressurised metered-dose inhalers usually operate in a valve-down position. For inhalers that operate in a valve-up position, an equivalent test is applied using methods that ensure the complete collection of the delivered dose.

The dose collection apparatus must be capable of quantitatively capturing the delivered dose.

The following apparatus (Fig. 1) and procedure may be used.

The apparatus consists of a filter-support base with an open-mesh filter-support, such as a stainless steel screen, a collection tube that is clamped or screwed to the filter-support base, and a mouthpiece adapter to ensure an airtight seal between the collection tube and the mouthpiece. Use a mouthpiece adapter that ensures that the front face of the inhaler mouthpiece is flush with the front face or the 2.5 mm indented shoulder of the sample collection tube, as appropriate. The vacuum connector is connected to a system comprising a vacuum source and a flow regulator. The source is adjusted to draw air through the complete assembly, including the filter and the inhaler to be tested, at 28.3 litres per minute (± 5 per cent). Air should be drawn continuously through the apparatus to avoid loss of the active substance into the atmosphere. The filter-support base is designed to accommodate 25 mm diameter filter disks. The filter disk and other materials used in the



Dimensions in millimeters

Fig. 1: Dose collection apparatus for pressurized metered-dose inhalers

construction of the apparatus must be compatible with the active substance and solvents that are used to extract the active substance from the filter. One end of the collection tube is designed to hold the filter disk tightly against the filter-support base. When assembled, the joints between the components of the apparatus are airtight so that when a vacuum is applied to the base of the filter, all of the air drawn through the collection tube passes through the inhaler.

Unless otherwise prescribed in the instructions to the patient, shake the inhaler for 5 seconds and discharge 1 delivery to waste. Discharge the inverted inhaler into the apparatus, depressing the valve for a sufficient time to ensure complete discharge. Repeat the procedure until the numbers of deliveries that constitute the minimum recommended dose have been sampled. Quantitatively collect the contents of the apparatus and determine the amount of active substance.

Repeat the procedure for a further 2 doses.

Discharge the inhaler to waste, waiting not less than 5 seconds between actuations, until $(n/2) + 1$ deliveries remain, where n is the number of deliveries stated on the label. Collect 4 doses using the procedure described above.

Discharge the inhaler to waste, waiting not less than 5 seconds between actuations, until 3 doses remain. Collect these 3 doses using the procedure described above.

For preparations containing more than 1 active substance, carry out the test for uniformity of delivered dose for each active substance.

Unless otherwise justified and authorised, the preparation complies with the test if 9 out of 10 results lie between 75 per cent and 125 per cent of the average value and all lie between 65 per cent and 135 per cent. If 2 or 3 values lie outside the limits of 75 per cent to 125 per cent, repeat the test for 2 more inhalers. Not more than 3 of the 30 values lie outside the limits of 75 per cent to 125 per cent and no value lies outside the limits of 65 per cent to 135 per cent. Unless otherwise authorised, the mean value must be between 85 per cent and 115 per cent of the label claim for delivered dose.

Fine particle dose

Using an apparatus and procedure described in *Preparations for inhalation: aerodynamic assessment of fine particles* (apparatus B, C or D), calculate the fine particle dose.

Number of deliveries per inhaler

Take 1 inhaler and discharge the contents to waste, actuating the valve at intervals of not less than 5 seconds. The total number of deliveries so discharged from the inhaler is not less than the number stated on the label (this test may be combined with the test for uniformity of delivered dose).

Leak rate

Take a suitable number of containers, for example 1 container, remove any labels and record the date and time to the nearest half hour. Weigh the container to the nearest milligram and record the mass (M_1) in milligrams. Allow the containers to stand in an upright position at a temperature of 25.0 ± 2.0° for not less than 3 days, and again weigh the container, recording the mass (M_2) in milligrams, and recording the date and time to the nearest half hour. Determine the time (T), in hours, during which the container was under test.

Calculate the total loss of mass, in milligrams, over the entire shelf life (D), in months, of the container, using the following expression:

$$\frac{730 \times D}{T} \times (M_1 - M_2)$$

Unless otherwise justified, the preparation complies if the total loss of mass over the entire shelf life is not more than 10 per cent (m/m) of the nominal fill mass of the container.

Non-pressurised metered-dose preparations for inhalation

Non-pressurised metered-dose preparations for inhalation are solutions, suspensions or emulsions for use with inhalers that convert liquids into aerosols using single or multiple liquid jets, ultrasonic vibration or other methods. The volume of liquid to be converted into an aerosol is pre-metered or metered by the inhaler so that the dose delivered from the inhaler can be inhaled with 1 or more inspirations.

Non-pressurised metered-dose preparations for inhalation supplied in multidose containers may contain a suitable antimicrobial preservative at a suitable concentration except where the preparation itself has adequate antimicrobial properties.

Non-pressurised metered-dose preparations for inhalation supplied in multidose containers that do not contain an antimicrobial preservative and where the preparation itself does not have adequate antimicrobial properties, are sterile and are supplied in containers preventing microbial contamination of the contents during storage and use.

Non-pressurised metered-dose preparations for inhalation supplied in single-dose containers are sterile and preservative-free, unless otherwise justified and authorised.

Production

The size of aerosol particles to be inhaled is controlled so that a consistent portion is deposited in the lung. The fine-particle characteristics of non-pressurised metered-dose preparations for inhalation are determined using the method described in *Preparations for inhalation: aerodynamic assessment of fine particles*. Alternatively, laser diffraction analysis may be used, when properly validated against method (apparatus B, C or D).

Tests

For breath-triggered non-pressurised metered-dose inhalers, the test conditions described below may need to be modified to ensure that actuation occurs for the inhaler under test.

Prepare the inhaler as directed in the instructions to the patient.

Uniformity of delivered dose

The dose collection apparatus must be capable of quantitatively capturing the delivered dose. The apparatus described in the test for uniformity of delivered dose for pressurised metered-dose preparations may be used.

Discharge the inhaler into the apparatus. Repeat the procedure until the number of deliveries that constitute the minimum recommended dose have been sampled. Quantitatively collect the contents of the apparatus and determine the amount of active substance.

Repeat the procedure for a further 2 doses.

Discharge the inhaler to waste until $(n/2) + 1$ deliveries remain, where n is the number of deliveries stated on the label. Collect 4 doses using the procedure described above.

Discharge the inhaler to waste until 3 doses remain. Collect these 3 doses using the procedure described above.

For preparations containing more than 1 active substance, carry out the test for uniformity of delivered dose for each active substance.

Unless otherwise justified and authorised, the preparation complies with the test if 9 out of 10 results lie between 75 per cent and 125 per cent of the average value and all lie between 65 per cent and 135 per cent. If 2 or 3 values lie outside the limits of 75 per cent to 125 per cent, repeat the test for 2 more inhalers. Not more than 3 of the 30 values lie outside the limits of 75 per cent to 125 per cent and no value lies outside the limits of 65 per cent to 135 per cent.

Where justified and authorised, another apparatus and procedure may be used.

Fine particle dose

Using an apparatus and procedure described in *Preparations for inhalation: aerodynamic assessment of fine particles* (apparatus B, C or D), calculate the fine particle dose. Use the same procedure as for pressurised inhalers with appropriate adaptation of the methodology to non-pressurised inhalers. Depending on the characteristics of the non-pressurised metered-dose preparations for inhalation, relative humidity and/or temperature may need to be controlled during the test.

Number of deliveries per inhaler

Take 1 inhaler and discharge the contents to waste. The total number of deliveries so discharged from the inhaler is not less than the number stated on the label (this test may be combined with the test for uniformity of delivered dose).

Inhalation powders

Inhalation powders are supplied in single-dose or multidose containers. To facilitate their use, active substances may be combined with a suitable carrier. They are administered by powder inhalers. For pre-metered inhalers, the inhaler is loaded with powders pre-dispensed in capsules or other suitable dosage forms. For inhalers using a powder reservoir, the dose is created by a metering mechanism within the inhaler.

The delivered dose is the dose delivered from the inhaler. For some preparations, the labelled dose has been established as a metered dose or as a pre-dispensed dose. The metered dose is determined by adding the amount deposited on the inhaler to the delivered dose. It may also be determined directly.

Production

The size of aerosol particles to be inhaled is controlled so that a consistent portion is deposited in the lung. The fine-particle characteristics of powders for inhalation are determined using the method described in general chapter *Preparations for inhalation: aerodynamic assessment of fine particles.*

Tests

Prepare the inhaler as directed in the instructions to the patient.

Uniformity of delivered dose

The dose collection apparatus must be capable of quantitatively capturing the delivered dose. A dose collection apparatus similar to that described for the evaluation of pressurised metered-dose inhalers may be used provided that the dimensions of the tube and the filter can accommodate the measured flow rate. A suitable tube is defined in Table 1. Connect the tube to a flow system according to the scheme specified in Fig. 2 and Table 1.

Unless otherwise stated, determine the test flow rate and duration using the dose collection tube, the associated flow system, a suitable differential pressure meter and a suitable volumetric flow meter, calibrated for the flow leaving the meter, according to the following procedure.

Prepare the inhaler for use and connect it to the inlet of the apparatus using a mouthpiece adapter to ensure an airtight seal. Use a mouthpiece adapter that ensures that the front face of the inhaler mouthpiece is flush with the front face of the sample collection tube. Connect one port of a differential pressure meter to the pressure reading point P1 in Fig. 2, and let the other be open to the atmosphere. Switch on the pump, open the 2-way solenoid valve and adjust the flow control valve until the pressure drop across the inhaler is 4.0 kPa (40.8 cm H_2O) as indicated by the differential pressure meter. Remove the inhaler from the mouthpiece adapter and, without touching the flow control valve, connect a flowmeter to the inlet of the sampling apparatus. Use a flowmeter calibrated for the volumetric flow leaving the meter, or calculate the volumetric

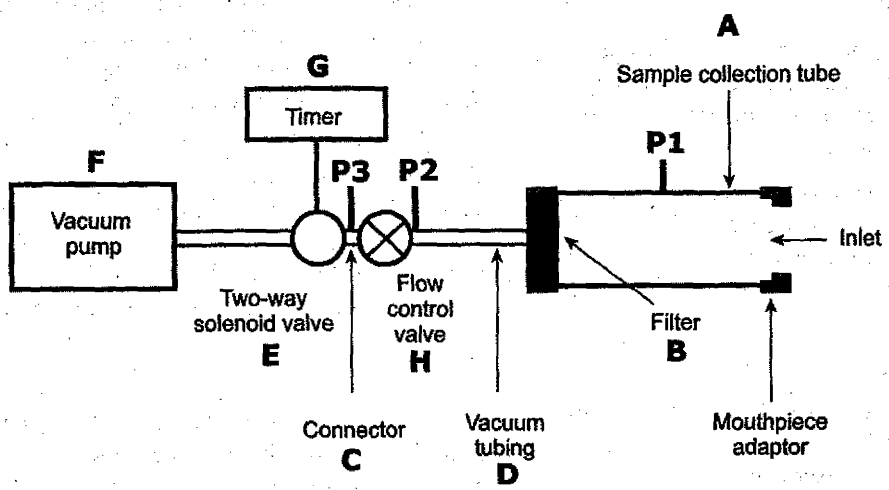


Fig. 2: Apparatus for measuring the uniformity of delivered dose for powders for inhalation

Table 1 – Specifications of the apparatus used for powder for inhalation described in Fig. 2

Code	Item	Description
A	Sample collection tube	Capable of quantitatively capturing the delivered dose, e.g. dose collection tube similar to that described in Figure A with dimensions of 34.85 mm ID x 12 cm length (e.g. product number XX40 047 00, Millipore Corporation, Bedford, MA 01732 with modified exit tube, ID ≥ 8 mm, fitted with Gelman product number 61631), or equivalent.
B	Filter	47 mm filter, e.g. A/E glass fibre filter (Gelman Sciences, Ann Arbor, MI 48106), or equivalent.
C	Connector	ID ≥ 8 mm, e.g. short metal coupling, with low-diameter branch to P3
D	Vacuum tubing	A length of suitable tubing having an ID ≥ 8 mm and an internal volume of 25 ± 5 ml
E	2-way solenoid valve	A 2-way, 2-port solenoid valve having a minimum airflow resistance orifice with ID ≥ 8 mm and an opening time ≤ 100 ms (e.g. type 256-A08, Burkert GmbH, D-74653 Ingelfingen), or equivalent.
F	Vacuum pump	Pump must be capable of drawing the required flow rate through the assembled apparatus with the powder inhaler in the mouthpiece adapter (e.g. product type 1023, 1423 or 2565, GAST Manufacturing Inc., Benton Harbor, MI 49022), or equivalent. Connect the pump to the 2-way solenoid valve using short and/or wide (≥ 10 mm ID) vacuum tubing and connectors to minimize pump capacity requirements.
G	Timer	Timer capable of driving the 2-way solenoid valve for the required time period (e.g. type G814, RS Components International, Corby, NN17 9 RS, UK), or equivalent.
P1	Pressure tap	2.2 mm ID, 3.1 mm OD, flush with internal surface of the sample collection tube, centred and burr-free, 59 mm from its inlet. The pressure tap P1 must never be open to the atmosphere.
P2, P3	Pressure measurements	Differential pressure to atmosphere (P1) or absolute pressure (P2 and P3)
H	Flow control valve	Adjustable regulating valve with maximum Cv ≥1, (e.g. type 8FV12LNSS, Parker Hannifin plc., Barnstaple, EX31 1NP, UK), or equivalent.

flow leaving the meter (Q_{out}) using the ideal gas law. For a meter calibrated for the entering volumetric flow (Q_{in}), use the following expression:

$$Q_{out} = \frac{Q_{in} \times P_0}{P_0 - \Delta P}$$

Where, P_0 = Atmospheric pressure;
ΔP = Pressure drop over the meter.

If the flow rate is above 100 liters per minutes adjust the flow control valve to obtain a flow rate of 100 liter per minutes (± 5 per cent). Note the volumetric airflow rate exiting the meter and define this as the test flow rate, Q_{out}, in litres per minute. Define the test flow duration, T, in seconds so that a volume of 4 litre of air is drawn from the mouthpiece of the inhaler at the test flow rate, Q_{out}.

Ensure that critical flow occurs in the flow control valve by the following procedure: with the inhaler in place and the test flow rate Q_{out}, measure the absolute pressure on both sides of the control valve (pressure reading points P2 and P3 in Fig. 2); a ratio P3/P2 of less than or equal to 0.5 indicates critical flow; switch to a more powerful pump and re-measure the test flow rate if critical flow is not indicated.

Pre-metered inhalers. Connect the inhaler to the apparatus using an adapter that ensures a good seal. Draw air through the inhaler using the predetermined conditions. Repeat the procedure until the number of deliveries that constitute the minimum recommended dose have been sampled. Quantitatively collect the contents of the apparatus and determine the amount of active substance.

Repeat the procedure for a further 9 doses.

Device-metered inhalers. Connect the inhaler to the apparatus using an adapter that ensures a good seal. Draw air through the inhaler under the predetermined conditions. Repeat the procedure until the number of deliveries that constitute the minimum recommended dose have been sampled. Quantitatively collect the contents of the apparatus and determine the amount of active substance. Repeat the procedure for a further 2 doses.

Discharge the inhaler to waste until $(n/2) + 1$ deliveries remain, where n is the number of deliveries stated on the label. If necessary, store the inhaler to discharge electrostatic charges. Collect 4 doses using the procedure described above.

Discharge the inhaler to waste until 3 doses remain. If necessary, store the inhaler to discharge electrostatic charges. Collect 3 doses using the procedure described above.

For preparations containing more than 1 active substance, carry out the test for uniformity of delivered dose for each active substance.

Results. The preparation complies with the test if 9 out of 10 results lie between 75 per cent and 125 per cent of the average value and all lie between 65 per cent and 135 per cent. If 2 or 3 values lie outside the limits of 75 per cent to 125 per cent, repeat the test for 2 more inhalers. Not more than 3 of the 30 values lie outside the limits of 75 per cent to 125 per cent and no value lies outside the limits of 65 per cent to 135 per cent.

In justified and authorised cases, these ranges may be extended but no value should be greater than 150 per cent or less than 50 per cent of the mean value. Unless otherwise authorized, the mean value must be between 85 per cent and 115 per cent of the label claim for delivered dose.

Fine particle dose

Using an apparatus and procedure described in *Preparations for inhalation: aerodynamic assessment of fine particles* (apparatus B, C or D), calculate the fine particle dose.

Number of deliveries per inhaler for multidose inhalers

Discharge doses from the inhaler until empty, at the predetermined flow rate. Record the deliveries discharged. The total number of deliveries so discharged from the inhaler is not less than the number stated on the label (this test may be combined with the test for uniformity of delivered dose).

Preparations for Inhalation: Aerodynamic Assessment of Fine Particles

This test is used to determine the fine particle characteristics of the aerosol clouds generated by preparations for inhalation.

Unless otherwise justified and authorised, one of the following apparatus and test procedures is used.

Stage mensuration. Is performed periodically together with confirmation of other dimensions critical to the effective operation of the impactor.

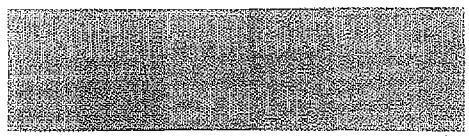
Re-entrainment (for apparatus B and D). To ensure efficient particle capture, coat each plate with glycerol, silicone oil or similar high viscosity liquid, typically deposited from a volatile solvent. Plate coating must be part of method validation and may be omitted where justified and authorised.

Mass balance. The total mass of the active substance is not less than 75 per cent and not more than 125 per cent of the average delivered dose determined during testing for uniformity of delivered dose. This is not a test of the inhaler but it serves to ensure that the results are valid.

Apparatus A. Glass Impinger

Procedure for Nebulisers

Introduce 7 ml and 30 ml of a suitable solvent into the upper and lower impingement chambers, respectively.



Connect all the component parts. Ensure that the assembly is vertical and adequately supported and that the jet spacer peg of the lower jet assembly just touches the bottom of the lower impingement chamber. Connect a suitable pump fitted with a filter (of suitable pore size) to the outlet of the apparatus. Adjust the air flow through the apparatus, as measured at the inlet to the throat, to 60 ± 5 litres per minute.

Introduce the liquid preparation for inhalation into the reservoir of the nebuliser. Fit the mouthpiece and connect it by means of an adapter to the device.

Switch on the pump of the apparatus and after 10 seconds switch on the nebuliser.

After 60 seconds, unless otherwise justified, switch off the nebuliser, wait for about 5 seconds and then switch off the pump of the apparatus. Dismantle the apparatus and wash the inner surface of the upper impingement chamber collecting the washings in a volumetric flask. Wash the inner surface of the lower impingement chamber collecting the washings in a second volumetric flask. Finally, wash the filter preceding the pump and its connections to the lower impingement chamber and combine the washings with those obtained from the lower impingement chamber. Determine the amount of active substance collected in each of the 2 flasks. Express the results for each of the 2 parts of the apparatus as a percentage of the total amount of active substance.

Procedure for pressurised inhalers

Place the actuator adapter in position at the end of the throat so that the mouthpiece end of the actuator, when inserted to a depth of about 10 mm, lines up along the horizontal axis of the throat and the open end of the actuator, which accepts the pressurised container, is uppermost and in the same vertical plane as the rest of the apparatus.

Introduce 7 ml and 30 ml of a suitable solvent into the upper and lower impingement chambers, respectively.

Connect all the component parts. Ensure that the assembly is vertical and adequately supported and that the lower jet-spacer peg of the lower jet assembly just touches the bottom of the lower impingement chamber. Connect a suitable pump to the outlet of the apparatus. Adjust the air flow through the apparatus, as measured at the inlet to the throat, to 60 ± 5 litres per minute.

Prime the metering valve by shaking for 5 seconds and discharging once to waste; after not less than 5 seconds, shake and discharge again to waste. Repeat a further 3 times.

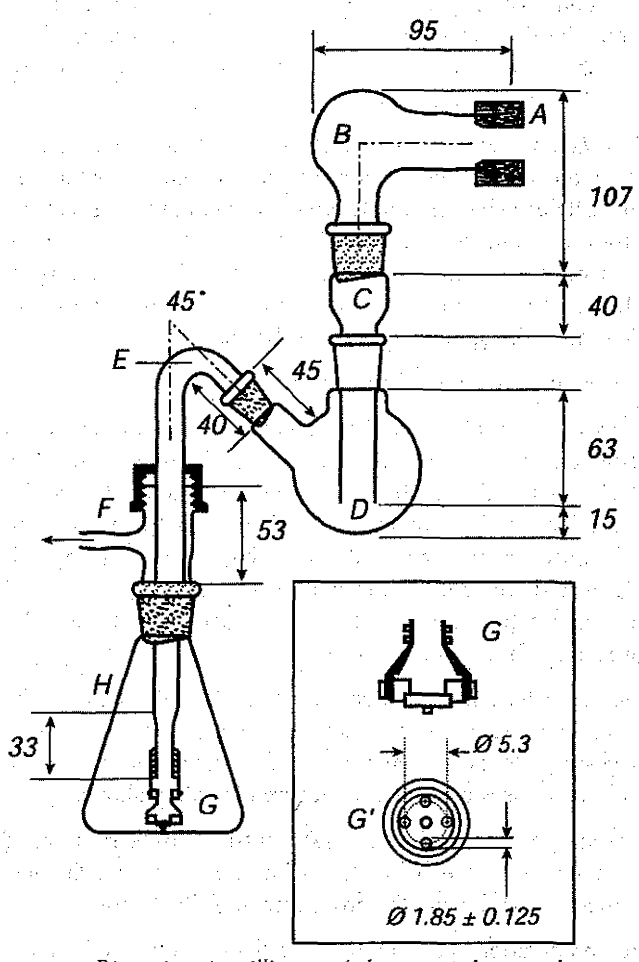
Shake for about 5 seconds, switch on the pump to the apparatus and locate the mouthpiece end of the actuator in the adapter, discharge once immediately. Remove the assembled inhaler from the adapter, shake for not less than 5 seconds, relocate the mouthpiece end of the actuator in the adapter and discharge again. Repeat the discharge sequence. The number of discharges should be minimised and typically would not be greater than 10. After the final discharge wait for not less than 5 seconds and then switch off the pump. Dismantle the apparatus.

Wash the inner surface of the inlet tube to the lower impingement chamber and its outer surface that projects into the chamber with a suitable solvent, collecting the washings in the lower impingement chamber. Determine the content of active substance in this solution. Calculate the amount of active substance collected in the lower impingement chamber per discharge and express the results as a percentage of the dose stated on the label.

Procedure for Powder Inhalers

Introduce 7 ml and 30 ml of a suitable solvent into the upper and lower impingement chambers, respectively.

Connect all the component parts. Ensure that the assembly is vertical and adequately supported and that the jet-spacer peg of the lower jet assembly just touches the bottom of the lower



Dimensions in millimetres (tolerances ± 1 mm, unless otherwise prescribed)

Fig. 3: Apparatus A. Glass impinger

impingement chamber. Without the inhaler in place, connect a suitable pump to the outlet of the apparatus. Adjust the air flow through the apparatus, as measured at the inlet to the throat, to 60 ± 5 litres per minute.

Prepare the inhaler for use and locate the mouthpiece in the apparatus by means of a suitable adapter. Switch on the pump for 5 seconds. Switch off the pump and remove the inhaler. Repeat the discharge sequence. The number of discharges

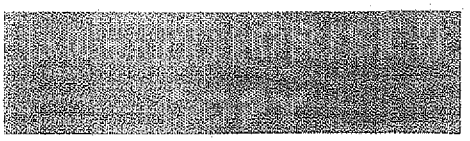
H	Lower impingement chamber	Conical flask	250 ml
		ground-glass inlet socket	24/29

Dimensions in millimetres, unless otherwise stated.



should be minimised and typically would not be greater than 10. Dismantle the apparatus. Wash the inner surface of the inlet tube to the lower impingement chamber and its outer surface that projects into the chamber with a suitable solvent, collecting the washings in the lower impingement chamber. Determine the content of active substance in this solution. Calculate the amount of active substance collected in the lower impingement chamber per discharge and express the results as a percentage of the dose stated on the label.

Apparatus B. Andersen Cascade impactor

The Andersen 1 ACFM non-viable cascade impactor consists of 8 stages together with a final filter. Material of construction may be aluminium, stainless steel or other suitable material. The stages are clamped together and sealed with O-rings. Critical dimensions applied by the manufacturer of apparatus B are provided in Table 3. In use, some occlusion and wear of holes will occur. In-use mensuration tolerances need to be justified. In the configuration used for pressurised inhalers (Fig. 4) the entry cone of the impactor is connected to an induction port (Fig. 9). A suitable mouthpiece adapter is used to provide an airtight seal between the inhaler and the induction port. The front face of the inhaler mouthpiece must be flush with the front face of the induction port.

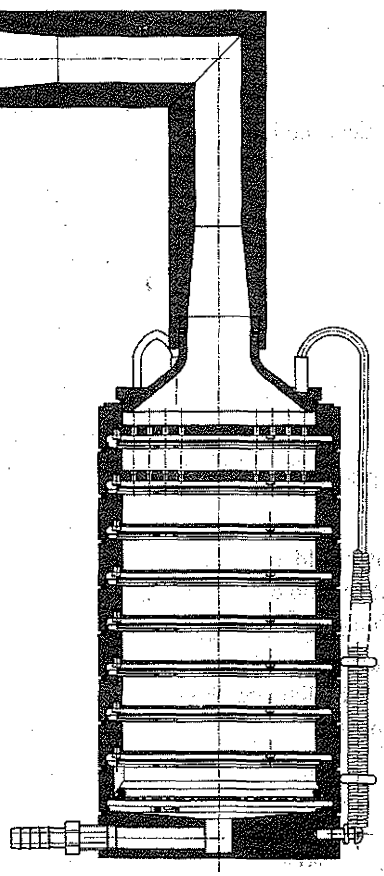


Fig. 4: Apparatus B. Andersen cascade impactor used for *pressurised inhalers*

In the configuration for powder inhalers, a pre-separator is placed above the top stage to collect large masses of non-respirable powder. It is connected to the induction port as shown in Fig. 5. To accommodate high flow rates through the impactor, the outlet nipple, used to connect the impactor to the vacuum system is enlarged to have an internal diameter of greater than or equal to 8 mm.

Table 3 - Critical dimensions for Apparatus B

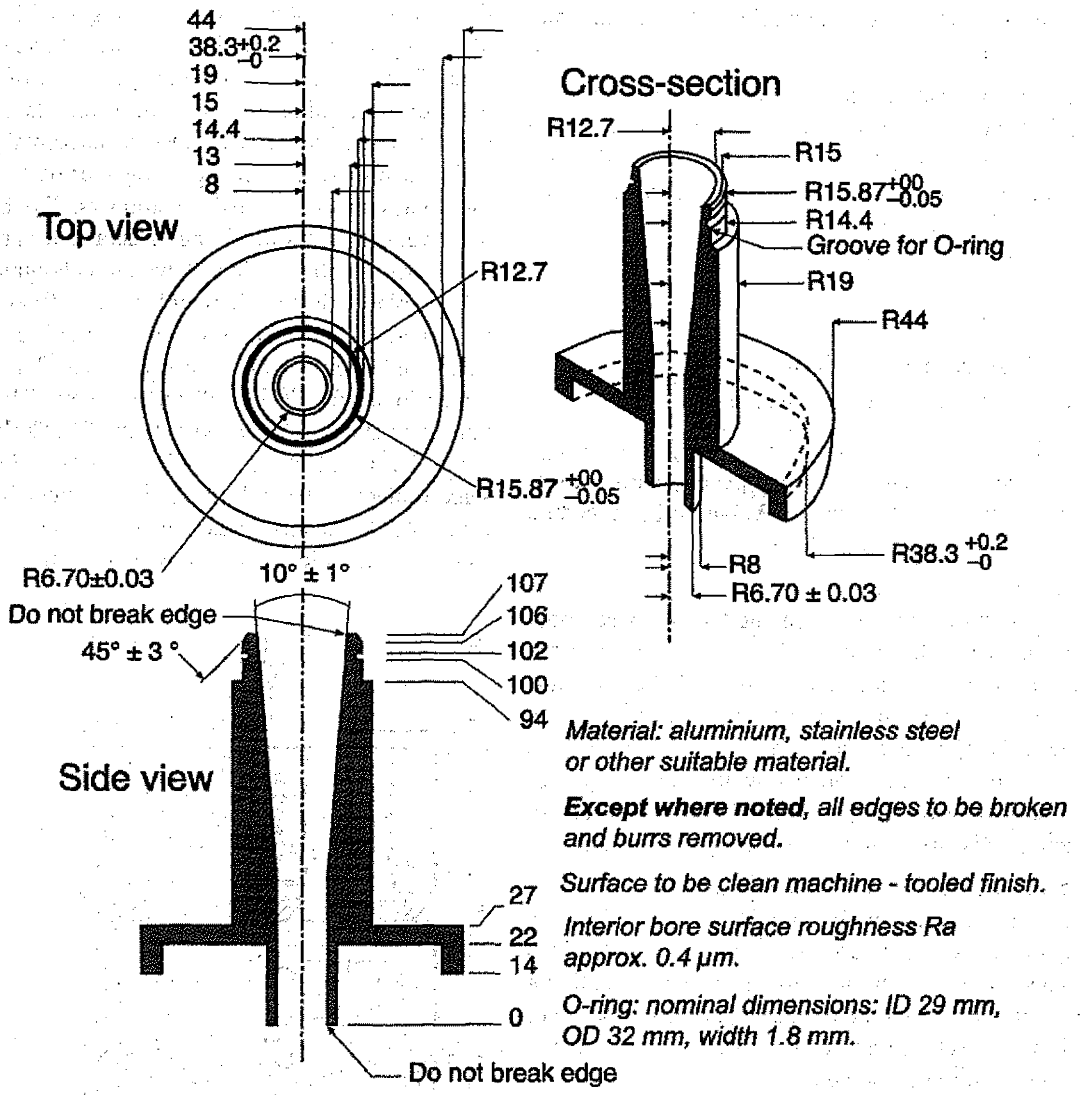
Description	Number	Dimension (mm)
Stage 0 nozzle diameter	96	2.55 ± 0.025
Stage 1 nozzle diameter	96	1.89 ± 0.025
Stage 2 nozzle diameter	400	0.914 ± 0.0127
Stage 3 nozzle diameter	400	0.711 ± 0.0127
Stage 4 nozzle diameter	400	0.533 ± 0.0127
Stage 5 nozzle diameter	400	0.343 ± 0.0127
Stage 6 nozzle diameter	400	0.254 ± 0.0127
Stage 7 nozzle diameter	201	0.254 ± 0.0127

Procedure for pressurised inhalers

Assemble the Andersen impactor with a suitable filter in place. Ensure that the system is airtight. In that respect, follow the manufacturer's instructions. Place a suitable mouthpiece adapter in position at the end of the induction port so that the mouthpiece end of the actuator, when inserted, lines up along the horizontal axis of the induction port and the inhaler unit is positioned in the same orientation as the intended use. Connect a suitable pump to the outlet of the apparatus and adjust the air flow through the apparatus, as measured at the inlet to the induction port, to 28.3 litres per minute (± 5 per cent). Switch off the pump.

Unless otherwise prescribed in the patient instructions shake the inhaler for 5 seconds and discharge one delivery to waste. Switch on the pump to the apparatus, locate the mouthpiece end of the actuator in the adapter and discharge the inverted inhaler into the apparatus, depressing the valve for a sufficient time to ensure complete discharge. Wait for 5 seconds before removing the assembled inhaler from the adapter. Repeat the procedure. The number of discharges should be minimised and typically would not be greater than 10. The number of discharges is sufficient to ensure an accurate and precise determination of the fine particle dose. After the final discharge, wait for 5 seconds and then switch off the pump.

Dismantle the apparatus. Carefully remove the filter and extract the active substance into an aliquot of the solvent. Remove



(Dimensions in millimetres, unless otherwise stated)

Fig. 5: Connection of the induction port to the preseparator of the Andersen cascade impactor

the induction port and mouthpiece adapter from the apparatus and extract the active substance into an aliquot of the solvent. Extract the active substance from the inner walls and the collection plate of each of the stages of the apparatus into aliquots of solvent.

Using a suitable method of analysis, determine the quantity of active substance contained in each of the aliquots of solvent.

Calculate the fine particle dose (see Calculations).

Procedure for powder inhalers

The aerodynamic cut-off diameters of the individual stages of this apparatus are currently not well-established at flow rates other than 28.3 litres per minute.

Users must justify and validate the use of the impactor in the chosen conditions, when flow rates different from 28.3 litres per minute are selected.

Assemble the Andersen impactor with the pre-separator and a suitable filter in place and ensure that the system is airtight. Depending on the product characteristics, the pre-separator may be omitted, where justified and authorised. Stages 6 and 7 may also be omitted at high flow rates, if justified. The pre-separator may be coated in the same way as the plates or may contain 10 ml of a suitable solvent. Connect the apparatus to a flow system according to the scheme specified in Fig. 10 and Table 6.

Unless otherwise defined, conduct the test at the flow rate, Q_{out}, used in the test for uniformity of delivered dose

drawing 4 litres of air from the mouthpiece of the inhaler and through the apparatus.

Connect a flow meter to the induction port. Use a flow meter calibrated for the volumetric flow leaving the meter, or calculate the volumetric flow leaving the meter (Q_{out}) using the ideal gas law. For a meter calibrated for the entering volumetric flow (Q_{in}), use the following expression:

$$Q_{out} = \frac{Q_{in} \times P_0}{P_0 - \Delta P}$$

Where, P_0 = Atmospheric pressure;
ΔP = Pressure drop over the meter.

Adjust the flow control valve to achieve steady flow through the system at the required rate, Q_{out} (± 5 per cent). Ensure that critical flow occurs in the flow control valve by the procedure described for Apparatus C. Switch off the pump.

Prepare the powder inhaler for use according to the patient instructions. With the pump running and the 2-way solenoid valve closed, locate the mouthpiece of the inhaler in the mouthpiece adapter. Discharge the powder into the apparatus by opening the valve for the required time, T (± 5 per cent). Repeat the discharge sequence. The number of discharges should be minimised and typically would not be greater than 10. The number of discharges is sufficient to ensure an accurate and precise determination of fine particle dose.

Dismantle the apparatus. Carefully remove the filter and extract the active substance into an aliquot of the solvent. Remove the pre-separator, induction port and mouthpiece adapter from the apparatus and extract the active substance into an aliquot of the solvent. Extract the active substance from the inner walls and the collection plate of each of the stages of the apparatus into aliquots of solvent.

Using a suitable method of analysis, determine the quantity of active substance contained in each of the aliquots of solvent.

Calculate the fine particle dose (see Calculations).

Apparatus C. Multi-stage liquid impinger

The multi-stage liquid impinger consists of impaction stages 1 (Pre-separator), 2, 3 and 4 and an integral filter stage (stage 5) (see Fig. 6/8). An impaction stage comprises an upper horizontal metal partition wall (B) through which a metal inlet jet tube (A) with its impaction plate (D) is protruding. A glass cylinder (E) with sampling port (F) forms the vertical wall of the stage, and a lower horizontal metal partition wall (G) through which the tube (H) connects to the next lower stage. The tube into stage 4 (U) ends in a multi-jet arrangement. The impaction plate (D) is secured in a metal frame (J) which is fastened by 2 wires (K) to a sleeve (L) secured on the jet tube. The horizontal face of the collection plate is perpendicular to the axis of the jet tube and centrally aligned. The upper surface of the impaction plate is slightly raised above the edge of the metal frame. A recess around the perimeter of the horizontal partition wall guides the position of the glass cylinder. The glass cylinders are sealed against the horizontal partition walls with gaskets (M) and clamped together by 6 bolts (N). The sampling ports are sealed by stoppers. The bottom-side of the lower partition wall of Stage 4 has a concentrical protrusion fitted with a rubber O-ring (P) which seals against the edge of a filter placed in the filter holder. The filter holder (R) is constructed as a basin with a concentrical recess in which a perforated filter support (S) is flush-fitted. The filter holder is dimensioned for 76 mm diameter filters. The assembly of impaction stages is clamped onto the filter holder by 2 snap-locks (T). Connect an induction port (see Fig. 9) onto the stage 1 inlet jet tube of the impinger. A rubber O-ring on the jet tube provides an airtight connection to the induction port. A suitable mouthpiece adapter is used to provide an airtight

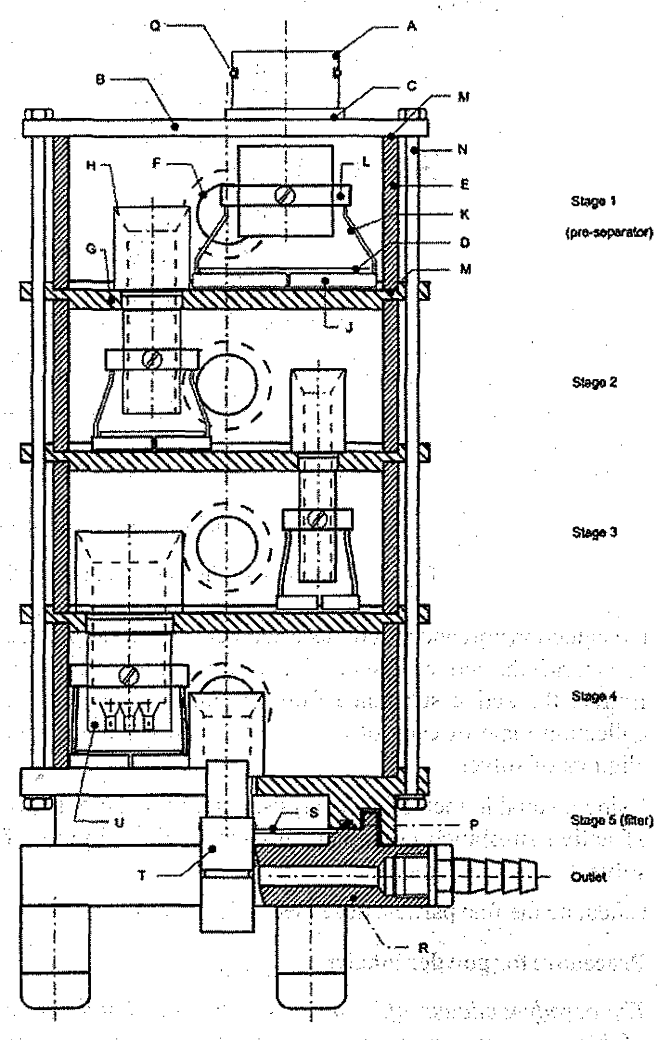


Fig. 6: Multi-stage liquid impinger

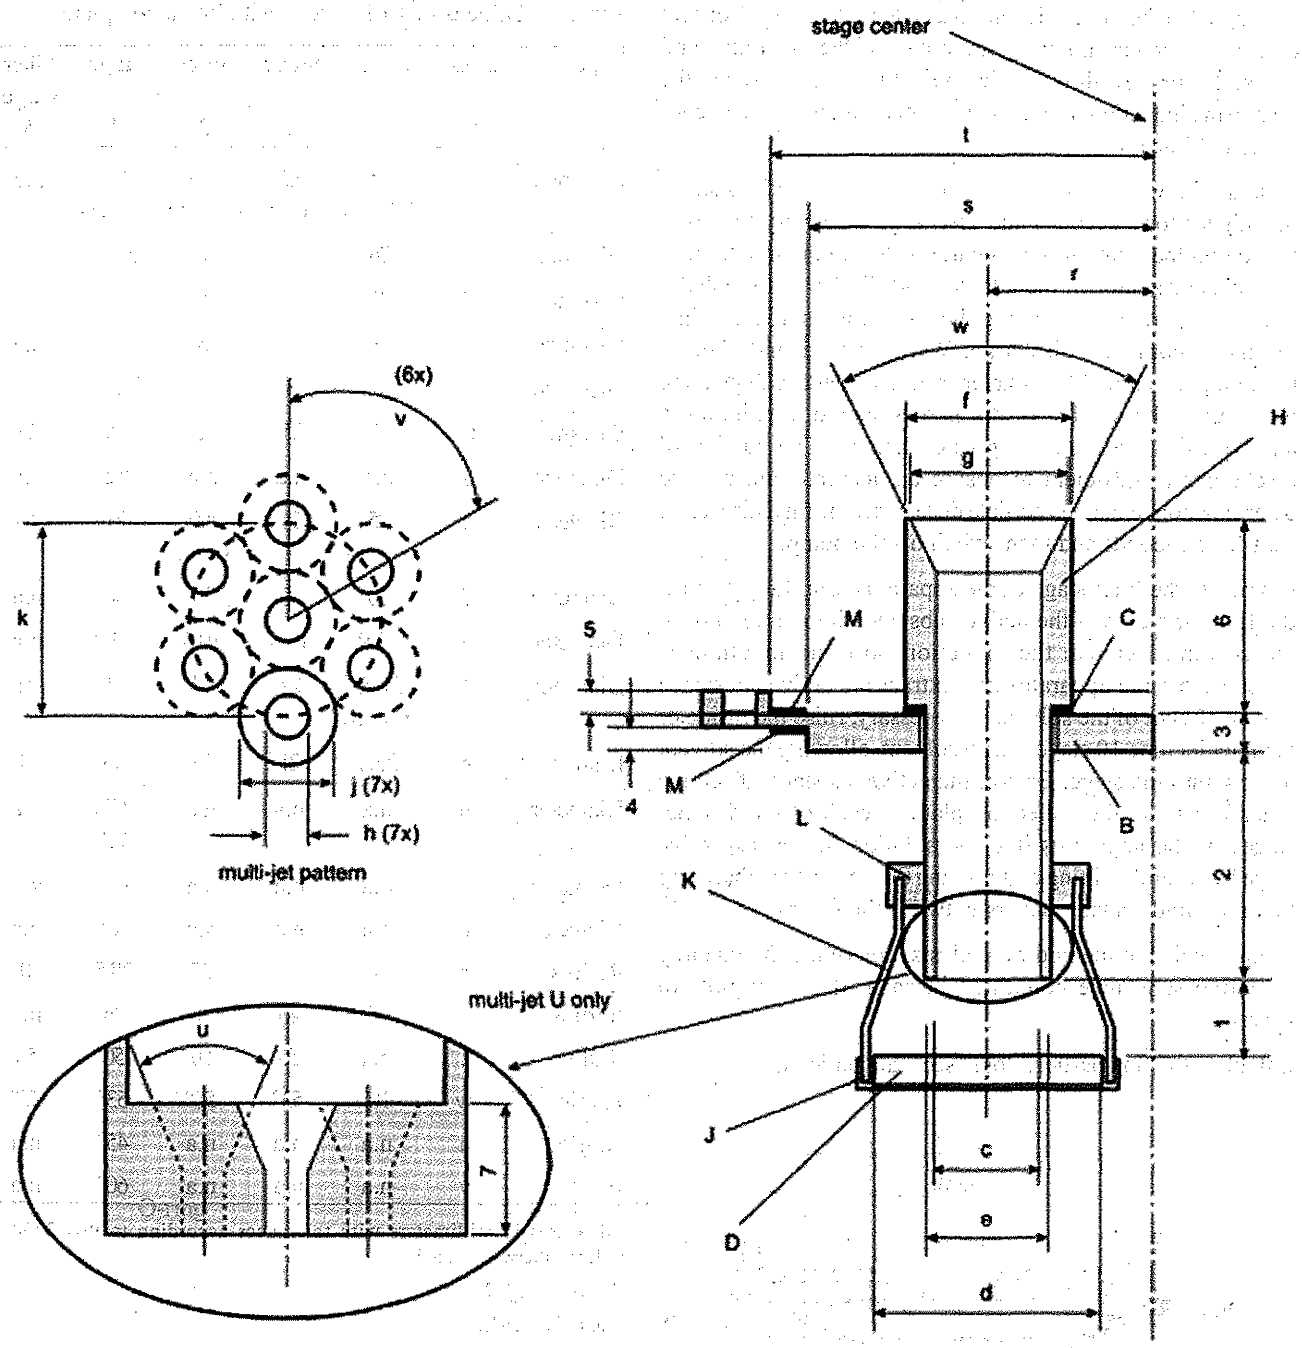

Fig. 7: Details of jet tube and impaction plate. Inserts show end of multi-jet tube U leading to stage 4. (Numbers and lowercase letters refer to Table 5 and uppercase letters refer to Fig. 6)

seal between the inhaler and the induction port. The front face of the inhaler mouthpiece must be flush with the front face of the induction port.

Procedure for pressurised inhalers

Dispense 20 ml of a solvent, capable of dissolving the active substance into each of stages 1 to 4 and replace the stoppers. Tilt the apparatus to wet the stoppers, thereby neutralising electrostatic charge. Place a suitable filter capable of quantitatively collecting the active substance in stage 5 and assemble the apparatus. Place a suitable mouthpiece adapter in position at the end of the induction port so that the mouthpiece end of the actuator, when inserted, lines up along the horizontal axis of the induction port and the inhaler is

positioned in the same orientation as intended for use. Connect a suitable vacuum pump to the outlet of the apparatus and adjust the air flow through the apparatus, as measured at the inlet to the induction port, to 30 litres per minute (± 5 per cent). Switch off the pump.

Unless otherwise prescribed in the patient instructions shake the inhaler for 5 seconds and discharge 1 delivery to waste. Switch on the pump to the apparatus, locate the mouthpiece end of the actuator in the adapter and discharge the inhaler into the apparatus, depressing the valve for a sufficient time to ensure complete discharge. Wait for 5 seconds before removing the assembled inhaler from the adapter. Repeat the procedure. The number of discharges should be minimised and typically would not be greater than 10. The number of discharges is sufficient to ensure an accurate and precise determination of the fine particle dose. After the final discharge, wait for 5 seconds and then switch off the pump.

Dismantle the filter stage of the apparatus. Carefully remove the filter and extract the active substance into an aliquot of the solvent. Remove the induction port and mouthpiece adapter from the apparatus and extract the active substance into an aliquot of the solvent. If necessary, rinse the inside of the inlet jet tube 10 stage 1 with solvent, allowing the solvent to flow into the stage. Extract the active substance from the inner walls and the collection plate of each of the 4 upper stages of the apparatus into the solution in the respective stage by carefully tilting and rotating the apparatus, observing that no liquid transfer occurs between the stages.

Using a suitable method of analysis, determine the quantity of active substance contained in each of the aliquots of solvent.

Calculate the fine particle dose (sec Calculations).

Procedure for powder inhalers

Place a suitable low resistance filter capable of quantitatively collecting the active substance in stage 5 and assemble the apparatus. Connect the apparatus to a flow system according to the scheme specified in Fig. 10 and Table 6. Unless otherwise defined, conduct the test at the flow rate, Q_{out}, used in the test for uniformity of delivered dose, drawing 4 litre of air from the mouthpiece of the inhaler and through the apparatus.

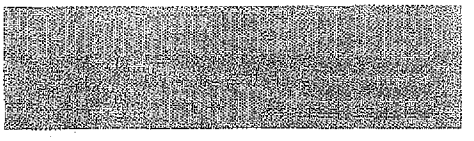
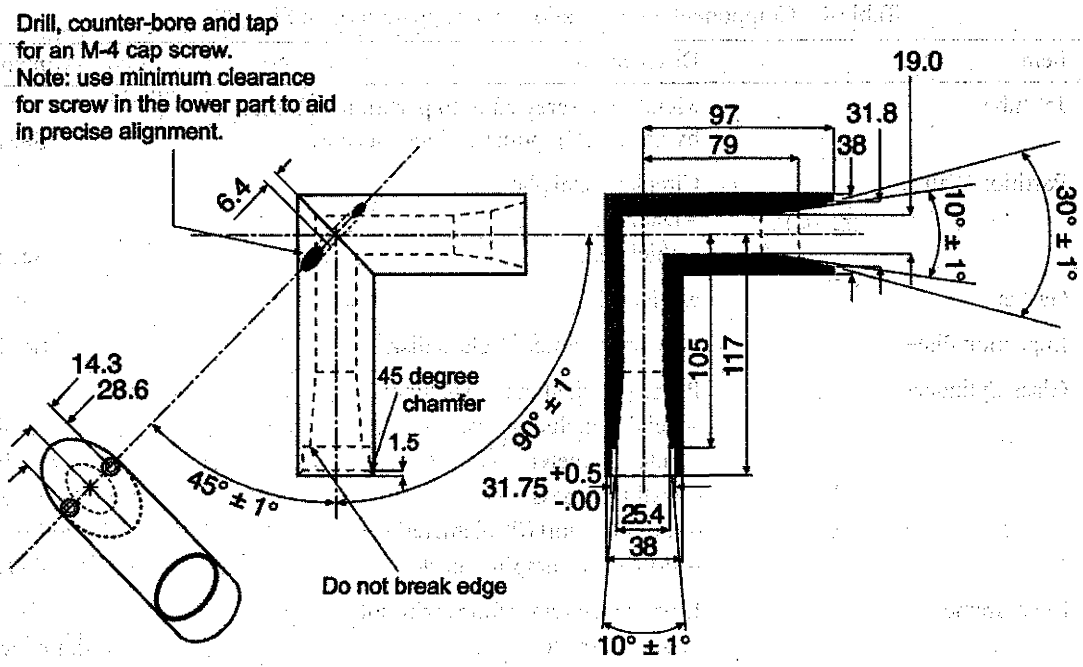
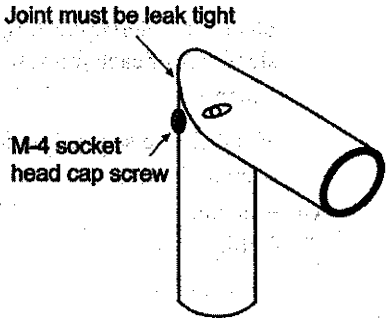
** Measures in millimeters with tolerances according to iso 2768-m unless otherwise stated.







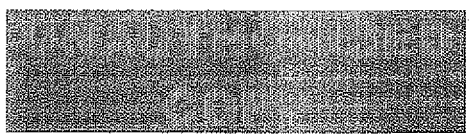
Isometric view of induction port

Note:

1. Material may be aluminium, stainless steel or other suitable material.
2. Machine from 38 mm bar stock.
3. Bore 19 mm hole through bar.
4. Cut tube to exact 45^0 as shown.
5. The inner bores and tapers should be smooth - surface roughness Ra approx. 0.4µm.
6. Mill joining cads of stock to provide a liquid tight leak-free seal.
7. Set up a holding fixture for aligning the inner 19 mm bore and for drilling and tapping M4 × 0.7 threads. There must be virtually no mismatch of the inner bores in the miter joint.

(Dimensions in millimetres, unless otherwise stated)

Fig.9: Induction port



Connect a flow meter to the induction port. Use a flow meter calibrated for the volumetric flow leaving the meter, or calculate the volumetric flow leaving the meter (Q_{out}) using the ideal gas law. For a meter calibrated for the entering volumetric flow (Q_{in}), use the following expression:

$$Q_{out} = \frac{Q_{in} \times P_0}{P_0 - \Delta P}$$

Where, P_0 = Atmospheric pressure;
ΔP = Pressure drop over the meter.

Adjust the flow control valve to achieve steady flow through the system at the required rate, Q_{out} (± 5 per cent). Switch off the pump. Ensure that critical flow occurs in the flow control valve by the following procedure.

With the inhaler in place and the test flow rate established, measure the absolute pressure on both sides of the control valve (pressure reading points P2 and P3 in Fig. 10). A ratio P3/P2 of less than or equal to 0.5 indicates critical flow. Switch to a more powerful pump and re-measure the test flow rate if critical flow is not indicated.

Dispense 20 ml of a solvent, capable of dissolving the active substance into each of the 4 upper stages of the apparatus and replace the Stoppers. Tilt the apparatus to wet the stoppers, thereby neutralising electrostatic charge. Place a suitable mouthpiece adapter in position at the end of the induction port.

Prepare the powder inhaler for use according to patient instructions. With the pump running and the 2-way solenoid valve closed, locate the mouthpiece of the inhaler in the

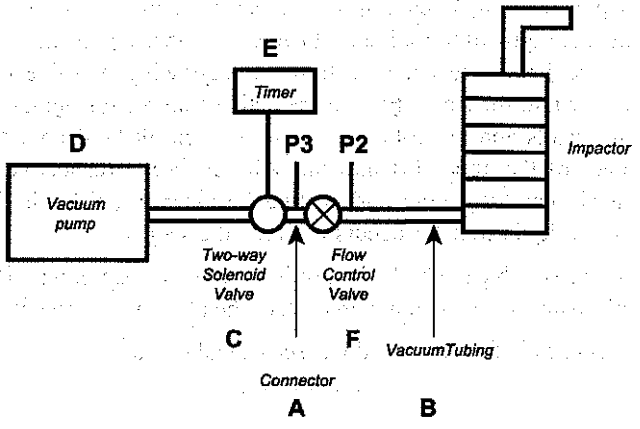


Fig. 10: Experimental set-up for testing powder inhalers

Table 6 – Component specification for set-up in Fig. 10

Code	Item	Description
A	Connector	ID ≥ 8 mm, e.g., short metal coupling with low-diameter branch to P3.
B	Vacuum tubing	A length of suitable tubing having an ID ≥ 8 mm and an internal volume of 25 ± 5 ml.
C	2-way solenoid valve	A 2-way, 2-port solenoid valve having a minimum airflow resistance orifice with ID ≥ 8 mm and an opening time ≤ 100 ms. (e.g. type 256 - A08), Burkert GmbH, D-74653 Ingelfingen), or equivalent.
D	Vacuum pump	Pump must be capable of drawing the required flow rate through the assembled apparatus with the powder inhaler in the mouthpiece adapter (e.g. product type 1023, 1423 or 2565, Gast Manufacturing Inc., Benton Harbor, MI 49022), or equivalent. Connect the pump to the 2-way solenoid valve using short and / or wide (ID ≥ 10 mm) vacuum tubing and connectors to minimize pump capacity requirements.
G	Timer	Timer capable to drive the 2-way solenoid valve for the required duration (e.g. type G814, RS components International, Corby, NN17 9RS, UK), or equivalent.
P2, P3	Pressure measurements	Determine under steady-state flow condition with an absolute pressure transducer.
F	Flow control valve	Adjustable regulating valve with maximum Cv, ≥ 1, (e.g. type 8FV12LNSS, Parker Hannifin plc., Barnstaple, EX311 NP, UK), or equivalent.

mouthpiece adapter. Discharge the powder into the apparatus by opening the valve for the required time, T (± 5 per cent). Repeat the procedure. The number of discharges should be minimised and typically would not greater than 10. The number of discharges is sufficient to ensure an accurate and precise determination of fine particle dose.

Dismantle the filter stage of the apparatus. Carefully remove the filter and extract the active substance into an aliquot of the solvent. Remove the induction port and mouthpiece adapter from the apparatus and extract the active substance into an aliquot of the solvent. If necessary, rinse the inside of the inlet jet tube to stage 1 with solvent, allowing the solvent to flow into the stage. Extract the active substance from the inner walls and the collection plate of each of the 4 upper stages of the apparatus into the solution in the respective stage by carefully tilting and rotating the apparatus, observing that no liquid transfer occurs between the stages.

Using a suitable method of analysis, determine the amount of active substance contained in each of the aliquots of solvent.

Calculate the fine particle dose (see Calculations).

Apparatus D. Cascade impactor with 7 Stages and a Micro orifice collector (MOC)

Appararus D is a cascade impactor with 7 stages and a micro-orifice collector (MOC). Over the flow rate range of 30 litre per minutes to 100 litres per minutes the 50 per cent efficiency cut-off diameters (D_{50} values) range between 0.24 µm to 11.7 µm, evenly spaced on a logarithmic scale. In this flow range, there are always at least 5 stages with D_{50} values between 0.5 µm and 6.5 µm. The collection efficiency curves for each stage are sharp and minimise overlap between stages.

Material of construction may be aluminium, stainless steel or other suitable material.

The impactor configuration has removable impaction cups with all the cups in one plane (Fig. 11/14). There are 3 main sections to the impactor; the bottom frame that holds the impaction cups, the seal body that holds the jets and the lid that contains the interstage passageways (Fig. 11/12). Multiple nozzles are used at all but the first stage (Fig. 13). The flow passes through the impactor in a saw-tooth pattern.

Critical dimensions are provided in Table 7.

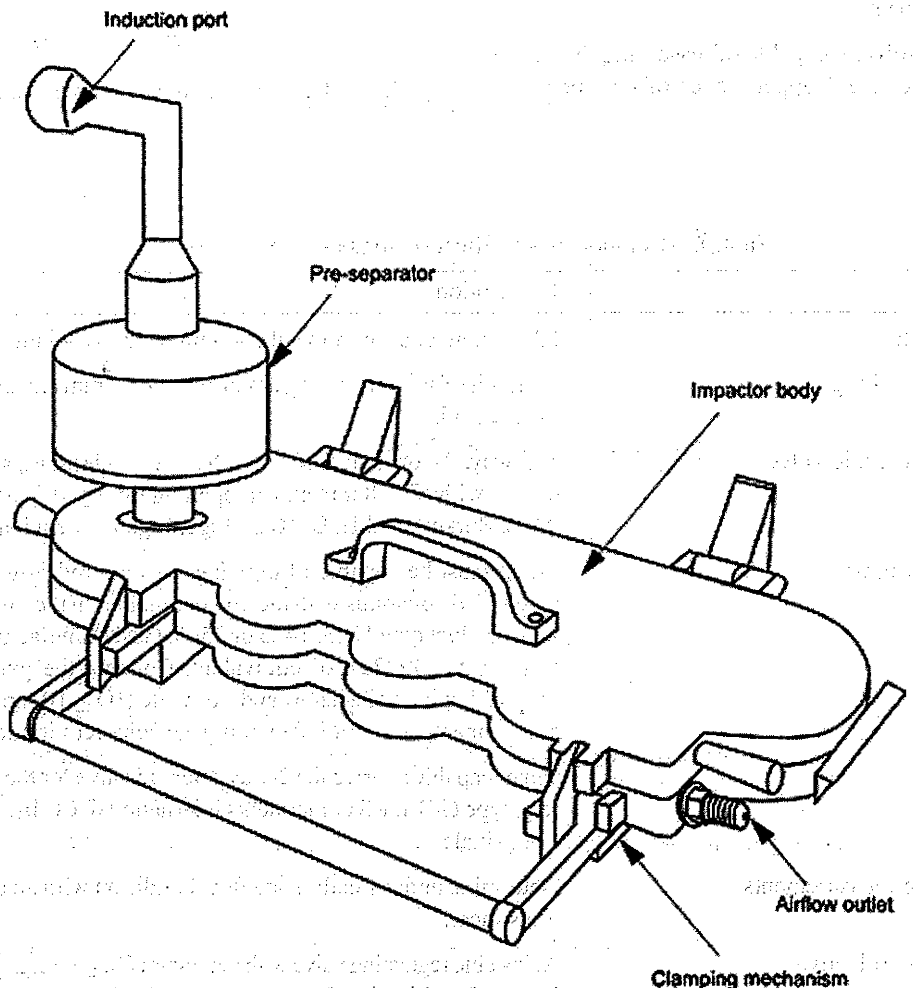

Fig. 11: Apparatus D (Shown with the pre-separator in place)

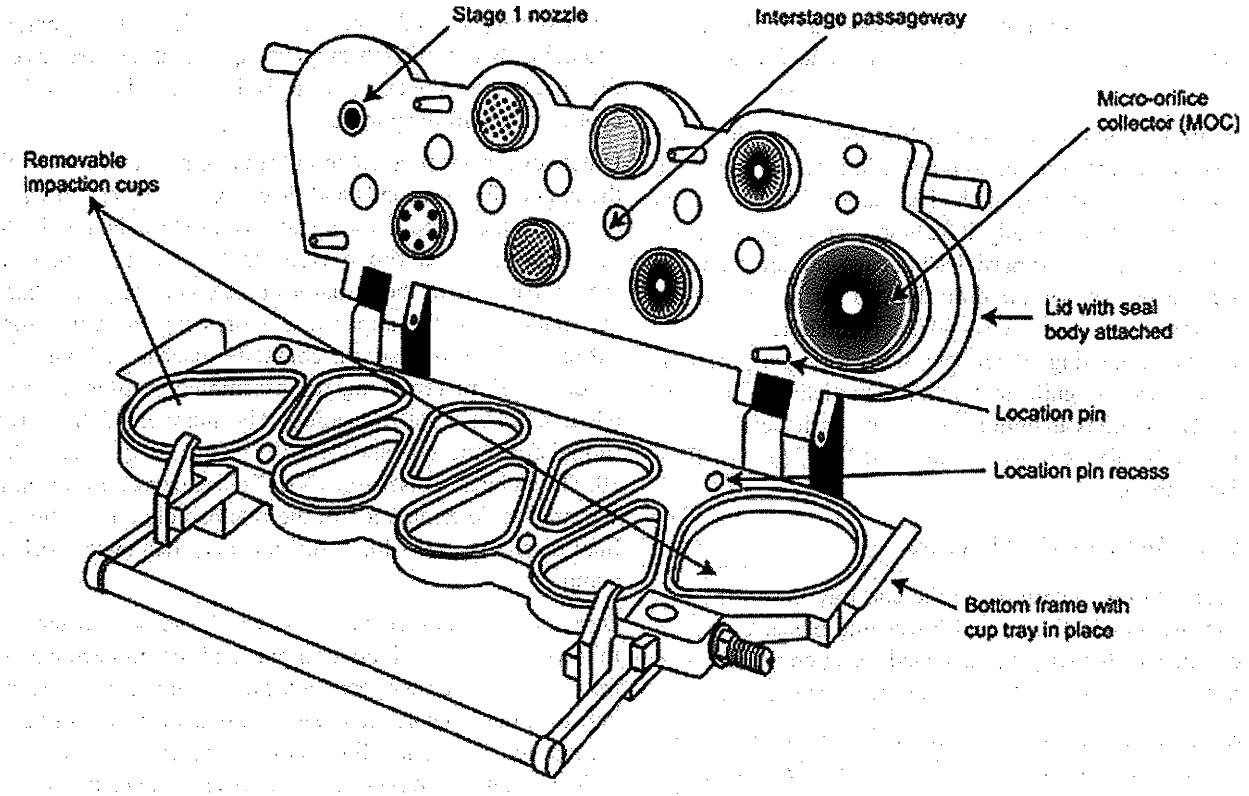

Fig. 12: Apparatus D showing component parts

Table 7– Critical dimensions for apparatus D

Description	Dimension (mm)
Pre-separator (dimension a - see Fig. 15)	12.8 ± 0.05
Stage 1* Nozzle diameter	14.3 ± 0.05
Stage 2* Nozzle diameter	4.88 ± 0.04
Stage 3* Nozzle diameter	2.185 ± 0.02
Stage 4* Nozzle diameter	1.207 ± 0.01
Stage 5* Nozzle diameter	0.608 ± 0.01
Stage 6* Nozzle diameter	0.323 ± 0.01
Stage 7* Nozzle diameter	0.206 ± 0.01
MOC*	Approx. 0.070
Cup depth (dimension b- see Fig. 14)	14.625 ± 0.10
Collection cup surface roughness (Ra)	0.5 – 2 µm
Stage 1 nozzle to seal body distance** - dimension C	0 ± 1.18
Stage 2 nozzle to seal body distance** - dimension C	5.236 ± 0.736
Stage 3 nozzle to seal body distance** - dimension C	8.445 ± 0.410
Stage 4 nozzle to seal body distance** - dimension C	11.379 ± 0.273
Stage 5 nozzle to seal body distance** - dimension C	13.176 ± 0.341
Stage 6 nozzle to seal body distance** - dimension C	13.999 ± 0.071
Stage 7 nozzle to seal body distance** - dimension C	14.000 ± 0.071
MOC nozzle to seal body distance** - dimension C	14.429 to 14.571

*See Fig. 13,

**See Fig. 14.

In routine operation, the seal body and lid are held together as a single assembly. The impaction cups are accessible when this assembly is opened at the end of an inhaler test. The cups are held in a support tray, so that all cups can be removed from the impactor simultaneously by lifting out the tray.

An induction port with internal dimensions (relevant to the airflow path) defined in Fig. 9 connects to the impactor inlet. A pre-separator can be added when required, typically with powder inhalers, and connects between the induction port

and the impactor. A suitable mouthpiece adapter is used to provide an airtight seal between the inhaler and the induction port.

Apparatus D contains a terminal Micro-Orifice Collector (MOC) that for most formulations will eliminate the need for a final filter as determined by method validation. The MOC is an impactor plate with nominally 4032 holes, each approximately 70 µm in diameter. Most particles not captured on stage 7 of the impactor will be captured on the cup surface below the MOC. For impactors operated at 60 liter per minutes, the MOC is capable of collecting 80 per cent of 0.14 µm particles. For formulations with a significant fraction of particles not captured by the MOC, there is an optional filter holder that can replace the MOC or be placed downstream of the MOC (a glass fibre filter is suitable).

Procedure for pressurised inhalers

Place cups into the apertures in the cup tray. Insert the cup tray into the bottom frame, and lower into place. Close the impactor lid with the seal body attached and operate the handle to lock the impactor together so that the system is airtight.

Connect an induction port with internal dimensions defined in Fig. 9 to the impactor inlet. Place a suitable mouthpiece adapter in position at the end of the induction port so that the mouthpiece end of the actuator, when inserted, lines up along the horizontal axis of the induction port. The front face of the inhaler mouthpiece must be flush with the front face of the induction port. When attached to the mouthpiece adapter, the inhaler is positioned in the same orientation as intended for use. Connect a suitable pump to the outlet of the apparatus and adjust the air flow through the apparatus, as measured at the inlet to the induction port, to 30 liter per minutes (± 5 per cent). Switch off the pump.

Unless otherwise prescribed in the patient instructions shake the inhaler for 5 seconds and discharge 1 delivery to waste. Switch on the pump to the apparatus. Prepare the inhaler for use according to the patient instructions, locate the mouthpiece end of the actuator in the adapter and discharge the inhaler into the apparatus, depressing the valve for a sufficient time to ensure a complete discharge. Wait for 5 seconds before removing the assembled inhaler from the adapter. Repeat the procedure. The number of discharges should be minimised, and typically would not be greater than 10. The number of discharges is sufficient to ensure an accurate and precise determination of the fine panicle dose. After the final discharge, wait for 5 seconds and then switch off the pump.

Dismantle the apparatus and recover the active substance as follows: remove the induction port and mouthpiece adapter from the apparatus and recover the deposited active substance into an aliquot of solvent. Open the impactor by releasing the handle and lifting the lid. Remove the cup tray, with the collection cups, and recover the active substance in each cup into an aliquot of solvent.

Using a suitable method of analysis, determine the quantity of active substance contained in each of the aliquots of solvent.

Calculate the fine panicle dose (see Calculations).

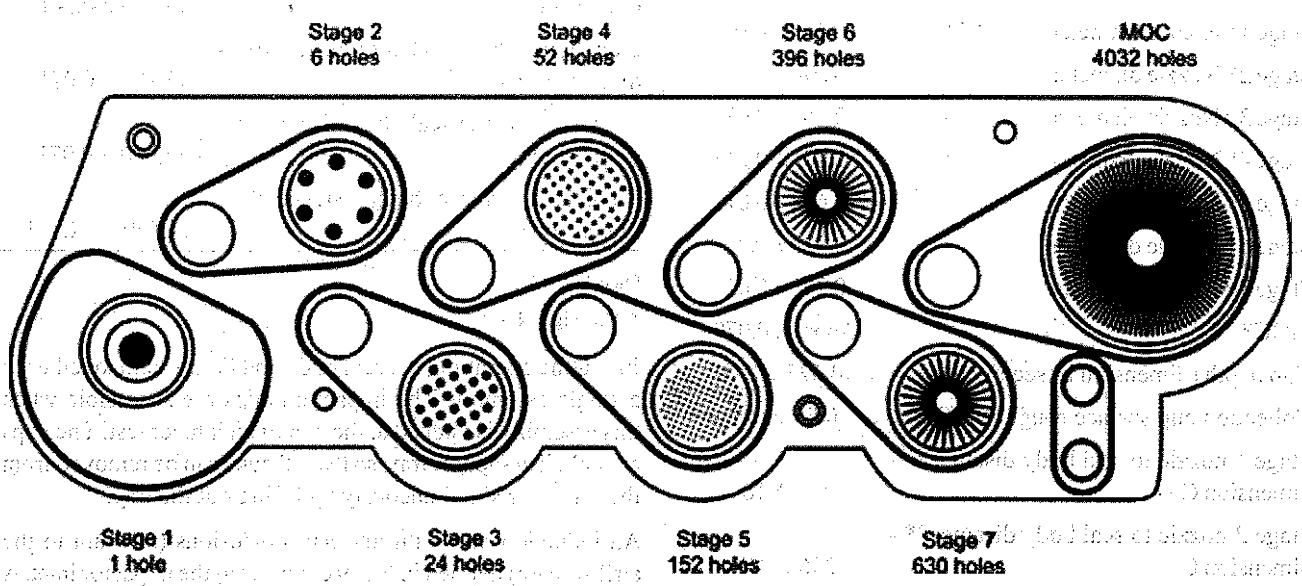

Fig. 13: Apparatus D: nozzle configuration

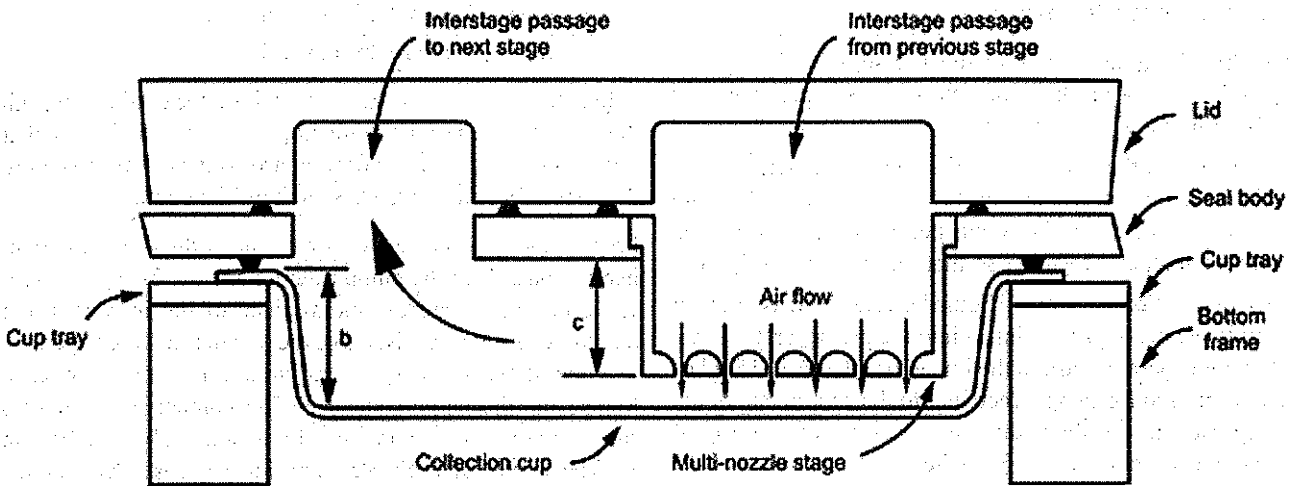

Fig. 14: Apparatus D: configuration of interstage passageways

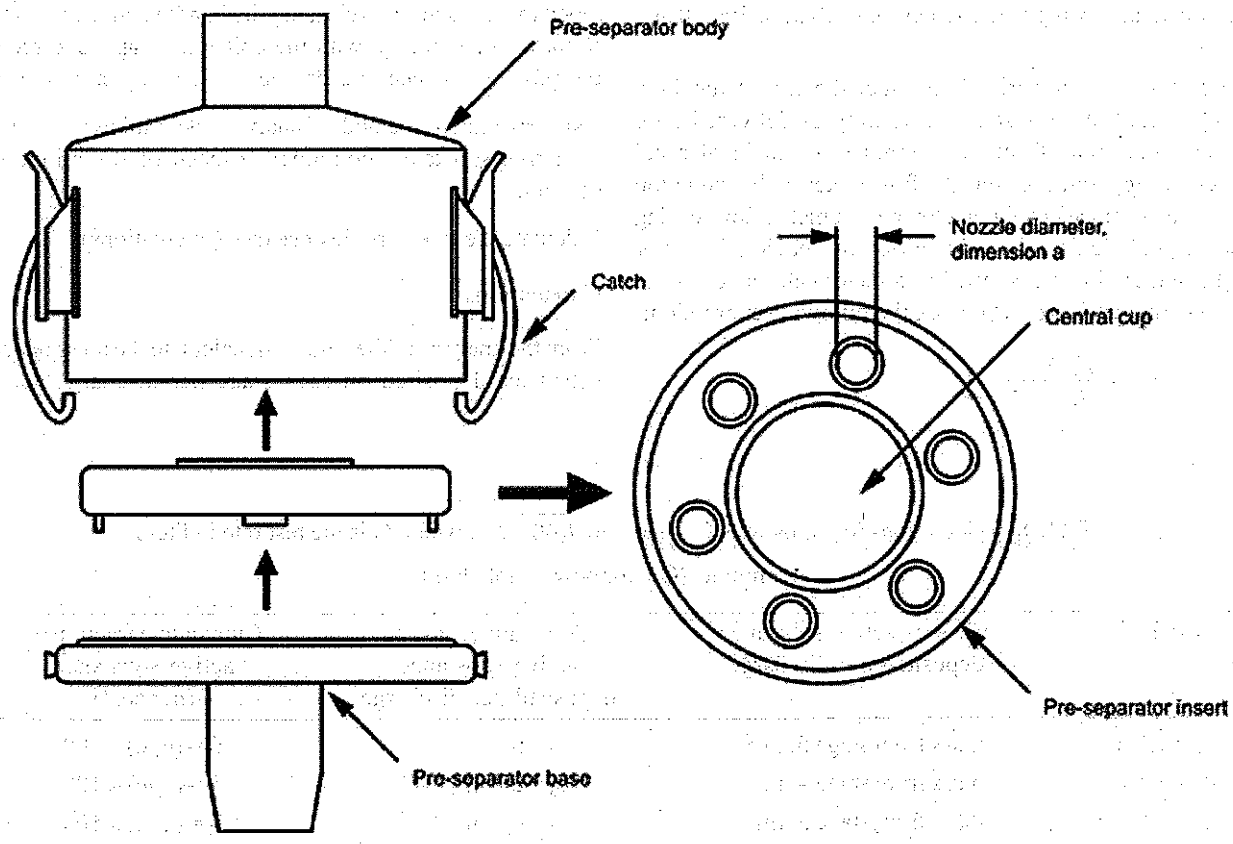

Fig. 15: Apparatus D: Pre-seperator configuration

Procedure for powder inhalers

Assemble the apparatus with the pre-separator (Fig. 15) Depending on the product characteristics, the pre-separator may be omitted, where justified.

Place cups into the apertures in the cup tray. Insert the cup tray into the bottom frame, and lower into place. Close the impactor lid with the seal body attached and operate the handle to lock the impactor together so that the system is airtight.

When used, the pre-separator should be assembled as follows: assemble the pre-separator insert into the pre-separator base. Fit the pre-separator base to the impactor inlet. Add 15 ml of the solvent used for sample recovery to the central cup of the pre-separator insert. Place the pre-separator body on top of this assembly and close the 2 catches.

Connect an induction port with internal dimensions defined in Fig. 9 to the impactor inlet or pre-separator inlet. Place a suitable mouthpiece adapter in position at the end of the induction port so that the mouthpiece end of the inhaler, when inserted, lines up along the horizontal axis of the induction port. The front face of the inhaler mouthpiece must be flush with the front face of the induction port. When attached to the mouthpiece adapter, the inhaler is positioned in the same orientation as intended for use. Connect the apparatus to a flow system according to the scheme specified in Fig. 10 and Table 6.

Unless otherwise prescribed, conduct the test at the flow rate, Q_{out}, used in the test for uniformity of delivered dose drawing 4 liter of air from the mouthpiece of the inhaler and through the apparatus. Connect a flow meter to the induction port. Use a flow meter calibrated for the volumetric flow leaving the meter, or calculate the volumetric flow leaving the meter (Q_{out}) using the ideal gas law. For a meter calibrated for the entering volumetric flow (Q_{in}), use the following expression:

$$Q_{out} = \frac{Q_{in} \times P_0}{P_0 - \Delta P}$$

where, P_0 = Atmospheric pressure;

ΔP = Pressure drop over the meter.

Adjust the flow control valve to achieve steady flow through the system at the required rate, Q_{out} (± 5 per cent). Ensure that critical flow occurs in the flow control valve by the procedure described for Apparatus D. Switch off the pump.

Prepare the powder inhaler for use according to the patient instructions. With the pump running and the 2-way solenoid valve closed, locate the mouthpiece of the inhaler in the mouthpiece adapter. Discharge the powder into the apparatus by opening the valve for the required time, T (± 5 per cent). Repeat the discharge sequence. The number of discharges should be minimised and typically would not be greater than 10. The number of discharges is sufficient to ensure an accurate and precise determination of fine particle dose.

Dismantle the apparatus and recover the active substance as follows: remove the induction port and mouthpiece adapter from the pre-separator, when used, and recover the deposited active substance into an aliquot of solvent. When used, remove the pre-separator from the impactor, being careful to avoid spilling the cup liquid into the impactor. Recover the active substance from the pre-separator.

Open the impactor by releasing the handle and lifting the lid. Remove the cup tray, with the collection cups, and recover the active substance in each cup into an aliquot of solvent.

Using a suitable method of analysis, determine the quantity of active substance contained in each of the aliquots of solvent.

Calculate the fine particle dose (see Calculations).

Calculations

From the analysis of the solutions, calculate the mass of active substance deposited on each stage per discharge and the

Table 8. Calculations for Apparatus C. Use $q = \sqrt{(60/Q)}$, where Q is the test rate in liters per minute (Q_{out} for powder inhalers)

Table 9 – Calculations for Apparatus B when used at a flow rate of 28.3 litres per minute

Cut-off diameter (μm)	Mass of active substance deposited per discharge	Cumulative mass of active substance deposited per discharge	Cumulative fraction of active substance (per cent)
$d_7 = 0.4$	mass from stage 8, m_8	$c_7 = m_8$	$f_7 = (c_7/c) \times 100$
$d_6 = 0.7$	mass from stage 7, m_7	$c_6 = c_7 + m_7$	$f_6 = (c_6/c) \times 100$
$d_5 = 1.1$	mass from stage 6, m_6	$c_5 = c_6 + m_6$	$f_5 = (c_5/c) \times 100$
$d_4 = 2.1$	mass from stage 5, m_5	$c_4 = c_5 + m_5$	$f_4 = (c_4/c) \times 100$
$d_3 = 3.3$	mass from stage 4, m_4	$c_3 = c_4 + m_4$	$f_3 = (c_3/c) \times 100$
$d_2 = 4.7$	mass from stage 3, m_3	$c_2 = c_3 + m_3$	$f_2 = (c_2/c) \times 100$
$d_1 = 5.8$	mass from stage 2, m_2	$c_1 = c_2 + m_2$	$f_1 = (c_1/c) \times 100$
$d_0 = 9.0$	mass from stage 1, m_1	$c_0 = c_1 + m_1$	$f_0 = (c_0/c) \times 100$
	mass from stage 0, m_0	$c = c_0 + m_0$	100

Table 10 – Calculations for Apparatus D. Use $q = (60/Q)^x$, where Q is the test flow rate in liters per minute, and x is listed in the table

Cut-off diameter (μm)	x	Mass of active substance deposited per discharge deposited per discharge	Cumulative mass of active substance (per cent)	Cumulative fraction of active substance
$d_7 = 0.34 \times q$	0.67	mass from MOC or terminal filter, m_8	$c_7 = m_8$	$f_7 = (c_7/c) \times 100$
$d_6 = 0.55 \times q$	0.60	mass from stage 7, m_7	$c_6 = c_7 + m_7$	$f_6 = (c_6/c) \times 100$
$d_5 = 0.94 \times q$	0.53	mass from stage 6, m_6	$c_5 = c_6 + m_6$	$f_5 = (c_5/c) \times 100$
$d_4 = 1.66 \times q$	0.47	mass from stage 5, m_5	$c_4 = c_5 + m_5$	$f_4 = (c_4/c) \times 100$
$d_3 = 2.82 \times q$	0.50	mass from stage 4, m_4	$c_3 = c_4 + m_4$	$f_3 = (c_3/c) \times 100$
$d_2 = 4.46 \times q$	0.52	mass from stage 3, m_3	$c_2 = c_3 + m_3$	$f_2 = (c_2/c) \times 100$
$d_1 = 8.06 \times q$	0.54	mass from stage 2, m_2	$c_1 = c_2 + m_2$	$f_1 = (c_1/c) \times 100$
		mass from stage 1, m_1	$c = c_1 + m_1$	100

mass of active substance per discharge deposited in the induction port, mouthpiece adapter and when used, the pre-separator.

Starting at the final collection site (filter or MOC), derive a table of cumulative mass versus cut-off diameter of the respective stage (see Tables 8 for Apparatus C, 9 for Apparatus B, 10 for Apparatus D). Calculate by interpolation the mass of the active substance less than 5 μm. This is the Fine Particle Dose (FPD).

If necessary, and where appropriate (e.g., where there is a log-normal distribution), plot the cumulative fraction of active substance versus cut-off diameter (see Tables 8/10) on log probability paper, and use this plot to determine values for the Mass Median Aerodynamic Diameter (MMAD) and Geometric Standard Deviation (GSD) as appropriate. Appropriate computational methods may also be used.

Preparations for Nebulisation: Characterisation

Products used for nebulisation and intended for pulmonary delivery are characterised using the following tests:

- Active substance delivery rate and total active substance delivered;
- Aerodynamic assessment of nebulised aerosols.

These tests standardise the approach given to the assessment of the dose that would be delivered to a patient but are not intended to provide assessment of the nebuliser device itself.

The mass- rather than the number-weighted size distribution is more appropriate to evaluate product performance. Indeed,

active substance mass as a function of aerodynamic diameter is more indicative of therapeutic effect within the respiratory tract.

Active substance delivery rate and Total active substance delivered

These tests are performed to assess the rate of delivery to the patient and the total active substance delivered to the patient, using standardised conditions of volumetric flow rate. It is essential that breath-enhanced and breath-actuated nebulisers be evaluated by a breathing simulator, as the output of these types of device is highly dependent on inhalation flow rate. The methodology below describes the use of a standard breathing pattern defined for adults. Should a particular product for nebulisation only be indicated for paediatric (i.e. neonate, infant or child) use, and then paediatric breathing pattern(s) must be used. Breathing patterns are used, rather than continuous flow rates, to provide a more appropriate measure of the mass of active substance that would be delivered to patients.

Active substance delivery rate and total active substance delivered are appropriate characteristics because they allow the mass delivered to be characterised in a standard way regardless of the nebuliser used. Accordingly, the test methodology described below allows that the mass of active substance delivered in the 1st period (typically 1 minute) is measured (consequently giving an assessment of active substance delivery rate) as well as capturing the total mass of active substance delivered.

Apparatus

Breathing simulator

A commercially available breathing simulator, which is able to generate the breathing profiles specified in Table 11, is used for the test. The breathing profile indicated for adults is used unless the medicinal product is specifically intended for use in paediatrics, where alternate patterns should be used, as indicated in Table 11.

Table 11 – Breathing simulator specifications

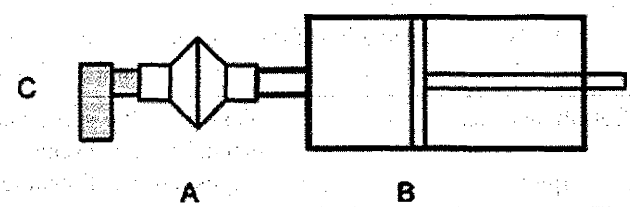
Item	Specification			
	Adult	Neonate	Infant	Child
Tidal volume	500 ml	25 ml	50 ml	155 ml
Frequency	15 cycles per minutes	40 cycles per minutes	30 cycles per minutes	25 cycles per minutes
Waveform	sinusoidal	sinusoidal	sinusoidal	sinusoidal
Inhalation/ exhalation ratio	1:1	1:3	1:3	1:2

Filter system

A suitably validated low-resistance filter, capable of quantitatively collecting the aerosol and enabling recovery of the active substance with an appropriate solvent, is used for the test. The dead volume of the filter casing does not exceed 10 per cent of the tidal volume used in the breath simulation.

Method

Attach the filter (contained in the filter holder) (A) to the breath simulator (B) according to Fig. 16 Fill the nebuliser (C) with the volume of the medicinal product as specified in the patient instructions. Attach the mouthpiece of the nebuliser to the inhalation filter using a mouthpiece adapter if required, ensuring that connections are airtight. Make sure the nebuliser is positioned in the same orientation as intended for use; this may require tilting the breathing simulator and filter holder. Set the breathing simulator to generate the specified breathing pattern.



A. Inhalation filter and filter holder
B. Breathing simulator
C. Nebuliser

Fig. 16: Experimental set-up for breathing simulator testing

Start the breathing simulator then, at the beginning of an inhalation cycle, start the nebuliser. Operate the nebuliser for a defined initial time period. The time chosen, usually 60 ± 1 second, must allow sufficient active substance deposition on the inhalation filter to allow quantitative analysis. If the quantity of active substance deposited on the inhalation filter in 60 seconds is in sufficient for this analysis, the length of the time interval for aerosol collection can be increased. If the filter is soaked with the preparation, this time can be decreased. At the end of this initial period, stop the nebuliser.

Place a fresh filter and filter holder in position and continue until nebulisation ceases. Interrupt nebulisation and exchange filters if necessary, to avoid filter saturation.

Results

Using a suitable method of analysis, determine the mass of active substance collected on the filters and filter holders during each time interval. Determine the active substance delivery rate by dividing the mass of active substance collected on the first inhalation filter by the time interval used for

collection. Determine the total mass of active substance delivered by summing the mass of active substance collected on all inhalation filters and filter holders.

Aerodynamic assessment of nebulised Aerosols

Nebulised products need to be size-characterised at flow rates lower than the range that is normally used for powder inhalers and metered-dose inhalers. A flow rate of 15 litre per minutes is recommended because this value represents a good approximation to the mid-inhalation flow rate achievable by a tidally breathing healthy adult (500 ml tidal volume). Although low-angle laser light scattering instruments (laser diffractometers) can provide rapid sae-distribution measurements of nebuliser-generated aerosols, these techniques do not detect the active substance; rather they measure the size distribution of the droplets irrespective of their content. This may not be a problem with homogeneous solutions, but can result in significant error if the product to be nebulised is a suspension, or if droplet evaporation is significant as can be the case with certain nebuliser types. Cascade impactors enable the aerosol to be characterised unambiguously in terms of the mass of active substance as a function of aerodynamic diameter. Laser diffraction may be used if validated against a cascade impaction method.

Apparatus D a cascade impactor, has been calibrated at 15 litres per minutes and is therefore used for this test. Determining mass balance in the same way as for powder inhalers and metered-dose inhalers is not straightforward, in that the dose is being captured as a continuous output, and hence is not included. As part of method development, recovery experiments must be performed to validate the method.

It is also recognised that the control of evaporation of droplets produced by nebulisers may be critical to avoid bias in the droplet size assessment process. Evaporation can be minimised by cooling the impactor to a temperature of about 5°, typically achieved by cooling the impactor in a refrigerator for about 90 minutes. Typically, at least after each day of use, the apparatus must be fully cleaned, including the inter-stage passageways, in view of the greater risk of corrosion caused by the condensation/accumulation of saline-containing droplets on inter-stage metalwork associated with cooling the impactor. It is recommended to dry all surfaces of the apparatus after each test, for example with compressed air. Note: the micro-orifice collector (MOC) should not be dried with compressed air.

Apparatus

A detailed description of Apparatus D and the induction port is contained in preparation for inhalation, and includes details of critical dimensions and the qualification process for the impactor (stage mensuration).

A back-up filter in addition to the micro-orifice collector (MOC) must be used to ensure quantitative recovery of active substance from the nebulised aerosol at the specified flow rate of 15 litres per minutes. The filter is located below the MOC (internal filter option) or a filter in holder, external to the impactor, is used to capture any fine droplets that pass beyond the last size fractionating stage.

A pre-separator is not used for testing nebuliser-generated aerosols.

Method validation

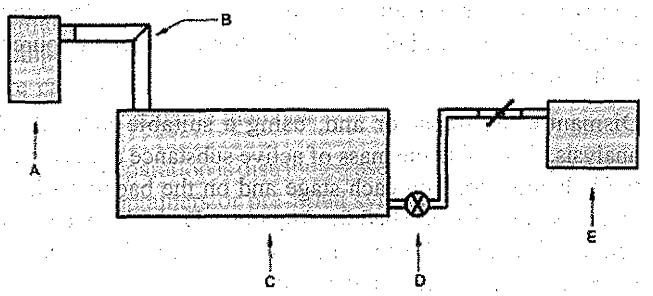
Impactor stage overloading

During method development and validation, it is important to confirm that the volume of liquid sampled from the nebuliser does not overload the impactor. Visual inspection of the collection surfaces on stages collecting most of the droplets may reveal streaking if overloading has occurred. This phenomenon is usually also associated with an increase in mass of active substance collected on the final stage and back-up filter. Reducing the sampling period (T_0) is the most effective way to avoid overloading in any given system, balancing overloading with analytical sensitivity.

Re-entrainment

Droplet bounce re-entrainment are less likely with nebuliser-produced droplets than with solid particles from inhalers and for that reason coating would not normally be required.

Method



A. Nebuliser
B. Induction port
C. Impactor(apparatus D)
D. Flow control valve
E. Vacuum source

Fig. 17: Apparatus D for measuring the size distribution of preparations for nebulisation

Pre-cool the assembled impactor and induction port in a refrigerator (set at about 5°) for not less than 90 minutes and start the determination within about 5 minutes of removal of

the impactor from the refrigerator. Other methods that maintain the impactor at a constant temperature (for example, use of a cooling cabinet) can also be employed when validated.

Set up the nebuliser with a supply of driving gas (usually air or oxygen), or use a compressor, at the pressure and flow rate specified by the manufacturer of the nebuliser. Take precautions to ensure that the gas supply line does not become detached from the nebuliser when under pressure. Fill the nebuliser with the volume of the medicinal product as specified in the patient instructions.

Remove the impactor from the refrigerator. Attach the induction port to the impactor, and connect the outlet of the impactor/ external filter to a vacuum source that is capable of drawing air through me system at 15 litres per minutes as specified in Fig. 17. Turn on the flow through the impactor.

Connect a flow meter, calibrated for the volumetric flow leaving the meter, to the induction port. Adjust the flow control valve located between the impactor and the vacuum source to achieve a steady flow through the system at 15 litres per minutes (± 5 per cent). Remove the flow meter.

Make sure the nebuliser is positioned in the same orientation as intended for use then attach the mouthpiece of the nebuliser to the induction port, using a mouthpiece adapter if required, ensuring that connections are airtight. Switch on the flow/ compressor for the nebuliser. Sample for a predetermined time (T_0). Once determined, this time (T_0) must be defined and used in the analytical method for a particular medicinal product to ensure that mass fraction data can be compared. At the end of the sampling period, switch off the driving gas flow/ compressor to the nebuliser, remove the nebuliser from the induction port and switch off the flow from the vacuum source to the impactor.

Dismantle the impactor and, using a suitable method of analysis, determine the mass of active substance collected in the induction port, on each stage and on the back-up filter/ external filter as described for Apparatus D. Add the mass of active substance collected in the MOC to that deposited on the back-up filter/external filter and treat as a single sample for the purpose of subsequent calculations.

Calculate the mass fraction ($F_{m,comp}$) of the active deposited on each component of the impactor, commencing with the induction port and proceeding in order through the impactor, using the following expression:

$$F_{m,comp} = \frac{m_{comp}}{M}$$

where, m_{comp} = mass associated with the components under evaluation;

M = total mass collected by the system.

Present $F_{m,comp}$ in order of location within the measurement equipment, beginning at the induction port and ending with the back-up filter of the impactor (Fig. 18). Where appropriate, $F_{m,comp}$ for adjacent stages of the impactor may be combined in order to report the mass fraction collected on a group of stages as a single value.

Determine the cumulative mass-weighed particle-size distribution of the aerosol size-fractionated by the impactor in accordance with the procedure given in inhalation preparation. Starting at the filter, derive a cumulative mass versus effective cut-off diameter of the respective stages (see Table 12 for the appropriate cut-off diameters at 15 litres per minutes). Plot the cumulative fraction of active substance versus cut-off diameter in a suitable format, for example logarithmic or log-probability format. Where appropriate, determine by interpolation the fraction either below a given size or between an upper and a lower size limit.

Table 12 - Cut-off sizes for Apparatus D at 15 litre per minutes

Stage	cut-off diameter (μm)
1	14.1
2	8.61
3	5.39
4	3.30
5	2.08
6	1.36
7	0.98

If necessary, and where appropriate, determine values for the mass median aerodynamic diameter (MMAD) and the geometric standard deviation (GSD), as appropriate.

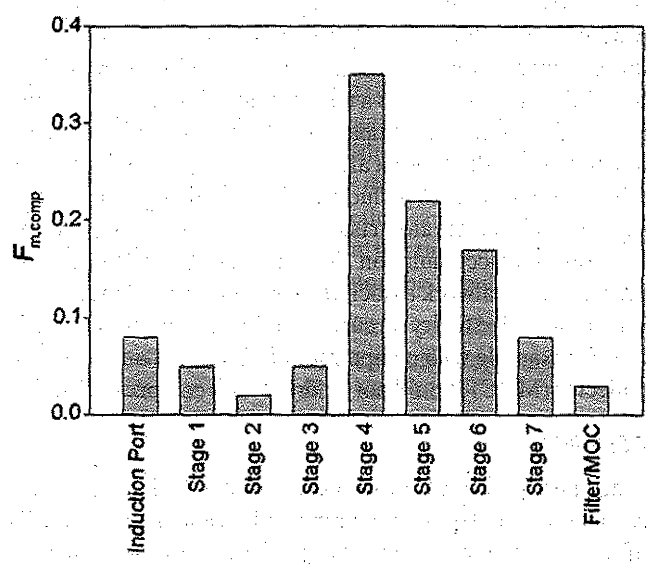


Fig. 18: Example of mass fraction of droplets presented in terms of location within the sampling system

Content of active ingredient on actuation of the valve test

The following test conditions are for use in preparations for inhalation. Specifically the methodology should be applied to pressurised inhalation products.

Content of active ingredient delivered by actuation of the valve

Remove the pressurised container from the actuator and remove all labels and markings which may be present on the container with a suitable solvent. Dry the container, replace in its actuator, shake for 30 seconds and prime the metering valve as follows. Discharge once to waste, wait for no less than 5 seconds and discharge again to waste. Remove the pressurised container from its actuator; clean the valve stem (internally and externally) and the valve ferrule by washing with a suitable solvent. Dry the complete valve assembly using an air line fitted with an appropriate narrow jet to ensure that all solvent is removed from the inside of the valve stem.

Place a stainless steel base plate that has three legs and a central circular indentation with a hole about 1.5 mm in diameter in a small vessel suitable for shaking and add the volume of solvent specified in the monograph. The size of the vessel is such that when the pressurised inhalation is discharged into the specified volume of solvent as described below the discharge takes place not less than 25 mm below the surface of the solvent.

Shake the pressurised container for about 30 seconds and place it inverted in the vessel. Discharge 10 deliveries below the surface of the solvent actuating the valve at intervals of not less than 5 seconds, maintaining the pressurised container in the vertical plane and discharging the pressurised inhalation through the hole in the centre of the base plate. (It may be necessary because of the nature of the formulation to shake the pressurised container between each actuation of the valve; where this is the case shaking should be carried out without removing the pressurised container from its inverted position in the vessel). Remove the pressurised container, wash it with the specified solvent and dilute the combined solution and washing to the volume specified in the monograph. Determine the amount of active ingredient by the method described under the assay and calculate the amount delivered from each actuation of the valve. The result lies within the range for the content of active ingredient stated in the monograph.

Insulin Preparations

Introduction

Insulin preparations are sterile preparations of human Insulin, bovine insulin, porcine insulin, Insulin lispro, Insulin lispro injection or Biphasic insulin lispro injection intended for subcutaneous injection into the human or animal body. They are either solutions or suspensions or they are prepared by combining solutions and suspensions. They contain not less than 90.0 per cent and not more than the equivalent of 110.0 per cent of the amount of insulin stated on the label.

Production

Insulin preparations are made by methods that are designed to ensure their sterility, to avoid the introduction of foreign contaminants, bacterial endotoxins and the growth of micro-organisms. The methods used should confer suitable properties with respect to the onset and duration of therapeutic action.

The use of excipients in the injections may be necessary, for example to make the preparation isotonic with respect to blood, to adjust the pH to the appropriate value, to prevent deterioration of the active substances or to provide adequate antimicrobial properties. Where appropriate, suitable substances may be added and suitable procedures carried out to confer the appropriate physical form on the insulin-containing component or components. Irrespective of the purpose for which additives are used, they should not to adversely affect the intended therapeutic action of the preparation or, at the concentration used, cause toxicity or undue local irritation.

In the course of production the strength of the insulin-containing component or components should be determined, where necessary, by adjustment so that the final preparation contains the required number of Units of insulin per ml.

Initial sterilisation of the insulin-containing component or components is done by filtration and subsequent procedures are carried out aseptically using materials that have been sterilised by suitable methods.

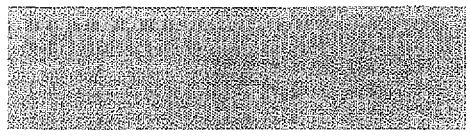
The final preparation is distributed aseptically into sterile glass or plastic containers or pre-filled syringes that are closed so as to exclude microbial contamination.

Tests

Insulin in the supernatant — *For preparations that are suspensions*

Not more than 2.5 per cent of the total insulin content, unless otherwise stated, determined in the following manner.

Centrifuge 10 ml of the suspension for 10 minutes and carefully separate the supernatant liquid from the residue. Determine the insulin content of the supernatant liquid (2.3.46) and calculate as a percentage of the total insulin content determined as described under Assay in the individual monograph.



Impurities with molecular masses greater than that of insulin

Determine by size-exclusion chromatography (2.4.16).

Test solution. Add 4 µl of *6 M hydrochloric acid* per millilitre of the preparation under examination, whether a suspension or a solution, to obtain a clear acid insulin solution. When sampling a suspension, agitate the material prior to sampling in order to obtain a homogeneous sample. If a suspension does not turn clear within 5 minutes of the initial addition of hydrochloric acid, add small aliquots of acid (less than 4 µl per millilitre) until a solution is obtained. Preparations with concentrations higher than 100 Units per ml need to be diluted with *0.01M hydrochloric acid* to avoid overloading the column with insulin monomer.

Resolution solution. Use a solution of insulin (approximately 4 mg per ml), containing more than 0.4 per cent of high molecular mass proteins. An injectable insulin preparation, whether a solution or a suspension, that has been clarified with a sufficient amount of *6 M hydrochloric acid*, containing the indicated percentage of high molecular mass proteins, or a solution prepared from insulin, dissolved in *0.01 M hydrochloric acid*, may be used. Insulin containing the indicated percentage of high molecular mass proteins may be prepared by allowing insulin powder to stand at room temperature for about ten days.

Maintain the solutions at 2° to 10° and use within 30 hours (soluble insulin injection) or 7 days (other insulin preparations). If an automatic injector is used, maintain the temperature at 2° to 10°.

Chromatographic system

- a stainless steel column 30 cm x 7.5 mm packed with *hydrophilic silica gel* (5 µm to 10 µm), of a grade suitable for the separation of insulin monomer from dimers and polymers,
- mobile phase: a filtered and degassed mixture of 15 volumes of *glacial acetic acid*, 20 volumes of *acetonitrile* and 65 volumes of a 1.0 g/l solution of *arginine*,
- flow rate: 0.5 ml per minute,
- spectrophotometer set at 276 nm,
- injection volume: 100 µl.

Before using a new column for chromatographic analysis, equilibrate by repeated injections of an insulin solution containing high molecular mass proteins. This can be done by at least three injections of the resolution solution. The column is equilibrated when repeatable results are obtained from two subsequent injections. If protamine-containing samples are to be analysed, the equilibration of the column is performed using a solution containing protamine.

Inject the resolution solution. When the chromatograms are recorded under the prescribed conditions, the retention times are: polymeric insulin complexes or covalent insulin-protamine complex, about 13 to 17 minutes, covalent insulin dimmer, about 17.5 minutes, insulin monomer, about 20 minutes, salts, about 22 min. If the sample solution contains preservatives, for example methyl paraben, *m*-cresol or phenol, these compounds elute later. The test is not valid unless the resolution, defined by the ratio of the height of the dimer peak to the height above the baseline of the valley separating the monomer and dimer peaks, is at least 2.0.

Inject the test solution. Record the chromatogram for approximately 35 min. In the chromatogram obtained, the sum of the areas of any peak with a retention time less than that of the insulin peak is not greater than 3.0 per cent (protamine-containing preparations) or 2.0 per cent (non-protamine containing preparations) of the total area of the peaks. Ignore any peak with a retention time greater than that of the insulin peak.

Related proteins

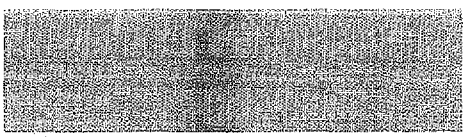
Determine by liquid chromatography (2.4.14) as described under Assay of Insulins (2.3.46), following the elution conditions as described in the Table:

Table

Time (min)	Mobile phase (a) (per cent v/v)	Mobile phase (b) (per cent v/v)	Comment
0-30	42	58	isocratic
30-44	42→11	58→89	linear gradient
44-50	11	89	isocratic

Maintain the solutions at 2° to 10° and use within 24 hours. Perform a system suitability check (resolution, linearity) as described under Assay of Insulins (2.3.46). If necessary, the relative proportions of the mobile phases may be adjusted to ensure complete elution of A21 desamido porcine insulin before commencement of the gradient. The profile of the gradient may also be adjusted to ensure complete elution of all insulin related impurities.

Inject 20 µl of the test solution and 20 µl of either reference solution (a), for insulin preparations containing 100 IU/ml, or reference solution (b), for insulin preparations containing 40 IU/ml. If necessary, adjust the injection volume to a volume between 10 µl and 20 µl in accordance with the results obtained in the test for linearity as described under Assay. Record the chromatograms for approximately 50 min. If necessary, make further adjustments to the mobile phase in order to ensure that the antimicrobial preservatives present in the test solution are well separated from the insulin and show a shorter retention time. A small reduction in the concentration of acetonitrile increases the retention time of the insulin peaks relatively



more than those of the preservatives. In the chromatogram obtained with either reference solution (a), or reference solution (b), as appropriate, A21 desamido insulin appears as a small peak after the principal peak and has a retention time of about 1.3 relative to the principal peak, due to insulin. In the chromatogram obtained with the test solution the area of the peak due to A21 desamido insulin is not greater than 5.0 per cent of the total area of the peaks; the sum of the areas of any other peaks, apart from those due to insulin and A21 desamido insulin is not greater than 6.0 per cent of the total area of the peaks. Disregard the peaks due to the preservatives and protamine (early eluting peaks).

Total zinc. Not more than the amount stated in the individual monograph, determined by either of the following methods.

A. To an accurately measured volume of the gently shaken injection containing 200 Units add 10 ml of *alkaline borate buffer pH 9.0*, 0.3 ml of *zincon solution* and sufficient *water* to produce 50 ml. Allow to stand for 1 hour and measure the absorbance of the resulting solution at about 620 nm, using as the blank a solution prepared by treating 5 ml of *water* instead of the substance under examination in a similar manner. Calculate the content of zinc from the absorbance obtained by repeating the procedure using a suitable aliquot of a mixture of 4 volumes of *zinc sulphate solution* and 6 volumes of *water*.

B. Determine by atomic absorption spectrometry (2.4.2).

Test solution. Shake the preparation gently and dilute a volume containing 200 Units of insulin to 25.0 ml with *0.01 M hydrochloric acid*. Dilute if necessary to a suitable concentration of zinc (for example 0.4 µg to 1.6 µg of Zn per millilitre) with *0.01 M hydrochloric acid*.

Reference solutions. Use solutions containing 0.40 µg, 0.80 µg, 1.00 µg, 1.20 µg and 1.60 µg of Zn per millilitre, freshly prepared by diluting *zinc solution AAS (5 mg/ml Zn)* with *0.01 M hydrochloric acid*.

Measure the absorbance at 213.9 nm using a zinc hollow-cathode lamp as source of radiation and an air-acetylene flame of suitable composition (for example 11 litres of air and 2 litres of acetylene per minute).

Bacterial endotoxins (2.2.3). Less than 80 Endotoxin Units per 100 Units of insulin.

Sterility. Comply with the test for sterility (2.2.11).

Using following modifications in Biphasic Isophane Insulin Injection and Isophane Insulin Injection.

Add freshly prepared 1 per cent w/v solution of *ascorbic acid* in *Fluid A* given in sterility (2.2.11) to get clear solution of suspension.

Assay. Determine as described under Assay of Insulins ((2.3.46).

Storage. Unless otherwise prescribed, store in sterile, airtight, tamper-proof containers, protected from light, at a temperature of 2° to 8°. Insulin preparations should not to be frozen.

Labelling. The label states (a) the potency in Units per millilitre; (2) the concentration in terms of the number of milligrams of insulin per ml (for preparations containing both bovine insulin and porcine insulin the concentration is stated as the combined amount of both insulins); (3) where applicable, that the substance is produced by enzymatic modification of porcine insulin; (4) where applicable, that the substance is produced by recombinant DNA technology; (5) where applicable, the animal species of origin; (6) the preparation must not be frozen; (7) where applicable, that the preparation must be re-suspended before use.

Liposomal Preparations

Liposomal Injectable Preparations

Introduction

Liposomal Preparations are sterile dispersions for injections or infusions made up of phospholipids with or without cholesterol dispersed in aqueous vehicle. It may contain antioxidants, stabilizers and buffers. They are translucent to opalescent in appearance and may contain the active compound encapsulated in the vesicle or intercalated between the lipid bilayer. Their method of preparation may involve formation of the lipid film for hydration, hydration with agitation, and sizing of vesicles using different techniques like sonication, homogenization or extrusion.

Liposomal Preparations should not show any evidence of separation and show uniform appearance after shaking.

Tests

Particulate matter. Complies with the test stated under Parenteral Preparations (Injections).

Uniformity of content. Complies with the test stated under Parenteral Preparations (Injections).

Extractable volume. Complies with the test stated under Parenteral Preparations (Injections).

Sterility. Complies with the test stated under Parenteral Preparations (Injections).

Pyrogens. Complies with the test stated under Parenteral Preparations (Injections).

Vesicle size. Complies with the requirement of the test stated under individual monograph. Determine by Dynamic light scattering or Photon correlation spectroscopy or Laser diffraction.

Lamellarity. Lamellarity of the Liposomal Preparations should be defined. Lamellarity is determined by Freeze fracture microscopy or Transmission electron microscopy.

Powders for Liposomal Injection

Definition

Powders for Liposomal Injection are solid, sterile substances distributed in their final containers and which, when shaken with the prescribed volume of a prescribed sterile liquid rapidly form translucent to opalescent dispersion and practically particle-free uniform dispersions.

Freeze-dried Liposomal Products for parenteral use are considered as Powders for Liposomal Injection or infusion.

NOTE—After reconstitution of Powders for Liposomal injection, the reconstituted dispersion should comply with the monograph for Liposomal Preparations.

Labelling. The label states the instructions for the preparation of Liposomal Injections and Infusions.

Lotions

Lotions are liquids for cutaneous application that is intended to be applied to the unbroken skin without friction.

Tests

Uniformity of weight or volume. Unless otherwise specified, Lotions comply with the test for contents of packaged dosage forms (2.5.6).

Storage. Store at a temperature not exceeding 30°. Do not freeze.

Labelling. The label states that the lotion should be shaken before use.

Nasal Preparations

Nasal Preparations are liquid, semi-solid or solid preparations containing one or more medicaments and are intended for administration to the nostrils for local or systemic effects. They should as far as possible be non-irritating and should not affect the functions of the nasal mucosa and its cilia. They are supplied in single dose or multiple dose containers of glass VD or plastic with, if necessary, a suitable device for administration. They may also be supplied in pressurised containers with a suitable adaptor and with or without a metering dose valve.

Aqueous nasal preparations are usually isotonic and, when supplied in multiple dose containers, contain a suitable antimicrobial preservative except when the product itself has adequate antimicrobial properties.

During manufacture, packaging, storage and distribution of nasal preparations, suitable means shall be taken to ensure their microbial quality; acceptance criteria for microbial quality are given in Chapter 2.2.9.

Tests

Uniformity of content. Comply with the test described under Parenteral Preparations.

Uniformity of weight. Nasal Preparations supplied in single dose containers comply with the test for contents of packaged dosage forms (2.5.6).

Nasal Drops, Solutions and Sprays

These are solutions, emulsions or suspensions intended for instillation or spraying into the nostrils. Emulsions should have a uniform appearance after shaking and should not show evidence of phase separation. Suspensions should be readily redispersible on shaking to give a smooth and stable suspension. In suspensions, the size of the dispersed particles should be such as to localise their deposition in the nostril.

Nasal Powders

These are powders intended for insufflation into the nostrils by means of a suitable device. The size of the particles should be such as to localise their deposition in the nostril.

Storage. Store protected from light and moisture.

Tests

Uniformity of content. Comply with the test described under Parenteral Preparations.

Uniformity of weight. Nasal Preparations supplied in single application containers comply with the test for contents of packaged dosage forms (2.5.6).

Ointments

Ointments are homogeneous, semi-solid preparations intended for external application to the skin or certain mucous membranes for emollient, protective, therapeutic or prophylactic purposes where a degree of occlusion is desired. They usually consist of solutions or dispersions of one or more medicaments in suitable bases. They are formulated using hydrophobic, hydrophillic or water-emulsifying bases to provide preparations that are immiscible, miscible or

emulsifiable with the skin secretion, respectively. The base should not produce irritation or sensitisation of the skin, nor should it retard wound healing; it should be smooth, inert, odourless or almost odourless, physically and chemically stable and compatible with the skin and with incorporated medicaments. The proportions of the base ingredients should be such that the ointment is not too soft or too hard for convenient use. The consistency should be such that the ointment spreads and softens when stress is applied.

Ointments may contain suitable auxiliary substances such as antioxidants, stabilisers, thickeners and emulsifiers and, when the base might support the growth of microbial contaminants, suitable antimicrobial preservatives.

During manufacture, packaging, storage and distribution of ointments, suitable means shall be taken to ensure their microbial quality; acceptance criteria for microbial quality are given in Chapter 2.2.9.

If an ointment is specifically intended for use on large wounds or on severely injured skin it should be sterile.

Ointments should not normally be diluted; if dilution is necessary care should be taken to choose the right diluent to avoid risk of instability or incompatibility.

Tests

Uniformity of weight. Comply with the test for contents of packaged dosage forms (2.5.6).

Sterility. When the ointment is labelled as sterile, it complies with the test for sterility (2.2.11).

Storage. Store at a temperature not exceeding 30° unless otherwise directed. Do not freeze.

Labelling. The label states (1) that the ointment is sterile, where necessary; (2) the name and concentration of any added antimicrobial preservative; (3) the storage conditions.

Oral Liquids

Oral Liquids are homogeneous liquid preparations, usually consisting of a solution, an emulsion or a suspension of one or more medicaments in a suitable vehicle*. They are intended for oral administration either undiluted or after dilution. They may contain auxiliary substances such as suitable dispersing, emulsifying, suspending, wetting, solubilising, thickening, stabilising agents and antimicrobial preservatives. They may also contain suitable sweetening, flavouring and permitted colouring agents. if saccharin, including its sodium and potassium salts, is used as a sweetening agent, its concentration in preparations meant for paediatric use should be restricted so as to limit its intake to 5 mg per kg of body weight.

Oral Liquids other than Oral Emulsions may be supplied as liquids or prepared just before use by dissolving or dispersing granules or powder in the liquid stated on the label. The granules or powder comply with the requirements stated under Oral Powders.

During manufacture, packaging, storage and distribution of oral liquids, suitable means shall be taken to ensure their microbial quality; acceptance criteria for microbial quality are given in Chapter 2.2.9.

Oral Liquids should not be diluted and stored; where, however, the individual monograph directs dilution, the diluted Oral Liquid should be freshly prepared irrespective of the nature of the diluent. Diluted Oral Liquids may be less stable physically and chemically than the corresponding undiluted preparation and should be used within the period stated on the label.

Oral Liquids are variously known as Elixirs, Linctuses Mixtures, Oral Drops, Oral Emulsions, Oral Solutions, Oral Suspensions and Syrups. These terms are defined below.

Elixirs. Elixirs are clear, flavoured Oral Liquids containing one or more active ingredients dissolved in a vehicle that usually contains a high proportion of Sucrose or a suitable polyhydric alcohol or alcohols and may also contain Ethanol (95 per cent) or a dilute Ethanol.

Linctuses. Linctuses are viscous Oral Liquids containing one or more active ingredients dissolved in a vehicle that usually contains a high proportion of sucrose, other sugars or a suitable polyhydric alcohol or alcohols. Linctuses are intended for use in the treatment or relief of cough, and are sipped and swallowed slowly without the addition of water.

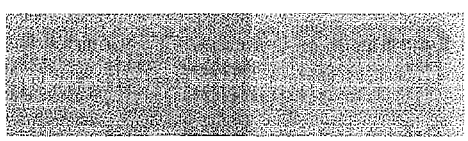
Mixtures. Mixtures are Oral Liquids containing one or more active ingredients dissolved, suspended or dispersed in a suitable vehicle. Suspended solids may separate slowly on keeping but are easily redispersed on shaking.

Oral Drops. Oral Drops are Oral Liquids that are intended to be administered in small volumes with the aid of a suitable measuring device such as a dropper.

Oral Emulsions. Oral Emulsions are Oral Liquids containing one or more active ingredients and are stabilised oil-in-water dispersions, either or both phases of which may contain dissolved solids. Solids may also be suspended in Oral Emulsions. Emulsions may exhibit phase separation but are easily reformed on shaking. The preparation remains sufficiently stable to permit a homogeneous dose to be withdrawn.

Oral Solutions. Oral Solutions are Oral Liquids containing one or more active ingredients dissolved in a suitable vehicle.

Oral Suspensions. Oral Suspensions are Oral Liquids containing one or more active ingredients suspended in a



suitable vehicle. Suspended solids may slowly separate on keeping but are easily redispersed.

In the manufacture of oral suspensions containing dispersed particles, measures shall be taken to ensure a suitable and controlled particle size with regard to the intended use of the product.

Syrups. Syrups are viscous Oral Liquids that may contain one or more active ingredients in solution. The vehicle usually contains large amounts of Sucrose or other sugars to which certain polyhydric alcohols may be added to inhibit crystallisation or to modify solubilisation, taste and other vehicle properties. Sugarless syrups may contain sweetening agents and thickening agents. Syrups may contain Ethanol (95 per cent) as a preservative or as a solvent to incorporate flavouring agents. Antimicrobial agents may also be added to Syrups.

Containers. Oral Liquids may be supplied in multiple dose or single dose containers. Oral Emulsions and Oral Suspensions should be packed in bottles sufficiently wide-mouthed to facilitate the flow of the contents. They are administered either in volumes such as 5 ml, or multiples of 5 ml, or in small volumes (drops). Each dose of a multiple dose Oral Liquid is administered by means of a suitable measuring device which is usually provided with the container.

Tests

Uniformity of content. Unless otherwise specified, single dose liquids in suspension form or powders or granules presented in single dose containers and that contain less than 10 mg or less than 10 per cent of active ingredient comply with the following test. For Oral Liquids containing more than one active ingredient, carry out the test for each active ingredient that corresponds to the above conditions. Empty each container as completely as possible and carry out the test on the individual contents of active ingredients.

The test for Uniformity of content should be carried out only after the content of active ingredient(s) in a pooled sample of the preparation has been shown to be within the accepted limits of the stated content.

Determine the content of active ingredient(s) of each of 10 containers taken at random using the method given in the monograph or by any other suitable analytical method of equivalent accuracy and precision. The preparation complies with the test if the individual values thus obtained are all between 85 to 115 per cent of the average value. The preparation fails to comply with the test if more than one individual value is outside the limits 85 to 115 per cent of the average value or if any one individual value is outside the limits 75 to 125 per cent of the average value. If one individual value is outside the limits 85 to 115 per cent but within the limits 75 to 125 per cent of the average value, repeat the determination using another 20 containers taken at random. The preparation complies with the test if in the total sample of 30 containers not more than 3 individual values are outside the limits 85 to 115 per cent and not more than one is outside the limits 75 to 125 per cent of the average value.

Uniformity of weight/volume. Unless otherwise specified, Oral Liquids comply with the test for contents of packaged dosage forms (2.5.6).

Storage. Store Oral Liquids or powders and granules for the preparation of Oral Liquids in well-closed containers at temperatures not exceeding 30°.

Labelling. For Oral Liquids that are supplied as drops, the label states the number of drops per g of preparation if the dose is stated in drops or the number of drops per ml of preparation if the dose is stated in volume. For oral liquids supplied as granules or powder to be constituted before use, the label states (1) that the contents are meant for preparation of an Oral Liquid; (2) the directions for preparing the Oral liquid including the nature and quantity of the liquid to be used; (3) the conditions under which the constituted solution should be stored; (4) the period during which the constituted Oral Liquid may be expected to remain satisfactory for use when prepared and stored in accordance with the manufacturer's recommendations; (5) the strength in terms of the active ingredient(s) in a suitable dose-volume of the constituted preparation.

* The term vehicle means a carrier, composed of one or more excipients, for the active pharmaceutical ingredient(s) in a liquid preparation.

Oral Powders

Oral Powders are finely divided powders that contain one or more medicaments with or without auxilliary substances including, where specified, flavouring and colouring agents. However, addition of saccharin or its salts is not permitted in the preparations meant for paediatric use. They are intended to be taken internally with or without the aid of water or any other suitable liquid.

Oral Powders may be single dose or multiple dose preparations. For single dose powders, each dose is enclosed in a separate container, e.g., a sachet, a paper packet or a vial. With multiple dose powders it may be necessary to provide a measuring device capable of delivering the quantity prescribed.

Effervescent Oral Powders are intended to be dissolved or dispersed in water before administration.

In the manufacture of oral powders, means are taken to ensure a suitable particle size with regard to the intended use of the product. During manufacture, packaging, storage and distribution of oral powders, suitable means shall be taken to ensure their microbial quality; acceptance criteria for microbial quality are given in Chapter 2.2.9.

Storage. Store Oral Powders in containers protected from moisture.

Tests

Uniformity of content. Unless otherwise specified, Oral Powders presented in single dose containers that contain less than 10 mg of active ingredient per dose or that contain less than 10 per cent w/w of active ingredient comply with the following test. For Oral Powders containing more than one active ingredient carry out the test for each active ingredient that corresponds to the above conditions. Empty each container as completely as possible and carry out the test on the individual contents of active ingredients.

The test for Uniformity of content should be carried out only after the content of active ingredient(s) in a pooled sample of the preparation has been shown to be within the accepted limits of the stated content.

Determine the content of active ingredient(s) of each of 10 containers taken at random using the method given in the monograph or by any other suitable analytical method of equivalent accuracy and precision. The preparation complies with the test if the individual values thus obtained are all between 85 to 115 per cent of the average value. The preparation fails to comply with the test if more than one individual value is outside the limits 85 to 115 per cent of the average value or if any one individual value is outside the limits 75 to 125 per cent of the average value. If one individual value is outside the limits 85 to 115 per cent but within the limits 75 to 125 per cent of the average value, repeat the determination using another 20 containers taken at random. The preparation complies with the test if in the total sample of 30 containers not more than 3 individual values are outside the limits 85 to 115 per cent and not more than one is outside the limits 75 to 125 per cent of the average value.

NOTE — The test for Uniformity of content is not applicable to preparations containing multivitamins and trace elements.

Uniformity of weight. Unless otherwise specified, Oral Powders presented in single dose containers comply with the test for Uniformity of Weight of Single-Dose Preparations (2.5.3) and Oral Powders presented in other than single dose containers comply with the test for contents of packaged dosage forms (2.5.6).

Parenteral Preparations

Injectable Preparations

NOTE — The provisions of this monograph do not necessarily apply to Blood Products or Immunological Products because of their special nature and licensing requirements.

Introduction

Parenteral Preparations are sterile products intended for administration by injection, infusion or implantation into the body. They may be preparations intended for direct parenteral administration or they may be parenteral products for constituting or diluting prior to administration. There are five main types of Parenteral Preparations, namely, Injections, Infusions, Powders for Injection, Concentrated Solutions for Injection and Implants.

Production

Parenteral Preparations should be prepared by methods designed to ensure their sterility and to avoid the introduction of foreign contaminants, the presence of pyrogens or of bacterial endotoxins and the growth of micro-organisms.

Parenteral Preparations which are solutions or suspensions require vehicles in which the medicaments are incorporated. The most commonly used vehicle is Water for Injections that complies with the requirements for water for injections in bulk stated in the monograph on Water for injections. Any other suitable vehicles may be used provided they are safe in the volume of injections administered and also do not interfere with the therapeutic efficacy of the preparation or with its response to the prescribed tests and assays of the Pharmacopoeia. It may be necessary to include auxiliary substances to increase the stability or usefulness of the preparation, unless otherwise specified in the individual monograph. Such substances at the concentration at which they are used should not adversely affect the intended medicinal action of the preparation nor cause toxicity or local irritation and should not interfere with the responses to the specified tests and assays. No colouring agent may be added solely for the purpose of colouring the finished preparation.

Aqueous Parenteral Preparations for administration by the subcutaneous, intradermal, intramuscular, or in the case of large volumes, intravenous route, should if possible be made isotonic with blood by the addition of Sodium Chloride or other suitable substances. Buffering agents should not be used in preparations intended for intraocular or intracardiac injection, or in products that may gain access to the cerebrospinal fluid.

Parenteral Preparations that are packaged in multiple dose containers, regardless of the method of sterilisation employed, may contain suitable antimicrobial preservatives in appropriate concentration, unless otherwise directed in the individual monograph, or unless the active ingredients themselves are bacteriostatic. The effectiveness of the chosen preservative shall have been demonstrated during the development of a parenteral preparation.

Precautions to be taken for administration and for storage between successive withdrawals from such multiple dose

preparations should be indicated. Preservatives should not be added when the volume to be injected as a single dose exceeds 15 ml, unless otherwise justified, or when the preparation is intended for administration by the intraocular, intracardiac or intracisternal routes (or other route giving access to the cerebrospinal fluid).

Where the active ingredient is susceptible to oxidative degradation a suitable antioxidant may be added and/or the air in the container may be evacuated or displaced by oxygen-free nitrogen or other suitable inert gas.

Sterilisation. Methods of sterilisation that may be used in the manufacture of Parenteral Preparations are described in Chapter 5.3.

Containers. Containers for Parenteral Preparations are made as far as possible from materials that (1) are sufficiently transparent to permit visual inspection of the contents, except for implants; (2) do not adversely affect the quality of the preparation under the ordinary conditions of handling, shipment, storage, sale and use; (3) do not permit diffusion into or across the walls of the container or yield foreign substances into the preparation. Parenteral Preparations may be supplied in glass ampoules, vials or bottles or in other containers such as plastic bottles or bags or in prefilled syringes the integrity of which is ensured by suitable means. Requirements concerning containers are given in Chapter 6.2.

Single dose containers are used for administration of the contents on one occasion only and are to be preferred for all parenteral preparations. They may be used for intrathecal, intracardiac, intracisternal or intravenous injectable preparations. They contain sufficient of the Parenteral Preparation to permit the withdrawal and administration of the nominal dose using normal technique. They must be used for all parenteral preparations administered at one time in volumes of 10 ml or more.

Multiple dose containers permit the withdrawal of successive portions of the contents without removal or destruction of the closure and without changing the strength, quality or purity of the remaining portion. They may be used for intramuscular, subcutaneous or intracutaneous administration, but no multiple dose container may contain a total volume of injection sufficient to permit the withdrawal of more than ten doses, unless otherwise stated in the individual monograph. The period of time between the withdrawal of the first and final dose should not be unduly prolonged.

A multiple dose container for a sterile solid permits the addition of a suitable vehicle and withdrawal of portions of the resulting preparation in such a manner that the sterility of the product is maintained.

Closures. Vials or bottles are fitted with suitable closures that ensure a good seal, prevent the access of micro-organisms and other contaminants and usually permit the withdrawal of a part or the whole of the contents of the container without removal of the closure. The plastic or rubber materials of which the closure is composed must be compatible with the preparation and be sufficiently firm and elastic to allow the passage of a needle with minimal shedding of particles and to ensure that the puncture is resealed when the needle is withdrawn. Requirements concerning closures are given in Chapter 6.3.

Before use, closures should be washed with a suitable detergent and rinsed with and boiled in several changes of Purified Water. Closures made from rubber and synthetic materials are liable to absorb the ingredients of the parenteral preparation with which they are used, e.g., the preservative. When an antimicrobial preservative is used the closure, when necessary, should be placed in a solution of that preservative in Purified Water containing at least twice the concentration to be used in the preparation; the quantity of solution used should be sufficient to cover the closures and should be at least 2 ml for each g of the material. The vessel should then be closed and heated at an appropriate combination of time and temperature. After heating, the closures should be kept in the sealed container until required for use.

When the parenteral preparation with which the closures are to be used contains other added substances that are liable to be absorbed by the closure, these should be added to the solution in which the closures are to be heated in amounts equal to at least twice the concentration to be used in the parenteral preparation. Closures intended for containers of oily preparations should be made of oil-resistant materials.

Inspection. Good Manufacturing Practices require that each final container of a Parenteral Preparation be subjected individually to a physical inspection whenever the nature of the container permits and that every container the contents of which show evidence of contamination with visible foreign material be rejected.

Labelling. Containers of Parenteral Preparations should be labelled in a manner that sufficient area of the container remains uncovered for its full length or circumference to permit inspection of the contents. The label of a Parenteral Preparation states (1) the name of the Parenteral Preparation; (2) the strength in terms of the amount of active ingredient in percentage or in a suitable dose-volume; (3) the name and proportion of or antimicrobial preservative added; (4) the conditions under which the preparation should be stored.

In the case of Parenteral Preparations like Powders for Injection and Concentrated Solutions for Injection wherein a diluent is intended to be added before use, the label also states (1) the composition of the recommended diluent; (2) the conditions under which the constituted preparation should be stored; (3) the period within which the constituted solution should be used if it has been stored under the recommended conditions

of storage after constitution. In the case of Powders for Injection, the label also states the amount of diluent to be used to attain a specific concentration of the active ingredient in the solution or suspension so obtained whereas in the case of Concentrated Solutions for Injection, the amount of diluent to be used to attain a specific concentration and the final volume of the solution or suspension so obtained.

Injections

Injections are sterile solutions, emulsions or suspensions. They are prepared by dissolving, emulsifying or suspending the active ingredient(s) and any added substances in Water for Injection or in a suitable non-aqueous vehicle, or in a mixture of the two if they are miscible.

Injections that are emulsions should not show any evidence of separation and show a uniform appearance after shaking. The diameter of the globules of the dispersed phase of emulsions intended for intravenous injection must be decided with regard to the use of the preparation. Injections that are suspensions may show a sediment which is readily dispersible on shaking. The suspension remains sufficiently stable to enable a homogenous dose to be withdrawn from the container.

Tests

Particulate matter. Injections that are solutions, when examined under suitable conditions of visibility, are clear and practically free from particles that can be observed on visual inspection by the unaided eye. Injections that are supplied in containers with a nominal content of 100 ml or more comply with the test for particulate contamination (2.5.9).

Uniformity of content. Unless otherwise stated in the individual monograph, suspensions for injection that are presented in single dose containers and that contain less than 10 mg or less than 10 per cent of active ingredient comply with the following test. For suspensions for injection containing more than one active ingredient carry out the test for each active ingredient that corresponds to the above conditions.

The test for Uniformity of content should be carried out only after the content of active ingredient(s) in a pooled sample of the preparation has been shown to be within accepted limits of the stated content.

Determine the content of active ingredient(s) of each of 10 containers taken at random, using the method given in the monograph or by any other suitable analytical method of equivalent accuracy and precision. The preparation under examination complies with the test if the individual values thus obtained are all between 85 and 115 per cent of the average value. The preparation under examination fails to comply with the test if more than one individual value is outside the limits 85 to 115 per cent of the average value or if any one individual value is outside the limits 75 to 125 per cent of the average value. If one individual value is outside the limits 85 to 115 per cent but within the limits 75 to 125 per cent of the average value, repeat the determination using another 20 containers taken at random. The preparation under examination complies with the test if in the total sample of 30 containers not more than one individual value is outside the limits 85 to 115 per cent and none is outside the limits 75 to 125 per cent of the average value.

NOTE — The test for Uniformity of content is not applicable to suspensions for injection containing multivitamins and trace elements.

Extractable volume

Suspensions and emulsions are shaken before withdrawal of the contents and before the determination of the density. Oily and viscous preparations may be warmed according to the instructions on the label, if necessary, and thoroughly shaken immediately before removing the contents. The contents are then cooled to 20-25° before measuring the volume.

Single-dose containers. Select 1 container if the nominal volume is 10 ml or more, 3 containers if the nominal volume is more than 3 ml and less than 10 ml, or 5 containers if the nominal volume is 3 ml or less. Take up individually the total contents of each container selected into a dry syringe of a capacity not exceeding 3 times the volume to be measured, and fitted with a 21-gauge needle not less than 2.5 cm in length. Expel any air bubbles from the syringe and needle, then discharge the contents of the syringe without emptying the needle into a standardised dry cylinder (graduated to contain rather than to deliver the designated volumes) of such size that the volume to be measured occupies at least 40 per cent of its graduated volume. Alternatively, the volume of the contents in millilitres may be calculated as the mass in grams divided by the density. For containers with a nominal volume of 2 ml or less, the contents of a sufficient number of containers may be pooled to obtain the volume required for the measurement provided that a separate, dry syringe assembly is used for each container. The contents of containers holding 10 ml or more may be determined by opening them and emptying the contents directly into the graduated cylinder or tared beaker.

The volume is not less than the nominal volume in case of containers examined individually, or, in case of containers with a nominal volume of 2 ml or less, is not less than the sum of the nominal volumes of the containers taken collectively.

Multidose containers. Labelled to yield a specific number of doses of a stated volume, select one container and proceed as directed for single-dose containers using the same number of separate syringe assemblies as the number of doses specified. The volume is such that each syringe delivers not less than the stated dose.

Cartridges and prefilled syringes

Select one container if the nominal volume is 10 ml or more, three containers if the nominal volume is more than 3 ml and less than 10 ml or 5 containers if the nominal volume is 3 ml or less. If necessary, fit the containers with the accessories required for their use (needle, piston and syringe) and transfer the entire content of each container without emptying the needle in a dry tared beaker by slowly and constantly depressing the piston. Determine the volume in millilitres calculated as the mass in grams divided by density.

The volume measured for each of the container is not less than the nominal volume.

Parenteral infusions (Large volume)

Select one container. Transfer the contents into a dry standard measuring cylinder of such a capacity that the volume to be measured occupies at least 40 per cent of the nominal volume of the cylinder.

Measure the volume transferred.

The volume is not less than the nominal volume.

Sterility (2.2.11). Injections comply with the test for sterility.

Bacterial endotoxins-Pyrogens. A test for bacterial endotoxins (2.2.3) is carried out or where justified and authorized, the test for pyrogens (2.2.8).

Infusions

Infusions are sterile aqueous solutions or emulsions with water as the continuous phase. They are free from pyrogens or bacterial endotoxins, are usually made isotonic with blood and do not contain any added antimicrobial preservatives. Intravenous Infusions that are emulsions do not show any evidence of phase separation. The diameter of the globules of the dispersed phase of emulsions must be decided with regard to the use of the preparation.

Tests

Intravenous Infusions comply with the requirements of tests stated under individual monographs and with the following requirements.

Particulate contamination. Intravenous Infusions that are solutions, when examined under suitable conditions of visibility, are clear and practically free from particles that can be observed on visual inspection by the unaided eye. Intravenous Infusions that are solutions and are supplied in containers with a nominal content of 100 ml or more comply with the test for particulate contamination (2.5.9).

Sterility (2.2.11). Intravenous Infusions comply with the test for sterility.

Bacterial endotoxins-Pyrogens. They comply with a test for bacterial endotoxins (2.2.3) or where justified and authorized, with the test for pyrogens (2.2.8). For pyrogen, inject 10 ml per kg of body weight into each rabbit, unless otherwise justified and authorized.

Powders for injection

Powders for injection are sterile, solid substances (including freeze-dried materials) which are distributed in their final containers and which, when shaken with the prescribed volume of the appropriate sterile liquid, rapidly form clear and practically particle-free solutions or uniform suspensions.

Tests

Powders for injection comply with the requirements of tests stated under individual monographs and with the following requirements.

Uniformity of content. Unless otherwise stated in the individual monograph, Powders for injection that contain 10 mg or less than 10 mg or less than 10 per cent of active ingredient or that have a unit weight equal to or less than 40 mg comply with the test for Uniformity of content described under Injections. For Powders for injection containing more than one active ingredient carry out the test for each active ingredient that corresponds to the above conditions. The test is not applicable to Powders for injection containing multivitamins and trace elements.

The test for Uniformity of content should be carried out only after the content of active ingredient(s) in a pooled sample of the preparation has been shown to be within accepted limits of the stated content.

Uniformity of weight. For Powders for injection that are required to comply with the test for Uniformity of content of all active ingredients, the test for Uniformity of weight is not required.

Remove any adherent labels from a container and wash and dry the outside. Open the container and immediately weigh the container and its contents. Empty the container as completely as possible by gentle tapping, rinse if necessary with *water* and then with *ethanol (95 per cent)* and dry at 100° to 105° for 1 hour or, if the nature of the container precludes such treatment, dry at a lower temperature to constant weight. Allow to cool in a desiccator and weigh. The difference between the weights represents the weight of the contents. Repeat the procedure with a further 19 containers and determine the average weight. Not more than two of the individual weights deviate from the average weight by more than 10 per cent and none deviates by more than 20 per cent.

Clarity of solution. Constitute the injection as directed on the label. (Not applicable to suspensions).

a) The solid dissolves completely, leaving no visible residue as undissolved matter.

b) The constituted injection is not significantly less clear than an equal volume of the diluent or of *water for injections* contained in a similar container and examined in the same manner.

Particulate matter. Constitute the injection as directed on the label; the solution is essentially free from particles of foreign matter that can be seen on visual inspection.

Sterility (2.2.11). Powders for injection comply with the test for sterility.

Bacterial endotoxins-Pyrogens. They comply with the requirements prescribed for injections or for infusions, after dilution or suspension in a suitable volume of liquid.

Concentrated Solutions for injection

Concentrated Solutions for injection are sterile solutions that are intended to be administered by injection or by intravenous infusion only after dilution with a suitable liquid.

Tests

After dilution Concentrated Solutions for injection comply with the requirements of tests for Injections or Infusions as appropriate.

Bacterial endotoxins-Pyrogens. They comply with the requirements prescribed for injections or for infusions, after dilution to a suitable volume.

Implants

Implants are sterile solid preparations of size and shape suitable for implantation into body tissues so as to release the active ingredient over an extended period of time. They are normally presented individually in sterile containers.

Tests

Sterility (2.2.11). Implants comply with the test for sterility.

Pessaries

Pessaries are solid preparations containing one or more active ingredients and are suitable for vaginal insertion. They are normally intended for use as a single dose.

The active ingredients are dissolved or dispersed in a suitable base containing one or more auxiliary substances that may be dispersible, soluble or insoluble in water. The auxiliary substances may be similar to the ones used for Suppositories or Tablets; such substances must be innocuous and therapeutically inert in the quantities present.

During manufacture, packaging, storage and distribution of pessaries, suitable means shall be taken to ensure their microbial quality; acceptance criteria for microbial quality are given in Chapter 2.2.9.

Compressed Pessaries. Compressed Pessaries, also known as Vaginal Tablets, have the general characteristics of Uncoated Tablets but are usually large and of greater weight.

Storage. Store in well-closed containers, protected from moisture and from being crushed.

Moulded Pessaries. Moulded Pessaries are manufactured by pouring the liquefied mass containing the medicament(s) and auxiliary substances into moulds of suitable volume and cooling in order to solidify the mass. Auxiliary substances normally used are mixtures of mono-, di- and triglycerides of saturated fatty acids, macrogols, theobroma oil and gelatinous mixtures consisting of Gelatin, Glycerin and Water.

Moulded Pessaries are smooth and are usually ovoid in shape but may also be of various other shapes and of various volumes. When examined microscopically, their surfaces and longitudinal sections are normally of uniform texture except where the pessary consists of many layers.

Storage. Store in ventilated containers.

Shell Pessaries. Shell Pessaries, also known as Vaginal Capsules, are similar to Soft Capsules, differing only in their shape and size. They are commonly ovoid in shape, smooth and have a uniform appearance.

Storage. Store in well-closed containers.

Tests

Uniformity of container contents. Comply with the test for contents of packaged dosage forms (2.5.6).

Uniformity of content. The test is applicable to Pessaries that contain less than 10 mg or less than 10 per cent of active ingredient. For Pessaries containing more than one active ingredient carry out the test for each active ingredient that corresponds to the above conditions.

The test for Uniformity of content should be carried out only after the content of active ingredient(s) in a pooled sample of the pessaries has been shown to be within accepted limits of the stated content.

Carry out the test for Uniformity of content described under Capsules.

Uniformity of weight. This test is not applicable to Pessaries that are required to comply with the test for Uniformity of content for all active ingredients.

Weigh individually 20 pessaries, taken at random, and determine the average weight. Not more than two of the individual weights deviate from the average weight by more than 5 per cent and none deviates by more than 10 per cent.

Disintegration. *This test is not necessarily applicable to Pessaries intended for modified release or for prolonged local action.*

Carry out the disintegration test (2.5.1). Disintegration occurs in not more than 30 minutes for Compressed Pessaries and Shell Pessaries and in not more than 60 minutes for Moulded Pessaries.

Suppositories

Suppositories are solid preparations each containing one or more active ingredients and are suitable for rectal administration. They are normally intended for use as a single dose for local action or systemic absorption of the active ingredients.

The active ingredients are ground and passed through a sieve, if necessary, and dissolved or dispersed in a suitable basis that may be soluble or dispersible in water or that may melt at body temperature.

Suppositories may contain suitable auxiliary substances such as adsorbents, diluents, lubricants, antimicrobial preservatives and colouring agents permitted under the Drugs and Cosmetics Rules, 1945.

Moulded Suppositories. Moulded Suppositories are manufactured by liquefying by heating the mass containing the medicament(s) and auxiliary substances and then pouring the mass into moulds of suitable volume and cooling in order to solidify the mass. In some cases, the solid medicated mass may be cold-moulded by compression in a suitable matrix.

Moulded Suppositories have the characteristics of Moulded Pessaries.

Shell Suppositories. Shell Suppositories, also known as Rectal Capsules, are generally similar to Soft Capsules except that they may have lubricating coatings.

Shell Suppositories have the characteristics of Shell Pessaries.

During manufacture, packaging, storage and distribution of suppositories, suitable means shall be taken to ensure their microbial quality; acceptance criteria for microbial quality are given in Chapter 2.2.9.

Tests

Moulded Suppositories and Shell Suppositories comply with the tests stated under Moulded Pessaries and Shell Pessaries respectively.

Storage. Store in well-closed containers.

Tablets

NOTE — The provisions of this monograph do not necessarily apply to tablets intended for use other than by oral administration such as Vaginal preparations or Oromucosal preparations and to lozenges, oral pastes and oral gums.

Definition

Tablets are solid dosage forms each containing a unit dose of one or more medicaments. They are intended for oral administration. Some tablets are swallowed whole or after being chewed, some are dissolved or dispersed in water before administration and some are retained in the mouth where the active ingredient is liberated.

Tablets are usually solid, right circular cylindrical, the end surfaces of which are flat or convex and the edges of which may be bevelled. They may exist in other shapes like triangular, rectangular, etc also. They may have lines or break-marks and may bear a symbol or other markings. They are sufficiently hard to withstand handling without crumbling or breaking. Tablets may bear a break-mark or break-marks.

Because of their composition, method of manufacture or intended use, tablets present a variety of characteristics and consequently there are several categories of tablets.

Tablets may be coated. Where coating is essential, the monograph states 'The tablets are coated'. In all other cases, coating is optional. Unless otherwise directed, tablets may be coated in one of different ways.

Production

Tablets are obtained by compression of uniform volumes of powders or granules or beads or pellets by applying high pressure and using punches and dies. The particles to be compressed consist of one or more medicaments, with or without auxiliary substances such as diluents, binders, disintegrating agents, lubricants, glidants, permitted colours and substances capable of modifying the behaviour of the medicaments in the digestive tract. Such substances must be innocuous and therapeutically safe in the quantities present.

In the production of tablets, measures are taken to ensure that they have sufficient strength to avoid crumbling or breaking on handling or subsequent handling. Chewing tablets are manufactured to ensure that they are easily crushed by chewing.

Subdivision of tablets. Tablets may bear a break-mark and may be subdivided in parts either to ease the intake of the medicinal product or to comply with the posology. In order to ensure

that the patient will receive the intended dose, the efficacy of the break-mark(s) must be assessed during the development of the product, in respect of uniformity of mass of the subdivided parts. Each authorized dose must be tested using the following test.

Take 30 tablets at random, break them by hand and from all the parts obtained from 1 tablet, take 1 part for the test and reject the other part(s). Weigh each of the 30 parts individually and calculate the average mass. The tablets comply with the test if not more than 1 individual mass is outside the limits of 85 per cent to 115 per cent of the average mass. The tablets fail to comply with the test if more than 1 individual mass is outside these limits or if 1 individual mass is outside the limits of 75 per cent to 125 per cent of the average mass.

During manufacture, packaging, storage and distribution of tablets, suitable means shall be taken to ensure their microbial quality; acceptance criteria for microbial quality are given in Chapter 2.2.9.

Tests

NOTE —Unless otherwise stated below or in the individual monograph, the following tests apply to all categories of tablets.

Uniformity of container contents. Tablets comply with the test for contents of packaged dosage forms (2.5.6).

Content of active ingredients. Determine the amount of active ingredient(s) by the method described in the Assay and calculate the amount of active ingredient(s) per tablet. The result lies within the range for the content of active ingredient(s) stated in the monograph. This range is based on the requirement that 20 tablets, or such other number as may be indicated in the monograph, are used in the Assay. Where 20 tablets cannot be obtained, a smaller number, which must not be less than 5, may be used, but to allow for sampling errors the tolerances are widened in accordance with Table 1. The requirements of Table 1 apply when the stated limits are between 90 and 110 per cent. For limits other than 90 to 110 per cent, proportionately smaller or larger allowances should be made.

Table 1

Weight of active ingredients in each tablet	Subtract from lower limit for samples of			Add to the upper limit for samples of		
	15	10	5	15	10	5
0.12 g or less	0.2	0.7	1.6	0.3	0.8	1.8
More than 0.12 g but less than 0.3 g	0.2	0.5	1.2	0.3	0.6	1.5
0.3 g or more	0.1	0.2	0.8	0.2	0.4	1.0

Uniformity of content (2.5.4). This test is applicable to tablets that contain 10 mg or less than 10 mg or less than 10 per cent w/w of active ingredient. For tablets containing more than one active ingredient carry out the test for each active ingredient that corresponds to the aforementioned conditions.

Irrespective of their strengths the test is applicable to coated tablets other than film coated tablets.

The test for Uniformity of content should be carried out only after the content of active ingredient(s) in a pooled sample of the tablets has been shown to be within accepted limits of the stated content.

The test for Uniformity of content is not applicable to tablets containing multivitamins and trace elements."

Applicability of test for Uniformity of content for tablets

Table 2

Type of Tablets	For tablets containing 10 mg or less than 10 per cent w/w of active ingredient	For tablets containing more than 10 mg or more than 10 per cent w/w of active ingredient
Uncoated tablets	Applicable	Not Applicable
Film coated tablets	Applicable	Not Applicable
Other coated tablets	Applicable	Applicable*

*Unless otherwise justified and authorized.

Uniformity of weight (2.5.3).This test is not applicable to coated tablets other than film-coated tablets and to tablets that are required to comply with the test for uniformity of content for all active ingredients.

Dissolution (2.5.2). Where required, the requirements for this test are given in the individual monographs. Where a dissolution test is prescribed, the disintegration test may not be necessary.

Uncoated Tablets

Uncoated tablets may be single-layer tablets resulting from a single compression of particles or multi-layer tablets consisting of parallel layers obtained by successive compression of particles of different compositions. No treatment is applied to such tablets after compression. Any added substances are not specifically intended to modify the release of their active ingredient(s) in the digestive fluids.

The addition of flavouring agents to uncoated tablets other than multi-layer tablets is not official unless permitted in the individual monograph. Uncoated Tablets have the general

characteristics of tablets. When a broken section of an uncoated tablet is examined under a lens, either a relatively uniform texture (single-layer tablets) or a stratified structure (multi-layer tablets) is seen; there are no signs of coating.

Tests

Disintegration (2.5.1). Use *water* as the liquid. Add a disc to each tube. Operate the apparatus for 15 minutes, unless otherwise stated in the individual monograph. Examine the state of the tablets. If the tablets fail to comply because of adherence to the discs, repeat the test on a further 6 tablets omitting the discs. The tablets comply with the test if all 6 tablets have disintegrated.

The test does not apply to chewable tablets.

Coated Tablets

Coated tablets are tablets covered with one or more layers of mixtures of various substances such as resins, gums, gelatin, inactive and insoluble fillers, sugars, plasticisers, polyhydric alcohols, waxes, colouring matter authorized by the competent authority and sometime flavouring substances and active substances, etc. The coating may also contain medicaments. In compression-coated tablets, the coating is applied by compressing around the tablets granules prepared from tablet excipients such as lactose, calcium phosphate, etc. Substances used as coatings are usually applied as a solution or suspension in conditions in which evaporation of the vehicle occurs. When the coating is thin, the tablets are described as film-coated.

Coated tablets may contain flavouring agents.

Coated tablets have a smooth, usually polished and often coloured, surface; a broken section examined under a lens shows a core surrounded by one or more continuous layers of a different texture.

Tests

Disintegration (2.5.1). *For coated tablets other than film-coated tablets.*

Use *water* as the liquid. Add a disc to each tube. Operate the apparatus for 60 minutes, unless otherwise stated in the individual monograph. Examine the state of the tablets. If any of the tablets has not disintegrated, repeat the test on a further 6 tablets, replacing *water* with *0.1 M hydrochloric acid*. The tablets comply with the test if all 6 tablets have disintegrated.

Film-coated Tablets

Carry out the test described above but operate the apparatus for 30 minutes, unless otherwise stated in the individual monograph.

If coated tablets fail to comply because of adherence to the discs, repeat the test on a further 6 tablets omitting the discs. The tablets comply with the test if all 6 tablets have disintegrated in the acid medium.

The test does not apply to chewable tablets.

Dispersible Tablets

Dispersible tablets are uncoated or film-coated tablets that produce a uniform dispersion in water and may contain permitted flavouring and sweetening agents. However, if saccharin, including its sodium and potassium salts, is used as a sweetening agent, its concentration in dispersible tablets meant for paediatric use should be restricted so as to limit its intake to 5 mg/kg of body weight.

Tests

Disintegration (2.5.1).Use *water* as the liquid. Determine at 24° to 26° and operate the apparatus for 3 minutes.

Uniformity of dispersion. Place 2 tablets in 100 ml of *water* and stir gently until completely dispersed. A smooth dispersion is obtained which passes through a sieve screen with a nominal mesh aperture of 710 µm (sieve number 22).

Effervescent Tablets

Effervescent tablets are uncoated tablets generally containing acidic substances and either carbonates or bicarbonates which react rapidly in the presence of water to release carbon dioxide and they may contain permitted flavouring agents. They are intended to be dissolved or dispersed in water before administration.

Tests

Disintegration (2.5.1). Place one tablet in a 250-ml beaker containing 200 ml of *water* at 20° to 30°; numerous gas bubbles are evolved. When the evolution of gas around the tablet or its fragments has ceased the tablet shall have disintegrated, being either dissolved or dispersed in the water so that no agglomerates of particles remain. Repeat the operation on a further 5 tablets. The tablets comply with the test if each of the 6 tablets disintegrates in the manner prescribed within 5 minutes, unless otherwise stated in the individual monograph.

Modified-release Tablets

Modified-release tablets are coated or uncoated tablets containing auxiliary substances or prepared by procedures that, separately or together, are designed to modify the rate or the place at which the active ingredient is released.

Modified-release tablets include gastro-resistant tablets and prolonged-release tablets.

Gastro-resistant Tablets

Gastro-resistant tablets are delayed-release tablets that are intended to resist the gastric fluid but to release their active ingredient(s) in the intestinal fluid. For this purpose substances such as cellulose acetate phthalate and anionic copolymers of methacrylic acid and its ethers are used for providing tablets with a gastric-resistant coating (enteric coating) or for covering either granules or particles with gastric-resistant coating.

These tablets may be labeled as gastro-resistant tablets or enteric coated tablets as the case may be.

Tablets covered with gastro resistant coating conform to the definition of Coated Tablets.

Tests

Disintegration (2.5.1). If the tablet has a soluble external coating, immerse the basket in *water* at room temperature for 5 minutes. Suspend the assembly in the beaker containing *0.1 M hydrochloric acid* and operate without the discs for 120 minutes, unless otherwise stated in the individual monograph. Remove the assembly from the liquid. No tablet shows signs of cracks that would allow the escape of the contents of disintegration, apart from fragments of coating. Replace the liquid in the beaker with *phosphate buffer pH 6.8*, add a disc to each tube and operate the apparatus for a further 60 minutes. Remove the assembly from the liquid. The tablets pass the test if all six have disintegrated.

Dissolution (2.5.2). For tablets prepared from granules or particles already covered with an enteric coating, the dissolution test is carried out to demonstrate the appropriate release of the active substance(s).

Prolonged-release Tablets

Prolonged-release tablets, also known as sustained-release tablets, controlled-release tablets or extended-release tablets are tablets formulated in such a manner as to make the contained active ingredient available over an extended period of time after ingestion based on therapeutic justification.

Tests

Dissolution (2.5.2). The test should be designed to demonstrate the appropriate release of the active substance(s). The manufacturer is expected to give specifications for drug release at 3 or more test-time points. The first point should be set after a testing period corresponding to a dissolved amount of typically 20 per cent to 30 per cent. The second point should define the dissolution pattern and should be set typically 45 per cent to 55 per cent release. The final point should ensure almost complete release that is generally understood as more than 80 per cent release.

NOTE — Above specifications are non mandatory.

Carry out the test as per the manufacturer's specification for the indicated test-times.

Soluble Tablets

Soluble tablets are uncoated tablets or film-coated tablets that are to be dissolved in water before use. The solution produced may be slightly opalescent due to added substances used in the manufacture of the tablets.

Tests

Disintegration (2.5.1). Soluble tablets disintegrate within 3 minutes. The test is carried out using *water* as liquid medium at 15°to 25°.

Tablets for Use in the Mouth

Tablets for use in the mouth are usually uncoated tablets formulated to disintegrate orally or be chewed or to effect a slow release and local action of the active ingredient (lozenges) or the release and absorption of the active ingredient under the tongue (sublingual tablets). Chewable tablets and lozenges may contain flavouring agents. These can be categorized as

Orodispersible Tablets (Mouth Dissolving Tablets)

Orodispersible tablets are uncoated tablets intended to be placed in the mouth where they disperse rapidly before being swallowed.

Tests

Disintegration (2.5.1). Orodispersible tablets disintegrate within 3 minutes, using water as liquid medium.

Sublingual Tablets

Sublingual tablets are intended to be placed below the tongue for administration.

Tests

Disintegration (2.5.1). Sublingual tablets disintegrate within 3 minutes, at 15°to 25°.

Chewable Tablets

Chewable tablets are intended to be chewed before being swallowed.

Chewable tablets are prepared to ensure that they are easily crushed by chewing.

For chewable tablets disintegration test does not apply unless otherwise stated in the monograph.

Oral lyophilisates. Oral lyophilisates are solid preparations intended either to be placed in the mouth or to be dispersed (or dissolved) in water before administration.

Oral lyophilisates are obtained by freeze-drying (lyophilisation), involving division into single doses, freezing, sublimation and drying of usually aqueous, liquid or semisolid preparations.

Tests

Disintegration (2.5.1). Place 1 oral lyophilisates in a beaker containing 200ml of water at 15°to 25°. It disintegrates within 3 minutes. Repeat the test on 5 other oral lyophilisates. They comply with the test if all 6 have disintegrated.

Water (2.3.43). Oral lyophilisates comply with the test, the limits are approved by the competent authority.

Labelling. The label states whether or not the tablets are coated.

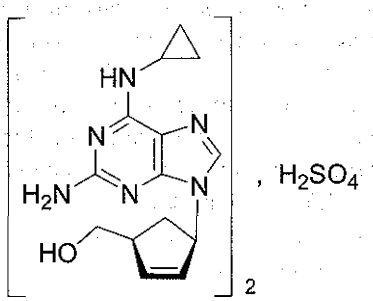
Where applicable the label states that the tablets should be chewed before swallowing.

The label states the common name of the colour used.

DRUG SUBSTANCES, DOSAGE FORMS AND PHARMACEUTICAL AIDS

A

Abacavir Sulphate



$(C_{14}H_{18}N_6O)_2,H_2SO_4$ Mol. Wt. 670.8

Abacavir Sulphate is {(1*S*,4*R*)-4-[2-amino-6-(cyclopropylamino)9*H*-purin-9-yl]cyclopent-2-enyl}methanol sulphate.

Abacavir Sulphate contains not less than 98.0 per cent and not more than 102.0 per cent of $(C_{14}H_{18}N_6O)_2$, H_2SO_4, calculated on the anhydrous basis.

Category. Antiretroviral.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *abacavir sulphate IPRS* or with the reference spectrum of abacavir sulphate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. It gives reaction (A) of sulphates (2.3.1).

Tests

Specific optical rotation (2.4.22). −38.0° to −32.0°, determined in a 0.5 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay using the following solutions.

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution. Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.3 per cent.

Water (2.3.43). Not more than 1.5 per cent, determined on 0.2 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *abacavir sulphate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica or ceramic microparticles (5 µm),
- mobile phase: a mixture of 75 volumes of a buffer solution prepared by dissolving 1.15 g of *ammonium dihydrogen phosphate* and 2 g of *tetrabutylammonium hydrogen sulphate* in 1000 ml of *water*, adjusted to pH 6.0 with *triethylamine*, 10 volumes of *methanol* and 15 volumes of *acetonitrile*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 214 nm,
- injection volume: 20 µl.

Inject the reference solution.The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $(C_{14}H_{18}N_6O)_2,H_2SO_4$.

Storage. Store at a temperature not exceeding 30°.

Abacavir Oral Solution

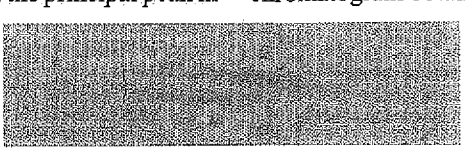
Abacavir Sulphate Oral Solution

Abacavir Oral Solution contains Abacavir Sulphate equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of abacavir $C_{14}H_{18}N_6O$. It may contain one or more suitable buffers, colours, flavours, preservatives, stabilizers, sweeteners, and suspending agents.

Usual strength. 20 mg per ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.



Tests

pH (2.4.24). 4.6 to 5.0.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Dissolve a quantity of the oral solution containing 50 mg of abacavir in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve a quantity of *abacavir sulphate IPRS* in the mobile phase to obtain a solution containing 0.05 per cent w/v of abacavir.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 85 volumes of a buffer solution prepared by dissolving 1.15 g of *ammonium dihydrogen phosphate* and 2 g of *tetrabutylammonium hydrogen sulphate* in 1000 ml of *water*, adjusted to pH 6.0 with *triethylamine* and 15 volumes of *acetonitrile,*
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 214 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 3000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent).

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Dissolve a quantity of the oral solution containing 60 mg of abacavir in the mobile phase and dilute to 100.0 ml of the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. Dissolve a quantity of *abacavir sulphate IPRS* in the mobile phase to obtain a solution containing 0.06 per cent w/v of abacavir. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 85 volumes of a buffer solution prepared by dissolving 1.15 g of *ammonium dihydrogen phosphate* and 2 g of *tetrabutyl ammonium hydrogen sulphate* in 1000 ml of *water,* adjusted to pH 6.0 with *triethylamine* and 15 volumes of *acetonitrile,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 214 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Determine the weight per ml of the oral solution (2.4.29) and calculate the content of $C_{14}H_{18}N_6O$ weight in volume.

Storage. Store at a temperature not exceeding 30°. Do not freeze.

Labelling. The label states the strength in terms of the equivalent amount of abacavir.

Abacavir Tablets

Abacavir Sulphate Tablets

Abacavir Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of abacavir, $C_{14}H_{18}N_6O$.

Usual strength. 300 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 75 rpm and 15 minutes.

Withdraw a suitable volume of the medium and filter.
Determine by liquid chromatography (2.4.14).
Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *abacavir sulphate IPRS* in the dissolution medium to obtain a solution of known concentration similar to the expected concentration of the test solution.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 85 volumes of a buffer solution prepared by dissolving 1.15 g of *ammonium dihydrogen phosphate* and 2 g of *tetrabutyl ammonium hydrogen sulphate* in 1000 ml of *water*, adjusted to pH 6.0 with *triethylamine* and 15 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 214 nm,
- injection volume: 10 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_{18}N_6O$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{14}H_{18}N_6O$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 50 mg of Abacavir in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve a quantity of *abacavir sulphate IPRS* in the mobile phase to obtain a solution containing 0.05 per cent w/v of abacavir.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 85 volumes of a buffer solution prepared by dissolving 1.15 g of *ammonium dihydrogen phosphate* and 2 g of *tetrabutylammonium hydrogen sulphate* in 1000 ml of *water*, adjusted to pH 6.0 with *triethylamine* and 15 volumes of *acetonitrile*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 214 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 3000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Water (2.3.43). Not more than 5.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg of Abacavir in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. Dissolve a quantity of *abacavir sulphate IPRS* in the mobile phase to obtain a solution containing 0.05 per cent w/v of abacavir. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 85 volumes of a buffer solution prepared by dissolving 1.15 g of *ammonium dihydrogen phosphate* and 2 g of *tetrabutyl ammonium hydrogen sulphate* in 1000 ml of *water*, adjusted to pH 6.0 with *triethylamine* and 15 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 214 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency in not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_{18}N_6O$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of abacavir.

Abacavir and Lamivudine Tablets

Abacavir Sulphate and Lamivudine Tablets

Abacavir and Lamivudine Tablets contain abacavir sulphate equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of abacavir, $C_{14}H_{18}N_6O$ and lamivudine, $C_8H_{11}N_3O_3S$.

Usual strengths. 600 mg abacavir and 300 mg Lamivudine.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14)

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve 75 mg of *abacavir sulphate IPRS* and 30 mg of *lamivudine IPRS* in 10 ml of *methanol* and dilute to 100.0 ml with the dissolution medium.

Use the chromatographic system as described under Assay.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_{18}N_6O$ and $C_8H_{11}N_3O_3S$ in the medium.

Q. Not less than 80 per cent of the stated amounts of $C_{14}H_{18}N_6O$ and $C_8H_{11}N_3O_3S$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 95 volumes of mobile phase A and 5 volumes of mobile phase B.

Test solution. Disperse a quantity of the powdered tablets containing 100 mg of abacavir in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). A 0.05 per cent w/v solution of *lamivudine IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. a buffer solution prepared by dissolving 1.9 g of *ammonium acetate* in 900 ml of *water*, adjusted to pH 3.8 with *glacial acetic acid* and dilute to 1000 ml with *water*,

  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 277 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	95	5
20	95	5
40	30	70
45	95	5
50	95	5

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 3000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Water (2.3.43). Not more than 3.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14)

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 60 mg of Abacavir in 20 ml of *0.1 M hydrochloric acid* and dilute to 100.0 ml with *methanol*. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. Dissolve 35 mg of *abacavir sulphate IPRS* and 15 mg of *lamivudine IPRS* in 15 ml of *0.1 M hydrochloric acid* and dilute to 50.0 ml with *methanol*. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 50 volumes of a buffer solution prepared by dissolving 7.66 g of *ammonium acetate* in 1000 ml of 0.5 per cent w/v solution of *glacial acetic acid* and 50 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 282 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the contents of $C_{14}H_{18}N_6O$ and $C_8H_{11}N_3O_3S$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Abacavir, Lamivudine and Zidovudine Tablets

Abacavir, Lamivudine and Zidovudine Tablets contain abacavir sulphate equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of abacavir, $C_{14}H_{18}N_6O$ lamivudine, $C_8H_{11}N_3O_3S$ and zidovudine, $C_{10}H_{13}N_5O_4$.

Usual strength. 300 mg Abacavir, 150 mg Lamivudine and 300 mg Zidovudine.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.1 M hydrochloric acid*,

Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A solution containing 0.035 per cent w/v of *abacavir sulphate IPRS*, 0.015 per cent w/v *lamivudine IPRS* and 0.03 per cent w/v of *zidovudine IPRS* in the dissolution medium.

Chromatographic system

- a stainless steel column 5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm) (Such as Restek's Pinnacle II C-18),
- column temperature: 50°,
- mobile phase: a mixture of 88 volumes of a buffer solution prepared by dissolving 1 g of *octanesulphonic acid* and 1 ml of *triethylamine* in 1000 ml of *water*, adjusted to pH 2.5 with *orthophosphoric acid* and 12 volumes of *acetonitrile*,
- flow rate: 2.5 ml per minute,
- spectrophotometer set at 272 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the resolution between lamivudine and zidovudine peaks is not less than 2.5, the column efficiency for lamivudine, zidovudine and abacavir peaks is not less than 700, 1200 and 2000 theoretical plates respectively, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent for each component.

Inject the reference solution and the test solution.

Calculate the contents of $C_{14}H_{18}N_6O$, $C_8H_{11}N_3O_3S$ and $C_{10}H_{13}N_5O_4$ in the medium.

Q. Not less than 70 per cent of the stated amounts of $C_{14}H_{18}N_6O$, $C_8H_{11}N_3O_3S$ and $C_{10}H_{13}N_5O_4$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. A 0.2 per cent v/v solution of *orthophosphoric acid* in a mixture of 70 volumes of *water* and 30 volumes of *methanol*.

Test solution. Disperse a quantity of the powdered tablets containing 75 mg of Lamivudine in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). A 0.075 per cent w/v solution of *lamivudine IPRS* in the solvent mixture.

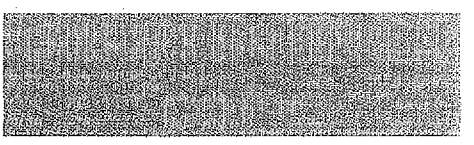
Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 70 volumes of *methanol*, 30 volumes of *acetonitrile* and 0.4 volume of *tetrahydrofuran*,

  B. a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid*,
- a gradient programme using the conditions given below,
- spectrophotometer set at 225 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)	Flow rate (ml per min.)
0	2	98	1
10	2	98	1
25	20	80	1
28	20	80	1
50	30	70	1
60	35	65	1.3
63	35	65	1.3
66	2	98	1
80	2	98	1



Inject reference solution (a). The test is not valid unless the column efficiency is not less than 3000 theoretical plates and the tailing factor is not more than 1.5 for each component.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (5.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of *water* and 50 volumes of *methanol*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 150 mg of Abacavir in 100 ml of *water*, add 80 ml of *methanol* and dilute to 200.0 ml with *methanol*. Dilute 10.0 ml of the solution to 25.0 ml with the solvent mixture.

Reference solution. A solution containing 0.35 per cent w/v of *abacavir sulphate IPRS*, 0.15 per cent w/v *lamivudine IPRS* and 0.30 per cent w/v of *zidovudine IPRS* in the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Kromasil C-18),
- column temperature: 50°,
- mobile phase: a mixture of 65 volumes of a buffer solution prepared by dissolving 1 g of *octanesulphonic acid* and 1 ml of *triethylamine* in 1000 ml of *water*, adjusted to pH 4.5 with *orthophosphoric acid* and 35 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 272 nm,
- injection volume: 10 µl.

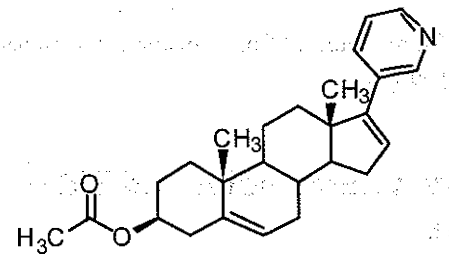
Inject the reference solution. The test is not valid unless the column efficiency for lamivudine is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent for each component.

Inject the reference solution and the test solution.

Calculate the contents of $C_{14}H_{18}N_6O$, $C_8H_{11}N_3O_3S$ and $C_{10}H_{13}N_5O_4$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Abiraterone Acetate



$C_{26}H_{33}NO_2$ Mol. Wt. 391.6

Abiraterone Acetate is 17-(3-pyridinyl)androsta-5,16-dien-3β-yl acetate.

Abiraterone Acetate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{26}H_{33}NO_2$, calculated on the anhydrous basis.

Category. Anticancer.

Description. A white to off-white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *abiraterone acetate IPRS* or with the reference spectrum of abiraterone acetate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 60 mg of the substance under examination in *methanol* and dilute to 20.0 ml with *methanol*.

Reference solution. A 0.0015 per cent w/v solution of *abiraterone acetate IPRS* in *methanol*.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with phenyl group (3.5 µm) (Such as Zorbax SB-Phenyl),
- mobile phase: A. a mixture of 70 volumes of *water* and 30 volumes of *acetonitrile*,
  B. a mixture of 90 volumes of *acetonitrile* and 10 volumes of *methanol*,
- a gradient programme using the conditions given below,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)	Flow (ml.per min.)
0	45	55	0.5
18	45	55	0.5
18.1	45	55	1.0
35	0	100	1.0
35.1	45	55	0.5
43	45	55	0.5

Name	Relative retention time	Correction factor
Abiraterone acetate impurity A[1]	0.22	1.3
Abiraterone acetate impurity B[2]	0.41	1.51
Abiraterone acetate impurity C[3]	0.49	0.49
Abiraterone acetate impurity D[4]	0.58	0.89
Abiraterone	0.67	0.44
Abiraterone acetate (Retention time: about 26 minute)	1.0	—
Reduced impurity[5]	1.07	1.3

[1](3β)- 3-hydroxy-androsta-5- ene-17-one,

[2](3β)- 3-acetoxy-androsta-5- ene-17-one,

[3]17-iodo-androsta-5,16-diene-3-beta-ol,

[4]5, 16-pregnadien-3B-acetoxy-20-one,

[5](3β)- 17-(pyridine-3-yl)androsta-16- ene-3-ol.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 4000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to abiraterone acetate impurities A, B, C, D and reduced impurity is not more than the area of principal peak in the chromatogram obtained with the reference solution (0.5 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm)

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 0.5g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 30 mg of the substance under examination in 100.0 ml with *methanol.*

Reference solution. A 0.03 per cent w/v solution of *abiraterone acetate IPRS* in *methanol.*

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with phenyl group (3.5 µm) (Such as Zorbax SB-Phenyl),
- mobile phase: a mixture of 50 volumes of *acetonitrile*, 40 volumes of *methanol* and 10 volumes of *water*,
- flow rate: 0.6 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 5 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 5000 theorotical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{26}H_{33}NO_2$.

Storage. Store protected from moisture.

Abiraterone Acetate Tablets

Abiraterone Acetate Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of abiraterone acetate, $C_{26}H_{33}NO_2$.

Usual strength. 250 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution. (2.5.2)

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.0565 M sodium dihydrogen orthophosphate monohydrate* in 0.25 per cent w/v solution of *sodium lauryl sulphate*, adjusted to pH 4.5 with *orthophosphoric acid,*

Speed and time. 50 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter, rejecting the first few ml of filtrate.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a weighed quantity of *abiraterone acetate IPRS* in dissolution medium and dilute quantitatively with the dissolution medium to obtain a solution of similar concentration as the test solution.

Use the chromatographic system as described under Assay.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{26}H_{33}NO_2$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{26}H_{33}NO_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Dissolve a quantity of the powder containing 150 mg of abiraterone acetate in 35 ml of *methanol* with the aid of ultrasound for 10 minutes and dilute to 50.0 ml with *methanol*, mix well and filter.

Reference solution. A 0.0006 per cent w/v solution of *abiraterone acetate IPRS* in the *methanol*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (3.5 µm) (Such as Waters X bridge shield RP 18),
- mobile phase: A. *0.01M potassium dihydrogen orthophosphate,*
  B. a mixture of 90 volumes of *acetonitrile* and 10 volumes of *water;*
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 252 nm,
- injection volume: 5 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	45	55
25	30	70
40	22	78
45	22	78
46	45	55
53	45	55

Inject reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (0.5 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (1.0 per cent). Ignore any peak with an area less than 0.5 times of the principal peak in the chromatogram obtained with reference solution. (0.1 per cent).

Other tests. Complies with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 250 mg of Abiraterone Acetate in 150 ml of *methanol* with the aid of ultrasound for 15 minutes and dilute to 200.0 ml with *methanol*, mix well and filter. Dilute 5.0 ml to 20.0 ml with *methanol*.

Reference solution. A 0.031 per cent w/v solution of *abiraterone acetate IPRS* in *methanol*.

Chromatographic system

- a stainless steel column 5 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (3.5 µm) (Such as Zorbax SB-C18),
- mobile phase: a mixture of 10 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and 90 volumes of a mixture of 90 ml of *acetonitrile* and 10 ml of *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 252 nm,
- injection volume: 5 µl.

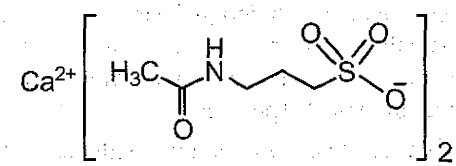
Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{26}H_{33}NO_2$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Acamprosate Calcium



$C_{10}H_{20}CaN_2O_8S_2$ Mol.Wt.400.5

Acamprosate Calcium is calcium bis(3-acetamidopropane-1-sulphonate).

Acamprosate Calcium contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{10}H_{20}CaN_2O_8S_2$, calculated on the dried basis.

Category. Indicated for treatment of alcohol dependence.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *acamprosate calcium IPRS* or with the reference spectrum of acamprosate calcium.

B. It gives reaction (A) of calcium (2.3.1).

Tests

Solution A. A 5.0 per cent w/v solution in *carbon dioxide-free water*.

Appearance of solution. Solution A is clear (2.4.1) and colourless (2.4.1).

pH (2.4.24). 5.5 to 7.0 for solution A.

Impurity A (Homotaurine). Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.4 g of the substance under examination in *water* and dilute to 20.0 ml with *water*. Dilute 10.0 ml of the solution to 100.0 ml with *borate buffer solution pH 10.4*. Transfer 3.0 ml of the solution in a 25 ml ground-glass-stoppered tube. Add 0.15 ml of a freshly prepared 0.5 per cent w/v solution of *fluorescamine* in *acetonitrile*. Shake immediately and vigorously for 30 seconds. Place in a water-bath at 50° for 30 minutes. Cool under a stream of cold water. Centrifuge and filter the supernatant liquid.

Reference solution. A 0.025 per cent w/v solution of *acamprosate impurity A IPRS* (*homotaurine IPRS*) in *water*. Dilute 0.4 ml of the solution to 100.0 ml with *borate buffer solution pH 10.4*. Treat 3.0 ml of the solution in the same way as the test solution.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with spherical octadecylsilane bonded to porous silica (5 µm) with a specific surface area of 170 m^2/g, and a pore size of 12 nm,
- mobile phase: a mixture of 10 volumes of *acetonitrile*, 10 volumes of *methanol* and 80 volumes of *0.1 M phosphate buffer pH 6.5*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 261 nm,
- injection volume: 20 µl.

The retention time of fluorescamine is about 4 minutes; acamprosate impurity A is about 8 minutes. Acamprosate is not detected by this system.

Inject the reference solution and the test solution. Run the chromatogram 6 times the retention time of acamprosate impurity A. In the chromatogram obtained with the test solution, the area of any peak corresponding to acamprosate impurity A is not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.05 per cent).

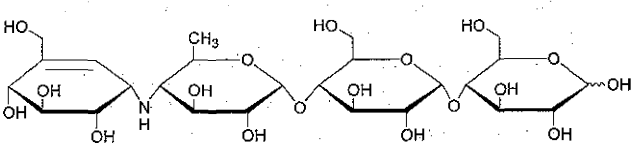
Heavy metals (2.3.13). Dissolve 2 g in *water* and dilute to 20 ml with *water*. 12 ml of the solution complies with the limit test for heavy metals, Method D (10 ppm) using 10.0 ml of *lead standard solution (1 ppm)*.

Loss on drying (2.4.19). Not more than 0.4 per cent, determined on 1 g by drying in an oven at 105°.

Assay. To 4 g of *cation exchange resin* (75 to 150 µm) add 20 ml of *water* and stir magnetically for 10 minutes. Introduce this suspension into a glass column 45 cm x 2.2 cm, equipped with a polytetrafluoroethylene flow cap covered by a glass-wool plug. Allow a few ml of the solution to flow, then place a plug of glass wool over the resin. Pass 50 ml of *1 M hydrochloric acid* through the column. The eluate reaches to pH 1. Wash with 3 quantities, each of 200 ml, of *water* to obtain an eluate at pH 6. Dissolve 0.1 g of the substance under examination in 15 ml of *water*. Slowly pass through the column and wash with 3 quantities, each of 25 ml, of *water*, collecting the eluate. Allow to elute until an eluate at pH 6 is obtained. Titrate the solution obtained with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.02002 g of $C_{10}H_{20}CaN_2O_8S_2$.

Acarbose



$C_{25}H_{43}NO_{18}$ Mol. Wt. 646.0

Acarbose is *O*-4,6-dideoxy-4-[[(1*S*,4*R*, 5*S*,6*S*)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino-α-D-glucopyranosyl-(1→4)-*O*-α-D- glucopyranosyl-(1→4)-D-glucopyranose, which is produced by certain strains of *Actinoplanes utahensis*.

Acarbose contains not less than 95.0 per cent and not more than 102.0 per cent of $C_{25}H_{43}NO_{18}$, calculated on the anhydrous basis.

Category. Antidiabetic.

Description. A white or yellowish, amorphous powder, hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *acarbose IPRS* or with the reference spectrum of acarbose.

B. In the Assay, the principal peak in the chromatogram obtained with test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 5.5 to 7.5, determined in 5.0 per cent w/v solution in *carbon dioxide-free water* (solution A).

Specific optical rotation (2.4.22). + 168° to + 183°, dilute 2 ml of solution A to 10 ml with *water*.

Light absorption (2.4.7). Absorbance of solution A at 425 nm, not more than 0.15.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.2 g of the substance under examination in *water* and dilute to 10.0 ml with *water*.

Reference solution (a). A 0.6 per cent w/v solution of *acarbose impurity A IPRS (O-4,6–dideoxy-4-[[(1S,4R,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl) cyclohex-2-enyl] amino]-α-D-glucopyranosyl-(1→4)-O-α-D-glucopyranosyl-(1→4)-D-arabino-hex-2-ulopyranose IPRS)* in the test solution.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *water*.

Chromatographic system
- a stainless steel column 25 cm x 4 mm, packed with aminopropylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: a mixture of 75 volumes of *acetonitrile*, 25 volumes of a solution containing 0.06 per cent w/v of *potassium dihydrogen orthophosphate* and 0.035 per cent w/v of *disodium hydrogen phosphate dihydrate*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Inject reference solution (a). The test is not valid unless the peak–to–valley ratio is not less than 1.2, where H_p is the height above the baseline of the peak due to acarbose impurity A and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to acarbose.

Inject reference solution (b) and the test solution. Run the chromatogram 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of the peak due to acarbose impurity A is not more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.6 per cent), the area of the peak at relative retention time of about 0.5 is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the area of the peak at relative retention time of about 1.2 is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 4.0 per cent, determined on 0.3 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of the substance under examination in *water* and dilute to 50.0 ml with *water*.

Reference solution. A 0.02 per cent w/v solution of *acarbose IPRS* in *water*.

Chromatographic system
- a stainless steel column 25 cm x 4 mm packed with aminopropylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 75 volumes of *acetonitrile* and 25 volumes of a solution containing 0.06 per cent w/v of *potassium dihydrogen phosphate* and 0.035 per cent w/v of *disodium hydrogen phosphate dihydrate*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{25}H_{43}NO_{18}$.

Storage. Store protected from moisture.

Acarbose Tablets

Acarbose Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of acarbose, $C_{25}H_{43}NO_{18}$.

Usual strengths. 50 mg; 100 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 500 ml of a phosphate buffer prepared by dissolving 1.36 g of *potassium dihydrogen orthophosphate* and 2 ml of *triethylamine* in 1000 ml of *water,* adjusted to pH 3.0 with *orthophosphoric acid,*
Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Solvent mixture. 15 volumes of the phosphate buffer and 85 volumes of *acetonitrile.*

Test solution. Use the filtrate, dilute if necessary, with the solvent mixture to obtain a solution of 0.01 per cent w/v of Acarbose.

Reference solution. A 0.01 per cent w/v solution of *acarbose IPRS* in the solvent mixture.

Use the chromatographic system as described under Assay.

Calculate the content of $C_{25}H_{43}NO_{18}$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{25}H_{43}NO_{18}$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg of Acarbose in the mobile phase by shaking mechanically, dilute to 250.0 ml with the mobile phase and filter.

Reference solution. A 0.02 per cent w/v solution of *acarbose IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with amino groups bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of a buffer solution prepared by dissolving 0.6 g of *potassium dihydrogen orthophosphate* and 0.35 g of *sodium dihydrogen phosphate* in 1000 ml of *water* and 60 volumes of *acetonitrile,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

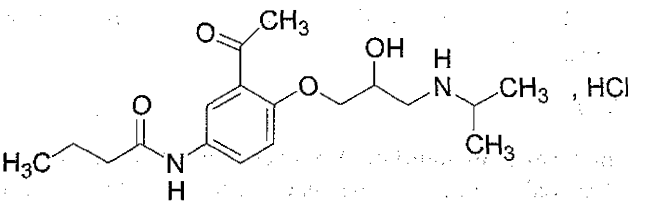
Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{25}H_{43}NO_{18}$ in the tablets.

Storage. Store protected from light and moisture.

Acebutolol Hydrochloride



$C_{18}H_{28}N_2O_4,HCl$ Mol. Wt. 372.9

Acebutolol Hydrochloride is (*RS*)-3'-acetyl-4'-(2-hydroxy-3-isopropylaminopropoxy)butyranilide hydrochloride.

Acebutolol Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{18}H_{28}N_2O_4$, HCl, calculated on the dried basis.

Category. β_1-receptor antagonist; antihypertensive; antianginal; antiarrhythmic.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *acebutolol hydrochloride IPRS* or with the reference spectrum of acebutolol hydrochloride.

B. When examined in the range 220 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in 0.1 per cent v/v solution of *hydrochloric acid* shows absorption maxima at 233 nm 322 nm; absorbance at 233 nm, 0.55 to 0.61.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 60 volumes of *water*, 40 volumes of *methanol* and 0.5 volume of *perchloric acid.*

Test solution. Dissolve 0.1 g of the substance under examination in *methanol* and dilute to 100.0 ml with *methanol.*

Reference solution (a). A 0.1 per cent w/v solution of *acebutolol hydrochloride IPRS* in *methanol.*

Reference solution (b). A mixture of equal volumes of reference solution (a) and a 0.1 per cent w/v solution of *pindolol IPRS* in *methanol.*

Apply to the plate 10 µl of each solution. After development, dry the plate in a current of warm air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

D. A 5 per cent w/v solution gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution is not more opalescent than opalescence standard OS2 (2.4.1) and not more intensely coloured than reference solution BYS5 (2.4.1).

pH (2.4.24). 5.0 to 7.0, determined in a 1.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in mobile phase A and dilute to 50.0 ml with mobile phase A.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 50.0 ml with mobile phase A.

Reference solution (c). Mix 2.0 ml of reference solution (b) and 1.0 ml of 0.2 per cent w/v solution of *acebutolol impurity A IPRS (N-[3-acetyl-4-[(2RS)-3-(ethylamino)-2-hydroxy-propoxy]phenyl] butanamide IPRS)* and dilute to 10.0 ml with mobile phase A.

Chromatographic system

- a stainless steel column 12.5 cm x 4 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. mix 2.0 ml of *orthophosphoric acid* and 3.0 ml of *triethylamine* and dilute to 1000 ml with *water,*

  B. equal volumes of *acetonitrile* and mobile phase A,
- a gradient programme using the conditions given below,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 25 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	98	2
2	98	2
30.5	10	90
41	10	90
42	98	2
50	98	2

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to acebutolol impurity A and acebutolol is not less than 7.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). The sum of the areas of all the secondary peaks is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method A (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Dissolve 0.3 g in 50 ml of *ethanol (95 per cent)* and add 1 ml of *0.1 M hydrochloric acid.* Titrate with *0.1 M sodium hydroxide,* determining the end point potentiometrically (2.4.25). Read the volumes added between the two points of inflection.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.03729 g of $C_{18}H_{28}N_2O_4,HCl$.

Storage. Store protected from light.

Acebutolol Tablets

Acebutolol Hydrochloride Tablets

Acebutolol Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of acebutolol hydrochloride, $C_{18}H_{28}N_2O_4$, HCl.

Usual strengths. 200 mg; 400 mg.

Identification

A. When examined in the range 220 nm to 360 nm (2.4.7), the solution obtained in the Assay, shows an absorption maximum at 233 nm.

B. Determine by thin layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 60 volumes of *water*, 40 volumes of *methanol* and 0.5 volume of *perchloric acid*.

Test solution. Disperse a quantity of the powdered tablets containing 0.5 g of Acebutolol Hydrochloride with 30 ml of *methanol*, with the aid of ultrasound for 15 minutes and dilute to 50.0 ml with *methanol*, centrifuge and use the clear supernatant liquid.

Reference solution (a). A 0.1 per cent w/v solution of *acebutolol hydrochloride IPRS* in *methanol*.

Reference solution (b). A mixture of equal volumes of reference solution (a) and a 0.1 per cent w/v solution of *pindolol IPRS* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in a current of warm air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating two plates with *silica gel GF254*.

Mobile phase (a). The upper layer obtained by shaking together 50 volumes of *water*, 40 volumes of *1-butanol* and 10 volumes of *glacial acetic acid*.

Mobile phase (b). A mixture of 90 volumes of *2-propanol* and 10 volumes of *glacial acetic acid*.

Test solution. Disperse a quantity of the powdered tablets containing 0.5 g of Acebutolol Hydrochloride with 30 ml of *methanol*, with the aid of ultrasound for 15 minutes and dilute to 50.0 ml with *methanol*, centrifuge and use the clear supernatant liquid.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with *methanol*.

Reference solution (b). Dilute 3.0 ml of reference solution (a) to 100.0 ml with *methanol*.

Reference solution (c). Dilute 1.0 ml of the reference solution (a) to 100.0 ml with *methanol*.

Apply 20 µl of each solution on each plate. Develop two chromatograms using separately the two mobile phases. After development, dry the plates in a current of warm air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatograms obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b) and not more than two such spots are more intense than the spot in the chromatograms obtained with reference solution (c). Ignore any spot at the point of application.

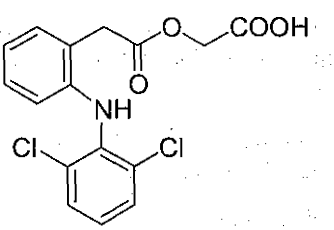
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.1 g of Acebutolol Hydrochloride with 40 ml of *0.1M hydrochloric acid* and add sufficient *water* to produce 100.0 ml, filter and dilute 10.0 ml of the filtrate to 100.0 ml with *water*. Dilute 10.0 ml of the solution to 100.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 233 nm (2.4.7).

Calculate the content of $C_{18}H_{28}N_2O_4$,HCl taking 580 as the specific absorbance at 233 nm.

Storage. Store protected from light.

Aceclofenac



$C_{16}H_{13}Cl_2NO_4$ Mol. Wt. 354.2

Aceclofenac is 2-[(2,6-dichlorophenyl)amino] phenylacetoxyacetic acid.

Aceclofenac contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{16}H_{13}Cl_2NO_4$, calculated on the dried basis.

Category. Nonsteroidal antiinflammatory.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *aceclofenac IPRS* or with the reference spectrum of aceclofenac.

B. When examined in the range 220 nm to 370 nm (2.4.7), a 0.002 per cent w/v solution in *methanol* shows an absorption maximum at 275 nm.

C. Dissolve 10 mg in 10 ml of *ethanol*. To 1 ml of the solution, add 0.2 ml of a mixture, prepared immediately before use, of equal volumes of a 0.6 per cent solution of *potassium ferricyanide* and a 0.9 per cent solution of *ferric chloride*. Allow to stand protected from light for 5 minutes. Add 3 ml of a 1 per cent solution of *hydrochloric acid*. Allow to stand protected from light for 15 minutes. A blue colour develops and a precipitate is formed.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE —Prepare the solutions immediately before use.

Solvent mixture. 30 volumes of mobile phase A and 70 volumes of mobile phase B.

Test solution. Dissolve 50 mg of the substance under examination in 25.0 ml of the solvent mixture.

Reference solution (a). A 0.043 per cent w/v solution of *aceclofenac impurity A IPRS (diclofenac sodium IPRS)* in the solvent mixture.

Reference solution (b). Mix 1.0 ml of reference solution (a) and 5.0 ml of the test solution and dilute to 100.0 ml with the solvent mixture.

Reference solution (c). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. a 0.11 per cent v/v solution of *orthophosphoric acid*, adjusted to pH 7.0 with *sodium hydroxide solution*,
  B. a mixture of 10 volumes of *water* and 90 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 275 nm,
- injection volume: 10 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	70	30
25	50	50
30	20	80
50	20	80
55	70	30

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to aceclofenac impurity A and aceclofenac is not less than 5.0.

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution, the area of the peak due to aceclofenac impurity A and any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent) and the sum of areas of all the secondary peaks is not more than 0.7 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.7 per cent). Ignore any peak with an area less than 0.02 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.02 per cent).

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 45 volumes of *water* and 55 volumes of *acetonitrile*.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.01 per cent w/v solution of *aceclofenac IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 45 volumes of buffer solution prepared by diluting 1 ml of *orthophosphoric acid* to 1000 ml with *water* and 55 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 275 nm,
- injection volume: 20 µl.

The retention time of the principal peak is about 5.0 minutes.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 4000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{13}Cl_2NO_4$.

Storage. Store protected from light, at a temperature not exceeding 30°.

Aceclofenac Tablets

Aceclofenac Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of aceclofenac, $C_{16}H_{13}Cl_2NO_4$.

Usual strength. 100 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium: 900 ml of *phosphate buffer pH 7.5*,
Speed and time. 50 rpm for 45 minutes.

Withdraw a suitable volume of the medium and filter. Reject the first few ml of the filtrate and dilute a suitable volume of the filtrate with dissolution medium. Measure the absorbance of the resulting solution at the maximum at about 273 nm (2.4.7). Calculate the content of aceclofenac, $C_{16}H_{13}Cl_2NO_4$ in the medium from the absorbance obtained from a solution of known concentration of *aceclofenac IPRS*.

Q. Not less than 70 per cent of the stated amount of $C_{16}H_{13}Cl_2NO_4$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and of *water*.

Test solution. Disperse a quantity of powdered tablets containing 100 mg of Aceclofenac with the solvent mixture anddilute to 100.0 ml with the solvent mixture, filter.

Reference solution (a). A 0.1 per cent w/v solution of *aceclofenac IPRS* in the solvent mixture.

Reference solution (b). Dissolve a quantity of *diclofenac sodium IPRS* containing 25 mg of diclofenac in the solvent mixture and dilute to 25.0 ml with the solvent mixture. Dilute 1.0 ml of the solution and 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with dimethyloctylsilane bonded to porous silica (5 µm) (Such as Hypersil MOS),
- mobile phase: a mixture of 55 volumes of buffer pH 3.5 prepared by adding 1.2 ml of *glacial acetic acid* in 1000 ml of *water*, adjusted to pH 3.5 with *dilute sodium hydroxide solution*, 22.5 volumes of *acetonitrile* and 22.5 volumes of *tetrahydrofuran*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 275 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to aceclofenac and diclofenac is not less than 5.0 and the column efficiency is not less than 2000 theoretical plates for peak due to aceclofenac.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of peak due to diclofenac is not more than 5 times the area of the peak due to diclofenac in the chromatogram obtained with reference solution (b) (5.0 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of the areas of all the secondary peaks other than diclofenac peak is not more than twice the area of the peak in the chromatogram obtained with reference solution (b) (2.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 55 volumes of *acetonitrile* and 45 volumes of *water*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 100 mg of Aceclofenac with 60 ml of *acetonitrile*, with the aid of ultrasound for 10 minutes and dilute to 100.0 ml with *acetonitrile*. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.1 per cent w/v solution of *aceclofenac IPRS* in *acetonitrile*. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

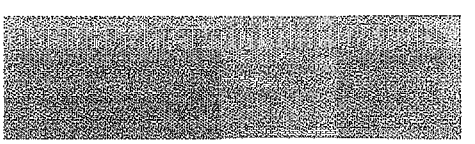
Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- mobile phase: a mixture of 55 volumes of buffer solution prepared by adding 1.0 ml of *glacial acetic acid* in 1000 ml of *water* and 45 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 275 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

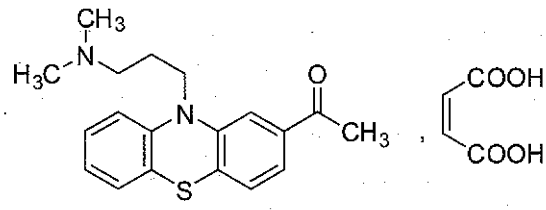
Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{13}Cl_2NO_4$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.



Acepromazine Maleate



$C_{19}H_{22}N_2OS,C_4H_4O_4$ Mol. Wt. 442.5

Acepromazine Maleate is 2-acetyl-10-(3-dimethylaminopropyl) phenothiazine hydrogen maleate.

Acepromazine Maleate contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{19}H_{22}N_2OS,C_4H_4O_4$, calculated on the dried basis.

Category. Antipsychotic.

Description. A yellow coloured, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *acepromazine maleate IPRS* or with the reference spectrum of acepromazine maleate.

B. Complies with the test for Identification of Phenothiazine (2.3.3).

C. Dissolve 0.2 g in a mixture of 3 ml of *water* and 2 ml of *5 M sodium hydroxide* and shake with 3 ml of *ether*. Add to the aqueous solution 2 ml of *bromine solution*, warm in a water-bath for 10 minutes, heat to boiling, cool and add 0.25 ml to a solution of 10 mg of *resorcinol* in 3 ml of *sulphuric acid*; a bluish black colour develops on heating for 15 minutes in a water-bath.

Tests

pH (2.4.24). 4.0 to 5.5, determined in a 1.0 per cent w/v solution.

Related substances. Complies with the test for related substances in phenothiazines (2.3.5), but using a mixture of 75 volumes of *n-hexane*, 17 volumes of *butan-2-one* and 8 volumes of *diethylamine* as the mobile phase.

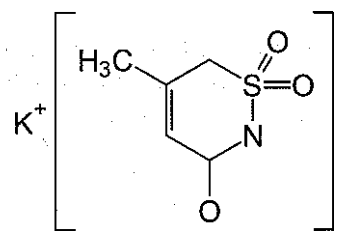
Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° at a pressure not exceeding 0.7 kPa for 16 hours.

Assay. Dissolve 0.4 g in 50 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04425 g of $C_{19}H_{22}N_2OS,C_4H_4O_4$.

Acesulphame Potassium



$C_4H_4KNO_4S$ Mol. Wt. 201.2

Acesulphame Potassium is potassium 6-methyl-1,2,3-oxathiazin-4-olate 2,2-dioxide.

Acesulphame Potassium contains not less than 99.0 per cent and not more than 101.0 per cent of $C_4H_4KNO_4S$, calculated on the dried basis.

Category. Sweetening agent.

Description. A white or almost white, crystalline powder or colourless crystals.

Identification

Test B may be omitted if tests A and C are carried out and test A may be omitted if tests B and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum obtained with *acesulphame potassium IPRS* or with the reference spectrum of acesulphame potassium.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *cellulose F254*.

Mobile phase. A mixture of 10 volumes of *ammonia*, 60 volumes of *acetone* and 60 volumes of *ethyl acetate*.

Test solution. Dissolve 5 mg of the substance under examination in *water* and dilute to 5.0 ml with *water*.

Reference solution (a). A 0.1 per cent w/v solution of *acesulphame potassium IPRS* in *water*.

Reference solution (b). A solution containing 0.1 per cent w/v each of *acesulphame potassium IPRS* and *saccharin sodium* in *water*.

Apply to the plate 5 µl of each solution. Run the plate twice over a path of 15 cm. Dry the plate in warm air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to the spot in the chromatogram obtained with reference solution

(a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

C. 0.5 ml of solution A gives reaction (A) of potassium salts (2.3.1).

Tests

Solution A. A 20 per cent w/v solution in *carbon dioxide-free water*.

Appearance of solution. Solution A is clear and colourless (2.4.1).

Acidity or alkalinity. To 20 ml of solution A, add 0.1 ml of *bromothymol blue solution*. Not more than 0.2 ml of *0.01 M hydrochloric acid* or *0.01 M sodium hydroxide* is required to change the colour of the indicator.

Impurity A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 2 volumes of *water*, 15 volumes of *ethanol (95 per cent)* and 74 volumes of *ethyl acetate*.

Test solution. Dissolve 0.8 g of the substance under examination in *water* and dilute to 10.0 ml with *water*.

Reference solution (a). A 0.2 per cent w/v solution of *acetylacetamide* (acesulphame impurity A) in *water*. To 5.0 ml of the solution, add 45 ml of *water* and dilute to 100.0 ml with *methanol*.

Reference solution (b). To 10.0 ml of reference solution (a), add 1.0 ml of the test solution and dilute to 20.0 ml with *methanol*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and spray with *phosphoric vanillin solution* and heat at 120° for about 10 minutes. Any spot due to acesulphame impurity A is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.125 per cent). The chromatogram obtained with reference solution (a) shows a clearly visible spot and the chromatogram obtained with reference solution (b) shows two clearly separated spots.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in *water* and dilute to 10.0 ml with *water*.

Reference solution (a). A 0.004 per cent w/v solution of *acesulphame potassium impurity B IPRS (5-chloro-6-methyl-1,2,3-oxathiazin-4(3H)-one 2,2-dioxide IPRS)* in *water*. Dilute 1.0 ml of the solution to 200.0 ml with *water*.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *water*. Further dilute 1.0 ml of the solution to 10.0 ml with *water*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: a mixture of 40 volumes of *acetonitrile*, 60 volumes of 0.33 per cent w/v solution of *tetrabutylammonium hydrogen sulphate*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 234 nm,
- injection volume: 20 µl.

The relative retention time with reference to acesulphame for acesulphame impurity B is about 1.6.

Inject reference solution (b). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0 for the principal peak.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. The area of any peak corresponding to acesulphame impurity B is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (20 ppm), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent), the sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) except for the peak due to acesulphame impurity B (0.05 per cent).

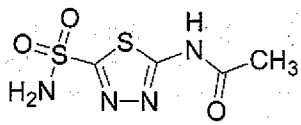
Heavy metals (2.3.13). 12 ml of solution A complies with the limit test for heavy metals, Method D (5 ppm), using 10.0 ml of *lead standard solution (1 ppm)*.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Dissolve 0.15 g in 50 ml of *anhydrous acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02012 g of $C_4H_4KNO_4S$.

Acetazolamide



$C_4H_6N_4O_3S_2$ Mol. Wt. 222.2

Acetazolamide is *N*-(5-sulphamoyl-1,3,4-thiadiazol-2-yl) acetamide.

Acetazolamide contains not less than 98.5 per cent and not more than 101.0 per cent of $C_4H_6N_4O_3S_2$, calculated on the dried basis.

Category. Carbonic anhydrase inhibitor; used in the treatment of glaucoma.

Description. A white to faintly yellowish-white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests C and D may be omitted if tests A and B are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *acetazolamide IPRS* or with the reference spectrum of acetazolamide.

B. When examined in the range 230 nm to 260 nm (2.4.7), a 0.003 per cent w/v solution in *0.01 M sodium hydroxide* shows an absorption maximum at 240 nm; absorbance at 240 nm, 0.49 to 0.53. When examined in the range 260 nm to 360 nm (2.4.7), a 0.00075 per cent w/v solution in *0.01 M sodium hydroxide* shows an absorption maximum at 292 nm; absorbance at 292 nm, 0.43 to 0.47.

C. To about 20 mg in a test-tube add 4 ml of *2 M hydrochloric acid* and 0.2 g of *zinc powder* and immediately place a piece of *lead acetate paper* over the mouth of the tube; the paper exhibits a brownish-black colour.

D. To 25 mg, add 5 ml of *water*, 4 drops of *1 M sodium hydroxide* and 2 drops of *cupric sulphate solution*; a bluish-green colour or precipitate is produced.

Tests

Silver-reducing substances. Mix 5 g with 25 ml of *ethanol (95 per cent)*, add 125 ml of *water*, 10 ml of *nitric acid* and 5 ml of *0.1 M silver nitrate*, stir for 30 minutes and filter. Wash the residue with *water*, mix the filtrate and washings and titrate the excess of silver nitrate in the mixture with *0.05 M ammonium thiocyanate* using *ferric ammonium sulphate solution* as indicator; not less than 9.5 ml of *0.05 M ammonium thiocyanate* is required.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 40 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Further dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with endcapped propoxybenzene bonded to porous silica (4 µm),
- mobile phase: a mixture of 10 volumes of *acetonitrile* and 90 volumes of 0.68 per cent w/v solution of *potassium dihydrogen phosphate*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 25 µl.

Name	Relative retention time	Correction factor
Acetazolamide impurity E[1]	0.3	—
Acetazolamide impurity D[2]	0.4	1.6
Acetazolamide impurity B[3]	0.6	2.3
Acetazolamide (Retention time: about 8 minutes)	1.0	—
Acetazolamide impurity C[4]	1.4	2.6
Acetazolamide impurity A[5]	2.1	—
Acetazolamide impurity F[6]	2.6	—

[1]5-acetamido-1,3,4-thiadiazole-2-sulphonic acid,

[2]5-amino-1,3,4-thiadiazole-2-sulphonamide,

[3]*N*-(1,3,4-thiadiazol-2-yl)acetamide,

[4]*N*-(5-sulphanyl-1,3,4-thiadiazol-2-yl)acetamide,

[5]*N*-(5-chloro-1,3,4-thiadiazol-2-yl)acetamide,

[6]*N*-[5-[(5-acetamido-1,3,4-thiadiazol-2-yl)sulfonyl]sulphamoyl-1,3,4-thiadiazol-2- yl]acetamide.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. Run the chromatogram 3.5 times the retention time of the principal peak. The area of any secondary peak is not more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.15 per cent) and the sum of the areas of all the secondary peaks is not more than 6 times the area of the principal peak in the chromatogram obtained with the reference solution (0.6 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Heavy metals (2.3.13). 1.0 g dissolved in a mixture of 10 ml of *1 M sodium hydroxide* and 15 ml of *water* complies with the limit test for heavy metals, Method C (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 40 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the

mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.004 per cent w/v solution of *acetazolamide IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 90 volumes of buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen phosphate* in 1000 ml of *water* and 10 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 20 µl.

The retention time of the principal peak is about 5.5 minutes.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 4000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_4H_6N_4O_3S_2$.

Storage. Store protected from light.

Acetazolamide Tablets

Acetazolamide Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of acetazolamide, $C_4H_6N_4O_3S_2$.

Usual strength. 250 mg.

Identification

A. To a quantity of the powdered tablets containing 0.5 g of Acetazolamide, add 10 ml of *1 M sodium hydroxide*, shake thoroughly and filter. Neutralise the filtrate with *glacial acetic acid*, filter and dry the resulting precipitate at 105°. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *acetazolamide IPRS* or with the reference spectrum of acetazolamide.

B. Triturate a quantity of the powdered tablets containing 0.5 g of Acetazolamide with a mixture of 5 ml of *water* and 1 ml of *1 M sodium hydroxide*, transfer to a test tube, add 0.2 g of *zinc powder*, add 0.5 ml of *hydrochloric acid* and immediately place a piece of *lead acetate paper* over the mouth of the tube; the paper exhibits a brownish-black colour.

C. To a quantity of the powdered tablets containing 25 mg of Acetazolamide add 5 ml of *water*, 3 drops of *1 M sodium hydroxide* and 2 drops of *cupric sulphate solution*; a bluish-green colour or precipitate is produced.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium: 900 ml of *0.01 M hydrochloric acid*,
Speed and time. 100 rpm for 60 minutes.

Withdraw a suitable volume of the medium and filter, rejecting the first few ml of filtrate. Dilute a suitable volume of the filtrate with the medium, if necessary. Measure the absorbance of the resulting solution at the maximum at about 265 nm (2.4.7). Calculate the content of acetazolamide, $C_4H_6N_4O_3S_2$ in the medium from the absorbance obtained from a solution of known concentration of *acetazolamide IPRS* in the dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_4H_6N_4O_3S_2$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A freshly prepared mixture of 50 volumes of *2-propanol*, 30 volumes of *ethyl acetate* and 20 volumes of *strong ammonia solution*.

Solvent mixture. Equal volumes of *ethanol (95 per cent)* and *ethyl acetate*.

Test solution. Disperse a quantity of the powdered tablets containing 50 mg of Acetazolamide in the solvent mixture and dilute to 10.0 ml with the solvent mixture, filter.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

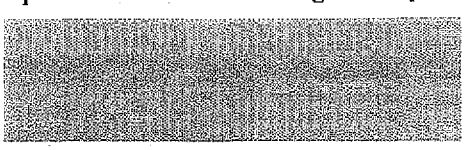
Apply to the plate 20 µl of each solution. Do not line the walls of the tank. Allow to saturate for 1 hour before development. After development, dry the plate in a current of warm air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Other tests. Comply with the tests stated under Tablets.

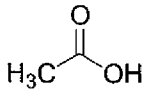
Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.4 g of Acetazolamide and add 90 ml of *dimethylformamide*. Titrate with *0.1 M tetrabutylammonium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.02222 g of $C_4H_6N_4O_3S_2$.

Storage. Store protected from light.



Glacial Acetic Acid



$C_2H_4O_2$ Mol. Wt. 60.1

Glacial Acetic acid contains not less than 99.0 per cent w/w and not more than 100.5 per cent w/w of $C_2H_4O_2$.

Category. Acidifying agent; buffering agent; pharmaceutical aid (analytical reagent).

Description. A crystalline mass or clear, colourless, volatile liquid.

Identification

A. A 10 per cent w/v solution is strongly acidic (2.4.46).

B. To 0.03 ml add 3 ml of *water* and neutralize with *2 M sodium hydroxide*; the solution gives reaction (C) of acetates (2.3.1).

Tests

Freezing point (2.4.11). Not less than 14.8°.

Residue on evaporation. Not more than 0.01 per cent, determined on 20.0 g by evaporating to dryness on a water-bath and drying at 105°.

Reducing substances. To 5 ml add 10 ml of *water* and mix. To 5 ml of the resulting solution add 6 ml of *sulphuric acid* and cool. Add 2 ml of *0.0167 M potassium dichromate*, allow to stand for 1 minute and add 25 ml of *water* and 1 ml of freshly prepared *dilute potassium iodide solution*. Titrate with *0.1 M sodium thiosulphate* using 1 ml of *starch solution* as indicator. Not less than 1.0 ml of *0.1 M sodium thiosulphate* is required.

Heavy metals (2.3.13). Dissolve the residue obtained in the test for Residue on evaporation by heating with two quantities, each of 15 ml, of *water* and add sufficient *water* to produce 50 ml (solution A). The solution complies with the limit test for heavy metals, Method D (5 ppm), using 10 ml of *lead standard solution (2 ppm Pb)*.

Iron (2.3.14). 5 ml of solution A diluted to 10 ml with *water* complies with the limit test for iron (5 ppm) Use 1.0 ml of *iron standard solution (10 ppm Fe)* to prepare the standard.

Chlorides (2.3.12). To 20 ml add sufficient *water* to produce 100 ml (solution B). 10 ml of solution B diluted to 15 ml with *water* complies with the limit test for chlorides (25 ppm). Use 10 ml of *chloride standard solution (5 ppm Cl)* to prepare the standard.

Sulphates (2.3.17). 15 ml of solution B complies with the limit test for sulphates (50 ppm).

Assay. Weigh a conical flask with a ground-glass stopper containing 25 ml of *water*, add 1 ml of the substance under examination and reweigh. Titrate with *1 M sodium hydroxide* using 0.5 ml of *phenolphthalein solution* as indicator.

1 ml of *1 M sodium hydroxide* is equivalent to 0.06005 g of $C_2H_4O_2$.

Storage. Store protected from light and moisture.

Acetic Acid Ear Drops

Acetic Acid Otic Solution

Acetic Acid Ear Drops is a solution of Glacial Acetic Acid in a suitable non-aqueous solvent.

Acetic Acid Ear Drops contain not less than 85.0 per cent and not more than 130.0 per cent of the stated amount of acetic acid, $C_2H_4O_2$.

Usual strength. 2 per cent w/v.

Identification

A. Dilute 5 ml with 10 ml of *water* and adjusted to pH 7 with *1 M sodium hydroxide*. Add *ferric chloride test solution*, a deep red colour is produced, which is decolorized on the addition of *hydrochloric acid*.

B. Warm the solution with *sulphuric acid* and *ethanol (95 per cent)*; a characteristic odour of *ethyl acetate* is evolved.

Tests

pH (2.4.24). 2.0 to 4.0, determined in a 50.0 per cent v/v solution.

Other tests. Comply with the tests stated under Ear Drops.

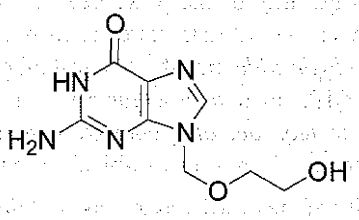
Assay. Transfer a volume containing 0.1 g of Glacial Acetic Acid to a conical flask, add 5 ml of *sodium chloride solution* and about 40 ml of *water*. Titrate with *0.1 M sodium hydroxide*, using 0.15 ml of *phenolphthalein solution* as indicator.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.006005 g of $C_2H_4O_2$.

Storage. Store protected from light and moisture.

Aciclovir

Acyclovir



$C_8H_{11}N_5O_3$ Mol. Wt. 225.2

Aciclovir is 2-amino-9-[(2-hydroxyethoxy)methyl]-1,9-dihydro-6*H*-purin-6-one.

Aciclovir contains not less than 98.5 per cent and not more than 101.0 per cent of $C_8H_{11}N_5O_3$, calculated on the anhydrous basis.

Category. Antiviral.

Description. A white or almost white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *aciclovir IPRS* or with the reference spectrum of aciclovir.

Tests

Appearance of solution. A 1.0 per cent w/v solution in *0.1 M sodium hydroxide* is clear (2.4.1), and not more intensely coloured than reference solution YS7 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 20 volumes of *dimethyl sulphoxide* and 80 volumes of *water*.

Test solution. Dissolve 25 mg of the substance under examination in 5 ml of *dimethyl sulphoxide* and dilute to 25.0 ml with *water*.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution (b). A 0.01 per cent w/v solution, each of, *aciclovir IPRS* and *aciclovir impurity B IPRS* in *0.1 M sodium hydroxide*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 1 volume of *acetonitrile* and 99 volumes of a buffer solution prepared by dissolving 3.48 g of *dipotassium hydrogen phosphate* in 1000 ml of *water*, adjusted to pH 3.1 with *orthophosphoric acid*,

  B. a mixture of 50 volumes of *acetonitrile* and 50 volumes of a buffer solution prepared by dissolving 3.48 g of *dipotassium hydrogen phosphate* in 1000 ml of *water* and adjusted to pH 2.5 with *orthophosphoric acid*
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)

[11]2-[[2-(acetylamino)-6-oxo-1,6-dihydro-9*H*-purin-9-yl]methoxy] ethyl acetate.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to aciclovir impurity B and aciclovir is not less than 20.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of any peak due to aciclovir impurity B is not more than 7 times the area of the principal peak in the chromatogram obtained with

reference solution (0.7 per cent), the area of any other secondary peak is not more than 3 times the area of the principal peak in the chromatogram obtained with the reference solution (a) (0.3 per cent) and the sum of the areas of all the secondary peaks is not more than 15 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent). Ignore any peak with an area less than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.03 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 6.0 per cent, determined on 0.5 g.

Assay. Dissolve 0.15 g, in 60 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02252 g of $C_8H_{11}N_5O_3$.

Aciclovir intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per mg of aciclovir.

Storage. Store protected from light and moisture.

Aciclovir Cream

Acyclovir Cream

Aciclovir Cream contains Aciclovir in a suitable cream base.

Aciclovir Cream contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of aciclovir, $C_8H_{11}N_5O_3$.

Usual strength. 5 per cent w/w.

Identification

A. When examined in the range 230 nm to 350 nm (2.4.7), the solution prepared in the Assay shows absorption maximum at 255 nm and shoulder at 274 nm.

B. In the test for Guanine, the principal spot in the chromatogram obtained with test solution (b) corresponds to the principal spot in the chromatogram obtained with reference solution (a).

Tests

Guanine. Determine by thin-layer chromatography (2.4.17), coating the plate with *cellulose F254* (Such as Merck cellulose F plates).

Mobile phase. Ethyl acetate.

Test solution (a). Disperse a quantity of cream containing 30 mg of Aciclovir with 3 ml of *0.1 M sodium hydroxide* into a 10-ml graduated stoppered centrifuge tube. Add 5 ml of a mixture of 1 volume of *chloroform* and 2 volumes of *propan-1-ol*, shake, centrifuge and dilute the upper aqueous layer to 5 ml with *0.1 M sodium hydroxide*. Mix, centrifuge and use the upper aqueous layer.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with *0.1 M sodium hydroxide*.

Reference solution (a). A 0.06 per cent w/v solution of *aciclovir IPRS* in *0.1 M sodium hydroxide*.

Reference solution (b). A 0.006 per cent w/v solution of *guanine* in *0.1 M sodium hydroxide*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise to the top of the plate. Dry the plate in air and repeat the development in the same direction using a mixture of 10 volumes of *propan-1-ol*, 30 volumes of *13.5 M ammonia* and 60 volumes of a 5 per cent w/v solution of *ammonium sulphate* as the mobile phase. Allow the mobile phase to rise 8 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot corresponding to guanine in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any spot that appears just below the solvent front.

Other tests. Comply with the tests stated under Creams.

Assay. Disperse a quantity of cream containing 7.5 mg of Aciclovir with 50 ml of *0.5 M sulphuric acid*. Shake with 50 ml of *ethyl acetate*, allow to separate and collect the clear lower aqueous layer. Wash the organic layer with 20 ml of *0.5 M sulphuric acid* and dilute the combined washings and the aqueous layer to 100.0 ml with *0.5 M sulphuric acid*, mix and filter. Discard the first few ml of filtrate and to 10.0 ml of the filtrate add *water* to produce 50.0 ml. Measure the absorbance of the resulting solution at 255 nm (2.4.7). Calculate the content of $C_8H_{11}N_5O_3$, taking 562 as specific absorbance at the maximum at 255 nm.

Aciclovir Dispersible Tablets

Acyclovir Dispersible Tablets

Aciclovir Dispersible Tablets contain Aciclovir in a suitable dispersible base.

Aciclovir Dispersible Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of aciclovir, $C_8H_{11}N_5O_3$.

Usual strengths. 200 mg; 400 mg; 800 mg.

Identification

A. When examined in the range 230 nm to 350 nm (2.4.7), the solution prepared in the Assay shows an absorption maximum at 255 nm and a broad shoulder at 274 nm.

B. In the test for Guanine, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

Tests

Guanine. Determine by thin-layer chromatography (2.4.17), coating the plate with *cellulose F254*.

Mobile phase. A mixture of 10 volumes of *propan-1-ol*, 30 volumes of *13.5 M ammonia* and 60 volumes of a 5.0 per cent w/v solution of *ammonium sulphate*.

Test solution (a). Disperse a quantity of the powdered tablets containing 0.25 g of Aciclovir with 25 ml of *0.1 M sodium hydroxide* for 10 minutes and dilute to 50.0 ml with *0.1 M sodium hydroxide*, filter.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with *0.1 M sodium hydroxide*.

Reference solution (a). A 0.05 per cent w/v solution of *aciclovir IPRS* in *0.1 M sodium hydroxide*.

Reference solution (b). A 0.005 per cent w/v solution of *guanine* in *0.1 M sodium hydroxide*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 15 cm, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot corresponding to guanine in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b) (1.0 per cent).

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 2 volumes of *13.5 M ammonia*, 20 volumes of *methanol* and 80 volumes of *dichloromethane*.

Test solution. Disperse a quantity of the powdered tablets containing 0.25 g of Aciclovir with 10.0 ml of *dimethyl sulphoxide* for 15 minutes and filter.

Reference solution. Dilute 0.7 ml of the test solution to 100.0 ml with *dimethyl sulphoxide*.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 10 cm, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (0.7 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of powder containing 0.1 g of Aciclovir in 60 ml of *0.1 M sodium hydroxide* with the aid of ultrasound for 15 minutes and dilute to 100.0 ml with *0.1 M sodium hydroxide* and filter. To 15 ml of the filtrate, add 50 ml of *water*, 5.8 ml of *2 M hydrochloric acid* and dilute to 100.0 ml with *water*. Dilute 5.0 ml of the solution to 50.0 ml with *0.1 M hydrochloric acid*. Measure the absorbance at the maximum at 255 nm (2.4.7). Calculate the content of $C_8H_{11}N_5O_3$ taking 560 as the specific absorbance at the maximum at 255 nm.

Labelling. The label states that the tablets should be dispersed in water immediately before use.

Aciclovir Eye Ointment

Acyclovir Eye Ointment

Aciclovir Eye Ointment is a sterile preparation containing Aciclovir in a suitable base.

Aciclovir Eye Ointment contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of aciclovir, $C_8H_{11}N_5O_3$.

Usual strengths. 3 per cent w/w; 5 per cent w/w.

Identification

A. When examined in the range 230 nm to 350 nm (2.4.7), the solution prepared in the Assay shows an absorption maximum at 255 nm and a broad shoulder at 274 nm.

B. In the test for Guanine, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

Tests

Guanine. Determine by thin-layer chromatography (2.4.17), coating the plate with *cellulose F254*.

Mobile phase. A mixture of 10 volumes of *propan-1-ol*, 30 volumes of *13.5 M ammonia* and 60 volumes of a 5.0 per cent w/v solution of *ammonium sulphate*.

Test solution (a). Disperse a quantity of the ointment containing 25 mg of Aciclovir in 100 ml of *hexane*, extract with 5 ml of *0.1 M sodium hydroxide*, allow to separate and retain the lower aqueous layer.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with *0.1 M sodium hydroxide*.

Reference solution (a). A 0.05 per cent w/v solution of *aciclovir IPRS* in *0.1 M sodium hydroxide*.

Reference solution (b). A 0.005 per cent w/v solution of *guanine* in *0.1 M sodium hydroxide*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 15 cm, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot corresponding to guanine in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b) (1.0 per cent).

Other tests. Comply with the tests stated under Eye Ointment.

Assay. Disperse a quantity of the eye ointment containing 10 mg of Aciclovir in 60 ml of *hexane*. Extract with three 30-ml quantities of *0.1 M sodium hydroxide*, add sufficient *0.1 M sodium hydroxide* to produce 100 ml and filter. To 15.0 ml of the solution, add 5 ml of *2 M hydrochloric acid* and dilute to 100.0 ml with *water*. Measure the absorbance of the resulting solution at the maximum at 255 nm (2.4.7). Calculate the content of $C_8H_{11}N_5O_3$ taking 560 as the specific absorbance at 255 nm.

Aciclovir Intravenous Infusion

Acyclovir Intravenous Infusion; Acyclovir Sodium Intravenous Infusion

Aciclovir Intravenous Infusion is a sterile material consisting of aciclovir sodium, prepared from Aciclovir with the aid of a suitable alkali, with or without auxiliary substances. It is filled in a sealed container.

The infusion is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Aciclovir Intravenous Infusion contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of aciclovir, $C_8H_{11}N_5O_3$.

Usual strength. 500 mg per vial.

Description. A white or almost white, crystalline powder.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injections) and with the following requirements.

Identification

A. When examined in the range 230 nm to 360 nm (2.4.7), the solution prepared in the Assay shows an absorption maximum at 255 nm and a broad shoulder at 274 nm.

B. In the test for Guanine, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

C. It gives reaction (A) of sodium salts (2.3.1).

Tests

Appearance of solution. Dissolve the contents of a sealed container in sufficient *Water for Injections* to produce a solution containing 2.5 per cent w/v solution of Aciclovir (solution A). The solution is not more opalescent than opalescence standard OS2 (2.4.1), and not more intensely coloured than reference solution BYS5 (2.4.1).

pH (2.4.24). 10.7 to 11.7, determined in solution A.

Guanine. Determine by thin-layer chromatography (2.4.17), coating the plate with *cellulose F254* (Merck celllulose F plates are suitable).

Mobile phase. A mixture of 10 volumes of *1-propanol*, 30 volumes of *strong ammonia solution* and 60 volumes of a 5 per cent w/v solution of *ammonium sulphate*.

Test solution (a). Dissolve a suitable quantity of the substance under examination in sufficient *0.1 M sodium hydroxide* to produce a solution containing 0.5 per cent of Aciclovir.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with *0.1 M sodium hydroxide*.

Reference solution (a). A 0.05 per cent w/v solution of *aciclovir IPRS* in *0.1 M sodium hydroxide*.

Reference solution (b). A 0.005 per cent w/v solution of *guanine* in *0.1 M sodium hydroxide*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the pate in a current of warm air and examine under ultraviolet light at 254 nm. Any secondary spot corresponding to guanine in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b) (1.0 per cent).

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 80 volumes of *dichloromethane*, 20 volumes of *methanol* and 2 volumes of *strong ammonia solution*.

NOTE— Prepare the following solutions immediately before use.

Test solution. Dissolve a quantity of the substance under examination in *dimethyl sulphoxide* to produce a solution containing 2.5 per cent w/v of aciclovir.

Reference solution. Dilute 1 volume of the test solution to 200 volumes with *dimethyl sulphoxide*.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate in a current of warm air and examine under ultraviolet light at 254 nm. Any secondary spot with an R_f value greater than that of the principal spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (0.5 per cent).

Bacterial endotoxins (2.2.3). Not more than 0.174 Endotoxin Units per mg of aciclovir.

Assay. Dissolve a quantity of the mixed contents of 10 containers containing 0.10 g of Aciclovir in sufficient *0.1 M hydrochloric acid* to produce 500.0 ml. Dilute 5.0 ml of the resulting solution to 100.0 ml with *0.1 M hydrochloric acid*. Measure the absorbance of the resulting solution at the maximum at about 255 nm (2.4.7). Calculate the content of $C_8H_{11}N_5O_3$ taking 560 as the specific absorbance at 255 nm.

Storage. Store protected from moisture, in a sterile, tamper-evident container sealed so as to exclude micro-organisms, at a temperature not exceeding 30°.

Labelling. The label states (1) the quantity of aciclovir sodium in the sealed container in terms of the equivalent amount of Aciclovir; (2) the strength of the constituted solution in terms of the equivalent amount of Aciclovir in a suitable dose-volume.

Aciclovir Oral Suspension

Acyclovir Oral Suspension

Aciclovir Oral Suspension is a suspension of Aciclovir in a suitable flavoured vehicle.

Aciclovir Oral Suspension contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of aciclovir, $C_8H_{11}N_5O_3$.

Usual strengths. 200 mg per 5 ml; 400 mg per 5 ml.

Identification

A. When examined in the range 230 nm to 250 nm (2.4.7), the solution prepared in the Assay before the final dilution shows maximum absorption at 255 nm and shoulder at 274 nm.

B. In the test for Guanine, the principal spot in the chromatogram obtained with test solution (b) corresponds to the principal spot in the chromatogram obtained with reference solution (a). If the R_f values of the principal spot in the chromatogram obtained with test solution (b) and reference solution (a) are different, the oral suspension complies if the chromatogram obtained with reference solution (c) shows a single, compact spot.

Tests

pH (2.4.24). 4.0 to 7.0.

Guanine. Determine by thin-layer chromatography (2.4.17), coating the plate with *cellulose F254* (Such as Merck cellulose F plates).

Mobile phase. A mixture of 10 volumes of *propan-1-ol*, 30 volumes of *13.5 M ammonia* and 60 volumes of a 5 per cent w/v solution of *ammonium sulphate*.

Solvent mixture. 35 volumes of *0.1 M sodium hydroxide* and 65 volumes of *ethanol*.

Test solution (a). Disperse a quantity of oral suspension containing 0.6 g of Aciclovir in 20 ml of *0.1 M sodium hydroxide* and dilute to 100.0 ml with *ethanol*.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with the solvent mixture.

Reference solution (a). A 0.06 per cent w/v solution of *aciclovir IPRS* in the solvent mixture.

Reference solution (b). A 0.006 per cent w/v solution of *guanine* in the solvent mixture.

Reference solution (c). A mixture of equal volumes of test solution (b) and reference solution (a).

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot corresponding to guanine in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any spot that appears just below the solvent peak.

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Disperse a quantity of oral suspension containing 0.4 g of Aciclovir in 400 ml of *water* and 25 ml of *1 M sulphuric acid* with the aid of ultrasound for 10 minutes and dilute to 500 ml with *water*. Filter the solution, discard the first few ml of filtrate and dilute 5.0 ml of the filtrate to 200.0 ml with *0.05 M sulphuric acid*. Add 10 ml of the solution to 5 ml of a 0.01 per cent w/v solution of *cetrimide* in *0.05 M sulphuric acid*, add sufficient *0.05 M sulphuric acid* to produce 100.0 ml and measure the fluorescence (2.4.5), using an excitation wavelength of 308 nm and an emission wavelength of 415 nm. Set the instrument to zero using a 0.0005 per cent w/v solution of *cetrimide* in *0.05 M sulphuric acid*. Calculate the content of $C_8H_{11}N_5O_3$ in the oral suspension from the fluorescence obtained by carrying out the operation at the same time using a mixture prepared by adding 10.0 ml of a 0.002 per cent w/v solution of *aciclovir IPRS* in *0.05 M sulphuric acid* and beginning at the words "to 5 ml of a 0.01 per cent w/v solution of *cetrimide* ...". Determine the weight per ml of the oral suspension (2.4.29) and calculate the content of $C_8H_{11}N_5O_3$, weight in volume, using the declared content of $C_8H_{11}N_5O_3$ in *aciclovir IPRS*.

Aciclovir Tablets

Acyclovir Tablets

Aciclovir Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of aciclovir, $C_8H_{11}N_5O_3$.

Usual strengths. *200 mg; 400 mg; 800 mg.*

Identification

A. When examined in the range 230 nm to 360 nm (2.4.7), the solution prepared in the Assay shows an absorption maximum at 255 nm and a broad shoulder at 274 nm.

B. In the test for Guanine, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).
Apparatus No. 2 (Paddle),
Medium: 900 ml of *0. 1 M hydrochloric acid*,
Speed and time. 50 rpm for 45 minutes.

Withdraw a suitable volume of the medium and filter, rejecting the first few ml of filtrate. Dilute a suitable volume of the filtrate with the medium, if necessary. Measure the absorbance of the resulting solution at the maximum at about 255 nm (2.4.7). Calculate the content of aciclovir, $C_8H_{11}N_5O_3$ in the medium from the absorbance obtained from a solution of known concentration of *aciclovir IPRS* in the dissolution medium.

Q. Not less than 80 per cent of the stated amount of $C_8H_{11}N_5O_3$.

Guanine. Determine by thin-layer chromatography (2.4.17), coating the plate with *cellulose F254* (Such as Merck celllulose F plates).

Mobile phase. A mixture of 10 volumes of *1- propanol*, 30 volumes of *strong ammonia solution* and 60 volumes of a 5 per cent w/v solution of *ammonium sulphate*.

Test solution (a). Disperse a quantity of the powdered tablets containing 0.25 g of Aciclovir with 25 ml of *0.1 M sodium hydroxide* with the aid of ultrasound for 10 minutes and dilute to 50.0 ml with *0.1 M sodium hydroxide*. Allow to stand and allow any undissolved material to settle before application to the plate.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with *0.1 M sodium hydroxide*.

Reference solution (a). A 0.05 per cent w/v solution of *aciclovir IPRS* in *0.1 M sodium hydroxide*.

Reference solution (b). A 0.005 per cent w/v solution of *guanine* in *0.1 M sodium hydroxide*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air and examine under ultraviolet light at 254 nm. Any secondary spot corresponding to guanine in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b) (1.0 per cent).

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 80 volumes of *dichloromethane*, 20 volumes of *methanol* and 2 volumes of *strong ammonia solution*.

NOTE— Prepare the solutions immediately before use.

Test solution. Disperse a quantity of the powdered tablets containing 0.25 g of Aciclovir in *dimethyl sulphoxide* and dilute to 10.0 ml with *dimethyl sulphoxide*, with the aid of ultrasound for 15 minutes and filter.

Reference solution. Dilute 0.7 ml of the test solution to 100.0 ml with *dimethyl sulphoxide*.

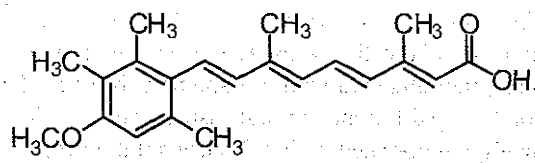
Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate in a current of warm air and examine under ultraviolet light at 254 nm. Any secondary spot with an R_f value more than that of the principal spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (0.7 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of powder containing 0.1 g of Aciclovir in 60 ml of *0.1 M sodium hydroxide* with the aid of ultrasound for 15 minutes and dilute to 100.0 ml with *0.1 M sodium hydroxide*, filter. To 15.0 ml of the filtrate add 50 ml of *water*, 5.8 ml of *2 M hydrochloric acid* and sufficient *water* to produce 100.0 ml. To 5.0 ml of the solution add sufficient *0.1 M hydrochloric acid* to produce 50.0 ml and mix well. Measure the absorbance of the solution at the maximum at about 255 nm (2.4.7), using *0.1 M hydrochloric* acid as the blank. Calculate the content of $C_8H_{11}N_5O_3$ taking 560 as the specific absorbance at 255 nm.

Storage. Store protected from light.

Acitretin



$C_{21}H_{26}O_3$ Mol. Wt. 326.4

Acitretin is (2*E*,4*E*,6*E*,8*E*)-9-(4-Methoxy-2,3, 6-trimethylphenyl)-3,7-dimethylnona-2,4,6,8-tetraenoic acid.

Acitretin contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{21}H_{26}O_3$, calculated on the dried basis.

Category. Antipsoriatic.

Description. A yellow or greenish yellow crystalline powder. It shows polymorphism (2.5.11).

Identification

Test A may be omitted if test B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *acitretin IPRS* or with the reference spectrum of acitretin.

B. When examined in the range 300 nm to 400 nm (2.4.7), a 0.000375 per cent w/v solution in *tetrahydrofuran* shows absorption maxima at 358 nm and specific absorbance at the absorption maxima is 1350 to 1475.

C. In the Assay, the principal peak in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Carry out the test protected from light, and prepare solutions immediately before use.

Test solution (a). Dissolve 25 mg of the substance under examination in 5 ml of *tetrahydrofuan* and dilute immediately to 100.0 ml with *ethanol.*

Test solution (b). Dilute 10.0 ml of test solution (a) to 25.0 ml with *ethanol.*

Reference solution (a). Dissolve 25 mg of *acitretin IPRS* in 5 ml of *tetrahydrofuran* and dilute immediately to 100.0 ml with *ethanol.* Dilute 10.0 ml of the solution to 25.0 ml with *ethanol.*

Reference solution (b). Dissolve 1 mg of *tretinoin IPRS* in *ethanol* and dilute to 20.0 ml with *ethanol.* Mix 5.0 ml of the solution with 2.5 ml of reference solution (a) and dilute to 100.0 ml with *ethanol.*

Reference solution (c). Dilute 2.5 ml of reference solution (a) to 50.0 ml with *ethanol.* Dilute 3.0 ml of the solution to 20.0 ml with *ethanol.*

Chromatographic system

- a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Lichrospher PAH, Merck),
- sample temperature: 4°,
- mobile phase: a 0.3 per cent v/v solution of *glacial acetic acid* in a mixture of 8 volumes of *water* and 92 volumes of *ethanol,*
- flow rate: 0.6 ml per minute,
- spectrophotometer set at 360 nm,
- injection volume: 10 µl.

Name	Relative retention time (in minutes)
Acetretin impurity A[1]	0.78
Tretinoin	0.84
Acetretin	1.0
Acetretin impurity B[2]	1.65

[1](2*Z*,4*E*,6*E*,8*E*)-9-(4-methoxy-2,3,6-trimethylphenyl)-3,7-dimethylnona-2,4,6,8- tetraenoic acid,

[2]ethyl (all-*E*)-9-(4-methoxy-2,3,6-trimethylphenyl)-3,7-dimethyl-nona-2,4,6,8- tetraenoate.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to acitretin and tretinion is not less than 2.0.

Inject reference solution (b), (c) and test solution (a). Run the chromatogram 2.5 times the retention time of principal peak. In the chromatogram obtained with test solution (a), the area of any secondary peak due to acitretin impurities A and B is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.3 per cent). The sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c).

Palladium. Not more than 10 ppm. Determine by atomic absorption spectrophotometry (2.4.2), measuring at 247.6 nm using air-acetylene flame and Palladium hollow-cathode lamp.

Test solution. Take 2.0 g into a quartz beaker and add 3 ml of *magnesium nitrate solution.* Heat in a muffle furnace at 350° to incinerate the content. Ignite at about 450° for 8 hours and then at 550 ± 50° for a further one hour. Dissolve the residue in a mixture of 0.75 ml of *hydrochloric acid* and 0.25 ml of *nitric acid,* warming gently. Cool, then transfer the solution into a volumetric flask containing *water* and dilute to 50.0 ml with *water.*

Reference solution. Dissolve 0.163 g of *heavy magnesium oxide* in a mixture of 0.5 ml of *nitric acid,* 1.5 ml of *hydrochloric acid* and 50 ml of *water,* add 2.0 ml of *palladium standard solution (20 ppm Pd)* and dilute to 100.0 ml with *water.*

Heavy metals (2.3.13). 1.0 g complies with the test for heavy metals, Method B (20 ppm).

Sulphated ash (2.4.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in vacuum at 100° for 4 hours.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modifications.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject reference solution (a) and test solution (b).

Calculate the content of $C_{21}H_{26}O_3$.

Storage. Store protected from light and moisture, at a temperature 2° to 8°. It is recommended that the contents of an opened container be used as soon as possible and any unused part be protected by an atmosphere of inert gas.

Acitretin Capsules

Acitretin Capsules contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of acitretin, $C_{21}H_{26}O_3$.

NOTE — Carry out the following tests avoiding exposure to actinic light and using freshly prepared solutions.

Usual strengths. 10 mg; 25 mg.

Identification

A. Dissolve a quantity of capsule contents containing 25 mg of Acitretin in *methanol* and dilute to 250.0 ml with *methanol*, filter. Dilute 1.0 ml of the filtrate to 20.0 ml with *methanol*. When examined in the range 230 nm to 500 nm (2.4.7), the solution shows an absorption maximum at 346 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),

Medium. 900 ml of 3 per cent w/v solution of *sodium lauryl sulphate*, adjusted to pH 9.5 with *0.01M hydrochloric acid* or *0.01M sodium hydroxide*,

Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted to obtain 0.0005 per cent w/v of acitretin, at the maximum at about 348 nm (2.4.7). Calculate the content of $C_{21}H_{26}O_3$ in the medium from the absorbance obtained from a solution of known concentration of *acitretin IPRS*.

Q. Not less than 75 per cent of the stated amount of $C_{21}H_{26}O_3$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 10 volumes of *tetrahydrofuran* and 13 volumes of *methanol*.

Test solution. Disperse a quantity of the capsule contents containing 25 mg of Acitretin with 8 ml of *water* in a water-bath at 45° for 10 minutes. Mix with the aid of ultrasound for 15 minutes and dilute to 100.0 ml with the solvent mixture, filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Further dilute 4.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution (b). A solution containing 0.00025 per cent w/v each of *tretinoin IPRS* and *acitretin IPRS* in the solvent mixture.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 4.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 0.5 volume of *glacial acetic acid*, 5 volumes of *ethanol*, 21 volumes of *water* and 74 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 365 nm,
- injection volume: 10 µl.

Inject reference solution (b) and (c). The test is not valid unless in the chromatogram obtained with reference solution (b), the resolution between the peaks due to acitretin and tretinoin is not less than 3.0 and in the chromatogram obtained with reference solution (c), the signal-to-noise ratio of the principal peak is not less than 10.

Inject reference solution (a), (c) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) except the area of one secondary peak is more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent) and the sum of areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 10 volumes of *tetrahydrofuran* and 13 volumes of *methanol*.

Test solution. Disperse a quantity of the mixed contents of 20 capsules containing 25 mg of Acitretin with 8 ml of *water* in a water-bath at 45° for 10 minutes. Mix with the aid of

ultrasound for 15 minutes and dilute to 100.0 ml with the solvent mixture. Further dilute 5.0 ml of the solution to 25.0 ml with the solvent mixture and filter.

Reference solution (a). A 0.005 per cent w/v solution of *acitretin IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.00025 per cent w/v, each of, *acitretin IPRS* and *tretinoin IPRS* in the solvent mixture.

Use chromatographic system as described under Related substances.

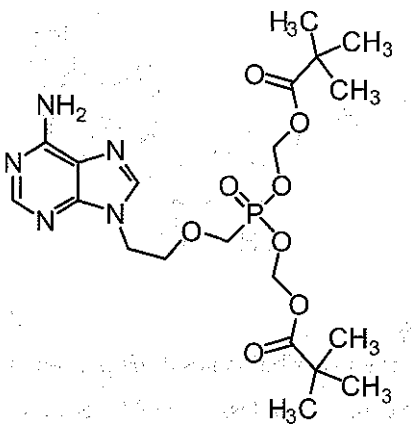
Inject reference solution (b).The test is not valid unless the resolution between the peaks due to tretinoin and acitretin is not less than 3.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{21}H_{26}O_3$ in the capsules.

Storage. Store protected from light.

Adefovir Dipivoxil



$C_{20}H_{32}N_5O_8P$ Mol. Wt. 501.5

Adefovir Dipivoxil is 9-[2-bis[(pivaloyloxy)methoxy] phosphonyl]-methoxy]ethyl]adenine.

Adefovir Dipivoxil contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{20}H_{32}N_5O_8P$, calculated on the dried basis.

Category. Antiretroviral.

Description. A white to off-white crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum obtained with that of *adefovir dipivoxil IPRS* or with the reference spectrum of adefovir dipivoxil.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of mobile phase A and mobile phase B.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution. A 0.001 per cent w/v solution of *adefovir dipivoxil IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with strong-cation exchange packing-sulphonated fluorocarbon polymer bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. *0.05 M sodium dihydrogen phosphate* in 0.1 per cent v/v *triethylamine*. To 1000 ml of the solution, add 1 g *hexane sulphonate*, adjusted to pH 3.3 with *orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
12	80	20
47	40	60
57	40	60
65	80	20

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the sum of areas of all the secondary peaks is not more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent). Ignore any peak with an area less than 0.01 times the area of the principal peak in the chromatogram obtained with the reference solution (0.01 per cent).

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying at 60° for 3 hours.

Assay. Weigh 0.3 g, dissolve in 40 ml of *glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.050147 g of $C_{20}H_{32}N_5O_8P$.

Adefovir Tablets

Adefovir Dipivoxil Tablets

Adefovir Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of adefovir dipivoxil, $C_{20}H_{32}N_5O_8P$.

Usual strength. 10 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A 0.03 per cent w/v solution of *adefovir dipivoxil IPRS* in the mobile phase. Further dilute 4.0 ml of the solution to 100.0 ml with the dissolution medium.

Use chromatographic system as described under Assay.

Calculate the content of $C_{20}H_{32}N_5O_8P$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{20}H_{32}N_5O_8P$.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Disperse one tablet in 30 ml of the mobile phase, with the aid of ultrasound for 20 minutes and dilute to 50.0 ml with the mobile phase. Centrifuge and use the supernatant liquid.

Calculate the content of $C_{20}H_{32}N_5O_8P$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 50 mg of Adefovir Dipivoxil in 15 ml of the mobile phase and dilute to 50.0 ml with the mobile phase and centrifuge. Dilute 5.0 ml of the supernatant liquid to 25.0 ml with the mobile phase.

Reference solution. A 0.02 per cent w/v solution of *adefovir dipivoxil IPRS* in the mobile phase.

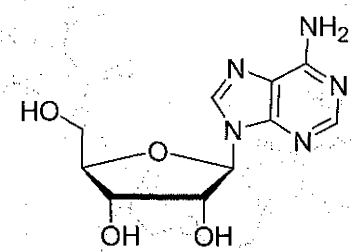
Chromatographic system
- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of buffer solution prepared by dissolving 8.7 g of *dipotassium hydrogen orthophosphate* and 0.15 ml of *triethylamine* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid*, 25 volumes of *acetonitrile* and 25 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates and the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{32}N_5O_8P$ in the tablets.

Adenosine



$C_{10}H_{13}N_5O_4$ Mol. Wt. 267.2

Adenosine is 9-β-D-ribofuranosyl-9*H*-purin-6-amine.

Adenosine contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{10}H_{13}N_5O_4$, calculated on the dried basis.

Category. Antiepileptic.

Description. A white or off white crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *adenosine IPRS* or with the reference spectrum of adenosine.

Tests

Appearance of solution. A 5.0 per cent w/v solution in hot *water* (Solution A) is colourless (2.4.1).

Acidity or alkalinity. To 10 ml of solution A, add 0.1 ml of *bromocresol purple solution* and 0.1 ml of *0.01 M hydrochloric*

acid. The solution is yellow. Add 0.4 ml of *0.01 M sodium hydroxide*. The solution is violet-blue.

Specific optical rotation (2.4.22). −49° to −45°, determined in a freshly prepared 2.5 per cent w/v solution in *1 M hydrochloric acid*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 6.8 g of *potassium hydrogen sulphate* and 3.4 g of *tetrabutylammonium hydrogen sulphate* in *water*, adjusted to pH 6.5 with 6.0 per cent w/v solution of *potassium hydroxide* and dilute to 1000 ml with the same solvent. Use freshly prepared solvent mixture.

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg each of adenosine impurities A and G in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 4.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of *water* and 60 volumes of solvent mixture,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Adenosine impurity A[1]	0.3	0.6
Adenosine impurity G[2]	0.4	1.4
Adenosine	1.0	---

[1]adenine,

[2]inosine.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to adenosine impurities A and G is not less than 1.5.

Inject reference solution (a) and the test solution. Run the chromatogram 1.5 times the principal peak. In the chromatogram obtained with the test solution, the area of any peak due to adenosine impurity A is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). The area of any peak due to adenosine impurity G is not more than area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). The sum of areas of all the secondary peaks is not more than the 5 times area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with a n area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Chlorides (2.3.12). Dissolve 2.5 g in *water* and dilute to 25 ml with *water*. The solution complies with the limit test for chlorides (100 ppm).

Sulphates (2.3.17). 15 ml of solution A, complies with the limit for sulphates (200 ppm).

Ammonium (2.3.53). Not more than 10 ppm,using method B, determined on 0.5 g. Prepare the reference solution using 5 ml of *ammonium standard solution* (1 ppm NH_4).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g. by drying in an oven at 105°.

Assay. Weigh 0.2 g, dissolve in a mixture of 20 ml of *acetic anhydride* and 30 ml of *anhydrous acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02672 g of $C_{10}H_{13}N_5O_4$.

Adenosine Injection

Adenosine Injection is a sterile solution of Adenosine in Water for Injection. It may contain Sodium Chloride.

Adenosine Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of adenosine, $C_{10}H_{13}N_5O_4$.

Usual strength. 3 mg per ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (b).

Tests

pH (2.4.24). 4.5 to 7.5.

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay.

Inject test solution (a). The area of any secondary peak is not more than 1.0 per cent and the sum of areas of all the secondary peak is not more than 1.5 per cent, calculated by area normalization.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Bacterial endotoxins (2.2.3). Not more than 11.62 Endotoxin Units per mg of adenosine *(for rapid intravenous injection)* and not more than 5.95 Endotoxin Units per mg of adenosine *(for continuous peripheral intravenous infusion)*.

Assay. Determine by liquid chromatography (2.4.14).

Test solution (a). Dilute a volume of injection containing 30 mg of Adenosine to 100.0 ml with *water*.

Test solution (b). Dilute 5.0 ml of test solution (a) to 50.0 ml with *water*.

Reference solution (a). A solution containing 0.003 per cent w/v each of *adenosine IPRS* and *inosine* in warm *water* (50° to 55°).

Reference solution (b). A 0.003 per cent w/v solution of *adenosine IPRS* in warm *water* (50° to 55°). If sodium chloride is present in the injection, add 0.01 ml of sodium chloride solution (0.9 in 100) per ml of the anticipated final volume of the solution before addition of the warm *water*.

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 2.0 g of *monobasic potassium phosphate* in 800 ml of *water*, add 5 ml of *1.0 M tetrabutylammonium dihydrogen phosphate solution*, dilute with *water* to 980 ml and mix. Add 20 ml of *acetonitrile*,
- flow rate: 2.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject reference solution (a) and (b). Run the chromatogram 2.5 times the retention time of the principal peak. The test is not valid unless in the chromatogram obtained with reference solution (a), the tailing factor for the principal peak is not more than 2.0 and the resolution between the peaks due to adenosine and inosine is not less than 6.0 and in the chromatogram obtained with reference solution (b), the relative standard deviation for replicate injections is not more than 1.5 per cent.

Inject reference solution (b) and test solution (b).

Calculate the content of $C_{10}H_{13}N_5O_4$ in the injection.

Storage. Store protected from moisture, in single dose containers, preferably of Type I glass.

Adipic Acid

$C_6H_{10}O_4$ Mol. Wt. 146.1

Adipic Acid is 1,6-Hexadioic acid.

Adipic Acid contains not less than 99.0 per cent and not more than 101.0 per cent of $C_6H_{10}O_4$, calculated on the dried basis.

Category. Pharmaceutical aid.

Description. A white or almost white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *adipic acid IPRS* or with the reference spectrum of adipic acid.

Tests

Solution A. Dissolve 5.0 g with heating in *water* and dilute to 50 ml with *water*. Allow to cool and to crystallise. Filter through a sintered-glass filter (G4). Wash the filter with *water*. Collect the filtrate and the washings until a volume of 50 ml is obtained.

Appearance of solution. A 5.0 per cent w/v solution in *methanol* is clear (2.4.1) and not more intensely coloured than reference solution BS8 (2.4.1).

Related substances. Determined by liquid chromatography (2.4.14).

Test solution. Dissolve 0.2 g of the substance under examination in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 20 mg of *glutaric acid* in 1.0 ml of the test solution and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 12.5 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 3 volumes of *acetonitrile* and 97 volumes of a 2.5 per cent w/v solution of *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 209 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peak corresponding to glutaric acid and adipic acid not less than 9.0.

Inject reference solution (b) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Chlorides (2.3.12). Dilute 12.5 ml of solution A to 15 ml with *water* complies with the limit test for chlorides (200 ppm).

Nitrates. Not more than 30 ppm.

To 1 ml of solution A, add 2 ml of *13.5 M ammonia*, 0.5 ml of a 1 per cent w/v solution of *manganese sulphate*, 1 ml of a 1.0 per cent w/v solution of *sulphanilamide* and dilute to 20 ml with *water*. Add 0.1 g of *zinc powder* and cool in iced water for 30 minutes, shake from time to time. Filter and cool 10 ml of the filtrate in iced water. Add 2.5 ml of 25 per cent w/v solution of *hydrochloric acid* and 1 ml of a 1.0 per cent w/v solution of *N-(1-naphthyl)ethylenediamine dihydrochloride*. Allow to stand at room temperature. After 15 minutes, the mixture is not more intensely coloured than a standard prepared at the same time and in the same manner, using 1.5 ml of *nitrate standard solution* (2 ppm) instead of 1 ml of solution A. The test is not valid if a blank solution prepared at the same time and in the same manner, using 1 ml of *water* instead of 1 ml of solution A, is more intensely coloured than 0.0002 per cent w/v solution of *potassium permanganate*.

Sulphates (2.3.17). 3 ml of solution A complies with the limit test for sulphates (500 ppm).

Iron (2.3.14). 10 ml of solution A complies with the limit test for iron (10 ppm), using 1.0 ml of *iron standard solution (10 ppm)*.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

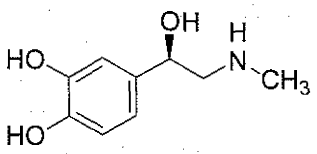
Loss on drying (2.4.19). Not more than 0.2 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 60 mg in 50 ml of *water*. Add 0.2 ml of *phenolphthalein solution* and titrate with *0.1 M sodium hydroxide*.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.00731 g of $C_6H_{10}O_4$.

Adrenaline

Epinephrine



$C_9H_{13}NO_3$ Mol. Wt. 183.2

Adrenaline is (*R*)-1-(3,4-dihydroxyphenyl)-2-methylaminoethanol.

Adrenaline contains not less than 98.5 per cent and not more than 101.0 per cent of $C_9H_{13}NO_3$, calculated on the dried basis.

Category. Sympathomimetic.

Description. A white or creamy-white, microcrystalline powder or granules. It gradually darkens on exposure to light and air, decomposition being faster in the presence of moisture and at higher temperatures.

Identification

Test A may be omitted if tests B, C and D are carried out. Test C may be omitted if tests A, B and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *adrenaline IPRS* or with the reference spectrum of adrenaline.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.003 per cent w/v solution in *0.01 M hydrochloric acid* shows an absorption maximum at 280 nm; absorbance at 280 nm, about 0.45.

C. To 1 ml of a neutral or faintly acid solution add dropwise a 0.25 per cent w/v solution of *ferric chloride* until an emerald-green colour is produced. Add *sodium bicarbonate solution* gradually; the solution changes first to blue and then to red.

D. To 1 ml of a 0.1 per cent w/v solution add 1 ml of a 1.0 per cent v/v solution of *2,5-diethoxytetrahydrofuran* in *glacial acetic acid*. Heat at 80° for 2 minutes, cool in ice and add 3 ml of a 2.0 per cent w/v solution of *4-dimethylaminobenzaldehyde* in a mixture of 19 volumes of *glacial acetic* acid and 1 volume of *hydrochloric acid*. Mix and allow to stand for 2 minutes. The solution becomes yellow and is similar to the one obtained by performing the test in the same manner but omitting the substance under examination (distinction from noradrenaline).

Tests

Specific optical rotation (2.4.22). −53.5° to −50.0°, determined in a freshly prepared 4.0 per cent w/v solution in *1 M hydrochloric acid*.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions protected from light.

Solvent mixture A. Dissolve 5.0 g of *potassium dihydrogen phosphate* and 2.6 g of *sodium octanesulphonate* in *water* and dilute to 1000 ml with *water*, stir for at least 30 minutes, adjusted to pH 2.8 with *orthophosphoric acid.*

Solvent mixture B. 13 volumes of *acetonitrile* and 87 volumes of solvent mixture A.

Test solution. Dissolve 40 mg of the substance under examination in 5 ml of *0.1 M hydrochloric acid* and dilute to 50.0 ml with solvent mixture B.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with solvent mixture B.

Reference solution (b). Dissolve 1.5 mg of *adrenaline impurity A IPRS (noradrenaline tartrate IPRS)* in solvent mixture B, add 1.0 ml of the test solution and dilute to 100.0 ml with solvent mixture B.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (3 µm),
- column temperature: 50°,
- mobile phase: A. a mixture of 5 volumes of *acetonitrile* and 95 volumes of solvent mixture A,
  B. a mixture of 45 volumes of *acetonitrile* and 55 volumes of solvent mixture A,
- a gradient programme using the conditions given below,
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	92	8
15	50	50
20	92	8
25	92	8

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to adrenaline impurity A and adrenaline is not less than 3.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak at relative retention time of about 0.2, 0.8 and 1.3 with reference to the principal peak (retention time of Adrenaline is about 4 min) is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any peak at relative retention times of about 3.3 multiplied by a correction factor of 0.7 and about 3.7 multiplied by a correction factor of 0.6 with reference to the principal peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent), the area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). The sum of areas of all the secondary peaks is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Phenones. Absorbance of a 0.2 per cent w/v solution in *0.1 M hydrochloric acid* at the maximum at about 310 nm (2.4.7), not more than 0.20, calculated on the dried basis.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa for 18 hours.

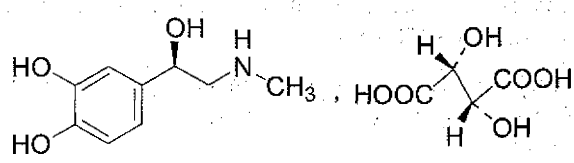
Assay. Dissolve 0.3 g in 50 ml of *anhydrous glacial acetic acid*, warming slightly, if necessary, to effect solution. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01832 g of $C_9H_{13}NO_3$.

Storage. Store protected from light in containers preferably filled with nitrogen.

Adrenaline Tartrate

Adrenaline Acid Tartrate; Adrenaline Bitartrate; Epinephrine Bitartrate.



$C_9H_{13}NO_3,C_4H_6O_6$ Mol. Wt. 333.3

Adrenaline tartrate is (*R*)-1-(3,4-dihydroxyphenyl)-2-methylaminoethanol hydrogen tartrate.

Adrenaline Tartrate contains not less than 98.0 per cent and not more than 101.0 per cent of $C_9H_{13}NO_3,C_4H_6O_6$, calculated on the dried basis.

Category. Sympathomimetic.

Description. A white or greyish-white, crystalline powder. It darkens on exposure to air and light, decomposition being faster in the presence of moisture and at higher temperatures.

Identification

Dissolve 5 g in 50 ml of a 0.5 per cent w/v solution of *sodium metabisulphite* and make alkaline by addition of *ammonia*. Keep the mixture at room temperature for at least 15 minutes and filter. Reserve the filtrate for identification test C. Wash the precipitate with 3 quantities, each of 10 ml, of *methanol*. Evaporate to dryness at 80°. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *adrenaline IPRS* or with the reference spectrum of adrenaline.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.003 per cent w/v solution in *0.01 M hydrochloric acid* shows an absorption maximum only at about 279 nm, about 0.45.

C. The filtrate reserved above gives the reaction (C) of tartrates (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution examined immediately after preparation is not more opalescent than opalescence standard OS2 (2.4.1) and not more intensely coloured than reference solution BYS4 (2.4.1).

pH (2.4.24). 2.8 to 4.0, determined in a 1.0 per cent w/v solution.

Specific optical rotation (2.4.22). −54.0° to −50.0°, determined in a freshly prepared 4.0 per cent w/v solution of residue obtained in identification test in *1 M hydrochloric acid*.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions protected from light.

Solvent mixture A. Dissolve 5.0 g of *potassium dihydrogen phosphate* and 2.6 g of *sodium octanesulphonate* in *water* and dilute to 1000 ml with the same solvent, stir for at least 30 minutes, adjusted to pH 2.8 with *orthophosphoric acid*.

Solvent mixture B. 13 volumes of *acetonitrile* and 87 volumes of solvent mixture A.

Test solution. Dissolve 75 mg of the substance under examination in 5 ml of *0.1 M hydrochloric acid* and dilute to 50.0 ml with solvent mixture B.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with solvent mixture B.

Reference solution (b). Dissolve 1.5 mg of *noradrenaline tartrate IPRS (adrenaline impurity A IPRS)* in solvent mixture B, add 1.0 ml of the test solution and dilute to 100.0 ml with solvent mixture B.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (3 µm),
- column temperature: 50°,
- mobile phase: A. a mixture of 5 volumes of *acetonitrile* and 95 volumes of solvent mixture A,
  B. a mixture of 45 volumes of *acetonitrile* and 55 volumes of solvent mixture A,
- a gradient programme using the conditions given below,
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	92	8
15	50	50
20	92	8
25	92	8

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to adrenaline impurity A and adrenaline is not less than 3.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak at relative retention time of about 3.2 with reference to the principal peak is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent). The area of any peak at relative retention times of about 0.8 and 1.3 with reference to the principal peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). The area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). The sum of areas of all the secondary peaks is not more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.6 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Phenones. Absorbance of a 0.2 per cent w/v solution in *0.1 M hydrochloric acid* at the maximum at about 310 nm, not more than 0.10, calculated on the dried basis (2.4.7).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* at a pressure of 1.5 to 2.5 kPa for 18 hours.

Assay. Dissolve 0.3 g in 50 ml of *anhydrous glacial acetic acid*, warming slightly, if necessary, to effect solution. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03333 g of $C_9H_{13}NO_3,C_4H_6O_6$.

Storage. Store protected from light in containers preferably filled with nitrogen.

Adrenaline Injection

Adrenaline Bitartrate Injection; Adrenaline Acid Tartrate Injection; Adrenaline Tartrate Injection; Epinephrine Tartrate Injection

Adrenaline Injection is a sterile, isotonic solution containing 0.18 per cent w/v of Adrenaline Tartrate in Water for Injections.

Adrenaline Injection contains adrenaline tartrate equivalent not less than 90.0 per cent and not more than 115.0 per cent w/v of the stated amount of adrenaline, $C_9H_{13}NO_3$.

Usual strength. 0.1 per cent w/v.

Description. A clear, colourless or almost colourless solution.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponding to the peak in the chromatogram obtained with reference solution (a).

B. To 1 ml add dropwise a 0.25 per cent w/v solution of *ferric chloride* until an emerald-green colour is produced. Add *sodium bicarbonate solution* gradually; the solution changes first to blue and then to red.

C. To 10 ml add 2 ml of *disodium hydrogen phosphate solution* and sufficient *iodine solution* to produce a brown colour. Add *0.1 M sodium thiosulphate* dropwise until excess iodine is removed; a red colour is produced.

Tests

Appearance of solution. Examine the injection in a clear glass test-tube against a white background; it is not pinkish and does not contain a precipitate. If any yellow colour is observed, it is not more intense than a reference solution prepared by diluting 0.4 ml of *0.1 M iodine* to 100 ml with *water*, when viewed similarly.

pH (2.4.24). 2.8 to 3.6.

Noradrenaline. Determine by liquid chromatography (2.4.14).

Test solution. Use the undiluted injection.

Reference solution (a). A 0.0018 per cent w/v solution of *noradrenaline acid tartrate* in the mobile phase.

Reference solution (b). A solution containing 0.0018 per cent w/v of *noradrenaline-free adrenaline acid tartrate* and 0.0018 per cent w/v of *noradrenaline acid tartrate* in the mobile phase.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica or ceramic microparticles (5 to 10 µm) (Such as Nucleosil ODS),
- mobile phase: a buffer solution prepared by dissolving 4.0 g of *tetramethylammonium hydrogen sulphate*, 1.1 g of *sodium heptanesulphonate* and 2 ml of *0.1 M disodium edetate* in 1000 ml of 5 per cent v/v solution of *methanol*, adjusted to pH 3.5 to 3.6 with *1 M sodium hydroxide*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 2.0.

Inject reference solution (a) and the test solution. The area of the peak corresponding to noradrenaline is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent).

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of the injection containing 20 mg of Adrenaline Tartrate to 100.0 ml with the mobile phase.

Reference solution (a). A 0.02 per cent w/v solution of *adrenaline acid tartrate IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.02 per cent w/v each of *adrenaline acid tartrate IPRS* and *noradrenaline acid tartrate* in the mobile phase.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Nucleosil C18),
- mobile phase: a buffer solution prepared by dissolving 4.0 g of *tetramethylammonium hydrogen sulphate*, 1.1 g of *sodium heptanesulphonate* and 2 ml of *0.1 M disodium edetate* to a mixture of 950 volumes of *water* and 50 volumes of *methanol*, adjusted to pH 3.5 with *1 M sodium hydroxide*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to adrenaline acid tartrate and noradrenaline acid tartrate is not less than 2.0.

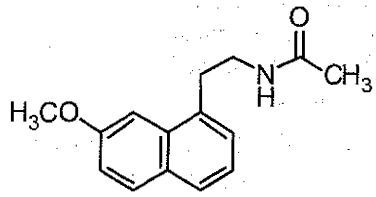
Inject reference solution (a) and the test solution.

Calculate the content of $C_9H_{13}NO_3$ in the injection.

Storage. Store protected from light, in a single dose or multiple dose container.

Labelling. The label states (1) the quantity of active ingredient in parts per 1000 or mg per ml in terms of equivalent amount of adrenaline; (2) that the injection should not be used if it is pinkish or darker than slightly yellow.

Agomelatine



$C_{15}H_{17}NO_2$ Mol Wt. 243.3

Agomelatine is *N*-[2-(7-methoxy-1-naphthyl)ethyl] acetamide.

Agomelatine contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{15}H_{17}NO$, calculated on the anhydrous basis.

Category. Antidepressant.

Description. A white to cream colour crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *agomelatine IPRS* or with the reference spectrum of agomelatine.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *water* and *acetonitrile*.

Test solution. Dissolve 10 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution. A 0.02 per cent w/v solution of *agomelatine IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature: 40°,
- mobile phase: A. Dissolve 1.38 g of *sodium dihydrogen orthophosphate monohydrate* in 1000 ml of *water*, adjusted to pH 2.5 with *orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
5	80	20
50	30	70
52	80	20
60	80	20

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution. The area of any secondary peak is not more than 0.5 per cent and the sum of areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalisation.

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 0.2 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *water* and *acetonitrile*.

Test solution. Dissolve 25 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution. A 0.0025 per cent w/v solution of *agomelatine IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: a mixture of 65 volumes of a buffer solution prepared by dissolving 1.38 g of *sodium dihydrogen orthophosphate monohydrate* in 1000 ml of *water*, adjusted to pH 2.5 with *orthophosphoric acid* and 35 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

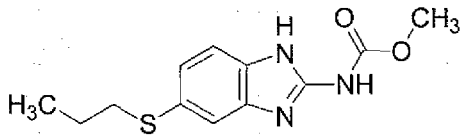
Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{17}NO_2$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Albendazole



$C_{12}H_{15}N_3O_2S$ Mol. Wt. 265.3

Albendazole is methyl 5-propylthio-1*H*-benzimidazol-2-yl-carbamate.

Albendazole contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{12}H_{15}N_3O_2S$, calculated on the dried basis.

Category. Anthelmintic.

Description. A white to pale buff-coloured powder.

Identification

Test A may be omitted if tests B and C are carried out. Test B may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *albendazole IPRS* or with the reference spectrum of albendazole.

B. In the test for Related substances, the principal peak in the chromatogram obtained with test solution corresponds to that of Albendazole in the chromatogram obtained with reference solution (b).

C. Melting point (2.4.21). 208° to 210°.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. A 1.0 per cent v/v solution of *sulphuric acid* in *methanol*.

Test solution. Dissolve 25 mg of the substance under examination in 5 ml of the solvent mixture and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 10 mg of the substance under examination in 10 ml of the solvent mixture and dilute to 100.0 ml with the mobile phase. Dilute 0.5 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (b). Dissolve 50 mg each of the substance under examination and *oxibendazole IPRS* in 5 ml of the solvent mixture and dilute to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 30 volumes of 0.17 per cent w/v solution of *ammonium dihydrogen phosphate* and 70 volumes of *methanol*,
- flow rate: 0.7 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to albendazole and oxibendazole is not less than 3.0.

Inject reference solution (a) and the test solution. Run the chromatogram 1.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.75 per cent) and the sum of the areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

Assay. Dissolve 0.5 g in 80 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02653 g of $C_{12}H_{15}N_3O_2S$.

Storage. Store protected from light.

Albendazole Oral Suspension

Albendazole Oral Suspension is a suspension of albendazole in a suitable vehicle.

Albendazole Oral Suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of albendazole $C_{12}H_{15}N_3O_2S$.

Usual strength. 200 mg per 5 ml.

Identification

A. To a volume of oral suspension containing 25 mg of Albendazole add 50 ml of *0.1 M sodium hydroxide* and shake with the aid of ultrasound for 10 minutes and dilute to 100 ml with *water* and filter. Dilute 1.0 ml of the solution to 10 ml with *water*. When examined in the range 240 nm to 340 nm (2.4.7),

the resulting solution exhibits a maximum at 308 nm, a minimum at 281 nm and a shoulder at 269 nm.

B. To a volume of oral suspension containing 25mg of Albendazole add 50 ml of *0.1 M hydrochloric acid* and shake with the aid of ultrasound for 10 minutes and dilute to 100.0 ml with *0.1 M hydrochloric acid*, filter. Dilute 1.0 ml of the solution to 10.0 ml with *0.1 M hydrochloric acid*. When examined in the range 240 nm to 340 nm (2.4.7), the resulting solution exhibits a maximum at 292 nm, a minimum at 273 nm and a shoulder at 261 nm.

C. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 4.5 to 5.5.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE- Prepare the solutions immediately before use.

Solvent mixture. 30 volumes of *0.015 M ammonium dihydrogen orthophosphate* and 70 volumes of *methanol*.

Test solution. Dilute a quantity of the oral suspension containing 500 mg of Albendazole to 50.0 ml with 1.0 per cent w/v solution of *methanolic sulphuric acid*. Dilute 5.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Reference solution (b). Dissolve 25 mg each of *albendazole IPRS* and *oxibendazole IPRS* in 5.0 ml of 1.0 per cent v/v solution of *methanolic sulphuric acid* and dilute to 50.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. *0.015 M ammonium dihydrogen orthophosphate*,
  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 0.7 ml per minute,
- spectrophotometer set at 292 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
3	100	0
5	30	70
70	30	70
72	100	0
80	100	0

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 7.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). The sum of areas of all the secondary peaks is not more than twice the area of the principal peak in chromatogram obtained with reference solution (a) (2.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the oral suspension containing 0.1 g of Albendazole, add 70 ml of 1 per cent v/v solution of *methanolic sulphuric acid*, mix with the aid of ultrasound for 1 minute and dilute to 100.0 ml with 1 per cent v/v *methanolic sulphuric acid*. Allow to stand and dilute 5 ml of the supernatant liquid to 25 ml with 1 per cent v/v *methanolic sulphuric acid*.

Reference solution. A 0.02 per cent w/v solution of *albendazole IPRS* in 1 per cent v/v solution of *methanolic sulphuric acid*.

Use chromatographic system as described under Related substances, operating the system for twice the retention time of albendazole peak.

Determine the weight per ml (2.4.29) and calculate the content of $C_{12}H_{15}N_3O_2S$.

Albendazole Tablets

Albendazole Tablets contain albendazole. The tablets may be chewable and may contain permitted flavouring and sweetening agents.

Albendazole Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of albendazole, $C_{12}H_{15}N_3O_2S$.

Usual strength. 400 mg.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 60 volumes of *chloroform*, 10 volumes of *ether* and 10 volumes of *glacial acetic acid*.

Test solution. Disperse a quantity of the powdered tablets containing 200 mg of Albendazole in 20 ml of a mixture of 18 volumes of *chloroform* and 1 volume of *formic acid*, warm the suspension on a water-bath for 15 minutes, cool and filter. Dilute 10 ml of the filtrate with an equal volume of *glacial acetic acid*.

Reference solution. A 0.5 per cent w/v solution of *albendazole IPRS* in *glacial acetic acid*.

Apply to the plate 10 µl of each solution. After development, dry the plate in a current of warm air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. Extract a quantity of the powdered tablets containing 100 mg of Albendazole with 100 ml of *0.1 M methanolic hydrochloric acid*, filter and dilute 1.0 ml of the filtrate to 100 ml with *0.1 M sodium hydroxide*. The absorbance of the resulting solution at the maximum at about 309 nm (2.4.7) is about 0.74.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.1 M hydrochloric acid*,

Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Dilute 1.0 ml of filtrate to 50.0 with *0.1 M sodium hydroxide*. Measure the absorbance of the resulting solution at the maximum at about 308 nm (2.4.7). Calculate the content of $C_{12}H_{15}N_3O_2S$ in the medium taking 742 as the specific absorbance at 308 nm.

Q. Not less than 80 per cent of the stated amount of $C_{12}H_{15}N_3O_2S$.

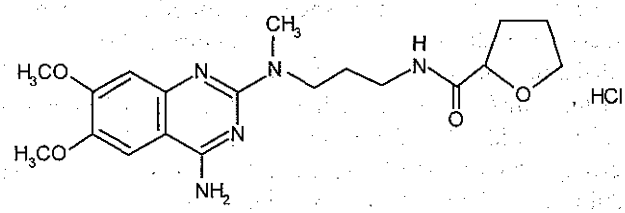
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.1 g of Albendazole, add 150 ml *0.1 M methanolic hydrochloric acid*, shake for 15 minutes and dilute to 250.0 ml with *0.1 M methanolic hydrochloric acid*. Mix, filter and dilute 5.0 ml of the filtrate to 250.0 ml with *0.1 M sodium hydroxide*. Measure the absorbance of the resulting solution at the maximum at about 309 nm (2.4.7). Calculate the content of $C_{12}H_{15}N_3O_2S$ taking 742 as the specific absorbance at 309 nm.

Storage. Store protected from light.

Labelling. The label states, whereever applicable, the tablets should be chewed before swallowing.

Alfuzosin Hydrochloride



$C_{19}H_{27}N_5O_4,HCl$ Mol. Wt. 425.9

Alfuzosin Hydrochloride is (2*RS*)-*N*-[3-[(4-amino-6,7-dimethoxyquinazolin-2-yl)methylamino]propyl]tetrahydrofuran-2-carboxamide hydrochloride.

Alfuzosin Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{19}H_{27}N_5O_4,HCl$, calculated on the anhydrous basis.

Category. Indicated in benign prostatic hyperplasia.

Description. A white or almost white, crystalline powder, slightly hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *alfuzosin hydrochloride IPRS* or with the reference spectrum of alfuzosin hydrochloride.

B. It gives reaction (A) of chlorides (2.3.1).

Tests

pH (2.4.24). 4.0 to 5.5, determined in a 2.0 per cent w/v solution in *carbon dioxide-free water*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 40 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 1 volume of *tetrahydrofuran*, 20 volumes of *acetonitrile* and 80 volumes of a solution prepared by dissolving 5.0 ml of *perchloric acid* in 900 ml of *water*, adjusted to pH 3.5 with *dilute sodium hydroxide solution* and dilute to 1000 ml with *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Name	Relative retention time
Alfuzosin impurity D[1]	0.4
Alfuzosin hydrochloride (Retention time: about 8 minutes)	1.0
Alfuzosin impurity A[2]	1.2

[1]*N*-(4-amino-6,7-dimethoxyquinazolin-2-yl)-*N*-methylpropane-1,3-diamine,
[2]*N*-[3-[(4-amino-6,7-dimethoxyquinazolin-2-yl)methylamino]propyl] furan-2-carboxamide.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak due to alfuzosin impurity D is not more than 0.2 times the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent). The area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 0.3 times the area of the principal peak in the chromatogram obtained with the reference solution (0.3 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 1.0 g.

Assay. Weigh 0.3 g, dissolve in 40 ml of *acetic acid*, add 40 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*. Determine the end point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04259 g of $C_{19}H_{27}N_5O_4,HCl$.

Storage. Store protected from light and moisture.

Alfuzosin Prolonged-release Tablets

Alfuzosin Hydrochloride Prolonged-release Tablets

Alfuzosin Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Alfuzosin Prolonged-release Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of alfuzosin hydrochloride, $C_{19}H_{27}N_5O_4,HCl$.

Usual strength. 10 mg.

Identification

Disperse a quantity of the powdered tablets containing 30 mg of Alfuzosin Hydrochloride with 150 ml of *water* for 5 minutes and filter. To the filtrate, add 10 ml of *18 M ammonia*, extract with two 25 ml quantities of *dichloromethane*, wash the combined extracts with 10 ml of *water*, dry over *sodium sulphate* and evaporate to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum obtained with *alfuzosin hydrochloride IPRS* treated in the same manner or with the reference spectrum of alfuzosin.

Tests

Dissolution (2.5.2). Complies with the test stated under Tablets.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing 15 mg of Alfuzosin Hydrochloride in 70 ml of *methanol* with the aid of ultrasound for 30 minutes, add 10 ml of *0.01M hydrochloric acid* , cool, dilute to 100.0 ml with *methanol* and filter. Dilute 1.0 ml of the solution to 5.0 ml with the mobile phase.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: mobile phase: a mixture of 1 volume of *tetrahydrofuran*, 20 volumes of *acetonitrile* and 80 volumes of sodium perchlorate solution prepared by dissolving 5 ml of *perchloric acid* to 900 ml of *water*, adjusted to pH 3.5 with *2 M sodium hydroxide* and dilute to 1000 ml with *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent), the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent). Ignore any peak with an area less than

0.05 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Uniformity of content. Complies with the test stated under Tablets using following test solution.

Test solution. Disperse 1 tablet in 70 ml of *methanol* with the aid of ultrasound for 30 minutes, add 10 ml of *0.01M hydrochloric acid*, cool, dilute to 100.0 ml with *methanol* and filter. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 10 mg of Alfuzosin Hydrochloride in 70 ml of *methanol* with the aid of ultrasound for 30 minutes, add 10 ml of *0.01M hydrochloric acid*, cool, dilute to 100 ml with *methanol* and filter. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution. A 0.001 per cent w/v solution of *alfuzosin hydrochloride IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{27}N_5O_4$,HCl in the tablets.

Alfuzosin Tablets

Alfuzosin Hydrochloride Tablets

Alfuzosin Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of alfuzosin hydrochloride, $C_{19}H_{27}N_5O_4$,HCl.

Usual strength. 10 mg.

Identification

Disperse a quantity of the powdered tablets containing 30 mg of Alfuzosin Hydrochloride with 150 ml of *water* for 5 minutes and filter. To the filtrate, add 10 ml of *18 M ammonia*, extract with two 25-ml quantities of *dichloromethane*, wash the combined extracts with 10 ml of *water*, dry over *sodium sulphate* and evaporate to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum obtained with *alfuzosin hydrochloride IPRS* treated in the same manner or with the reference spectrum of alfuzosin.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the mobile phase to obtain a solution containing a 0.0001 per cent w/v of Alfuzosin Hydrochloride.

Reference solution. A 0.0001 per w/v solution of *alfuzosin hydrochloride IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

- injection volume: 100 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{27}N_5O_4$,HCl in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{19}H_{27}N_5O_4$,HCl.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing 15 mg of Alfuzosin Hydrochloride in 70 ml of *methanol* with the aid of ultrasound for 30 minutes, add 10 ml of *0.01M hydrochloric acid*, cool, dilute to 100.0 ml with *methanol* and filter. Dilute 1.0 ml of the solution to 5.0 ml with the mobile phase.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 1 volume of *tetrahydrofuran*, 20 volumes of *acetonitrile* and 80 volumes of sodium perchlorate solution prepared by dissolving 5 ml of *perchloric acid* to 900 ml of *water*, adjusted to pH 3.5 with *2 M sodium hydroxide* and add sufficient *water* to produce 1000 ml,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any

secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent), the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Uniformity of content. Complies with the test stated under Tablets using following test solution.

Test solution. Disperse 1 tablet in 70 ml of *methanol*, with the aid of ultrasound for 30 minutes, add 10 ml of *0.01M hydrochloric acid*, cool, dilute to 100.0 ml with *methanol* and filter. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 10 mg of Alfuzosin Hydrochloride in 70 ml of *methanol* with the aid of ultrasound for 30 minutes, add 10 ml of *0.01M hydrochloric acid*, cool, dilute to 100.0 ml with *methanol* and filter. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution. A 0.001 per cent w/v solution of *alfuzosin hydrochloride IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{27}N_5O_4$,HCl in the tablets.

Alginic Acid

Polymannuronic Acid

Alginic acid is a hydrophilic colloidal mixture of polyuronic acids, $[(C_6H_8O_6)_n]$, composed of residues of D-mannuronic acid and L-guluronic acid extracted with dilute alkali from various species of brown seaweeds (Fam. Phaeophyceae).

Alginic Acid contains not less than 19.0 per cent and not more than 25.0 per cent of carboxylic acid groups (COOH), calculated on the dried basis.

Category. Pharmaceutical aid.

Description. A white to yellowish-white, fibrous powder.

Identification

A. To 5 ml of a 0.75 per cent w/v solution in *0.1 M sodium hydroxide* add 1 ml of *calcium chloride solution*; a gelatinous precipitate is formed.

B. To 5 ml of the solution obtained in test A add 1 ml of *2 M sulphuric acid*; a gelatinous precipitate is formed.

C. To about 5 mg in a test-tube add 5 ml of *water*, 1 ml of a freshly prepared 1 per cent w/v solution of *1,3-naphthalenediol* in *ethanol (95 per cent)* and 5 ml of *hydrochloric acid*. Heat the mixture to boiling, boil gently for 3 minutes and cool to about 15°. Transfer the contents of the test-tube to a small separator with the aid of 5 ml of *water* and extract with 15 ml of *di-isopropyl ether*; the di-isopropyl ether extract exhibits a deep purple colour which is more intense than that exhibited by a blank prepared in the same manner without the substance under examination.

Tests

pH (2.4.24). 1.5 to 3.5, determined in a 3.0 per cent w/v dispersion in *water*.

Acid value. Not less than 230, calculated on the dried basis and determined in the following manner. Weigh 1.0 g and suspend in a mixture of 50 ml of *water* and 30 ml of a 4.4 per cent w/v solution of *calcium acetate*. Shake vigorously, allow the mixture to stand for 1 hour, add *phenolphthalein solution* and titrate the liberated acetic acid with *0.1 M sodium hydroxide*. Carry out a blank titration.

Calculate the acid value from the expression 5.611 *A/W*, where *A* is the volume, in ml, of *0.1 M sodium hydroxide* consumed and W is the weight, in g, of the sample.

Arsenic (2.3.10). Mix 2.0 g with 5 ml of *sulphuric acid*, add a few glass beads and digest at a temperature not exceeding 120° until charring begins. Additional sulphuric acid may be added if necessary but the total volume of acid added should not exceed 10 ml. Add cautiously, dropwise, *hydrogen peroxide solution (100 vol)* allowing the reaction to subside and again heating between addition of drops. Discontinue heating if foaming becomes excessive. When the reaction has abated, heat cautiously rotating the flask occasionally. Maintain oxidising conditions at all times during the digestion by adding small quantities of the hydrogen peroxide solution whenever the mixture turns brown or darkens. Continue the digestion until the organic matter has been destroyed, gradually raising the temperature until fumes of sulphur trioxide are copiously evolved and the solution becomes colourless or has only a light straw colour. Cool, add cautiously 10 ml of *water*, mix, and again evaporate till there is strong fuming, repeating this procedure to remove any trace of hydrogen peroxide. Cool, add cautiously 10 ml of *water*, wash the sides of the flask with

a few ml of *water* and dilute with *water* to 35 ml. The resulting solution complies with the limit test for arsenic (5 ppm).

Heavy metals (2.3.13). 0.5 g complies with the limit test for heavy metals, Method B (40 ppm). Use *nitric acid* in place of *sulphuric acid* to wet the sample.

Microbial contamination (2.2.9). 1 g is free from *Escherichia coli* and 10 g is free from *Salmonella* and *Shigella*.

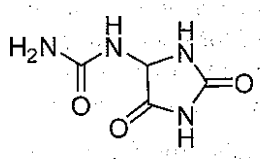
Total ash (2.3.19). Not more than 4.0 per cent, determined on 0.5 g by Method B.

Loss on drying (2.4.19). Not more than 15.0 per cent, determined on 0.1 g by drying in an oven at 105° for 4 hours.

Assay. Weigh 0.25 g, add 25 ml of *water* and 25.0 ml of *0.1 M sodium hydroxide* and titrate with *0.1 M hydrochloric acid* using 0.2 ml of *dilute phenolphthalein solution* as indicator. Repeat the operation without the substance under examination. The difference between the titrations represents the amount of sodium hydroxide required.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.004502 g of carboxylic acid groups (COOH).

Allantoin



$C_4H_6N_4O_3$ Mol. Wt. 158.1

Allantoin is (*RS*)-(2,5-dioxo-4-imidazolidinyl)urea.

Allantoin contains not less than 98.5 per cent and not more than 101.0 per cent of $C_4H_6N_4O_3$, calculated on the dried basis.

Category. Astringent.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *allantoin IPRS* or with the reference spectrum of allantoin.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

C. Boil 20 mg with a mixture of 1 ml each of *dilute sodium hydroxide solution* and *water*, allow to cool. Add 1 ml of *dilute hydrochloric acid*. To 0.1 ml of the solution add 0.1 ml of a 10 per cent w/v solution of *potassium bromide*, 0.1 ml of a 2 per cent w/v solution of *resorcinol* and 3 ml of *sulphuric acid*. Heat for 10 minutes on a water bath; a dark blue colour develops, which becomes red after cooling and pouring into about 10 ml of *water*.

D. Heat about 0.5 g, ammonia vapour is evolved, which turns *red litmus paper* blue.

Tests

Acidity or alkalinity. To 5 ml of a 0.5 per cent w/v solution in *carbon dioxide-free water* with heating if necessary (solution A), add 5 ml of *carbon dioxide-free water*, 0.1 ml of *methyl red solution* and 0.2 ml of *0.01 M sodium hydroxide*, the solution is yellow. Add 0.4 ml of *0.01 M hydrochloric acid*, the solution is red.

Optical rotation (2.4.22). −0.10° to +0.10°, determined on solution A.

Reducing substances. Shake 1.0 g with 10 ml of *water* for 2 minutes, filter. Add 1.5 ml of *0.02 M potassium permanganate*. The solution must remain violet for at least 10 minutes.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *cellulose*.

Mobile phase. A mixture of 15 volumes of *glacial acetic acid*, 25 volumes of *water* and 60 volumes of *butanol*.

Test solution (a). Dissolve 0.1 g of the substance under examination in 5.0 ml of *water* with heating and allow to cool, dilute to 10.0 ml with *methanol*. (*Use the solution immediately after preparation*).

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with a mixture of 1 volume of *methanol* and 1 volume of *water*.

Reference solution (a). A 0.1 per cent w/v solution of *allantoin IPRS* in a mixture of 1 volume of *methanol* and 1 volume of *water*.

Reference solution (b). Dissolve 10 mg of *urea* in 10.0 ml of *water*. Dilute 1.0 ml of the solution to 10.0 ml with *methanol*.

Reference solution (c). Mix 1.0 ml each of reference solution (a) and reference solution (b).

Apply to the plate 10 µl of test solution (a) and 5 µl each of test solution (b), reference solution (a), (b) and (c). Allow the mobile phase to rise 10 cm. Dry the plate in air, and spray with a 0.5 per cent w/v solution of *dimethylaminobenzaldehyde* in a mixture of 1 volume of *hydrochloric acid* and 3 volumes of *methanol*. Dry the plate in a current of hot air. Examine in daylight after 30 minutes. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the principal spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid

unless the chromatogram obtained with reference solution (c) shows two clearly separated principal spots.

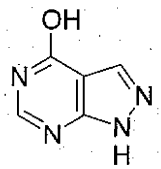
Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.1 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 120 mg in 40 ml of *water*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01581 g of $C_4H_6N_4O_3$.

Allopurinol



$C_5H_4N_4O$ Mol. Wt. 136.1

Allopurinol is a tautomeric mixture of 1*H*-pyrazolo[3,4-*d*] pyrimidin-4-ol and 1,5-dihydro-4*H*-pyrazolo[3,4-*d*]pyrimidin-4-one.

Allopurinol contains not less than 98.0 per cent and not more than 101.0 per cent of $C_5H_4N_4O$, calculated on the dried basis.

Category. Uricosuric agent.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *allopurinol IPRS* or with the reference spectrum of allopurinol.

B. Dissolve 0.1 g in 10 ml of *0.1 M sodium hydroxide* and add sufficient *0.1 M hydrochloric acid* to produce 100.0 ml; dilute 10.0 ml to 100.0 ml with *0.1 M hydrochloric acid* and dilute 10.0 ml of the solution to 100.0 ml with *0.1 M hydrochloric acid*. When examined in the range 220 nm to 360 nm (2.4.7), the resulting solution shows an absorption maximum at about 250 nm and a minimum at about 231 nm; ratio of the absorbance at the minimum at about 231 nm to that at the maximum at about 250 nm, 0.52 to 0.62.

C. Dissolve 50 mg in 5 ml of *dilute sodium hydroxide solution*, add 1 ml of *alkaline potassium mercuri-iodide solution*, heat to boiling and allow to stand; a flocculent yellow precipitate is produced.

D. Shake about 0.1 g with 5 ml of *dilute sodium hydroxide solution*, add 3 ml of *lithium and sodium molybdophosphotungstate solution* and 5 ml of a 20 per cent w/v solution of *sodium carbonate*; a grey-blue colour is produced.

Tests

Appearance of solution. A 5.0 per cent w/v solution in *2 M sodium hydroxide* is clear, (2.4.1) and not more intensely coloured than reference solution YS6 or GYS4 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Use freshly prepared solutions, store and inject at 8°, using a cooled autosampler.

Test solution. Dissolve 25 mg of the substance under examination in 2.5 ml of a 0.4 per cent w/v solution of *sodium hydroxide* and dilute immediately to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 2.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). A solution containing 5.0 mg each of *allopurinol impurity A IPRS (5-amino-1H-pyrazole-4-carboxamide IPRS), allopurinol impurity B IPRS (5-(formylamino)-1H-pyrazole-4-carboxamide IPRS)* and *allopurinol impurity C IPRS (5-(4H-1,2,4–triazol-4-yl)-1H-pyrazole-4-carboxamide IPRS)* in 5.0 ml of a 0.4 per cent w/v solution of *sodium hydroxide* and dilute immediately to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a 0.125 per cent w/v solution of *potassium dihydrogen phosphate*,
- flow rate: 1.4 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

The elution order of the peaks is allopurinol impurity A, allopurinol impurity B, allopurinol impurity C and allopurinol. The retention time for allopurinol is about 10 minutes.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to allopurinol impurity B and allopurinol impurity C is not less than 1.1.

Inject reference solution (a), (b) and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of the peak due to allopurinol impurity A is not more than

twice the area of corresponding peak in the chromatogram obtained with reference solution (b) (0.2 per cent). The area of the peak due to allopurinol impurity C is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The area of the peak due to allopurinol impurity B and of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). The sum of areas of all the secondary peaks other than allopurinol impurity A, B and C is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.2 g and dissolve with gentle heating, if necessary, in 50 ml of *dimethylformamide*. Titrate with *0.1 M tetrabutylammonium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.01361 g of $C_5H_4N_4O$.

Allopurinol Tablets

Allopurinol Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of allopurinol, $C_5H_4N_4O$.

Usual strengths. 100 mg; 300 mg.

Identification

A. When examined in the range 230 nm to 360 nm (2.4.7), the solution obtained in the Assay shows an absorption maximum only at about 250 nm.

B. Disperse a quantity of the powdered tablets containing 0.1 g of Allopurinol with 5 ml of *dilute sodium hydroxide solution*, add 3 ml of *lithium and sodium molybdo-phosphotungstate solution* and 5 ml of a 20 per cent w/v solution of *sodium carbonate*; a grey-blue colour is produced.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium: 900 ml of *0.01 M hydrochloric acid*,
Speed and time. 75 rpm for 45 minutes.

Withdraw a suitable volume of the medium and filter. Reject the first few ml of the filtrate and dilute a suitable volume of the filtrate with dissolution medium. Measure the absorbance of the resulting solution at the maximum at about 250 nm (2.4.7). Calculate the content of allopurinol, $C_5H_4N_4O$ in the medium from the absorbance obtained from a solution containing 0.001 per cent w/v of *allopurinol IPRS* prepared by dissolving in minimum amount of *0.1 M sodium hydroxide* and diluted with the dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_5H_4N_4O$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 0.1 g of Allopurinol with 10 ml of *0.1 M sodium hydroxide* with the aid of ultrasound and immediately dilute to 200.0 ml with mobile phase A, filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase A. Further dilute 1.0 ml of the solution to 10.0 ml with mobile phase A.

Reference solution (b). Dissolve 10 mg of *allopurinol impurity A IPRS (5–amino–1H–pyrazole–4–carboxamide IPRS)* in mobile phase A, add 20 ml of the test solution and immediately dilute to 100.0 ml with mobile phase A. Further dilute 1.0 ml of the solution to 100.0 ml with mobile phase A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Nucleosil C18),
- mobile phase: A. a mixture of 10 volumes of *methanol* and 90 volumes of a 0.125 per cent w/v solution of *potassium dihydrogen orthophosphate*,
  B. a mixture of 30 volumes of *methanol* and 70 volumes of a 0.125 per cent w/v solution of *potassium dihydrogen orthophosphate*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
30	0	100
40	0	100
42	100	0

The elution order of the peaks is allopurinol impurity A, allopurinol impurity B, allopurinol impurity C and allopurinol. The retention time for allopurinol is about 10 minutes.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to allopurinol impurity A and allopurinol is not less than 3.0.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of the peak due to allopurinol impurity A is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.2 per cent). The area of unresolved double peak, the peak at retention time of about 6.1 minutes is not more than twice the area of the principle peak in the chromatogram obtained with reference solution (a) (0.2 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). The sum of the areas of any other secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent). Ignore any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.1 g of Allopurinol with 20 ml of *0.05 M sodium hydroxide* for 15 to 20 minutes, add 75 ml of *0.1 M hydrochloric acid* shake for 10 minutes, add sufficient *0.1 M hydrochloric acid* to produce 250.0 ml, filter. Dilute 5.0 ml of the filtrate to 250.0 ml with *0.1 M hydrochloric acid*. Measure the absorbance of the resulting solution at the maximum at about 250 nm (2.4.7) using *0.1 M hydrochloric acid* as the blank.

Calculate the content of $C_5H_4N_4O$, taking 563 as the specific absorbance at 250 nm.

Aloes

Aloes is the dried juice of the leaves of *Aloe barbadensis* Miller *(A. vera* Linn), known in commerce as Curacao Aloes or Barbados Aloes, or of *A. ferox* Miller and hybrids of this species with *A. africana* Miller and *A. spicata* Baker, known in commerce as Cape Aloes (Fam. Liliaceae). Indian Aloes of commerce is obtained from *A. barbadensis*.

Aloes contains not less than 50.0 per cent of water-soluble extractive. Curacao Aloes contains not less than 18.0 per cent and Cape Aloes not less than 28.0 per cent of hydroxyanthracene derivatives, calculated as anhydrous barbaloin.

Category. Laxative.

Description. *Unground Curacao Aloes* — Brownish-black, opaque masses; fractured surface uneven, waxy and somewhat resinous.

Unground Cape Aloes — Dark-brown or greenish-brown to olive-brown masses; fractured surface shiny and conchoidal.

Identification

Mix 0.5 g with 50 ml of *water*, boil until nearly dissolved, cool, add 0.5 g of *silica gel* and filter. On the filtrate carry out the following tests.

A. Heat 5 ml with 0.2 g of *borax* until dissolved, add a few drops of the solution to a test-tube nearly filled with *water*; a green fluorescence is produced.

B. Mix 2 ml with 2 ml of *bromine water*; a pale yellow precipitate is produced. The supernatant liquid is violet with Curacao Aloes; no such violet colour appears with Cape Aloes.

C. Mix 5 ml with 2 ml of *nitric acid*; with Cape Aloes a reddish-yellow colour is produced; with Socotrine Aloes a pale brownish-yellow colour is produced; with Cape Aloes a yellowish-brown colour passing rapidly to green is produced.

D. Determine by thin-layer chromatography (2.4.17), coating the plate with silica *gel G*.

Mobile phase. A mixture of 100 volumes of *ethyl acetate*, 17 volumes of *methanol* and 13 volumes of *water*.

Test solution. Heat 0.5 g, in powder, with 20 ml *methanol* to boiling on a water-bath, shake well, decant the supernatant liquid, keep at 4° and use within 24 hours.

Reference solution. Dissolve 50 mg of *barbaloin* in 10.0 ml *methanol*.

Apply to the plate 5 µl of each solution as bands 20 mm x 3 mm. Allow the mobile phase to rise 15 cm. Dry the plate in a current of air, spray with a 10 per cent w/v solution of *potassium hydroxide* in *methanol* and examine under ultraviolet light at 365 nm. The chromatogram obtained with the reference solution shows a yellow band with an R_f value of 0.4 to 0.5. In the case of Curacao Aloes, the chromatogram obtained with the test solution shows a yellow fluorescent band corresponding to that due to barbaloin in the chromatogram obtained with the reference solution and in the lower part a light blue fluorescent band (corresponding to aloesine). In the case of Cape Aloes, the test solution shows a yellow fluorescent band corresponding to that due to barbaloin in the chromatogram obtained with the reference solution and in the lower part two yellow fluorescent bands (due to aloinosides A and B) as well as a blue fluorescent band (due to aloesine). Heat the plate at 110° for 5 minutes. In the case of Curacao Aloes, with the test solution a violet fluorescent band appears just below the yellow band corresponding to barbaloin while in the case of Cape Aloes no such violet band appears.

Tests

Ethanol-insoluble substances. Weigh 1.0 g, in fine powder, and add to 50 ml of *ethanol (95 per cent)* in a flask. Reflux the mixture for 15 minutes. Remove the source of heat and set aside for 1 hour, shaking frequently, filter through a small dried and tared filter paper or suitable filtering crucible and wash the residue on the filter with *ethanol (95 per cent)* till the washings are colourless. The residue after drying to constant weight at 105° weighs not more than 0.1 g.

Water-soluble extractive. Weigh 2.0 g, in fine powder, and macerate with about 60 to 70 ml of *water* in a flask. Shake the mixture at 30-minute intervals for 8 hours and allow to stand for a further 16 hours without shaking. Filter, wash the flask and the residue with small portions of *water*, passing the washings through the filter until the filtrate measures 100 ml. Evaporate 50 ml of this filtrate to dryness in a tared dish on a water-bath and dry at 105° for 3 hours; the residue weighs not less than 0.5 g.

Total ash (2.3.19). Not more than 0.5 per cent, determined on 1.0 g by Method A.

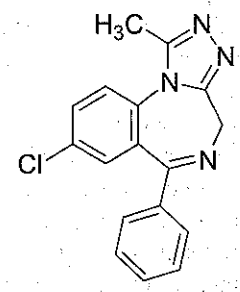
Loss on drying (2.4.19). Not more than 12.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Moisten 0.2 g, in fine powder, with 2 ml of *methanol*, add 5 ml of *water* at about 60°, mix, add a further 75 ml of *water* at about 60°, shake for 30 minutes, cool, filter through a filter paper, washing the flask with 20 ml of *water* and add sufficient *water* to the combined filtrate and washings to produce 1000.0 ml. Transfer 10.0 ml of the solution to a flask containing 1 ml of a 60 per cent w/v solution of *ferric chloride hexahydrate* and 6 ml of *hydrochloric acid*, heat in a water-bath under a reflux condenser for 4 hours so that the water level is always above that of the liquid in the flask, cool, transfer the solution to a separating funnel, rinsing the flask successively with 4 ml of *1 M sodium hydroxide* and 4 ml of *water* and adding the rinsings to the contents of the separating funnel. Extract with three quantities, each of 20 ml, of *carbon tetrachloride* and wash the combined carbon tetrachloride layers with two quantities, each of 100 ml, of *water*, discarding the washings. Dilute the organic phase to 100.0 ml with *carbon tetrachloride*, evaporate 20.0 ml carefully to dryness on a water-bath and dissolve the residue in 10.0 ml of *1 M sodium hydroxide*. Immediately measure the absorbance of the resulting solution at the maximum at about 440 nm and at about 500 nm (2.4.7) Calculate the content of anhydrous barbaloin, taking 200 as the specific absorbance at 500 nm. The result of the Assay is not valid unless the ratio of the absorbance at about 500 nm to that at about 440 nm is not less than 1.9.

Storage. Store protected from light and moisture.

Labelling. The label states whether the material is Curacao Aloes or Cape Aloes.

Alprazolam



$C_{17}H_{13}ClN_4$ Mol. Wt. 308.8

Alprazolam is 8-chloro-1-methyl-6-phenyl-4*H*-1,2,4-triazolo[4,3-*a*][1,4]benzodiazepine.

Alprazolam contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{17}H_{13}ClN_4$, calculated on the dried basis.

Category. Anxiolytic.

Description. A white to off-white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *alprazolam IPRS* or with the reference spectrum of alprazolam.

B. Dissolve 10 mg in *methanol* and dilute to 500.0 ml with *methanol*. Dilute 20.0 ml of the solution to 100.0 ml with *methanol*. When examined in the range 210 nm to 360 nm (2.4.7), the solution shows an absorption maximum at about 220 nm.

C. Melts at about 225° (2.4.21).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in *dimethylformamide* and dilute 10.0 ml with *dimethylformamide*.

Reference solution. Dilute 5.0 ml of the test solution to 100.0 ml with *dimethylformamide*. Dilute 0.5 ml of the solution to 10.0 ml with *dimethyformamide*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with phenylsilane bonded to porous silica (5 µm),
- column temperature: 40°,

– mobile phase: A. a mixture of 44 volumes of a buffer solution prepared by dissolving 7.7 g of *ammonium acetate* in 1000 ml of *water*, adjusted to pH 4.2 with *glacial acetic acid* and 56 volumes of *methanol*,
B. a mixture of 5 volumes of a buffer solution prepared by dissolving 7.7 g of *ammonium acetate* in 1000 ml of *water*, adjusted to pH 4.2 with *glacial acetic acid* and 95 volumes of *methanol*,
– a gradient programme using the conditions given below,
– flow rate: 2 ml per minute,
– spectrophotometer set at 254 nm,
– injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	98	2
15	98	2
35	1	99
40	1	99
42	98	2

Equilibrate the column for at least 30 minutes with the initial eluent composition. For subsequent chromatographs equilibrate the column for 10 minutes with the same eluent. The retention time of the principal peak is about 10 minutes.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.25 per cent). Ignore any peaks with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.5 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in *acetonitrile* and dilute to 100.0 ml with *acetonitrile*. Dilute 10.0 ml of the solution to 100.0 ml with *acetonitrile*.

Reference solution. A 0.0025 per cent w/v solution of *alprazolam IPRS* in *acetonitrile*.

Chromatographic system
– a stainless steel column 25 cm x 4.6 mm, packed with porous silica particles (3 to 10 µm),
– mobile phase: a mixture of 850 volumes of *acetonitrile*, 80 volumes of *chloroform*, 50 volumes of *1-butanol*, 20 volumes of *water* and 0.5 volume of *glacial acetic acid*,
– flow rate: 2 ml per minute,
– spectrophotometer set at 254 nm,
– injection volume: 10 µl or 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{13}ClN_4$.

Storage. Store protected from light.

Alprazolam Prolonged-release Tablets

Alprazolam Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Alprazolam Prolonged-release tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of alprazolam, $C_{17}H_{13}ClN_4$.

Usual strengths. 0.5 mg; 1 mg; 1.5 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2). Complies with the test stated under Tablets.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay, using the following solution as the test solution.

Test solution. Disperse 1 tablet in *acetonitrile* with the aid of ultrasound. Add about 25 ml of *water*, sonicate for 15 minutes, add about 12 ml of *acetonitrile* and further sonicate for 15 minutes, dilute to 50.0 ml with the mobile phase, filter.

Reference solution. A 0.05 per cent w/v solution of *alprazolam IPRS* in *acetonitrile*. Dilute if necessary with the mobile phase to obtain a concentration similar to that of the test solution.

Calculate the content of $C_{17}H_{13}ClN_4$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 2.5 mg of Alprazolam in 1.0 ml of *acetonitrile* and 50 ml of *water* with the aid of ultrasound for 15 minutes with occasional shaking. Further add 35 ml of *acetonitrile* and sonicate for 20 minutes and dilute to 100.0 ml with *acetonitrile*. Centrifuge at 3500 rpm for 20 minutes. Dilute the clear supernatant liquid with the mobile phase to obtain a solution containing 0.00125 per cent w/v of alprazolam.

Reference solution. A 0.05 per cent w/v solution of *alprazolam IPRS* in *acetonitrile*. To 5.0 ml of the solution, add 50 ml of *water* and dilute to 100.0 ml with *acetonitrile*. Further dilute the solution with the mobile phase to obtain a solution containing 0.00125 per cent w/v of alprazolam.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of buffer solution prepared by dissolving 0.8 g of *monobasic potassium phosphate* and 0.2 g of *dibasic potassium phosphate* in 1000 ml of *water*, adjusted to pH 6.0 with *dilute orthophosphoric acid* or *potassium hydroxide*, 35 volumes of *acetonitrile* and 5 volumes of *tetrahydrofuran*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{13}ClN_4$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Alprazolam Tablets

Alprazolam Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of alprazolam, $C_{17}H_{13}ClN_4$.

Usual strengths. 0.25 mg; 0.5 mg; 1 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 500 ml of a buffer solution prepared by dissolving 0.8 g of *monobasic potassium phosphate* and 0.2 g of *dibasic potassium phosphate* in 1000 ml of *water*, adjusted to pH 6.0 with *orthophosphoric acid*,

Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. The filtrate obtained as given above.

Reference solution. A 0.005 per cent w/v solution of *alprazolam IPRS* in *methanol*. Dilute the solution with the dissolution medium to obtain a solution of about the same concentration as the test solution.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of buffer solution, 35 volumes of *acetonitrile* and 5 volumes of *tetrahydrofuran*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 500 theoretical plates, and the relative standard deviation for replicate injections is not more than 3.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{13}ClN_4$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{17}H_{13}ClN_4$.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14).

Test solution. Transfer one tablet to a container, add 0.4 ml of *water* on to the tablet, allow the tablet to stand for 2 minutes and swirl the container to disperse the tablet. Add sufficient *acetonitrile* to produce a solution containing 0.0025 per cent w/v of alprazolam. Shake to mix and centrifuge, if necessary.

Reference solution. A 0.0025 per cent w/v solution of *alprazolam IPRS* in *acetonitrile*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with porous silica particles (5 to 10 µm),
- mobile phase: a mixture of 850 volumes of *acetonitrile*, 80 volumes of *chloroform*, 50 volumes of *1-butanol*, 20 volumes of *water* and 0.5 volume of *glacial acetic acid*.
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl or 20 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{13}ClN_4$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Place 5 tablets in a flask, add 2 ml of *water* and swirl to disperse the tablets. Add sufficient *acetonitrile* to produce 25.0 ml. Shake for 10 to 15 minutes and centrifuge if necessary. Dilute a portion of the clear solution with *acetonitrile* to produce a solution containing 0.0025 per cent w/v of alprazolam.

Reference solution. A 0.0025 per cent w/v solution of *alprazolam IPRS* in *acetonitrile*.

Use chromatographic system as described under Uniformity of content.

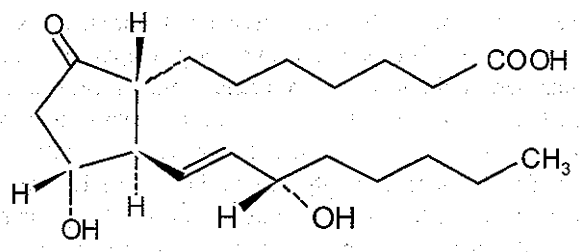
Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{13}ClN_4$ in the tablets.

Storage. Store protected from light.

Alprostadil



$C_{20}H_{34}O_5$ Mol. Wt. 354.5

Alprostadil is (11α,13*E*,15*S*)-11,15-dihydroxy-9-oxo-prost-13-en-1-oic acid.

Alrostadil contains not less than 95.0 per cent and not more than 102.5 per cent of $C_{20}H_{34}O_5$, calculated on the anhydrous basis.

Category. Indicated in erectile dysfunction.

Description. A white or slightly yellowish, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *alprostadil IPRS* or with the reference spectrum of alprostadil.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.3.22). – 70.0° to – 60.0°, determined on 0.5 per cent w/v solution in *ethanol (95 per cent)*.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE— Prepare the solutions protected from light.

Buffer solution. Dissolve 3.9 g of *sodium dihydrogen phosphate* in *water* and dilute to 1000.0 ml with *water*, adjusted to pH 2.5 with 0.3 per cent v/v solution of *orthophosphoric acid*.

Solvent mixture. Equal volumes of *acetonitrile* and *water*.

Test solution. Dissolve 10 mg of the substance under examination in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution (a). Dilute 100 µl of the test solution to 20.0 ml with the solvent mixture.

Reference solution (b). A solution containing 0.005 per cent w/v each of *alprostadil impurity H IPRS* and *alprostadil IPRS* in the solvent mixture.

Reference solution (c). In order to prepare in situ the degradation compounds (alprostadil impurity A and alprostadil impurity B), dissolve1 mg of the substance under examination in100 µl of *1 M sodium hydroxide* (the solution becomes brownish-red), wait for 3 minutes and add 100 µl of *1 M orthophosphoric acid* (yellowish-white opalescent solution); dilute to 5.0 ml with the solvent mixture.

System A

Chromatographic system

- a stainless steel column 25 cm x 4 mm, packed with base deactivated octylsilane bonded to porous silica (4 µm),
- column temperature: 35°,
- mobile phase: A. a mixture of 74 volumes of the buffer solution and 26 volumes of *acetonitrile*,
  B. a mixture of 20 volumes of the buffer solution and 80 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 200 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
75	100	0
76	0	100
86	0	100
87	100	0
102	100	0

Name	Relative retention time	Correction factor
Alprostadil impurity G[1]	0.8	0.7
Alprostadil impurity F[2]	0.88	0.8
Alprostadil impurity D[3]	0.90	1.0
Alprostadil impurity H[4]	0.96	0.7
Alprostadil (retention time: about 63 minutes)	1.0	---
Alprostadil impurity E[5]	1.1	0.7

[1]dinoprostone,

[2]8-epiprostaglandin E_1,

[3]15-epiprostaglandin E_1,

[4](5E)-prostaglandin E_2,

[5]11-epiprostaglandin E_1.

Inject reference solution (b). The test is not valid unless the between the peaks due to alprostadil impurity H and alprostadil is not less than 1.5.

System B

Chromatographic system

- a stainless steel column 25 cm x 4 mm, packed with base deactivated octylsilane bonded to porous silica (4 µm),
- column temperature: 35°,
- mobile phase: A. a mixture of 60 volumes of the buffer solution and 40 volumes of *acetonitrile,*
  B. a mixture of 20 volumes of the buffer solution and 80 volumes of *acetonitrile,*
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 200 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)

[6]15-oxoprostaglandin E_1,

[7]triphenylphosphine oxide,

[8]prostaglandin A_1,

[9]prostaglandin B_1,

[10]prostaglandin E_1,ethyl ester,

[11]prostaglandin E_1,isopropyl ester.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to alprostadil impurity A and alprostadil impurity B is not less than 1.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to alprostadil impurity A is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent), the area of any peak corresponding to alprostadil impurity B is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). The area of any other secondary peak is not more than 1.8 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.9 per cent) and not more than 1 such peak has an area more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). The sum of areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Water (2.3.43). Not more than 0.5 per cent, determined on 0.05 g.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances, System A.

NOTE— Prepare the solutions protected from light.

Solvent mixture. Equal volumes of *acetonitrile* and *water.*

Test solution. Dissolve 10 mg of the substance under examination in the solvent mixture and dilute to 25.0 ml with the solvent mixture. Dilute 3.0 ml of the solution to 20.0 ml with the solvent mixture.

Reference solution. A 0.006 per cent w/v solution of *alprostadil IPRS* in the solvent mixture.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{34}O_5$.

Storage. Store at a temperature of 2° to 8°.

Alprostadil Injection

Alprostadil Injection is a sterile solution of Alprostadil in Dehydrated Alcohol.

Alprostadil Injection contains not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of alprostadil, $C_{20}H_{34}O_5$.

Usual strength. 500 µg per ml for intravascular or intramuscular use.

Identification

Dry an amount of injection containing 2 mg of alprostadil on 500 mg of *potassium bromide* at about 40° to 50° under vacuum. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *alprostadil IPRS* or with the reference spectrum of alprostadil.

Tests

Water (2.3.43). Not more than 0.4 per cent.

Bacterial endotoxins (2.2.3). Not more than 5 Endotoxin Units per 100 µg of Alprostadil.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Gently evaporate a volume of injection containing 0.25 mg of Alprostadil to dryness using a stream of nitrogen. Add 150 µl of freshly prepared 4.0 per cent w/v solution of *α-bromo-2'-acetonaphthone* in *acetonitrile*. Add 150 µl of a freshly prepared 0.5 per cent w/v solution of *diisopropylethylamine* in *acetonitrile* to the container, cap and dissolve with the aid of ultrasound. Heat the container at 45° for 45 minutes. Sonicate again after heating is complete. Evaporate the solution using a stream of nitrogen, add 2.0 ml of internal standard solution and mix. *(NOTE — If incomplete dissolution is observed, discard the specimen).*

Internal standard solution. A 0.005 per cent w/v solution of *ethylparaben* in *dichloromethane*.

Reference solution. A 0.05 per cent w/v solution of *alprostadil IPRS* in *dehydrated alcohol*. Gently evaporate a 0.5 ml of the solution to dryness with a stream of nitrogen. Proceed as directed for the test solution beginning with "Add 150 µl of freshly prepared 4.0 per cent w/v solution....".

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with amino and cyano groups bonded to porous silica (5 µm),
- mobile phase: a mixture of 1000 volumes of *dichloromethane*, 6 volumes of *1,3-butanediol* and 0.5 volume of *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

The relative retention time with reference to alprostadil for ethylparaben is about 0.4

Inject the reference solution. The test is not valid unless the resolution between the peaks corresponding to alprostadil and the internal standard is not less than 9.0 and the relative standard deviation for replicate injections is not more than 2.5 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{34}O_5$ in the injection from the peak response ratios of alprostadil to the internal standard obtained with the reference solution and the test solution respectively.

Storage. Store protected from moisture, at a temperature of 2° to 8°, in single-dose containers, preferably of Type I glass.

Aluminium Acetate Ear Drops

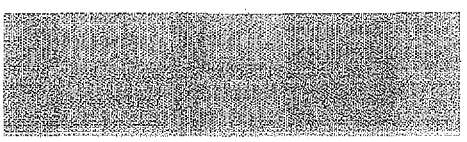
Aluminium Acetate Otic Drops; Aluminium Acetate Solution; Burow's Solution.

Aluminium Sulphate	255	g
Calcium Carbonate	100	g
Tartaric Acid	45	g
Glacial Acetic Acid	82.5	ml
Purified Water sufficient to produce	1000	ml

Dissolve the Aluminium Sulphate in 600 ml of Purified Water, add Glacial Acetic Acid followed by Calcium Carbonate mixed with the remainder of the Purified Water and allow to stand for not less than 24 hours in a cool place, stirring occasionally. Filter, add the Tartaric Acid to the filtrate and mix.

Aluminium Acetate Ear Drops contain not less than 1.7 per cent w/v and not more than 1.9 per cent w/v of aluminium, Al.

Description. A clear solution.



Tests

Weight per ml (2.4.29). 1.06 g to 1.08 g.

Other tests. Comply with the tests stated under Ear Drops.

Assay. Dilute 10.0 ml to 100.0 ml with *water*. To 10.0 ml of the resulting solution add 40.0 ml of *0.05 M disodium edetate*, 90 ml of *water* and 0.15 ml of *methyl red solution*. Neutralise by the addition of *1 M sodium hydroxide* dropwise and warm on a water-bath for 30 minutes. Cool, add 1 ml of *2 M nitric acid* and 5 g of *hexamine* and titrate with *0.05 M lead nitrate* using 0.5 ml of *xylenol orange solution* as indicator. Carry out a blank titration.

1 ml of *0.05 M disodium edetate* is equivalent to 0.001349 g of Al.

Storage. Store protected from light, in well-filled containers.

Dried Aluminium Hydroxide

Dried Aluminium Hydroxide Gel; Hydrated Aluminium Oxide

Dried Aluminium Hydroxide consists largely of hydrated aluminium oxide together with varying quantities of basic aluminium carbonate and bicarbonate.

Dried Aluminium Hydroxide contains not less than 47.0 per cent and not more than 60.0 per cent of Al_2O_3.

Description. A white, light, amorphous powder containing some aggregates.

Identification

A solution in *dilute hydrochloric acid* gives the reactions of aluminium salts (2.3.1).

Tests

pH (2.4.24). Not more than 10.0, determined in a 4.0 per cent w/v suspension in *carbon dioxide-free water*.

Arsenic (2.3.10). Dissolve 2 g in 18 ml of *brominated hydrochloric acid*, add 42 ml of *water* and remove the excess of bromine with a few drops of *stannous chloride solution AsT*. The resulting solution complies with the limit test for arsenic (5 ppm).

Heavy metals (2.3.13). Dissolve 0.33 g in 10 ml of *dilute hydrochloric acid* with the aid of heat, filter if necessary, and dilute to 25 ml with *water*. The resulting solution complies with the limit test for heavy metals Method A (60 ppm).

Chlorides (2.3.12). Dissolve 0.1 g in 10 ml of *dilute nitric acid*, boil, cool, dilute to 100 ml with *water* and filter. 20 ml of the filtrate complies with the limit test for chlorides (1.25 per cent).

Sulphates (2.3.17). Dissolve 0.5 g in 5 ml of *dilute hydrochloric acid*, boil, cool, dilute to 200 ml with *water* and filter. 5 ml of the filtrate complies with the limit test for sulphates (1.2 per cent).

Neutralising capacity. Pass a sufficient quantity, triturated if necessary, through a sieve of nominal mesh aperture of 150 µm. Weigh 0.5 g of the sifted material and add to 200.0 ml of *0.05 M hydrochloric acid* previously heated to 37° and stir continuously, maintaining the temperature at 37°; the pH of the solution, at 37°, after 10, 15 and 20 minutes, is not less than 1.8, 2.3 and 3.0 respectively and at no time is more than 4.5. Add 10.0 ml of *0.5 M hydrochloric acid* previously heated to 37°, stir continuously for 1 hour maintaining the temperature at 37° and titrate with *0.1 M sodium hydroxide* to pH 3.5.

Not more than 35.0 ml of *0.1 M sodium hydroxide* is required and the pH of the solution at 37° at no time is more than 4.5.

Microbial contamination (2.2.9). Total aerobic viable count is not more than 10^3 CFU and total fungal count is not more than 10^2 CFU per g determined by plate count. 1g is free from *bile-tolerant gram-negative bacteria* and *Escherichia coli*.

Assay. Dissolve 0.4 g in a mixture of 3 ml of *hydrochloric acid* and 3 ml of *water* by warming on a water-bath, cool to below 20° and dilute to 100.0 ml with *water*. To 20.0 ml of the solution, add 40.0 ml of *0.05 M disodium edetate*, 80 ml of *water*, and 0.15 ml of *methyl red solution* and neutralise by the dropwise addition of *1 M sodium hydroxide*. Warm on a water-bath for 30 minutes, add 3 g of *hexamine* and titrate with *0.05 M lead nitrate* using 0.5 ml of *xylenol orange solution* as indicator. Carry out a blank titration.

1 ml of *0.05 M disodium edetate* is equivalent to 0.002549 g of Al_2O_3.

Storage. Store protected from moisture.

Aluminium Hydroxide Gel

Aluminium Hydroxide Suspension; Aluminium Hydroxide Mixture

Aluminium Hydroxide Gel is an aqueous suspension of hydrated aluminium oxide together with varying quantities of basic aluminium carbonate and bicarbonate. It may contain Glycerin, Sorbitol, Sucrose or Saccharin as sweetening agents and Peppermint Oil or other suitable flavours. It may also contain suitable antimicrobial agents.

Aluminium Hydroxide Gel contains not less than 3.5 per cent and not more than 4.4 per cent w/w of Al_2O_3.

Category. Antacid.

Description. A white, viscous suspension, translucent in thin layers; small amounts of clear liquid may separate on standing.

Identification

A solution in *dilute hydrochloric acid* gives the reactions of aluminium salts (2.3.1).

Tests

pH (2.4.24). 5.5 to 8.0.

Arsenic (2.3.10). Dissolve 10.0 g in 18 ml of *brominated hydrochloric acid*, add 42 ml of *water* and remove the excess bromine with a few drops of *stannous chloride solution AsT*. The resulting solution complies with the limit test for arsenic (1 ppm).

Heavy metals (2.3.13). Dissolve 2.0 g in 10 ml of *dilute hydrochloric acid*, filter if necessary, and dilute to 25 ml with *water*. The resulting solution complies with the limit test for heavy metals, Method A (10 ppm).

Chlorides (2.3.12). Dissolve 0.5 g in 5 ml of *dilute nitric acid*, boil, cool, dilute to 100 ml with *water* and filter. 20 ml of the filtrate complies with the limit test for chlorides (0.25 per cent).

Sulphates (2.3.17). Dissolve 1.0 g in 5 ml of *dilute hydrochloric acid* with the aid of heat. Cool and dilute to 100 ml with *water*. Mix well and filter, if necessary. To 5 ml of the filtrate add 2 ml of *dilute hydrochloric acid*; the solution complies with the limit test for sulphates (0.3 per cent).

Neutralising capacity. Disperse 5.0 g in 100 ml of *water*, heat to 37°, add 100.0 ml of *0.1 M hydrochloric acid* previously heated to 37° and stir continuously, maintaining the temperature at 37°; the pH of the solution, at 37°, after 10, 15 and 20 minutes, is not less than 1.8, 2.3 and 3.0 respectively and at no time is more than 4.5. Add 10.0 ml of *0.5 M hydrochloric acid* previously heated to 37°, stir continuously for 1 hour maintaining the temperature at 37° and titrate with *0.1 M sodium hydroxide* to pH 3.5.

Not more than 50.0 ml of *0.1 M sodium hydroxide* is required.

Microbial contamination (2.2.9). Total aerobic viable count is not more than 10^2 CFU per ml determined by plate count. 1 ml is free from *Escherichia coli*.

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Dissolve 5.0 g in 3 ml of *hydrochloric acid* by warming on a water-bath; cool to below 20° and dilute to 100.0 ml with *water*. To 20.0 ml of the solution, add 40.0 ml of *0.05 M disodium edetate*, 80 ml of *water*, and 0.15 ml of *methyl red solution* and neutralise by the dropwise addition of *1 M sodium hydroxide*. Warm on a water-bath for 30 minutes, add 3 g of *hexamine* and titrate with *0.05 M lead nitrate* using 0.5 ml of *xylenol orange solution* as indicator. Carry out a blank titration.

1 ml of *0.05 M disodium edetate* is equivalent to 0.002549 g of Al_2O_3.

Storage. Store at a temperature not exceeding 30°. Do not freeze.

Aluminium Magnesium Silicate

$Al_2MgO_8Si_2$ Mol. Wt. 262.4

Aluminium Magnesium Silicate is mixture of particles with colloidal particle size of montmorillonite and saponite, free from grit and non-swellable ore.

Aluminium Magnesium Silicate contains not less than 95.0 per cent and not more than 105.0 per cent each of the stated amount of aluminium, Al and magnesium, Mg, calculated on the dried basis.

Category. Pharmaceutical aid.

Description. A almost white powder, granules or plates.

Identification

A. Fuse 1 g with 2 g of *anhydrous sodium carbonate*. Warm the residue with *water* and filter. Acidify the filtrate with *hydrochloric acid* and evaporate to dryness on a water bath. About 0.25 g of the residue gives the reaction of silicates (2.3.1).

B. Dissolve the remainder of the residue obtained in identification test A in a mixture of 5 ml of *dilute hydrochloric acid* and 10 ml of *water*. Filter and add *ammonium chloride buffer solution pH 10*. A white, gelatinous precipitate is formed. Centrifuge and keep the supernatant for identification C. Dissolve the remaining precipitate in *dilute hydrochloric acid*; gives the reaction of aluminium (2.3.1).

C. The supernatant liquid obtained after centrifugation in identification test B gives the reaction of magnesium (2.3.1).

Tests

pH (2.4.24). 9.0 to 10.0, determined in a 5.0 per cent w/v solution in *carbon dioxide-free water*.

Arsenic (2.3.10). Dissolve 16.6 g in 100 ml of *dilute hydrochloric acid* in a 250-ml beaker. Mix, cover with a watch glass and boil gently, with occasional stirring, for 15 minutes, allow the insoluble matter to settle and decant the supernatant liquid through a rapid-flow filter paper into a 250-ml volumetric flask, retaining as much sediment as possible in the beaker. To the residue in the beaker, add 25 ml of hot *dilute hydrochloric acid*, stir, heat to boiling, allow the insoluble matter to settle and decant the supernatant liquid through the filter into the volumetric flask. Repeat the extraction with 4 additional quantities, each of 25 ml, of hot *dilute hydrochloric acid*, decanting each supernatant liquid through the filter into the volumetric flask. At the last extraction, transfer as much of

the insoluble matter as possible onto the filter. Allow the combined filtrates to cool to room temperature and dilute to 250.0 ml with *dilute hydrochloric acid*. 50 ml of the resulting solution complies with the limit test for arsenic (3 ppm).

Lead. Not more than 15 ppm, determine by atomic absorption spectrophotometry (2.4.2), measuring at 217 nm using a oxidising air-acetylene flame.

Test solution. Dissolve 10 g in 100 ml of *dilute hydrochloric acid* in a 250-ml beaker. Mix, cover with a watch glass and boil for 15 minutes, cool to room temperature, allow the insoluble matter to settle. Decant the supernatant liquid through a rapid-flow filter paper into a 400-ml beaker. To the insoluble matter in the 250-ml beaker, add 25 ml of hot *water*. Stir, allow the insoluble matter to settle and decant the supernatant liquid through the filter into the 400-ml beaker. Repeat the extraction with 2 additional quantities, each of 25 ml of *water*, decanting each time the supernatant liquid through the filter into the 400-ml beaker. Wash the filter with 25 ml of hot *water*, collecting this filtrate in the 400-ml beaker. Concentrate the combined filtrates to about 20 ml by gently boiling. If a precipitate appears, add about 0.1 ml of *nitric acid*, heat to boiling and allow to cool to room temperature. Filter the concentrated extracts through a rapid-flow filter paper into a 50-ml volumetric flask. Transfer the remaining contents of the 400-ml beaker through the filter paper and into the flask with *water*. Dilute the solution to 50.0 ml with *water*.

Reference solution. Prepare the reference solution using *lead standard solution AAS (10 ppm Pb)*, diluted if necessary with *water*.

Loss on drying (2.4.19). Not more than 8.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Microbial contamination (2.2.9). Total aerobic viable count is not more than 10^3 CFU per g determined by plate count. 1 g is free from *Escherichia coli*.

Assay. *For aluminium*—Determine by atomic absorption spectrophotometry (2.4.2), measuring at 309 nm using a oxidising acetylene-nitrous oxide flame and aluminium hollow-cathode lamp.

Test solution. Mix 0.2 g with 1.0 g of *lithium metaborate* in a platinum crucible. Heat slowly at first and ignite at 1000 to 1200° for 15 minutes, cool, then place the crucible in a 100-ml beaker containing 25 ml of *dilute nitric acid* and add an additional 50 ml of *dilute nitric acid*, filling and submerging the crucible. Place a polytetrafluoroethylene-coated magnetic stirring bar in the crucible and stir gently with a magnetic stirrer until dissolution is complete. Pour the contents into a 250-ml beaker and remove the crucible. Warm the solution and transfer through a rapid-flow filter paper into a 250-ml volumetric flask, wash the filter and beaker with *water* and dilute to 250.0 ml with *water* (solution A). To 20.0 ml of solution A, add 20 ml of a 1.0 per cent w/v solution of *sodium chloride* and dilute to 100.0 ml with *water*.

Reference solution. Dissolve, with gentle heating, 1.0 g of *aluminium* in a mixture of 10 ml of *hydrochloric acid* and 10 ml of *water*, cool. Dilute to 1000.0 ml with *water* (1 mg of aluminium per millilitre). Into 3 identical volumetric flasks, each containing 0.2 g of *sodium chloride*, introduce 2.0 ml, 5.0 ml and 10.0 ml of the solution respectively, and dilute to 100.0 ml with *water*.

For magnesium—Determine by atomic absorption spectrophotometry (2.4.2), measuring at 285 nm using a reducing air acetylene flame and magnesium hollow-cathode lamp.

Test solution. Dilute 25.0 ml of solution A, prepared in the assay for aluminium, to 50.0 ml with *water*. To 5.0 ml of the solution add 20.0 ml of *lanthanum nitrate solution* and dilute to 100.0 ml with *water*.

Reference solution. Place 1.0 g of *magnesium* in a 250-ml beaker containing 20 ml of *water* and carefully add 20 ml of *hydrochloric acid*, warming if necessary to dissolve. Transfer the solution to a volumetric flask and dilute to 1000.0 ml with *water* (1 mg of magnesium per millilitre). Dilute 5.0 ml of the solution to 250.0 ml with *water*. Into 4 identical volumetric flasks, introduce 5.0 ml, 10.0 ml, 15.0 ml and 20.0 ml of the solution respectively. To each flask add 20.0 ml of *lanthanum nitrate solution* and dilute to 100.0 ml with *water*.

Labelling. The label states the content of aluminium and magnesium.

Aluminium, Magnesium and Simethicone Oral Suspension

Aluminium Hydroxide, Magnesium Hydroxide and Simethicone Oral Suspension

Aluminium, Magnesium and Simethicone Oral Suspension contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of aluminium hydroxide, $Al(OH)_3$ and magnesium hydroxide, $Mg(OH)_2$ and polydimethylsiloxane $[-(CH3)_2SiO-]_n$ is not less than 85.0 per cent and not more than 115.0 per cent of the stated amount of simethicone.

Usual strengths. Aluminium Hydroxide, 250 mg, Magnesium Hydroxide, 250 mg and Simethicone, 50 mg per 5 ml; Aluminium Hydroxide, 200 mg, Magnesium Hydroxide, 200 mg and Simethicone, 25 mg per 5 ml.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with

polydimethylsiloxane IPRS or with the reference spectrum of polydimethylsiloxane.

B. Dissolve about 5.0 g of oral suspension in 10.0 ml of *3 M hydrochloric acid*, add 5 drops of *methyl red solution* and heat to boiling. Add *6M ammonium hydroxide solution* until the colour changes to deep yellow, continue boiling for 2 minutes and filter; the filtrate gives the reactions of magnesium salts (2.3.1).

C. Wash the precipitate obtained in test B with 0.002 per cent w/v solution of hot *ammonium chloride solution* and dissolve the precipitate in *hydrochloric acid*. Divide the resulting solution into two equal portions. The dropwise addition of *6 M ammonium hydroxide solution* to first portion yields a gelatinous white precipitate, which does not dissolve in an excess of *6 M ammonium hydroxide solution*. The dropwise addition of *1 M sodium hydroxide* to the second portion yields a gelatinous white precipitate, which dissolves in an excess of *1 M sodium hydroxide*, leaving some turbidity.

Tests

pH (2.4.24). 7.0 to 8.6.

Neutralising capacity. Transfer an accurately weighed quantity of the uniform mixture, equivalent to the minimum labelled dosage, to a 250-ml beaker, add *water* to make a total volume of about 70 ml, and mix on the magnetic stirrer for 1 minute.

Further add 30.0 ml of *1.0 M hydrochloric acid* while continuing to stir with the magnetic stirrer for 10 minutes, after the addition of the acid, then begin to titrate immediately, titrate the excess of *hydrochloric acid* with *0.5 M sodium hydroxide* to obtain a pH of 3.5. Calculate the number of mEq of acid consumed by the solution using the formula:

$$\text{Total mEq} = (30 \times M_{HCl}) - (V_{NaOH} \times M_{NaOH})$$

in which M_{HCl} and M_{NaOH} are the molarities of the *hydrochloric acid* and the *sodium hydroxide* respectively; and V_{NaOH} is the volume of sodium hydroxide used for titration. Express the result in mEq of acid consumed per g of the substance tested.

Acceptance criteria. The acid consumed by the minimum single dose recommended in the labelling is not less than 5 mEq and not less than the number of mEq calculated by the formula:

$$\text{Result} = 0.55 \times (FA \times A) + 0.8 \times (FM \times M)$$

in which FA and FM are theoretical acid-neutralizing capacity of aluminum hydroxide [$Al(OH)_3$], 0.0385 mEq and theoretical acid-neutralizing capacity of magnesium hydroxide [$Mg(OH)_2$], 0.0343 mEq respectively, A and M are the amount of aluminum hydroxide [$Al(OH)_3$] in the sample, based on the stated quantity (mg) and amount of magnesium hydroxide [$Mg(OH)_2$] in the sample, based on the stated quantity (mg) respectively.

Other tests. Comply with the tests stated under Oral Liquids.

Microbial contamination (2.2.9). The total aerobic viable count is not more than 10^2 CFU per g. It meets the requirements of the tests for the absence of *Escherichia coli*.

Assay

Aluminium hydroxide — Transfer a measured volume containing about 0.8 g of the Aluminium Hydroxide to a suitable beaker. Add 20 ml of *water*, stir, and slowly add 10 ml of *hydrochloric acid*. Heat gently, if necessary, cool to room temperature, and filter into a 200.0 ml volumetric flask. Wash the filter with *water* into the flask, and add *water* to volume (solution A).

Pipet 10 ml of the solution A into a 250-ml beaker, add 20 ml of *water*, then add with continuous stirring, 25.0 ml of *0.05 M disodium edetate* and 20 ml of *acetic acid–ammonium acetate buffer*, and heat the solution near the boiling temperature for 5 minutes. Cool, add 50 ml of *alcohol* and 2 ml of *dithizone*. Titrate the excess *disodium edetate* with *0.05 M zinc sulphate* until the colour changes from green-violet to rose-pink. Repeat the procedure without the substance under examination. The difference between the titrations represents the amount of *disodium edetate* is consumed.

1 ml of *0.05 M disodium edetate* is equivalent to 0.0039 g of $Al(OH)_3$.

1 mg of dried aluminium hydroxide gel is equivalent to 0.765 mg of $Al(OH)_3$.

Magnesium hydroxide — Pipet a volume of the solution A containing 40 mg of Magnesium Hydroxide into a 400-ml beaker, add 200.0 ml of *water* and 20 ml of *triethanolamine*, and stir. Add 10 ml of *ammonia–ammonium chloride buffer* and 3 drops of an *eriochrome black indicator solution* prepared by dissolving 200 mg of *eriochrome black* in a mixture of 15 ml of *triethanolamine* and 5 ml of *alcohol*, and mixing. Cool the solution between 3° to 4° by immersion of the beaker in an ice bath, then remove, and titrate with *0.05 M disodium edetate* to a blue endpoint. Repeat the procedure without the substance under examination. The difference between the titrations represents the amount of *disodium edetate* is consumed.

1 ml of *0.05 M disodium edetate* is equivalent to 0.002916 g of $Mg(OH)_2$.

Polydimethylsiloxane — Determine by infrared absorption spectrophotometry (2.4.6).

Blank. Mix 10 ml of *toluene* with 0.5 g of *anhydrous sodium sulphate*, and centrifuge to obtain a clear supernatant.

Test solution. Transfer a measured volume containing about 50 mg of Simethicone to a suitable round, narrow-mouth, screw-capped, 100 ml bottle. Add 40 ml of *0.1 M sodium hydroxide*, and swirl to disperse. Add 25.0 ml of *toluene*, close the bottle securely with a cap having an inert liner, and shake

for 30 minutes on a reciprocating shaker. Transfer the mixture to a 125-ml separator, and allow to separate. Remove the upper, organic layer to a screw-capped, centrifuge tube containing 0.5 g of *anhydrous sodium sulphate*. Close the tube with a screw-cap having an inert liner, agitate vigorously, and centrifuge the mixture until a clear supernatant is obtained.

Reference solution. Weigh accurately about 50.0 mg of *polydimethylsiloxane IPRS* to a suitable round, narrow-mouth add 40 ml of *0.1 M sodium hydroxide*, and swirl to disperse. Add 25.0 ml of *toluene*, close the bottle securely with a cap having an inert liner, and shake for 30 minutes on a reciprocating shaker. Transfer the mixture to a 125-ml separator, and allow to separate. Remove the upper, organic layer to a screw-capped, centrifuge tube containing 0.5 g of *anhydrous sodium sulphate*. Close the tube with a screw-cap having an inert liner, agitate vigorously, and centrifuge the mixture until a clear supernatant is obtained.

Measure the absorbance by using 0.5-mm cell at the wavelength of maximum absorbance at about 7.9 µm, with an infrared absorption spectrophotometer.

Calculate the content of $[-(CH3)_2SiO-]_n$ in the oral suspension.

Sodium content — Determine by atomic absorption spectrophotometery (2.4.2), equipped with a sodium hollow-cathode lamp and an air–acetylene flame.

Blank. A mixture of 4.0 ml of *1 M hydrochloric acid* and 10.0 ml of *potassium chloride solution* in a 100-ml volumetric flask, and dilute with *water* to volume.

Potassium chloride solution. A solution containing *3.8 per cent w/v* of *potassium chloride* in *water*.

Sodium chloride solution. Weigh 254.2 mg of *sodium chloride* (previously dried at 105° for 2 hours) to a 100-ml volumetric flask and dilute to 100.0 ml with *water*. Dilute 1.0 ml of the solution to 100.0 ml with *water*. This solution contains 10 µg of sodium (equivalent to 25.42 µg of sodium chloride) per ml.

Test solution. Transfer 5.0 ml of Oral Suspension to a 100-ml volumetric flask. Add 50 ml of *1 M hydrochloric acid*, boil for 15 minutes, cool to room temperature, and dilute with *water* to volume. Filter, discarding the first few ml of the filtrate. Transfer 5.0 ml of the filtrate to a 100-ml volumetric flask containing 10.0 ml of *Potassium chloride solution*, and dilute with *water* to volume.

Reference solution. Transfer 4.0 ml of *1 M hydrochloric acid* and 10.0 ml of *potassium chloride solution* in a two 100-ml volumetric flask.. To the respective flask, add 5.0 ml and 10.0 ml of *sodium chloride solution* and, dilute to volume with *water*. The reference solutions contain 0.5 µg and 1.0 µg sodium per ml respectively.

Determine the absorbance of the reference solutions and the test solution at the sodium emission line of 589.0 nm. Plot the absorbance of the reference solution versus concentration, in µg per ml, of sodium, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration in µg per ml of sodium in the test solution.

Calculate the quantity, in mg, of Na in oral suspension taken by the formula:

$$(1/N) \times C \times D \times F$$

Where, N is the volume of the oral suspension taken to prepare the test solution, C is the concentration, in µg per ml, of sodium in the test solution, D is the dilution factor for the test solution, 2000 and F is the conversion factor, 0.001 mg per µg.

Storage. Store in tightly-closed containers and avoid freezing.

Labelling. The label states (1) the oral suspension to be labelled to state the sodium content, if it is more than 1 mg per ml; (2) The oral suspension may be labelled to state the aluminum hydroxide content in terms of the equivalent amount of dried aluminum hydroxide gel.

Aluminium, Magnesium and Simethicone Chewable Tablets

Aluminium Hydroxide, Magnesium Hydroxide and Simethicone Chewable Tablets

Aluminium, Magnesium and Simethicone Chewable Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of aluminium hydroxide $[Al(OH)_3]$ and magnesium hydroxide$[Mg(OH)_2]$ and polydimethylsiloxane$[-(CH3)_2SiO-]_n$ is not less than 85.0 per cent and not more than 115.0 per cent of the stated amount of simethicone.

Usual strengths. Aluminium Hydroxide, 300 mg, Magnesium Hydroxide, 200 mg and Simethicone, 25 mg; Aluminium Hydroxide, 250 mg, Magnesium Hydroxide, 250 mg and Simethicone, 50 mg; Aluminium Hydroxide, 300 mg, Magnesium Hydroxide, 150 mg and Simethicone, 40 mg; Aluminium Hydroxide, 300 mg, Magnesium Hydroxide, 300 mg and Simethicone, 25 mg.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *polydimethylsiloxane IPRS* or with the reference spectrum of polydimethylsiloxane.

B. Dissolve about 0.6 g of magnesium hydroxide in 25.0 ml of *3 M hydrochloric acid*, add 25 ml of *water* and mix. Boil gently for 2 minutes. Allow to cool, and filter, add 5 drops of *methyl red solution* and heat to boiling. Add *6M ammonia hydroxide*

solution until the colour changes to deep yellow, continue boiling for 2 minutes and filter; the filtrate gives the reactions of magnesium salts (2.3.1).

C. Wash the precipitate obtained in test B with 0.002 per cent w/v solution of hot *ammonium chloride* and dissolve the precipitate in *hydrochloric acid*. Divide the resulting solution into two equal portions. The dropwise addition of *6 M ammonium hydroxide solution* to first portion yields a gelatinous white precipitate, which does not dissolve in an excess of *6 M ammonium hydroxide solution*. The dropwise addition of *1 M sodium hydroxide* to the second portion yields a gelatinous white precipitate, which dissolves in an excess of *1 M sodium hydroxide*, leaving some turbidity.

Tests

Neutralising capacity. Weigh and powder 20 tablets, disperse one tablet in 250-ml of beaker, add 50.0 ml of *water* and mix on the magnetic stirrer for 1 minute. If wetting is desired, add not more than 5 ml of *alcohol* (neutralized to a pH of 3.5), and mix to wet the substance thoroughly. Add 70 ml of *water*, and mix on the magnetic stirrer for 1 minute. Further add 30.0 ml of *1 M hydrochloric acid* while continuing to stir with the magnetic stirrer for 10 minutes, after the addition of the acid. Discontinue stirring briefly, and without delay remove any gum base from the beaker using a long needle. Promptly rinse the needle with 20 ml of *water*, collecting the washing in the beaker, and further stirring for 5 minutes, then begin to titrate immediately, titrate the excess *hydrochloric acid* with *0.5 M sodium hydroxide* to obtain a pH of 3.5. Calculate the number of mEq of acid is consumed by the Tablet using the formula:

$$\text{Total mEq} = (30 \times M_{HCl}) - (V_{NaOH} \times M_{NaOH})$$

in which M_{HCl} and M_{NaOH} are the molarities of the *hydrochloric acid* and the *sodium hydroxide* respectively; and V_{NaOH} is the volume of sodium hydroxide used for titration. Express the result in mEq of acid consumed per g of the substance tested.

Acceptance criteria. The acid consumed by the minimum single dose recommended in the labelling is not less than 5 mEq and not less than the number of mEq calculated by the formula:

$$\text{Result} = 0.55 \times (FA \times A) + 0.8 \times (FM \times M)$$

in which FA and FM are theoretical acid-neutralizing capacity of aluminum hydroxide [$Al(OH)_3$], 0.0385 mEq and theoretical acid-neutralizing capacity of magnesium hydroxide [$Mg(OH)_2$], 0.0343 mEq respectively, A and M are the amount of aluminum hydroxide [$Al(OH)_3$] in the sample, based on the stated quantity (mg) and amount of magnesium hydroxide [$Mg(OH)_2$] in the sample, based on the stated quantity (mg) respectively.

Other tests. Comply with the tests stated under Tablets.

Assay

Aluminium hydroxide — Weigh and powder 20 tablets. Transfer a portion of the powder containing about 0.8 g of *aluminum hydroxide*, to a 150-ml beaker. Add 20 ml of *water*, stir, and slowly add 30 ml of *3 M hydrochloric acid*. Heat gently, if necessary, cool to room temperature, and filter into a 200-ml volumetric flask. Wash the filter with *water* into the flask, and add *water* to volume (solution A).

Pipet 10 ml of the solution A into a 250-ml beaker, add 20 ml of *water*, then add with continuous stirring, 25.0 ml of *0.05 M disodium edetate* and 20 ml of *acetic acid–ammonium acetate buffer*, and heat the solution near the boiling temperature for 5 minutes. Cool, add 50 ml of *alcohol* and 2 ml of *dithizone*. Titrate the excess *disodium edetate* with *0.05 M zinc sulphate* until the colour changes from green-violet to rose-pink. Repeat the procedure without the substance under examination. The difference between the titrations represents the amount of *disodium edetate* is consumed.

1 ml of *0.05 M disodium edetate* is equivalent to 0.0039 g of $Al(OH)_3$.

1 mg of dried aluminium hydroxide gel is equivalent to 0.765 mg of $Al(OH)_3$.

Magnesium hydroxide — Pipet a volume of the solution A containing 40 mg of *magnesium hydroxide*, into a 400-ml beaker, add 200.0 ml of *water* and 20 ml of *triethanolamine*, and stir. Add 10 ml of *ammonia–ammonium chloride buffer* and 3 drops of an *eriochrome black indicator solution* prepared by dissolving 200 mg of *eriochrome black* in a mixture of 15 ml of *triethanolamine* and 5 ml of *alcohol*, and mixing). Cool the solution between 3° to 4° by immersion of the beaker in an ice bath, then remove, and titrate with *0.05 M disodium edetate* to a blue endpoint. Repeat the procedure without the substance under examination. The difference between the titrations represents the amount of *disodium edetate* is consumed.

1 ml of *0.05 M disodium edetate* is equivalent to 0.002916 g of $Mg(OH)_2$.

Polydimethylsiloxane — Determine by infrared absorption spectrophotometry (2.4.6).

Blank. Mix 10 ml of *toluene* with 1 g of *anhydrous sodium sulphate*, and centrifuge to obtain a clear supernatant.

Test solution. Weigh and powder 20 Tablets. Transfer a portion of the powder containing 33 mg of Simethicone, to a suitable round, narrow-mouth, screw-capped, 120-ml bottle. Add 40 ml of *0.1 M sodium hydroxide*, and swirl to disperse. Add 20.0 ml of *toluene*, close the bottle securely with a cap having an inert liner, and shake for 30 minutes on a reciprocating shaker. Transfer the mixture to a 125-ml separator, and allow to separate. Remove the upper, organic layer to a screw-capped, centrifuge tube containing 2 g of *anhydrous sodium sulphate*.

Close the tube with a screw-cap having an inert liner, agitate vigorously, and centrifuge the mixture until a clear supernatant is obtained.

Reference solution. Weigh about 33 mg of *Polydimethylsiloxane IPRS* to a suitable round, narrow-mouth, screw-capped, 120-ml bottle. Add 40 ml of *0.1 M sodium hydroxide*, and swirl to disperse. Add 20.0 ml of *toluene*, close the bottle securely with a cap having an inert liner, and shake for 30 minutes on a reciprocating shaker. Transfer the mixture to a 125-ml separator, and allow to separate. Remove the upper, organic layer to a screw-capped, centrifuge tube containing 2 g of *anhydrous sodium sulphate*. Close the tube with a screw-cap having an inert liner, agitate vigorously, and centrifuge the mixture until a clear supernatant is obtained.

Measure the absorbance by using 0.5-mm cell at the wavelength of maximum absorbance at about 1265.8 cm^{-1} with an infrared absorption spectrophotometer.

Calculate the content of $[-(CH3)_2SiO-]_n$ in the tablets.

Sodium content — Determine by atomic absorption spectrophotometery (2.4.2), equipped with a sodium hollow-cathode lamp and an air–acetylene flame.

Blank. A mixture of 4.0 ml of *1 M hydrochloric acid* and 10.0 ml of *potassium chloride solution* in a 100.0 ml volumetric flask, and dilute with *water* to volume.

Potassium chloride solution. A solution containing *3.8 per cent w/v of potassium chloride* in *water.*

Sodium chloride solution. Dissolve 254.2 mg of *sodium chloride* (previously dried at 105° for 2 hours) to a 100.0 ml volumetric flask and dilute to 100.0 ml with *water*. Dilute 1.0 ml of the solution to 100.0 ml with *water*. This solution contains 10 µg of sodium (equivalent to 25.42 µg of sodium chloride) per ml.

Test solution. Weigh and powder 20 Tablets. Transfer a portion of the powder, equivalent to the average weight of one Tablet, to a 100-ml volumetric flask. Add 50 ml of *1 M hydrochloric acid*, boil for 15 minutes, cool to room temperature, and dilute with *water* to volume. Filter, discarding the first few ml of the filtrate. Transfer 5.0 ml of the filtrate to a 100-ml volumetric flask containing 10.0 ml of *potassium chloride solution*, and dilute with *water* to volume.

Reference solution. Transfer 4.0 ml of *1 M hydrochloric acid* and 10.0 ml of *potassium chloride solution* in a two 100.0 ml volumetric flask.. To the respective flask, add 5.0 ml and 10.0 ml of *sodium chloride solution* and, dilute to volume with *water*. The reference solutions contain 0.5 µg and 1.0 µg sodium per ml respectively.

Determine the absorbances of the reference solutions and the test solution at the sodium emission line of 589.0 nm. Plot the absorbance of the reference solution versus concentration, in µg per ml, of sodium, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration in µg per ml of sodium in the test solution.

Calculate the quantity, in mg, of Na in the tablets taken by the formula:

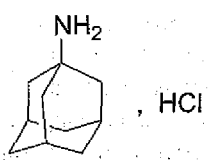
$$C \times D \times F$$

where C is the concentration, in µg per ml, of sodium in the test solution, D is the dilution factor for the Sample solution, 2000 and F is the conversion factor, 0.001 mg per µg.

Storage. Store in tightly-closed containers.

Labelling. The label states (1) the Chewable Tablets to indicate that they are to be chewed before being swallowed; (2) the Chewable Tablets to be labelled to state the sodium content if it is more than 5 mg per Tablet; (3) The Chewable Tablets may be labelled to state the aluminum hydroxide content in terms of the equivalent amount of dried aluminium hydroxide gel.

Amantadine Hydrochloride



$C_{10}H_{17}N,HCl$ Mol. Wt. 187.7

Amantadine Hydrochloride is tricyclo[3.3.1.$1^{3,7}$]dec-1-ylamine hydrochloride.

Amantadine Hydrochloride contains not less then 98.5 per cent and not more than 101.0 per cent of $C_{10}H_{17}N,HCl$, calculated on the anhydrous basis.

Category. Antiviral; antiparkinsonian.

Description. A white or almost white, crystalline powder; sublimes when heated.

Identification

Test A may be omitted if tests B and C are carried out. Test B may be omitted if tests A and C are carried out.

A. Dissolve 0.1 g in 5 ml of *water*, add 0.5 ml of *5 M sodium hydroxide*, extract with 5 ml of *dichloromethane*, filter the dichloromethane layer through *anhydrous sodium sulphate* with 2 ml of *dichloromethane* and evaporate the solution to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *amantadine hydrochloride IPRS* treated in the same manner or with the reference spectrum of amantadine.

B. Dissolve 0.2 g in 1 ml of *0.1 M hydrochloric acid* and add 1 ml of a 50 per cent w/v solution of *sodium nitrite*; a white precipitate is produced.

C. 1 ml of a 10 per cent w/v solution in *carbon dioxide-free water* gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1) and not more intensely coloured than reference solution YS7 (2.4.1).

pH (2.4.24). 3.0 to 5.5, determined in a 20.0 per cent w/v solution.

Related substances. Determine by gas chromatography (2.4.13).

Internal standard solution. Dissolve 0.5 g of adamantane in *dichloromethane* and dilute to 10.0 ml with the same solvent.

Test solution. Weigh 0.5 g of the substance under examination into a centrifuge tube. Add 9 ml of *dichloromethane* and 10 ml of a 21.0 per cent w/v solution of *sodium hydroxide*. Shake for 10 minutes. Discard the upper layer. Dry the lower layer over *anhydrous sodium sulphate*. Filter and collect the filtrate in a volumetric flask. Add 0.1 ml of the internal standard solution and dilute to 10.0 ml with *dichloromethane*.

Reference solution. Weigh 5 mg of *amantadine hydrochloride IPRS* into a centrifuge tube. Add 9 ml of *dichloromethane* and 10 ml of a 21.0 per cent w/v solution of *sodium hydroxide*. Shake for 10 minutes. Discard the upper layer. Dry the lower layer over *anhydrous sodium sulphate*. Filter and collect the filtrate in a volumetric flask. Add 1.0 ml of the internal standard solution and dilute to 100.0 ml with *dichloromethane*.

Chromatographic system

- a capillary column 30 m x 0.53 mm packed with base-deactivated poly(dimethyl)(diphenyl)siloxane (film thickness 1 µm),
- temperature:

column	time (in min.)	temperature (°)
	0 – 5	70
	5 – 23	70 – 250
	23 – 40	250

  inlet port: 220° and detector: 300°,
- flow rate: 4 ml per minute, using helium as the carrier gas,
- Split ratio: 1:50.

The relative retention time with reference to amantadine (retention time: about 14 minutes) for adamantane is about 0.8.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to amantadine and adamantane is not less than 5.0.

Inject 1 µl of the reference solution and the test solution.

Any secondary peak. Calculate the ratio (R_1) of the area of the peak due to amantadine to the area of the peak due to the internal standard from the chromatogram obtained with the reference solution; from the chromatogram obtained with the test solution, calculate the ratio of the area of any secondary peak to the area of the peak due to the internal standard: this ratio is not more than R_1 (0.10 per cent).

The sum of all the secondary peaks. Calculate the ratio (R_2) of 3 times the area of the peak due to amantadine to the area of the peak due to the internal standard from the chromatogram obtained with the reference solution; from the chromatogram obtained with the test solution, calculate the ratio of the sum of the areas of any peaks, apart from the principal peak and the peak due to the internal standard, to the area of the peak due to the internal standard: this ratio is not more than R_2 (0.3 per cent);

disregard limit: Calculate the ratio (R_3) of 0.5 times the area of the peak due to amantadine to the area of the peak due to the internal standard from the chromatogram obtained with the reference solution; from the chromatogram obtained with the test solution, calculate the ratio of the area of any peak, apart from the principal peak and the peak due to the internal standard, to the area of the peak due to the internal standard: disregard any peak with a ratio less than R_3 (0.05 per cent).

Heavy metals (2.3.13). A solution prepared by dissolving 1.0 g in 1 ml of *dilute acetic acid* and sufficient *water* to produce 25 ml complies with the limit test for heavy metals, Method A (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 2.0 g.

Assay. Dissolve 0.15 g in a mixture of 5.0 ml of *0.01 M hydrochloric acid* and 50 ml of *ethanol (95 per cent)* and titrate with *0.1 M sodium hydroxide* determining the end-point potentiometrically (2.4.25). Record the volume used between the two inflections.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01877 g of $C_{10}H_{17}N,HCl$.

Amantadine Capsules

Amantadine Hydrochloride Capsules

Amantadine Capsules contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of amantadine hydrochloride, $C_{10}H_{17}N,HCl$.

Usual strength. 100 mg.

Identification

Dissolve the contents of capsules containing 0.1 g of Amantadine Hydrochloride in 5 ml of *water*, add 0.5 ml of *5 M sodium hydroxide*, extract with 5 ml of *dichloromethane*, filter the dichloromethane layer through *anhydrous sodium sulphate* with 2 ml of *dichloromethane* and evaporate the solution to dryness. The residue complies with the following test.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *amantadine hydrochloride IPRS* treated in the same manner or with the reference spectrum of amantadine.

B. Dissolve 0.2 g in 1 ml of *0.1 M hydrochloric acid* and add 1 ml of a 50 per cent w/v solution of *sodium nitrite*; a white precipitate is produced.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *water;*
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by gas chromatography (2.4.13).

Internal standard solution. A 0.0054 per cent w/v solution of *naphthalene* in *hexane*.

Test solution. Transfer 15.0 ml of the filtrate in 50-ml screw-capped test tube. Add 5.0 ml of *5M sodium hydroxide* and 10.0 ml of the internal standard solution into the test tube, and shake for 60 minutes. Collect the hexane layer.

Reference solution (a). A 0.01per cent w/v solution of *amantadine hydrochloride IPRS* in *water*.

Reference solution (b). Transfer 15.0 ml of reference solution (a) in 50-ml screw-capped test tube. Add 5.0 ml of *5M sodium hydroxide* and 10.0 ml of the internal standard solution into the test tube, and shake for 60 minutes. Collect the hexane layer.

Chromatographic system
- a capillary column 30 m x 0.32 mm, coated with a 0.25-µm film of dimethyl polysiloxane oil,
- temperature:
  column.100° for 3 minutes, 100° to 200° at a constant rate of 10° per minute, hold for 2 minutes,
- inlet port 250°and detector 300°,
- flow rate: 1.4 ml per minute using nitrogen as carrier gas,
- injection volume: 2 µl.

The relative retention time with respect to amantadine for naphthalene is about 0.9.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to naphthalene and amantadine is not less than 2.0, the tailing factor is not more than 2.0 for the amantadine peak and the relative standard deviation for replicate injections is not more than 2.0 per cent for the peak response ratio of amantadine to naphthalene.

Inject reference solution (b) and the test solution.

Calculate the content of $C_{10}H_{17}N$, HCl in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{10}H_{17}N$, HCl.

Related substances. Determine by gas chromatography (2.4.13).

Test solution. Dissolve a quantity of the contents of capsules containing 0.1 g of Amantadine Hydrochloride in 2 ml of *water*, add 2 ml of a 20 per cent w/v solution of *sodium hydroxide* and 2 ml of *chloroform* and shake for 10 minutes. Separate the chloroform layer, dry over *anhydrous sodium sulphate* and filter.

Chromatographic system
- a glass column 1.8 m x 2 mm, packed with material prepared in the following manner. Mix 19.5 g of silanised diatomaceous support (such as Chromosorb G/AW/DMCS) with 60 ml of a 0.33 per cent w/v solution of *potassium hydroxide* in *methanol* and evaporate the solvent under reduced pressure while slowly rotating the mixture. Dissolve over a 5-hour period 0.4 g of low-vapour pressure hydrocarbons (type L) (such as Apiezon L) in 60 ml of *toluene*, add the solution to the prepared silanised diatomaceous support and evaporate the solvent under reduced pressure while slowly rotating the mixture,
- temperature:
  column. 100° to 200° at a constant rate of 6° per minute, inlet port. 220° and detector. 300°,
- flow rate: 30 ml per minute, using nitrogen as the carrier gas.

Inject 1 µl or other suitable volume of the test solution. Run the chromatogram 2.5 times the retention time of the principal peak. The area of any secondary peak is not more than 0.3 per cent and the sum of the areas of all secondary peaks is not more than 1.0 per cent, calculated by area normalization method.

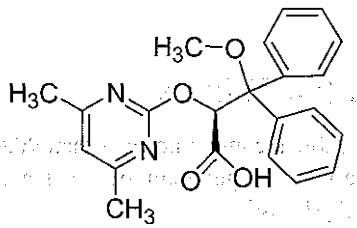
Other tests. Comply with the tests stated under Capsules.

Assay. Weigh a quantity of the mixed contents of 20 capsules containing 0.12 g of Amantadine Hydrochloride and warm in a mixture of 30 ml of *anhydrous glacial acetic acid* and 10 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01877 g of $C_{10}H_{17}N$,HCl.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Ambrisentan



$C_{22}H_{22}N_2O_4$ Mol. Wt. 378.4

Ambrisentan (2*S*)-2-[(4,6-dimethylpyrimidin-2-yl)oxy]-3-methoxy-3,3-diphenylpropanoic acid.

Ambrisentan contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{22}H_{22}N_2O_4$, calculated on the anhydrous basis.

Category. Antihypertensive.

Description. A white to off-white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ambrisentan IPRS* or with the reference spectrum of ambrisentan.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of equal volumes of mobile phase A and mobile phase B.

Test solution. Dissolve 25 mg of the substance under examination in 12.5 ml of mobile phase B and dilute to 25.0 ml with mobile phase A.

Reference solution (a). Dissolve 15 mg of the *diphenylvinyloxy impurity IPRS* in 5 ml of mobile phase B and dilute to 10.0 ml with mobile phase A.

Reference solution (b). Dissolve 25 mg of *ambrisentan IPRS* in 12.5 ml of mobile phase B and dilute to 25.0 ml with mobile phase A.

Reference solution (c). Mix 5.0 ml each of reference solution (a) and reference solution (b) and dilute to 50.0 ml with solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with solvent mixture. Further dilute 5.0 ml of the solution to 50.0 ml with solvent mixture.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm), (Such as Inertsil ODS 3),
- column temperature: 40°,
- mobile phase: A. buffer solution prepared by dissolving 1.38g of *sodium dihydrogen phosphate dihydrate* in 1000 ml of *water*, adjusted to pH 3.0 with *ortho-phosphoric acid*,

  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 5 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	65	35
3	65	35
10	50	50
25	30	70
30	30	70
30.1	65	35
35	65	35

Inject reference solution (c). The test is not valid unless the tailing factor for the principal peak and diphenylvinyloxy impurity is not more than 2.0, the column efficiency is not less than 2000 theoretical plates and the relative standard deviation for replicate injections is not more than 5.0 per cent each. Retention time of the principal peak is about 16 minutes and the relative retention time of diphenyl vinyloxy impurity is about 1.92

Inject reference solution (c) and the test solution in the chromatogram obtained with test solution, the area of any peak due to diphenylvinyloxy impurity is not more than the area of corresponding peak in the chromatogram obtained with reference solution (c) (0.15 per cent). In the chromatogram obtained with test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent). The sum of areas of all the secondary peaks is not more than ten times the area of the principal peak in the chromatogram with reference solution (c) (1.0 per cent).

Enantiomeric purity. Not more than 2.0 per cent of *R*-isomer.

NOTE — prepare the solutions immediately before use.

Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 50.0 ml of *ethanol* and dilute to 100.0 ml with the *n-hexane*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, such as chiral pak AD-H (5 µm),
- mobile phase: a mixture of 90 volumes of *n-hexane*, 10 volumes of *ethanol*, 0.1 volume of *trifluoroacetic acid*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Inject the test solution. The test is not valid unless the column efficiency is not less than 1200 theoretical plates. The relative retention time with reference to ambrisentan (retention time: about 6 minutes) for *R*-isomer is about 1.3.

Calculate the content of *R*-isomer in ambrisentan by area normalization.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.4.43). Not more than 0.5 per cent.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of equal volumes of buffer solution and *acetonitrile*.

Test solution. Dissolve 25 mg of the substance under examination in 12.5 ml of *acetonitrile* and dilute to 25.0 ml with buffer solution. Dilute 10.0 ml of the solution to 100.0 ml with solvent mixture.

Reference solution. Dissolve 25 mg of *ambrisentan IPRS* in 12.5 ml of *acetonitrile* and dilute to 25.0 ml with buffer solution. Dilute 10.0 ml of the solution to 100.0 ml with solvent mixture.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm), (Such as Hypersil BDS C18),
- column temperature: 40°,
- mobile phase. a mixture of 55 volumes of a buffer solution prepared by dissolving 1.38 g of *sodium dihydrogen phosphate dihydrate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and 45 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 5 µl.

The retention time of the principal peak is about 5 minutes.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{22}N_2O_4$.

Storage. Store protected from light and moisture.

Ambrisentan Tablets

Ambrisentan Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ambrisentan, $C_{22}H_{22}N_2O_4$.

Usual Strengths. 5 mg; 10 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium : 900 ml of 0.05 M acetate buffer pH 5.0, prepared by dissolving 4.1 g of *sodium acetate* in sufficient *water* to produce 1000 ml, adjusted to pH 5.0 with *glacial acetic acid*,
Speed and time. 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter, rejecting the first few ml of filtrate.

Determine by liquid chromatography (2.4.14).

Buffer solution A. 0.01 M sodium dihydrogen phosphate dihydrate, adjusted to pH 3.0 with 10 per cent *orthophosphoric acid solution* and filter.

Solvent mixture. 25 volumes of buffer solution and 75 volumes of *acetonitrile*.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a weighed quantity of *ambrisentan IPRS* in solvent mixture and dilute quantitatively with the dissolution medium to obtain a solution of similar concentration as the test solution.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (3 µm) (Such as Hypersil BDS C18),
- column temperature: 40°,
- mobile phase: A. a mixture of 85 volumes of buffer solution and 15 volumes of *acetonitrile*,

B. a mixture of 15 volumes of buffer solution and 85 volumes of *acetonitrile*,

- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 262 nm,
- injection volume: 50 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	40	60
3	0	100
3.1	40	60
6.0	40	60

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{22}N_2O_4$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{22}H_{22}N_2O_4$.

Other tests. Complies with the tests stated under Tablets.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 25 mg of ambrisentan in 5 ml of *water* and then in sufficient volume of solvent mixture, mix with the aid of ultrasound for 10 minutes and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). A 0.005 per cent w/v solution of *ambrisentan IPRS* in the solvent mixture.

Reference solution (b). A 0.0025 per cent w/v solution of *diphenylvinyloxy IPRS* in the solvent mixture.

Reference solution (c). Dilute 5.0 ml, each of, reference solution (a) and reference solution (b) to 100.0 ml with the solvent mixture.

Reference solution (d). A solution containing 0.025 per cent w/v of *ambrisentan IPRS* in solvent mixture, add 5 ml of reference solution (b).

Use the chromatographic system as described under Dissolution with the following modification.

- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	65	35
3	65	35
12	50	50
30	40	60
30.1	65	35
35	65	35

Inject reference solution (c) and (d). The test is not valid unless the resolution between ambrisentan and diphenylvinyloxy is not less than 25 in the chromatogram obtained with reference solution (d) and the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0 in the chromatogram obtained with reference solution (c).

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to diphenylvinyloxy is not more than 0.5 times than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent), the area of any other secondary peak is not more than 0. 5 times the area of the principal peak in the chromatogram obtained with the reference solution (c) (0. 5 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (2.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14) as described under Assay using the following solutions.

Test solution. Disperse 1 tablet in 2 ml of *water* with the aid of ultrasound for about 2 minutes. Add about 15 ml of solvent mixture and ultrasound for further 10 minutes, cool and dilute to 20.0 ml with the solvent mixture. Shake well to mix and filter, rejecting the first few ml of filtrate. Dilute further with the solvent mixture, if necessary.

Reference solution. A 0.025 per cent w/v solution of *ambrisentan IPRS* in the solvent mixture.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{22}N_2O_4$ in the tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 25 mg of Ambrisentan in 5 ml of *water* add a sufficient volume of solvent mixture, with the aid of ultrasound for 10 minutes and dilute to 100.0 ml with the solvent mixture.

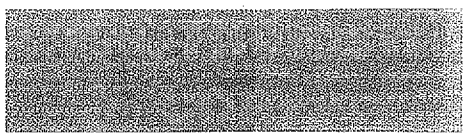
Reference solution. A 0.025 per cent w/v solution of *ambrisentan IPRS* in the solvent mixture.

Chromatographic system

Use the chromatographic system as described under Dissolution with the following modification.

- injection volume: 5 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

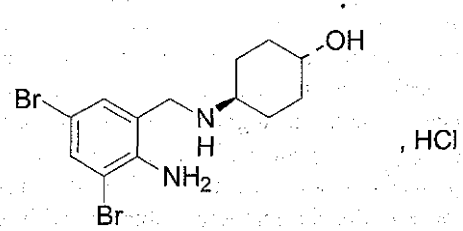


Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{22}N_2O_4$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Ambroxol Hydrochloride



$C_{13}H_{18}Br_2N_2O,HCl$ Mol. Wt. 414.6

Ambroxol hydrochloride is *trans*-4-[(2-amino-3,5-dibromobenzyl)amino]cyclohexanol hydrochloride.

Ambroxol Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{13}H_{18}Br_2N_2O,HCl$, calculated on the dried basis.

Category. Mucolytic.

Description. A white or yellowish crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ambroxol hydrochloride IPRS* or with the reference spectrum of ambroxol hydrochloride.

B. Dissolve 25 mg in 2.5 ml of *water*, add 1.0 ml of *dilute ammonia* and allow to stand for 5 minutes. Acidify the aqueous layer with *dilute nitric acid* and filter. The filtrate gives reaction (A) of chlorides (2.3.1).

Tests

pH (2.4.24). 4.5 to 6.0, determined in a 1.0 per cent w/v solution in *carbon dioxide-free water*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in *water* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dissolve 5 mg of *ambroxol hydrochloride IPRS* in 250.0 ml of *water*. Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of the substance under examination in 0.2 ml of *methanol* and add 0.04 ml of a mixture of 1 volume of *formaldehyde solution* and 99 volumes of *water*. Heat at 60° for 5 minutes. Evaporate to dryness under a current of nitrogen. Dissolve the residue in 5 ml of *water* and dilute to 20.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of equal volumes of *acetonitrile* and a buffer solution prepared by dissolving 1.32 g of *ammonium phosphate, dibasic* in 900 ml of *water*, adjusted to pH 7.0 with *orthophosphoric acid* and diluting to 1000 ml with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 248 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the secondary peak (*trans*-4-(6,8-dibromo-1,4-dihydroquinazolin-3(2*H*)-yl)cyclohexanol) and the ambroxol peak is at least 4.0.

Inject reference solution (a) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.01 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in *water* and dilute to 50.0 ml with *water*. Dilute 5.0 ml of the solution to 50.0 ml with *water*.

Reference solution. A 0.01 per cent w/v solution of *ambroxol hydrochloride IPRS* in *water*.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of equal volumes of buffer solution prepared by dissolving 1.32 g of *ammonium phosphate, dibasic* in 900 ml of *water*, adjusted to pH 7.0 with *orthophosphoric acid* and dilute to 1000 ml with *water*, filter and *acetonitrile*,
- flow rate: 1 ml per minute,

– spectrophotometer set at 248 nm,
– injection volume: 20 µl.

The retention time of the principal peak is about 8.0 minutes.

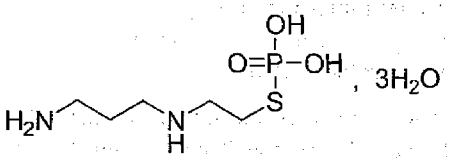
Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{13}H_{18}Br_2N_2O,HCl$.

Storage. Store protected from light.

Amifostine



$C_5H_{15}N_2O_3PS,3H_2O$ Mol. Wt. 268.3

Amifostine is Ethanethiol, 2-[(3-aminopropyl)amino]-, dihydrogen phosphate (ester), trihydrate.

Amifostine contains not less than 78.0 per cent and not more than 82.0 per cent of $C_5H_{15}N_2O_3PS$, calculated on as-is basis.

Category. Cytoprotective agent.

Description. A white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *amifostine IPRS* or with the reference spectrum of amifostine.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 6.5 to 7.5, determined in a 5.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Dissolve 150 mg of the substance under examination in *water* and dilute to 10.0 ml with *water*.

Reference solution (a). A solution containing 0.007 per cent w/v of *amifostine thiol (ethanethiol,2-[(3-aminopropyl)amino]dihydrochloride) IPRS* and 0.0016 per cent w/v *amifostine IPRS* in *water*.

Reference solution (b). A 0.3 per cent w/v solution of *amifostine IPRS* in *water*.

Chromatographic system
– a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as Luna C8),
– sample temperature: 4°,
– mobile phase: a mixture of 72 volumes of a buffer solution prepared by dissolving 0.94 g of *sodium 1-hexanesulphonate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid*, and 28 volumes of *methanol*,
– flow rate: 1 ml per minute,
– spectrophotometer set at 220 nm,
– injection volume: 10 µl.

Inject reference solution (a) and (b). The test is not valid unless the column efficiency is not less than 1000 theoretical plates, the tailing factor is not more than 2.0 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 15.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to amifostine thiol is not more than 0.64 times the area of corresponding peak in the chromatogram obtained with reference solution (a) (0.3 per cent), the area of any other secondary peak is not more than 0.94 times the area of amifostine peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 2.8 times the area of amifostine peak in the chromatogram obtained with reference solution (a) (0.3 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Water (2.3.43). 19.2 per cent to 21.2 per cent, using Method 3, determined on 0.1 g contained in a stoppered centrifuge tube, add 10.0 ml of 4.0 per cent w/v solution of *N-ethylmaleimide* in *methanol* and sonicate for 15 minutes. Shake to disperse, and sonicate for an additional 15 minutes. Use 1.0 ml of the supernatant.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modifications.

NOTE — Prepare the solutions immediately before use.

Test solution. Dissolve 30 mg of the substance under examination in *water* and dilute to 10.0 ml with *water*.

Reference solution. A 0.3 per cent w/v solution of *amifostine IPRS* in *water*.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_5H_{15}N_2O_3PS$.

Storage. Store protected from light and moisture, at a temperature 2° to 8°.

Amifostine for Injection

Amifostine for Injection is a sterile, crystalline material suitable for parenteral use.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile 0.9 per cent w/v sodium chloride injection, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Amifostine for Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of amifostine, $C_5H_{15}N_2O_3PS$.

The contents of the sealed containers comply with the requirements stated under Parenteral Preparations (powder for Injections) and with the following requirements.

Usual strength. 50 mg per ml.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *amifostine IPRS* or with the reference spectrum of amifostine.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 6.5 to 7.5, in a solution constituted as directed in the labelling.

Related substances.

NOTE — Prepare the solutions immediately before use.

A. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve a quantity of injection containing 24 mg of amifostine in *water* and dilute to 10.0 ml with *water.*

Reference solution (a). A 0.007 per cent w/v solution of *amifostine thiol (Ethanethiol,2-[(3-aminopropyl)amino]-, dihydrochloride) IPRS* in *water.*

Reference solution (b). A solution containing 0.0015 per cent w/v of *sodium thiophosphate* and 0.0013 per cent w/v of *N,N-dimethylformamide* in *water.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as Luna C8),
- sample temperature: 4°,
- mobile phase: a mixture of 72 volumes of a buffer solution prepared by dissolving 0.94 g of *sodium 1-hexanesulphonate* in 1000 ml of *water,* adjusted to pH 3.0 with *orthophosphoric acid* and 28 volumes of *methanol,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

The retention times of sodium thiophosphate and *N,N*-dimethylformamide are about 2 minutes and about 3.6 minutes, respectively.

Inject reference solution (a) and (b). The test is not valid unless the relative standard deviation for replicate injections is not more than 10.0 per cent in the chromatogram obtained with reference solution (a) and not more than 4.0 per cent in the chromatogram obtained with reference solution (b).

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to sodium thiophosphate is not more than 0.16 times the area of sodium thiophosphate peak in the chromatogram obtained with reference solution (b) (0.1 per cent), the area of any peak corresponding to *N,N*-dimethylformamide is not more than 0.16 times the area of *N,N*-dimethylformamide peak in the chromatogram obtained with reference solution (b) (0.088 per cent) and the area of any other secondary peak is not more than 0.1 per cent, calculated by area normalisation.

Inject reference solution (a) and the test solution. Calculate the percentage of amifostine thiol in the test solution.

B. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Dissolve a suitable quantity of the injection in *water* to obtain a solution containing 1.0 per cent w/v of Amifostine.

Reference solution. A 0.0046 per cent w/v solution of *amifostine disulphide(1,3-Propanediamine, N,N-(dithiodi-2,1-ethanediyl)bis, tetrahydrochloride) IPRS* in *water.*

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5µm) (Such as Luna C18),
- sample temperature: 4°,
- mobile phase: a mixture of 75 volumes of a buffer solution prepared by dissolving 0.4 g of *sodium 1-octanesulphonate* in 1000 ml of *water*, adjusted to pH 2.5 with *trifluoroacetic acid*, and 25 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 247 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.5 and the relative standard deviation for replicate injections is not more than 4.0 per cent.

Inject the reference solution and the test solution. Calculate the percentage of amifostine disulphide in the test solution.

Total impurities, including amifostine thiol and amifostinedisulphide is not more than 2.0 per cent.

Water (2.3.43). 18.0 per cent to 22.0 per cent, using Method 3, determined on 0.1 g contained in a stoppered centrifuge tube, add 10.0 ml of 4.0 per cent w/v solution of *N-ethylmaleimide* in *methanol* and sonicate for 15 minutes. Shake to disperse, and sonicate for an additional 15 minutes. Use 1.0 ml of the supernatant.

Bacterial endotoxins (2.2.3). Not more than 0.2 Endotoxin Unit per mg of amifostine.

Sterility (2.2.11). Complies with the test for sterility.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances A with the following modifications.

NOTE — Prepare the solutions immediately before use.

Test solution. Dissolve a suitable quantity of injection in *water* to obtain a solution containing 0.3 per cent w/v of Amifostine.

Reference solution. A 0.3 per cent w/v solution of *amifostine IPRS* in *water*.

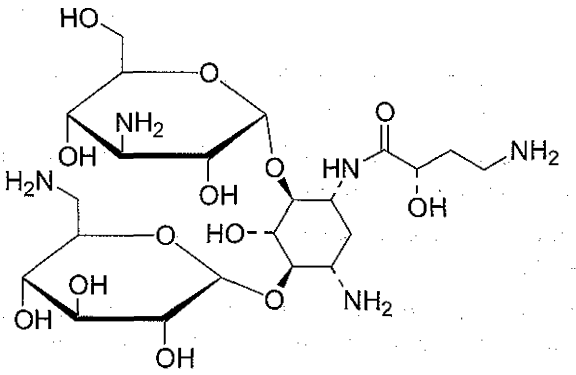
Inject the reference solution. The test is not valid unless the column efficiency is not less than 1000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_5H_{15}N_2O_3PS$ in the injection.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Amikacin



$C_{22}H_{43}N_5O_{13}$ Mol. Wt. 585.6

Amikacin is (*S*)-*O*-3-amino-3-deoxy-α-D-glucopyranosyl-(1→6)-*O*-[6-amino-6-deoxy-α-D-glucopyranosyl(1→4)]-*N*^{1}-(4-amino-2-hydroxy-1-oxobutyl)-2-deoxy-D-streptamine.

Amikacin contains not less than 900 µg of $C_{22}H_{43}N_5O_{13}$ per mg, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white crystalline powder.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 60 volumes of *methanol*, 30 volumes of *strong ammonia solution* and 25 volumes of *chloroform*.

Test solution. A 0.6 per cent w/v solution of the substance under examination.

Reference solution (a). A 0.6 per cent w/v solution of *amikacin IPRS*.

Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

Apply to the plate 3 µl of each solution. After development, allow the plate to dry in air, heat it at 110° for 15 minutes and immediately spray it with a 1 per cent w/v solution of *ninhydrin* in a mixture of 100 volumes of 1-*butanol* and 1 volume of *pyridine*. The principal pink-coloured spot in the chromatogram obtained with the test solution corresponds to those in the chromatograms obtained with reference solution (a) and (b).

B. To 1 ml of a 1 per cent w/v solution add 1 ml of *2 M sodium hydroxide*, mix and add 2 ml of a 1 per cent w/v solution of *cobalt nitrate*; a violet colour is produced.

C. To a solution of 50 mg in 5 ml of *water* add 4 ml of a 0.035 per cent w/v solution of *anthrone* in *sulphuric acid*; a bluish-violet colour is produced.

Tests

pH (2.4.24). 9.5 to 11.5, determined in a 1.0 per cent w/v solution in *carbon dioxide-free water*.

Specific optical rotation (2.4.22). + 97° to + 105°, determined in a 2.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in *water* and dilute to 10.0 ml with *water*.

Reference solution. A 0.01 per cent w/v solution of *amikacin IPRS* in *water*.

Derivatise the solutions prior to analysis by transferring 0.2 ml of the solution under test to a ground-glass-stoppered vial. Add 2 ml of a 1.0 per cent w/v solution of *2,4,6-trinitrobenzenesulphonic acid*. To the solution add 3 ml of *pyridine* and close the vial tightly. Shake vigorously for 30 seconds and heat in a water-bath at 75° for 45 minutes. Cool in cold water for 2 minutes and add 2 ml of *glacial acetic acid*. Shake vigorously for 30 seconds. Store the derivatised solutions at 10° prior to and during analysis.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Spherisorb ODS 2),
- column temperature: 30°,
- mobile phase: a mixture of 30 volumes of a 0.27 per cent w/v solution of *potassium dihydrogen orthophosphate*, adjusted to pH 6.5 with 2.2 per cent w/v solution of *potassium hydroxide* and 70 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 340 nm,
- injection volume: 20 µl.

The relative retention time with reference to amikacin for amikacin impurity A (4-*O*-(3-amino-3-deoxy-α-D-glucopyranosyl)-6-*O*-(6-amino-6-deoxy-α-D-glucopyranosyl)-1-*N*-[(2*S*)-4-amino-2-hydroxybutanoyl]-2-deoxy-*L*-streptamine) is about 1.5.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 1.5.

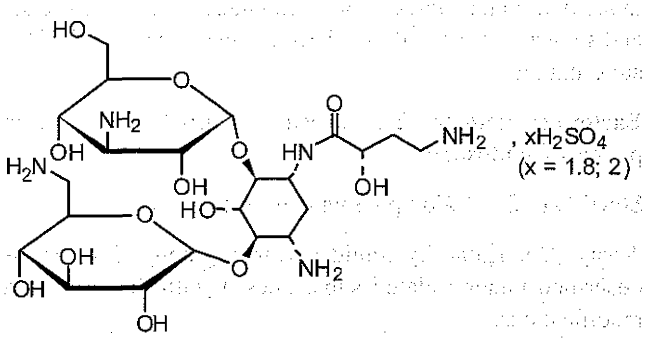
Inject the reference solution and the test solution. Run the chromatogram 4 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak due to amikacin impurity A is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent); the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of areas of all the secondary peaks other than amikacin impurity A is not more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent).

Sulphated ash (2.3.18). Not more than 1.0 per cent, the charred residue being moistened with 2 ml of *nitric acid* and 5 drops of *sulphuric acid*.

Water (2.3.43). Not more than 8.5 per cent, determined on 0.2 g.

Assay. Determine by the microbiological assay of antibiotics, Method B (2.2.10), and express the result in µg of Amikacin, $C_{22}H_{43}N_5O_{13}$, per mg.

Amikacin Sulphate



$C_{22}H_{43}N_5O_{13},1.8H_2SO_4$ Mol. Wt. 762.1

$C_{22}H_{43}N_5O_{13},2H_2SO_4$ Mol. Wt. 781.8

Amikacin Sulphate is (*S*)-*O*-3-amino-3-deoxy-α-D-glucopyranosyl-(1→6)-*O*-[6-amino-6-deoxy-α-D-glucopyranosyl (1→4)]-*N*^{1}-(4-amino-2-hydroxy-1-oxobutyl)- 2-deoxy-D-streptamine sulphate (1:2 or 1:1.8)(salt).

Amikacin Sulphate having a molar ratio of Amikacin to H_2SO_4 of 1:2 contains the equivalent of not less than 674 µg and not more than 786 µg of $C_{22}H_{43}N_5O_{13}$ per mg, calculated on the dried basis. Amikacin Sulphate having a molar ratio of Amikacin to H_2SO_4 of 1:1.8 contains the equivalent of not less than 691µg and not more than 806 µg of $C_{22}H_{43}N_5O_{13}$ per mg, calculated on the dried basis.

Category. Antibacterial.

Description. A white to yellowish-white crystalline powder.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 60 volumes of *methanol*, 30 volumes of *strong ammonia solution* and 25 volumes of *chloroform*.

Test solution. A 0.6 per cent w/v solution of the substance under examination.

Reference solution (a). A 0.6 per cent w/v solution of *amikacin IPRS*.

Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

Apply to the plate 3 µl of each solution. After development, allow the plate to dry in air, heat it at 110° for 15 minutes and immediately spray it with a 1 per cent w/v solution of *ninhydrin* in a mixture of 100 volumes of 1-*butanol* and 1 volume of *pyridine*. The principal pink-coloured spot in the chromatogram obtained with the test solution corresponds to those in the chromatograms obtained with reference solution (a) and (b).

B. To 1 ml of a 1 per cent w/v solution add 1 ml of *2 M sodium hydroxide*, mix and add 2 ml of a 1 per cent w/v solution of *cobalt nitrate*; a violet colour is produced.

C. To a solution of 50 mg in 5 ml of *water* add 4 ml of a 0.035 per cent w/v solution of *anthrone* in *sulphuric acid*; a bluish-violet colour is produced.

Tests

pH (2.4.24). 2.0 to 4.0 (1:2 salt), or 6.0 to 7.3 (1:1.8 salt), determined in a 1.0 per cent w/v solution in *carbon dioxide-free water*.

Specific optical rotation (2.4.22). + 76.0° to + 84.0°, determined in a 2.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in *water* and dilute to 10.0 ml with *water*.

Reference solution. Dissolve 7.5 mg of *amikacin IPRS* in *water* and dilute to 100.0 ml with *water*.

Derivatise the solutions prior to analysis by transferring 0.2 ml of the solution under test to a ground-glass-stoppered vial. Add 2 ml of a 1.0 per cent w/v solution of *2,4,6-trinitrobenzenesulphonic acid*. To the solution add 3 ml of *pyridine* and close the vial tightly. Shake vigorously for 30 seconds and heat in a water-bath at 75° for 2 hours. Cool in cold water for 2 minutes and add 2 ml of *glacial acetic acid*. Shake vigorously for 30 seconds. Store the derivatised solutions at 10° prior to and during analysis.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Spherisorb ODS 2),
- column temperature: 30°,
- mobile phase: a mixture of 30 volumes of a 0.27 per cent w/v solution of *potassium dihydrogen orthophosphate*, adjusted to pH 6.5 with 2.2 per cent w/v solution of *potassium hydroxide* and 70 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 340 nm,
- injection volume: 20 µl.

The relative retention time with reference to amikacin for amikacin impurity A (4-*O*-(3-amino-3-deoxy-α-D-glucopyranosyl)-6-*O*-(6-amino-6-deoxy-α-D-glucopyranosyl)-1-*N*-[(2*S*)-4-amino-2-hydroxybutanoyl]-2-deoxy-L-streptamine) is about 1.5.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 1.5.

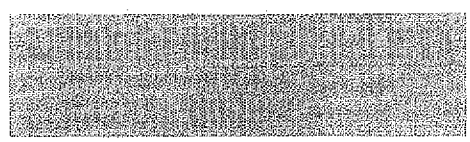
Inject the reference solution and the test solution. Run the chromatogram 4 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak due to amikacin impurity A is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent); the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of areas of all the secondary peaks other than amikacin impurity A is not more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent). Ignore any peak eluting before the principal peak and any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent).

Sulphated ash (2.3.18). Not more than 1.0 per cent, the charred residue being moistened with 2 ml of *nitric acid* and 5 drops of *sulphuric acid*.

Loss on drying (2.4.19). Not more than 13.0 per cent, determined on 0.1 g by drying in an oven over *phosphorus pentoxide* at 110° at a pressure not exceeding 0.7 kPa for 3 hours.

Assay. Determine by the microbiological assay of antibiotics, Method B (2.2.10), and express the result in µg of amikacin, $C_{22}H_{43}N_5O_{13}$, per mg.

Labelling. The label states (1) whether the molar ratio of amikacin to H_2SO_4 of the contents is 1:2 or 1:1.8; (2) whether the material is intended for use in the manufacture of parenteral preparations.



Amikacin Injection

Amikacin Sulphate Injection

Amikacin Injection is a sterile solution of Amikacin Sulphate in Water for Injections or of Amikacin in Water for Injections prepared with the aid of Sulphuric Acid.

Amikacin Injection contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of amikacin, $C_{22}H_{43}N_5O_{13}$.

Usual strengths. The equivalent of 100 mg or 500 mg of amikacin in 2 ml.

Identification

Dilute the injection to obtain a solution containing 6 mg of amikacin per ml (test solution). The test solution complies with the following tests.

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 60 volumes of *methanol*, 30 volumes of *strong ammonia solution* and 25 volumes of *chloroform*.

Reference solution (a). A 0.6 per cent w/v solution of *amikacin IPRS*.

Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

Apply to the plate 3 µl of each solution. After development, allow the plate to dry in air, heat it at 110° for 15 minutes and immediately spray it with a 1 per cent w/v solution of *ninhydrin* in a mixture of 100 volumes of *1-butanol* and 1 volume of *pyridine*. The principal pink-coloured spot in the chromatogram obtained with the test solution corresponds to those in the chromatograms obtained with reference solution (a) and (b).

B. To 1.5 ml of the test solution add 1 ml of *2 M sodium hydroxide*, mix and add 2 ml of a 1 per cent w/v solution of *cobalt nitrate*; a violet colour is produced.

C. To 1.5 ml of the test solution add 3.5 ml of *water* mix and add 4 ml of a 0.035 per cent w/v solution of *anthrone* in *sulphuric acid*; a bluish-violet colour is produced.

Tests

pH (2.4.24). 3.5 to 5.5.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of the injection containing about 0.1 g of Amikacin to 10.0 ml with *water*.

Reference solution. A 0.013 per cent w/v solution of *amikacin sulphate IPRS* in *water*.

Derivatise the solutions prior to analysis by transferring 0.2 ml of the solution under test to a ground-glass-stoppered vial. Add 2 ml of a 1.0 per cent w/v solution of *2,4,6-trinitrobenzenesulphonic acid*. To the solution add 3 ml of *pyridine* and close the vial tightly. Shake vigorously for 30 seconds and heat in a water-bath at 75° for 2 hours. Cool in cold water for 2 minutes and add 2 ml of *glacial acetic acid*. Shake vigorously for 30 seconds. Store the derivatised solutions at 10° prior to and during analysis.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Spherisorb ODS 2),
- mobile phase: a mixture of 30 volumes of a 0.27 per cent w/v solution of *potassium dihydrogen orthophosphate*, adjusted to pH 6.5 with 2.2 per cent w/v solution of *potassium hydroxide* and 70 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 340 nm,
- injection volume: 20 µl.

The relative retention time with reference to amikacin for amikacin impurity A (4-*O*-(3-amino-3-deoxy-α-D-glucopyranosyl)-6-*O*-(6-amino-6-deoxy-α-D-glucopyranosyl)-1-*N*-[(2*S*)-4-amino-2-hydroxybutanoyl]-2-deoxy-*L*-streptamine) is about 1.5.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 1.5.

Inject the reference solution and the test solution. Run the chromatogram 4 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent) and the sum of areas of all the secondary peaks is not more than three times the area of the principal peak in the chromatogram obtained with the reference solution (3.0 per cent). Ignore any peak eluting before the principal peak and any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent).

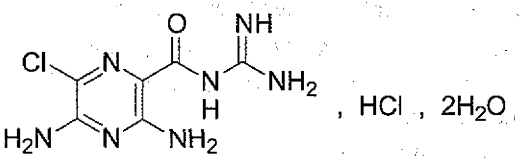
Bacterial Endotoxins (2.2.3). Not more than 0.33 Endotoxin unit per mg of amikacin.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Dilute the injection to obtain a solution containing 1 mg of amikacin per ml. Determine by the microbiological assay of antibiotics, Method B, (2.2.10) and express the result in mg of amikacin, $C_{22}H_{43}N_5O_{13}$ per ml.

Labelling. The label states the quantity of Amikacin Sulphate contained in the sealed container in terms of the equivalent amount of amikacin.

Amiloride Hydrochloride



$C_6H_8ClN_7O,HCl,2H_2O$ Mol. Wt. 302.1

Amiloride Hydrochloride is *N*-amidino-3,5-diamino-6-chloropyrazine-2-carboxamide hydrochloride dihydrate.

Amiloride Hydrochloride contains not less than 98.0 per cent and not more than 101.0 per cent of $C_6H_8ClN_7O,HCl$, calculated on the anhydrous basis.

Category. Diuretic.

Description. A pale yellow to greenish-yellow powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrphotometry (2.4.6). Compare the spectrum with that obtained with *amiloride hydrochloride IPRS* or with the reference spectrum of amiloride hydrochloride.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with a suitable silica gel.

Mobile phase. A freshly prepared mixture of 88 volumes of *dioxan*, 6 volumes of *dilute ammonia solution* and 6 volumes of *water*.

Test solution. Dissolve 0.2 g of the substance under examination in sufficient *methanol* to produce 50.0 ml.

Reference solution. A 0.4 per cent w/v solution of *amiloride hydrochloride IPRS* in *methanol*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air and examine under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

C. Dissolve 10 mg in 10 ml of *water* and add 10 ml of a 20 per cent w/v solution of *cetrimide*, 0.25 ml of *2 M sodium hydroxide* and 1 ml of *bromine water*; a greenish-yellow colour is produced. Add 2 ml of *2 M hydrochloric acid*; the solution becomes deep yellow and exhibits a blue fluorescence under ultraviolet light at 365 nm.

D. A 5 per cent w/v solution gives the reactions of chlorides (2.3.1).

Tests

Free acid. Dissolve 1.0 g in 100 ml of a mixture of equal volumes of *methanol* and *water* and titrate with *0.1 M sodium hydroxide* determining the end-point potentiometrically (2.4.25); not more than 0.3 ml is required.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 25 volumes of *acetonitrile* and 75 volumes of *water*.

Test solution. Dissolve 20 mg of the substance under examination in the solvent mixture and dilute to 10.0 ml of the solvent mixture.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 0.5 volume of *tetramethylammonium hydroxide solution*, 25 volumes of *acetonitrile* and 74.5 volumes of *water*, adjusted to pH 7.0 with a mixture of 1 ml of *orthophosphoric acid* and 9 ml of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the signal–to–noise ratio of the principal peak is not less than 5.0.

Inject the reference solution and the test solution. Run the chromatogram 5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 11.0 to 13.0 per cent, determined on 0.2 g.

Assay. Dissolve 0.25 g in a mixture of 100 ml of *anhydrous glacial acetic acid* and 15 ml of *dioxan* and add 10 ml of

mercuric acetate solution. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02661 g of $C_6H_8ClN_7O,HCl$.

Storage. Store protected from light.

Amiloride Tablets

Amiloride Hydrochloride Tablets

Amiloride Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of anhydrous amiloride hydrochloride, $C_6H_8ClN_7O,HCl$.

Usual strength. 5 mg.

Identification

A. Extract a quantity of the powdered tablets containing 0.5 mg of anhydrous amiloride hydrochloride with 100 ml of *0.1 M hydrochloric acid* and filter. When examined in the range 230 nm to 380 nm (2.4.7), the solution shows absorption maxima at about 285 nm and 363 nm.

B. In the test for Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium: 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm for 30 minutes.

Withdraw a suitable volume of the medium and filter, rejecting the first few ml of filtrate. Dilute a suitable volume of the filtrate with the medium, if necessary. Measure the absorbance of the resulting solution at the maximum at about 363 nm (2.4.7). Calculate the content of amiloride hydrochloride, $C_6H_8ClN_7O,HCl$ in the medium from the absorbance obtained from a solution of known concentration of *amiloride hydrochloride IPRS* in the dissolution medium.

Q. Not less than 80 per cent of the stated amount of $C_6H_8ClN_7O,HCl$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 25 volumes of *acetonitrile* and 75 volumes of *water*.

Test solution. Disperse a quantity of the powdered tablets containing 17.5 mg of anhydrous Amiloride Hydrochloride with the solvent mixture and dilute to 10.0 ml with the solvent mixture, centrifuge.

Reference solution (a). A solution of *amiloride hydrochloride IPRS* containing 0.175 per cent w/v of anhydrous amiloride hydrochloride in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the reference solution (a) to 10.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution (c). A 0.001 per cent w/v solution of *methyl 3,5–diamino–6–chloropyrazine–2–carboxylate IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm) (Such as Nucleosil C18),
- mobile phase: a mixture of 5 volumes of *tetramethylammonium hydroxide solution*, 250 volumes of *acetonitrile* and 745 volumes of *water*, adjusted to pH 7.0 using a mixture of 1 ml of *orthophosphoric acid* and 9 ml of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (c) and adjust the concentration of acetonitrile so that the retention time of methyl 3,5–diamino–6–chloropyrazine–2–carboxylate is 5 to 6 minutes.

Inject reference solution (a) and adjust the concentration of tetramethylammonium hydroxide and orthophosphoric acid keeping the pH at 7.0, so that the retention time of amiloride is 9 to 12 minutes.

Inject reference solution (b). The test is not valid unless the signal–to–noise ratio of the principal peak is not less than 5.0.

Inject reference solution (c) and the test solution. Run the chromatogram 5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the sum of the areas of all the secondary peaks is not more than the area of the peak due to methyl 3,5–diamino–6–chloropyrazine–2–carboxylate in the chromatogram obtained with reference solution (c) (0.6 per cent). Ignore any peak with an area less than 0.1 times the area of the peak due to methyl 3,5–diamino–6–chloropyrazine–2–carboxylate in the chromatogram obtained with reference solution (c) (0.06 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Powder one tablet and transfer to a 100-ml volumetric flask, add 60 ml of *0.1 M hydrochloric acid*, and shake by mechanical means for 30 minutes. Dilute with *0.1 M hydrochloric acid* to volume, mix, and centrifuge a portion of the mixture. Dilute a measured portion of the clear supernatant liquid quantitatively to obtain a solution containing about

10 µg of amiloride hydrochloride per ml. Measure the absorbance of the resulting solution at the maximum at about 363 nm (2.4.7).

Calculate the content of $C_6H_8ClN_7O$, HCl taking 692 as the specific absorbance at 363 nm.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Dispese a quantity of the powder containing10 mg of anhydrous amiloride hydrochloride with 60 ml of *0.1 M hydrochloric acid*, and shake by mechanical means for 30 minutes and dilute to 100.0 ml with *0.1 M hydrochloric acid* and centrifuge a portion of the mixture. Dilute a measured portion of the clear supernatant liquid quantitatively to obtain a solution containing about 10 µg of amiloride hydrochloride per ml. Measure the absorbance of the resulting solution at the maximum at about 363 nm (2.4.7).

Calculate the content of $C_6H_8ClN_7O$,HCl taking 692 as the specific absorbance at 363 nm.

Storage. Store protected from light.

Labelling. The label states the strength in terms of the equivalent amount of anhydrous amiloride hydrochloride.

Amiloride and Hydrochlorothiazide Tablets

Amiloride Hydrochloride and Hydrochlorothiazide Tablets

Amiloride and Hydrochlorothiazide Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of anhydrous amiloride hydrochloride, $C_6H_8ClN_7O$,HCl and hydrochlorothiazide, $C_7H_8ClN_3O_4S_2$.

Usual Strengths. Amiloride hydrochloride, 2.5 mg and Hydrochlorothiazide, 25 mg; Amiloride hydrochloride, 5 mg and Hydrochlorothiazide, 50 mg.

Identification

A. Disperse a quantity of the powdered tablets containing 0.1 g of hydrochlorothiazide with 50 ml of *acetone,* filter, evaporate the filtrate to dryness and dry the residue at 105° for 1 hour. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum obtained with *hydrochlorothiazide IPRS* treated in the same manner or with the reference spectrum of hydrochlorothiazide.

B. In the test for Methyl 3,5-diamino-6-chloropyrazine-2-carboxylate, the principal spot in the chromatogram obtained with the test solution (b) corresponds to that in the chromatogram obtained with reference solution (b).

C. In the Assay, the retention time of the principal peak in the chromatogram obtained with the test solution corresponds to the chromatogram obtained with reference solution (a) and (b).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution (a). A 0.1 per cent w/v solution of *amiloride hydrochloride IPRS* in *methanol.*

Reference solution (b). A 0.1 per cent w/v solution of *hydrochlorothiazide IPRS* in *methanol.*

Reference solution (c). Dilute a suitable quantity of reference solution (a) and reference solution (b) in the dissolution medium to obtain a solution of similar concentration as the test solution.

Chromatographic system
- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 25 volumes of *methanol*, 71 volumes of *water* and 4 volumes of buffer solution prepared by dissolving 13.6 g of *potassium dihydrogen orthophosphate* in 80 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and dilute to 100 ml with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 286 nm,
- injection volume: 50 µl.

Inject reference solution (c). The test is not valid unless the resolution between hydrochlorothiazide and amiloride is not less than 2.0 and relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (c) and the test solution.

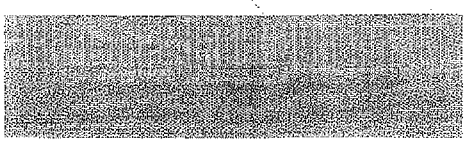
Calculate the content of $C_6H_8ClN_7O$,HCl and $C_7H_8ClN_3O_4S_2$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_6H_8ClN_7O$,HCl and not less than 75 per cent of the stated amount of $C_7H_8ClN_3O_4S_2$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF 254.*

Mobile phase. A mixture of 85 volumes of *ethyl acetate* and 15.0 volumes of *propan-2-ol.*

Test solution. Shake vigorously a quantity of the powdered tablets containing the 50 mg of Hydrochlorothiazide with 10 ml of *acetone* and filter.



Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with *acetone.*

Apply to the plate 5 µl of each solution. After development, dry the plate in a current of warm air and examine under UV light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution. Disregard any spot remaining on the line of application.

Methyl 3,5-diamino-6-chloropyrazine-2-carboxylate. Determine by thin-layer chromatography (2.4.17), using a silica gel precoated plate (silica gel GF254 plates are suitable).

Mobile phase. A freshly prepared mixture of 90 volumes of *1,4 dioxane* and 12 volumes of *3M ammonia solution.*

Test solution (a). Shake vigorously a quantity of the powder containing 17.5 mg of amiloride hydrochloride with 10 ml of *methanol* and centrifuge.

Test solution(b). Dilute 1.0 ml of test solution (a) to 20.0 ml with *methanol.*

Reference solution (a). A solution containing 0.001 per cent w/v solution of *methyl 3,5-diamino-6-chloropyrazine-2-carboxylate IPRS* in *methanol.*

Reference solution(b). A solution containing 0.010 per cent w/v solution of *amiloride hydrochloride IPRS* in *methanol.*

Apply to the plate 10 µl of each solution. After development, dry the plate in a current of warm air and examine the spot under 365nm. Any spot corresponding to methyl 3,5-diamino-6-chloropyrazine-2-carboxylate in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14) as described under Assay, using the following the solutions.

Test solution. Disperse one tablet in 2 ml of *water* with the aid of ultrasound for about 2 minutes. Add a mixture of 20 ml of *methanol* and 4 ml of *0.1 M hydrochloric acid* and sonicate for further 10 minutes and dilute to suitable volume with *water* to obtain a solution containing 0.005 per cent w/v of amiloride.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Dissolve a quantity of powder containing about 50 mg of Hydrochlorothiazide with a mixture of 20 ml of *methanol* and 4 ml of *0.1 M hydrochloric acid* sonicate for 15 minutes and dilute to 100.0 ml with *water*, mix and filter.

Reference solution (a). Dissolve a quantity of 50 mg of *hydrochlorothiazide IPRS* in a mixture of 20 ml of *methanol* and 4 ml of *0.1M hydrochloric acid* and dilute to 100.0 ml with *water.*

Reference solution (b). Dissolve 50 mg of *amiloride hydrochloride IPRS* in sufficient *methanol* to produce 200.0 ml. Dilute 20.0 ml of the resulting solution add 4 ml of *0.1 M hydrochloric acid* and dilute to 100.0 ml with *water.*

Reference solution (c). A solution contains 0.0010 per cent w/v of *4-amino-6-chlorobenzene-1,3-disulfonamide IPRS* in reference solution (a).

Chromatographic system

- a stainless steel column 20 cm x 4.6 mm, end capped, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: A mixture of 76 volumes of *water*, 20 volumes of *methanol* and 4 volumes of *phosphate buffer pH 3.0*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 286 nm,
- injection volume: 20 µl.

Inject the reference solution(c). The assay is not valid unless a peak due to 4-amino-6-chlorobenzene-1,3- disulfonamide appears immediately before the principal peak in the chromatogram obtained with reference solution (c). Increase the sensitivity, if necessary, to obtain at least 10 per cent of full-scale deflection on the chart paper for this peak. The assay is also not valid unless the height of the trough separating the two peaks is less than 10 per cent of the height of the peak due to 4-amino-6-chlorobenzene-1,3-disulfonamide. The resolution between the two peaks may be improved by decreasing the *methanol* content of the mobile phase.

Inject reference solution (a) and (b) and the test solution.

Calculate the content of $C_6H_8ClN_7O,HCl$ and $C_7H_8ClN_3O_4S_2$ in the tablets.

Storage. Store protected from light.

Labelling. The label states the strength in terms of equivalent amount of anhydrous amiloride hydrochloride and hydrochlorothiazide.

Amiloride and Frusemide Tablets

Amiloride Hydrochloride and Furosemide Tablets; Amiloride and Furosemide Tablets; Amiloride Hydrochloride and Frusemide Tablets; Frusemide and Amiloride Hydrochloride Tablets.

Amiloride Hydrochloride and Frusemide Tablets contains Amiloride Hydrochloride Dihydrate and Frusemide.

Amiloride Hydrochloride and Frusemide Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the

stated amount of anhydrous amiloride hydrochloride, $C_6H_8ClN_7O$, HCl and frusemide, $C_{12}H_{11}ClN_2O_5S$.

Usual strengths. Amiloride Hydrochloride 5 mg and Frusemide 20 mg; Amiloride Hydrochloride 5 mg and Frusemide 40 mg.

Identification

A. In the Related substances, the principal spots in the chromatogram obtained with test solution (b) corresponds to the corresponding principal spot in the chromatogram obtained with reference solution (b) and (c).

B. In the Assay, the principal peaks in the chromatogram obtained with the test solution corresponds to the principal peaks in the chromatogram obtained with reference solution (c).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 5 volumes of *glacial acetic acid*, 5 volumes of *methanol* and 90 volumes of *chloroform*.

Test solution (a). Weigh a quantity of the powdered tablets containing 80 mg of Frusemide, add 16 ml of *methanol* and disperse with the aid of ultrasound for 5 minutes, centrifuge and use the clear supernatant liquid.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with *methanol*.

Reference solution (a). Dilute 1.0 ml of test solution (b) to 20.0 ml with *methanol*.

Reference solution (b). A 0.05 per cent w/v solution of *frusemide IPRS* in *methanol*.

Reference solution (c). A 0.00625 per cent w/v solution of *amiloride hydrochloride IPRS* in *methanol*.

Reference solution (d). A 0.0025 per cent w/v solution of *4-chloro-5-sulfaamoylanthranilic acid IPRS* in *methanol*.

Reference solution (e). A 0.00031 per cent w/v solution of *methyl 3,5-diamino-6-chloropyazine-2-carboxylate IPRS* in *methanol*.

Apply to the plate 20 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in a current of warm air and examine under ultraviolet light at 254 nm and 365 nm.

At 254 nm —

In the chromatogram obtained with test solution (a) any secondary spot other than any spot remaining on the line of application or any spots corresponding to either of the named impurities is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent, with reference to the content of frusemide).

At 365 nm —

Spray the plate with *ethanolic sulphuric acid (20 per cent)*, heat at 105° for 30 minutes and immediately expose to nitrous fumes in a closed glass tank for 15 minutes (the nitrous fumes may be generated by adding *7 M sulphuric acid* dropwise to a solution containing 10 per cent w/v of *sodium nitrite* and 3 per cent w/v of *potassium iodide*). Place the plate in a current of warm air for 15 minutes and spray with a 0.5 per cent w/v solution of *N-(1-naphthyl)ethylenediaminedihydrochloride* in *ethanol (95 per cent)*. If necessary, allow to dry and repeat the spraying.

In the chromatogram obtained with test solution (a) any spot corresponding to methyl 3,5-diamino-6-chloropyrazine-2-carboxylate is not more intense than the spot in the chromatogram obtained with reference solution (e) (0.5 per cent, with reference to the content of anhydrous amiloride hydrochloride) and any spot corresponding to 4-chloro-5-sulfamoylanthranilic acid is not more intense than the spot in the chromatogram obtained with reference solution (d) (0.5 per cent, with reference to the content of frusemide).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 4 volumes of *water* and 6 volumes of *methanol*, adjusted to pH 2.0 with *orthophosphoric acid*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 40 mg of Frusemide in 70 ml of the solvent mixture, mix with the aid of ultrasound for 20 minutes, dilute to 100.0 ml with the solvent mixture, mix, filter. Dilute 20.0 ml of the filtrate to 50.0 ml with the solvent mixture.

Reference solution (a). A 0.04 per cent w/v solution of *amiloride hydrochloride IPRS* in the solvent mixture.

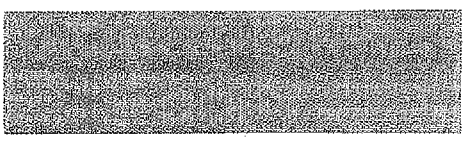
Reference solution (b). A 0.16 per cent w/v solution of *frusemide IPRS* in the solvent mixture.

Reference solution (c). Dilute reference solution (a) and (b) in the solvent mixture to obtain a solution having a known concentration similar to the test solution.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a *0.02 M* solution of *sodium hexanesulphonate* in a mixture of 40 volumes of *water* and 60 volumes of *methanol*, adjusted to pH 4.0 with *1 M acetic acid*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 361 nm,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to frusemide and amiloride is not less than 2.5.



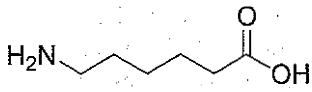
Inject reference solution (c) and the test solution.

Calculate the content of $C_6H_8ClN_7O$, HCl and $C_{12}H_{11}ClN_2O_5S$.

Storage. Store protected from light.

Labelling. The label states the strength of amiloride hydrochloride dihydrate in terms of the equivalent amount of anhydrous amiloride hydrochloride.

Aminocaproic Acid



$C_6H_{13}NO_2$ Mol. Wt. 131.2

Aminocaproic Acid is 6-aminohexanoic acid.

Aminocaproic Acid contains not less than 98.5 per cent and not more than 101.0 per cent of $C_6H_{13}NO_2$, calculated on the dried basis.

Category. Haemostatic; antifibrinolytic.

Description. Colourless crystals or a white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *aminocaproic acid IPRS* or with reference spectra of aminocaproic acid.

B. Determine by thin-layer chromatography (2.4.7), coating the plate with *silica gel G*.

Mobile phase. A mixture of 25 volumes of *ethanol (95 per cent)*, 3 volumes of *water* and 4 volumes of *strong ammonia solution*.

Test solution. Dissolve 0.25 g of the substance under examination in 100.0 ml of *water*.

Reference solution. A 0.25 per cent w/v solution of *aminocaproic acid IPRS*.

Apply to the plate 2 µl of each solution. After development, remove the plate, spray it with a 0.25 per cent w/v solution of *ninhydrin* in a mixture of equal volumes of *methanol* and *pyridine* and heat at 105° for 2 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Appearance of solution. A 20.0 per cent w/v solution remains clear for 24 hours (2.4.1), and is colourless (2.4.1).

pH (2.4.24). 7.5 to 8.0, determined in a 20.0 per cent w/v solution.

Stability. Place 20.0 g evenly spread in a shallow dish about 9 cm in diameter, cover and allow to stand at 100° ± 2° for 72 hours. Dissolve in sufficient *water* to produce 100.0 ml. Prepare a 20.0 per cent w/v solution of the substance under examination but without the above treatment. Measure the absorbances (2.4.7) of the two solutions at the maximum at about 287 nm and at about 450 nm. Absorbance of the solution prepared from the exposed substance being examined at the maximum at about 287 nm is not more than 0.15 and of the solution of the substance under examination without the above treatment, at the maximum at about 287 nm is not more than 0.10. Absorbance of both solutions at the maximum at about 450 nm is not more than 0.03.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.2 g in about 100 ml of *anhydrous glacial acetic acid* with gentle heat to effect solution, cool. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01312 g of $C_6H_{13}NO_2$.

Aminocaproic Acid Injection

Aminocaproic Acid Injection is a sterile solution of Aminocaproic Acid in Water for Injections.

Aminocaproic Acid Injection contains not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of aminocaproic acid, $C_6H_{13}NO_2$.

Usual strength. 400 mg per ml.

Identification

To a volume containing 0.4 g of Aminocaproic Acid add 2 ml of *ether*, stir, add 2 ml of *methanol*, stir again and allow to stand; the crystals after drying on a water-bath comply with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *aminocaproic acid IPRS* or with reference spectra of aminocaproic acid.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 25 volumes of *ethanol (95 per cent)*, 3 volumes of *water* and 4 volumes of *strong ammonia solution*.

Test solution. Dissolve 0.25 g of the substance under examination in *water* and dilute to 100.0 ml with *water*.

Reference solution. A 0.25 per cent w/v solution of *aminocaproic acid IPRS*.

Apply to the plate 2 µl of each solution. After development, remove the plate, spray it with a 0.25 per cent w/v solution of *ninhydrin* in a mixture of equal volumes of *methanol* and *pyridine* and heat at 105° for 2 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 6.0 to 7.6.

Bacterial endotoxins (2.2.3). Not more than 0.05 Endotoxin Unit per mg of aminocaproic acid.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. To a volume containing 0.2 g of Aminocaproic Acid, add 10 ml of *ethanol* and evaporate to dryness on a water-bath. Dissolve the residue in 100 ml of *anhydrous glacial acetic acid* by gentle heating, if necessary, cool. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01312 g of $C_6H_{13}NO_2$.

Aminocaproic Acid Tablets

Aminocaproic Acid Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of aminocaproic acid, $C_6H_{13}NO_2$.

Usual strength. 500 mg.

Identification

Triturate 2 tablets with 10 ml of *water* and filter into 100 ml of *acetone*. Swirl the mixture and allow to stand for 15 minutes to complete crystallisation. Filter through a medium porosity, sintered-glass filter and wash the crystals with 25 ml of *acetone*. Apply vacuum to remove the solvent, dry at 105° for 30 minutes and cool. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *aminocaproic acid IPRS* or with reference spectra of aminocaproic acid.

B. Determine by thin-layer chromatography (2.4.7), coating the plate with *silica gel G*.

Mobile phase. A mixture of 25 volumes of *ethanol (95 per cent)*, 3 volumes of *water* and 4 volumes of *strong ammonia solution*.

Test solution. Dissolve 0.25 g of the substance under examination in *water* and dilute to 100.0 ml with *water*.

Reference solution. A 0.25 per cent w/v solution of *aminocaproic acid IPRS*.

Apply to the plate 2 µl of each solution. After development, remove the plate, spray it with a 0.25 per cent w/v solution of *ninhydrin* in a mixture of equal volumes of *methanol* and *pyridine* and heat at 105° for 2 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 500 ml of *0.1 M hydrochloric acid*,
Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Buffer solution. A solution prepared by dissolving 13.3 g of *monobasic sodium phosphate* in 1000 ml of a solution containing 0.5 g of *sodium 1- heptane sulphonate* and 1 ml of *triethylamine*, adjusted to pH 2.2 with *orthophosphoric acid*.

NOTE — The pH of Buffer solution is critical because the diluents peak can coelute with the main peak even when the pH of Buffer solution is at 2.1 or 2.3.

Test solution. use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A 0.1 per cent w/v solution of *aminocaproic acid IPRS* in the dissolution medium.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 50°,
- sample temperature: 25°,
- mobile phase: a mixture of 25 volumes of *methanol* and 75 volumes of the buffer solution,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 25 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_6H_{13}NO_2$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_6H_{13}NO_2$.

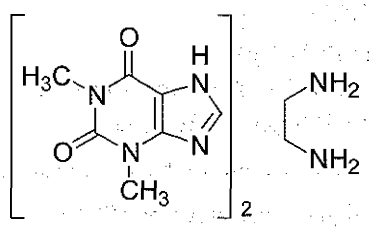
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.2 g of Aminocaproic Acid with 100 ml of *anhydrous glacial acetic acid*, heat gently to effect solution, cool. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01312 g of $C_6H_{13}NO_2$.

Aminophylline

Theophylline and Ethylenediamine



$(C_7H_8N_4O_2)_2,C_2H_8N_2$ Mol. Wt. 420.4 (anhydrous)

Aminophylline is a stable mixture or combination of theophylline and ethylenediamine. It may be anhydrous or may contain not more than two molecules of water of hydration.

Aminophylline contains the equivalent of not less than 84.0 per cent and not more than 87.4 per cent of theophylline, $C_7H_8N_4O_2$, and the equivalent of not less than 13.5 per cent and not more than 15.0 per cent of ethylenediamine, $C_2H_8N_2$, both calculated on the anhydrous basis.

Category. Bronchodilator.

Description. A white or slightly yellowish granules or powder. On exposure to air it gradually loses ethylenediamine and absorbs carbon dioxide with liberation of free theophylline. Even in the absence of light, it is gradually decomposed on exposure to a humid environment, the degradation being faster at higher temperatures.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

Dissolve 1 g in 10 ml of *water* and add 2 ml of *dilute hydrochloric acid* dropwise, with shaking. Separate the precipitate by filtration and reserve the filtrate for test D. Wash the precipitate with successive small quantities of cold *water*, recrystallise from hot *water* and dry at 100° to 105°. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *theophylline IPRS* or with the reference spectrum of theophylline.

B. To 10 mg of the residue obtained in test A add 1 ml of *hydrochloric acid* in a porcelain dish and 0.1 g of *potassium chlorate* and evaporate to dryness on a water-bath; invert the dish over a vessel containing a few drops of *dilute ammonia solution*; the residue acquires a purple colour. Add a few drops of *dilute sodium hydroxide solution*; the colour is discharged.

C. Saturate in *water* a portion of the residue obtained in test A and add *tannic acid solution*; a precipitate soluble in excess of the reagent is produced.

D. The filtrate complies with the following test.

To the filtrate reserved above add 0.2 ml of *benzoyl chloride*, make alkaline with *2 M sodium hydroxide* and shake vigorously. Filter, wash the precipitate with 10 ml of *water*, dissolve in 5 ml of hot *ethanol (95 per cent)* and add 5 ml of *water*. The precipitate, after washing with *water* and drying at 100° to 105° melts at 248° to 252° (2.4.21).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17) coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 40 volumes of *1-butanol*, 30 volumes of *acetone*, 30 volumes of *chloroform* and 10 volumes of *strong ammonia solution*.

Test solution. Dissolve 0.2 g of the substance under examination in 2 ml of *water* with the aid of heat and dilute to 10 ml with *methanol*.

Reference solution. Dilute 1.0 ml of the test solution to 200.0 ml with *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method A (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.5 per cent (for anhydrous), determined on 2.0 g dissolved in 20 ml of *pyridine*. 3.0 to 8.0 per cent (for hydrate), determined on 0.5 g.

Assay. *For theophylline* — Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of *water* and 20 volumes of *methanol*.

Test solution. Dissolve 24 mg of the substance under examination in 250.0 ml with the solvent mixture.

Reference solution (a). A 0.008 per cent w/v solution of *theophylline IPRS* in the solvent mixture.

Reference solution (b). A 0.008 per cent w/v solution of theobromine in reference solution (a). Dilute 20.0 ml of the solution to 25.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 200 ml of *methanol* and 960 mg of *sodium 1-pentanesulphonate*, diluted to 1000 ml with *water*, adjusted to pH 2.9 with *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

The relative retention time with respect to theophylline for theobromine is about 0.65.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to theobromine and theophylline is not less than 3.0, the tailing factor for theophylline is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of the theophylline, $C_7H_8N_4O_2$.

For ethylenediamine — Weigh 0.25 g and dissolve in 30 ml of *water*. Titrate with *0.1 M hydrochloric acid* using *methyl orange solution* as indicator.

1 ml of *0.1 M hydrochloric acid* is equivalent to 0.003005 g of $C_2H_8N_2$.

Storage. Store protected from light and from atmospheric carbon dioxide.

Aminophylline Injection

Theophylline and Ethylenediamine Injection

Aminophylline Injection is a sterile solution of Aminophylline in Water for Injections or is a sterile solution of Theophylline in a solution of Ethylenediamine Hydrate in Water for Injections free from carbon dioxide. Aminophylline Injection may contain an excess of ethylenediamine but no other substance may be added.

Aminophylline Injection contains theophylline, $C_7H_8N_4O_2$, equivalent to not less than 73.25 per cent and not more than 88.25 per cent of the stated amount of aminophylline, and not more than 0.295 g of ethylenediamine, $C_2H_8N_2$ for each g of anhydrous theophylline, $C_7H_8N_4O_2$, determined in the Assay for theophylline.

Usual strengths. 250 mg in 10 ml; 500 mg in 20 ml.

Identification

Dilute a volume containing about 0.5 g of aminophylline with *water* to about 25 ml and add 1 ml of *dilute hydrochloric acid* with constant stirring. Separate the precipitate by filtration and reserve the filtrate for test D. Wash the precipitate with a small portion of cold *water*, recrystallise from hot *water* and dry at 100° to 105°. The crystalline powder complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *theophylline IPRS* or with the reference spectrum of theophylline.

B. To 10 mg add 1 ml of *hydrochloric acid* in a porcelain dish and 0.1 g of *potassium chlorate* and evaporate to dryness on a water-bath; invert the dish over a vessel containing a few drops of *dilute ammonia solution*; the residue acquires a purple colour. Add a few drops of *dilute sodium hydroxide solution*; the colour is discharged.

C. Saturate a portion in *water* and add *tannic acid solution*; a precipitate soluble in excess of the reagent is produced.

D. The filtrate complies with the following test.

Add 0.2 ml of *benzoyl chloride*, make alkaline with *2 M sodium hydroxide* and shake vigorously. Filter, wash the precipitate with 10 ml of *water*, dissolve in 5 ml of hot *ethanol (95 per cent)* and add 5 ml of *water*. The precipitate, after washing with *water* and drying at 100° to 105° melts at 248° to 252° (2.4.21).

Tests

pH (2.4.24). 8.8 to 10.0.

Bacterial endotoxins (2.2.3). Not more than 1.0 Endotoxin Unit per mg of aminophylline.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. *For theophylline* — Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of *water* and 20 volumes of *methanol*.

Test solution. Measure a volume containing 100 mg of theophylline to 100 ml with solvent mixture. Dilute 4.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution (a). A 0.008 per cent w/v solution of *theophylline IPRS* in the solvent mixture.

Reference solution (b). A 0.008 per cent w/v solution of theobromine in reference solution (a). Dilute 20.0 ml of the solution to 25.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with octylsilane bonded to porous silica (5µm),
- mobile phase: a mixture of 200 ml of *methanol* and 960 mg of *sodium 1-pentanesulfonate*, diluted to 1000 ml with *water*, adjusted to pH 2.9 with *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

The relative retention time with respect to theophylline for theobromine is about 0.65.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to theobromine and theophylline is not less than 3.0, the tailing factor for theophylline is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of the theophylline, $C_7H_8N_4O_2$.

For ethylenediamine — To a volume containing 0.25 g of aminophylline, add sufficient *water* to produce 30 ml. Titrate with *0.1 M hydrochloric acid* using *methyl orange solution* as indicator.

1 ml of *0.1 M hydrochloric acid* is equivalent to 0.003005 g of $C_2H_8N_2$.

Storage. Store in single dose containers, from which carbon dioxide has been excluded. Do not allow contact with metals.

Labelling. The label states (1) the strength in terms of the equivalent amount of anhydrous aminophylline in a suitable dose-volume; (2) the route of injection; (3) that the injection is not to be used if crystals have separated.

Aminophylline Prolonged-release Tablets

Aminophylline Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Aminophylline Prolonged-release Tablets contain Aminophylline or Aminophylline Hydrate.

Aminophylline Prolonged-release Tablets contain not less than 81.4 per cent and not more than 90.0 per cent theophylline, $C_7H_8N_4O_2$ of the stated amount of aminophylline and not less than 13.5 per cent and not more than 15.0 per cent ethylenediamine, $C_2H_8N_2$ of the stated amount of aminophylline.

Usual strengths. 225 mg; 350 mg.

Identification

Disperse a quantity of the powdered tablets containing 0.5 g of Aminophylline with 20 ml of *water*, filter, add to the filtrate with constant stirring 1 ml of *2 M hydrochloric acid*, allow to stand for a few minutes and again filter. Reserve the filtrate for test C. Wash the residue with small quantities of cold *water*, recrystallise from hot *water* and dry at 105°. The residue complies with the following test.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *theophylline IPRS* or with the reference spectrum of theophylline.

B. Disperse a quantity of the powdered tablets containing 0.25 g of Aminophylline with 5 ml of *water* and filter. To 2 ml of the filtrate add 2 ml of a 1.0 per cent w/v solution of *copper (II) sulphate* and shake; a purplish blue colour is produced.

Tests

Dissolution (2.5.2). Complies with the test stated under tablets.

Other tests. Comply with the tests stated under Tablets.

Assay. *For theophylline* —Weigh and powder 20 tablets. Disperse a quantity of the powder containing 80 mg of Aminophylline with a mixture of 20 ml of *0.1 M sodium hydroxide* and 60 ml of *water* for 10 minutes and dilute to 200.0 ml with *water* and filter. Dilute 5.0 ml of the filtrate to 250.0 ml with *0.01 M sodium hydroxide* and measure the absorbance of the solution at the maximum at 275 nm (2.4.7). Calculate the content of $C_7H_8N_4O_2$ taking 650 as the specific absorbance at the maximum at 275 nm.

For ethylenediamine—Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.3 g of Aminophylline with 20 ml of *water*, heat to 50° for 30 minutes and titrate with *0.05 M sulphuric acid*, using *bromocresol green solution* as indicator, until the colour changes from blue to green.

1 ml of *0.05 M sulphuric acid* is equivalent to 0.003005 g of $C_2H_8N_2$.

Storage. Store protected from light and moisture.

Aminophylline Tablets

Theophylline and Ethylenediamine Tablets

Aminophylline Tablets contain theophylline, $C_7H_8N_4O_2$, equivalent to not less than 81.4 per cent and not more than 90.0 per cent of the stated amount of aminophylline, and ethylenediamine, $C_2H_8N_2$, equivalent to not less than 13.5 per cent and not more than 15.0 per cent of the stated amount of aminophylline.

Usual strength. 100 mg.

Identification

Disperse a quantity of the powdered tablets containing about 0.5 g of aminophylline with 25 ml of *water* and filter. To the filtrate add 1 ml of *dilute hydrochloric acid* with constant stirring. Separate the precipitate by filtration and reserve the filtrate. Wash the precipitate with a small portion of cold *water*, recrystallise from hot *water* and dry at 100° to 105°. The crystalline powder complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *theophylline IPRS* or with the reference spectrum of theophylline.

B. To 10 mg add 1 ml of *hydrochloric acid* in a porcelain dish and 0.1 g of *potassium chlorate* and evaporate to dryness on a water-bath; invert the dish over a vessel containing a few drops of *dilute ammonia solution*; the residue acquires a purple colour. Add a few drops of *dilute sodium hydroxide solution*; the colour is discharged.

C. Saturate a portion in *water* and add *tannic acid solution*; a precipitate soluble in excess of the reagent is produced.

The filtrate complies with the following test.

Add 0.2 ml of *benzoyl chloride*, make alkaline with *2 M sodium hydroxide* and shake vigorously. Filter, wash the precipitate with 10 ml of *water*, dissolve in 5 ml of hot *ethanol (95 per cent)* and add 5 ml of *water*. The precipitate, after washing with *water* and drying at 100° to 105° melts at 248° to 252° (2.4.21).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with *water* if necessary, at the maximum at about 269 nm (2.4.7). Calculate the content of $C_7H_8N_4O_2$ in the medium from the absorbance obtained from a known concentration of *theophylline IPRS* in the same medium.

Q. Not less than 70 per cent of the stated amount of $C_7H_8N_4O_2$.

Other tests. Comply with the tests stated under Tablets.

Assay. *For theophylline* — Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.5 g of aminophylline, transfer to a 200-ml volumetric flask with the aid of a mixture of 50 ml of *water* and 15 ml of *dilute ammonia solution* and allow to stand for 30 minutes with frequent shaking, warming to about 50°, if necessary. Cool, add *water* to volume and mix. Centrifuge the mixture, and pipette a volume of the clear supernatant liquid equivalent to about 0.25 g of aminophylline into a flask, dilute with sufficient *water* to produce 40 ml and add 8 ml of *dilute ammonia solution*. Add 20.0 ml of *0.1 M silver nitrate*, mix and boil for 15 minutes. Cool to between 5° and 10° for 20 minutes, filter at a pressure not exceeding 2.75 kPa and wash the precipitate with three quantities, each of 10 ml, of *water*. Acidify the combined filtrate and washings with *nitric acid* and add an excess of 3 ml of the acid. Cool, add 2 ml of *ferric ammonium sulphate solution*, and titrate with *0.1 M ammonium thiocyanate*.

1 ml of *0.1 M silver nitrate* is equivalent to 0.01802 g of $C_7H_8N_4O_2$.

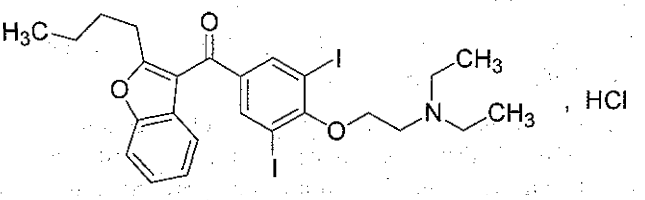
For ethylenediamine — Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.3 g of aminophylline, shake with 20 ml of *water*, heat at 50° for 30 minutes. Titrate with *0.1 M hydrochloric acid* using *methyl orange solution* as indicator.

1 ml of *0.1 M hydrochloric acid* is equivalent to 0.003005 g of $C_2H_8N_2$.

Storage. Store protected from light.

Labelling. The label states the strength in terms of the equivalent amount anhydrous aminophylline.

Amiodarone Hydrochloride



$C_{25}H_{29}I_2NO_3,HCl$ Mol. Wt. 681.8

Amiodarone Hydrochloride is 2-butylbenzofuran-3-yl-4-(2-diethylaminoethoxy)-3,5-diiodophenyl ketone hydrochloride.

Amiodarone Hydrochloride contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{25}H_{29}I_2NO_3,HCl$, calculated on the dried basis.

Category. Antiarrhythmic.

Description. A white or almost white, fine crystalline powder.

Identification

Test B may be omitted if tests A and C are carried out. Test A may be omitted if tests B and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *amiodarone hydrochloride IPRS* or with the reference spectrum of amiodarone hydrochloride.

B. In the test for Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

C. It gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *methanol* is clear (2.4.1), and not more intensely coloured than reference solution GYS5 (2.4.1).

pH (2.4.24). 3.2 to 3.8, determined in 5.0 per cent w/v solution, prepared by dissolving in *carbon dioxide-free water* at 80° and cooling.

Impurity H. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel F254*.

CAUTION—Prepare the solutions immediately before use and keep protected from bright light.

Mobile phase. A mixture of 5 volumes of *anhydrous formic acid*, 10 volumes of *methanol* and 85 volumes of *dichloromethane*.

Test solution. Dissolve 0.5 g of the substance under examination in 5.0 ml of the *dichloromethane*.

Reference solution (a). Dissolve 10 mg of *(2-chloroethyl) diethylamine hydrochloride* (amiodarone hydrochloride impurity H) in 50.0 ml of *dichloromethane*. Dilute 2.0 ml of the solution to 20.0 ml with *dichloromethane*.

Reference solution (b). Mix 2.0 ml of the test solution and 2.0 ml of reference solution (a).

Apply to the plate 50 µl of test solution, reference solution (a) and 100 µl of reference solution (b). Allow the mobile phase to rise 15 cm. Dry the plate in air and spray the plate with *potassium iodobismuthate solution* and then with *dilute hydrogen peroxide solution*, examine immediately in day light. Any spot correspond to amiodarone hydrochloride impurity H in the chromatogram obtained with the test solution is not more than the principal spot in the chromatogram obtained with reference solution (a) (0.02 per cent). The test is not valid unless the chromatogram obtained with the reference solution (b) shows clearly visible spot of amiodarone impurity H.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and *water*.

Test solution. Dissolve 0.125 g of the substance under examination in 25.0 ml of the solvent mixture.

Reference solution. A solution containing 0.02 per cent w/v each of *amiodarone impurity A IPRS, amiodarone impurity B IPRS* and *amiodarone hydrochloride IPRS* in *methanol*. Dilute 1.0 ml of the solution to 20.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 30°,
- mobile phase: a mixture of 30 volumes of buffer solution prepared by diluting 3.0 ml of *glacial acetic acid* with 800 ml of *water*, adjusted to pH 4.9 with *dilute ammonia* and dilute to 1000 ml with *water*, 30 volumes of *methanol* and 40 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 10 µl.

Name	Relative retention time
Amiodarone impurity A[1]	0.29
Amiodarone impurity B[2]	0.37
Amiodarone	1.0

[1](2–butylbenzofuran–3–yl)(4–hydroxy–3,5–diiodophenyl) methanone,

[2](2–butylbenzofuran–3–yl)(4–hydroxyphenyl)methanone .

Inject the reference solution. The test is not valid unless the resolution between the peaks due to amiodarone impurity A and amiodarone impurity B is not less than 3.5.

Inject the reference solution and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent). The sum of areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Iodides. Dissolve 1.5 g in 40 ml of *water* at 80° by shaking until completely dissolved. Cool and dilute to 50.0 ml with *water* (Solution A).

To 15 ml of solution A add 1 ml of *0.1 M hydrochloric acid* and 1 ml of *0.05 M potassium iodate* and dilute to 20 ml with *water*. Allow to stand protected from light for 4 hours (Solution 1). To 15 ml of solution A add 1 ml of *0.1 M hydrochloric* acid, 1 ml of an 88.2 ppm solution of *potassium iodide* and 1 ml of *0.05 M potassium iodate* and dilute to 20 ml with *water*. Allow to stand protected from light for 4 hours (Solution 2). Measure the absorbances of solutions (1) and (2) at the maximum at about 420 nm, using as the blank a mixture of 15 ml of solution A and 1 ml of *0.1 M hydrochloric* acid diluted to 20 ml with *water* (2.4.7). The absorbance of solution (1) is not greater than half the absorbance of solution (2) (150 ppm).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying at 100° at a pressure not exceeding 0.3 kPa for 4 hours.

Assay. Dissolve 0.6 g in a mixture of 5.0 ml of *0.01 M hydrochloric acid* and 75 ml of *ethanol (95 per cent)*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.06818 g of $C_{25}H_{29}I_2NO_3$, HCl.

Storage. Store protected from light, at a temperature not exceeding 30°.

Amiodarone Intravenous Infusion

Amiodarone Intravenous Infusion is a sterile solution of Amiodarone Hydrochloride in Water for Injections. It is prepared immediately before use by diluting Amiodarone Sterile Concentrate with Glucose Intravenous Infusion in accordance with the manufacturer's instructions.

Amiodarone Sterile Concentrate

Amiodarone Sterile Concentrate is a sterile solution of Amiodarone Hydrochloride in Water for Injections.

The concentrate complies with the requirements for Concentrates for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Amiodarone Intravenous Infusion contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of amiodarone hydrochloride, $C_{25}H_{29}I_2NO_3$,HCl.

Usual strengths. Concentrate, 150 mg per 3 ml ; infusion, 450 mg per 250 ml; 360 mg per 200 ml; 150 mg per 100 ml.

Identification

A. Extract a volume of the concentrate containing 0.3 g of Amiodarone Hydrochloride with three 25-ml quantities of *dichloromethane*. Dry the combined extracts over *anhydrous sodium sulphate*, filter and evaporate to dryness. To the residue, add 2 ml of *1 M sodium hydroxide* and extract with 25 ml of *ether*. Dry the extract over *anhydrous sodium sulphate*, filter and evaporate to dryness. Dry the residue obtained under reduced pressure over *phosphorus pentoxide* and dissolve in 2.5 ml of *dichloromethane*. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *amiodarone hydrochloride IPRS*, treated in the same manner or with the reference spectrum of amiodarone.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Appearance of solution. The solution is not more intense than reference solution BYS4 or GYS4 (2.4.1).

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel F254*.

Mobile phase. A mixture of 5 volumes of *anhydrous formic acid*, 10 volumes of *methanol* and 85 volumes of *dichloromethane*.

Test solution. Dilute a volume of the concentrate containing 50 mg of Amiodarone Hydrochloride to 20.0 ml with *methanol*.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with *methanol*.

Reference solution (b). A 0.004 per cent w/v solution of *2-butyl-3-(4-hydroxy-3,5-di-iodobenzoyl)benzofuran IPRS* in *methanol*.

Reference solution (c). A 0.1 per cent w/v solution of *benzyl alcohol* in *methanol*.

Pre-wash the plate with the mobile phase and allow it to dry in air before use.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. In the chromatogram obtained with the test solution, any spot corresponding to 2-butyl-3-(4-hydroxy-3,5-di-iodobenzoyl)benzofuran is not more intense than the spot in the chromatogram obtained with reference solution (b) (1.6 per cent). Any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any spot corresponding to benzyl alcohol.

Iodides. *(NOTE- Prepare test solution (a) and (b) simultaneously and allow all of the solutions to stand protected from light for 4 hours and shake vigorously every hour).*

Solution A. To 1 g of *polysorbate 80*, add 0.2 g of *benzyl alcohol* and dilute to 10 ml with *water*.

Test solution (a). Add 1 ml of *0.1 M hydrochloric acid* to a volume of the concentrate containing 0.2 g of Amiodarone Hydrochloride, add 1 ml of *0.05 M potassium iodate* and dilute to 25.0 ml with *water*.

Test solution (b). Add 1 ml of *0.1 M hydrochloric acid* to a volume of the concentrate containing 0.2 g of Amiodarone Hydrochloride and dilute to 25 ml with *water*.

Reference solution. Use the same volume of solution A in place of the concentrate under examination and add 1 ml of *0.1 M hydrochloric acid*, 1 ml of *0.05 M potassium iodate*, 1 ml of a 0.0131 per cent w/v solution of *potassium iodide* and dilute to 25 ml with *water*.

Measure the absorbance of test solution (a) and the reference solution at 420 nm (2.4.7) using test solution (b) in the reference cell. The absorbance of the test solution is not more than the absorbance of reference solution (500 ppm).

Bacterial endotoxins (2.2.3). Not more than 8.33 Endotoxin Units per mg of amiodarone hydrochloride.

Other tests. Comply with the tests stated under Parenteral Preparations (Infusions).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of the concentrate containing 50 mg of Amiodarone Hydrochloride to 50.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *amiodarone hydrochloride IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 7.5 cm x 3.9 mm, packed with silica chemically-bonded nitrile groups (4 µm) (Such as Nova-Pak CN HP),
- mobile phase: a mixture of 45 volumes of *0.01 M sodium perchlorate* and 55 volumes of *acetonitrile*, adjusted to pH 3.0 with *2 M orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 244 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{25}H_{29}I_2NO_3$,HCl in the Infusion.

Storage. Store protected from light.

Labelling. The label states (1) Amiodarone Sterile Concentrate; (2) that the solution must be diluted with Glucose Intravenous Infusion.

Amiodarone Tablets

Amiodarone Hydrochloride Tablets

Amiodarone Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of amiodarone hydrochloride, $C_{25}H_{29}I_2NO_3$,HCl.

Usual strengths. 100 mg; 200 mg.

Identification

A. Disperse a quantity of the powdered tablets containing about 0.3 g of Amiodarone Hydrochloride with 25 ml of *dichloromethane*, filter and evaporate the filtrate to dryness. To the residue, add 2 ml of *1 M sodium hydroxide* and extract with 25 ml of *ether*. Dry the extract over *anhydrous sodium sulphate*, filter and evaporate to dryness. Dry the residue obtained under reduced pressure over *phosphorus pentoxide* and dissolve in 2.5 ml of *dichloromethane*. The solution complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *amiodarone hydrochloride IPRS*, treated in the same manner or with reference spectra of amiodarone hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and *water*.

Test solution. Disperse a quantity of the powdered tablets containing 50 mg of Amiodarone Hydrochloride with 50.0 ml of *methanol*, filter. Dilute 5.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution. A solution containing 0.02 per cent w/v, each of, *amiodarone impurity A IPRS* (*(2-butylbenzofuran-3-yl)(4-hydroxy-3,5-diiodophenyl)methanone IPRS*), *amiodarone impurity B IPRS* (*(2-butylbenzofuran-3-yl)(4-hydroxyphenyl)methanone IPRS*) and *amiodarone hydrochloride IPRS* in *methanol*. Dilute 1.0 ml of the solution to 200.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS-2),
- column temperature: 30°,
- mobile phase: a mixture of 30 volumes of *methanol*, 40 volumes of *acetonitrile* and 30 volumes of a solution prepared by adding 3 ml of *glacial acetic acid* to 800 ml of *water*, adjusted to pH 4.9 with *dilute ammonia* and dilute to 1000 ml with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

The relative retention time with reference to amiodarone for amiodarone impurity A is about 0.29, for amiodarone impurity B is about 0.37.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to amiodarone impurity A and amiodarone impurity B is not less than 3.5.

Inject the reference solution and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to amiodarone impurity A is not more than the 2.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent). The sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.1g of Amiodarone Hydrochloride in 70 ml of *methanol* with the aid of ultrasound for 15 minutes, cool and dilute to 100.0 ml with *methanol* and filter. Dilute 10.0 ml of the filtrate to 100.0 ml with the mobile phase.

Reference solution. Dissolve 0.1g of *amiodarone hydrochloride IPRS* in 70 ml of *methanol*, cool and dilute to 100.0 ml with *methanol*. Dilute 10.0 ml of the resulting solution to 100.0 ml with the mobile phase.

Chromatographic system

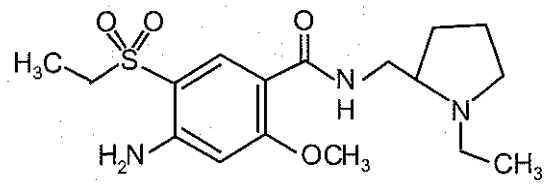
- a stainless steel column 7.5 cm x 3.9 mm, packed with very finely divided silica gel consisting of porous spherical particles with chemically bonded nitrile group (4 µm), (Such as Nova-Pack CNHP),
- mobile phase: a mixture of 45 volumes of *0.01 M sodium perchlorate* and 55 volumes of *acetonitrile*, adjusted to pH 3.0 with *2 M orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 244 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{25}H_{29}I_2NO_3,HCl$ in the tablets.

Amisulpride



$C_{17}H_{27}N_3O_4S$ Mol. Wt. 369.5

Amisulpride is 4-amino-*N*-[(1-ethyl-2-pyrrolidinyl)methyl]-5-(ethylsulphonyl)-2-methoxybenzamide.

Amisulpride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{17}H_{27}N_3O_4S$, calculated on the dried basis.

Category. Antipsychotic.

Description. A white or almost white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *amisulpride IPRS* or with the reference spectrum of amisulpride.

Tests

Appearance of solution. Dissolve 1.0 g in 3 ml of a mixture of 1 volume of *acetic acid* and 4 volumes of *water* and dilute to 20 ml with *water*. The solution is not more opalescent than OS2 (2.4.1) and not more intensely coloured than reference solution YS6 (2.4.1).

Optical rotation (2.4.22). – 0.10° to + 0.10°, determined in a 10.0 per cent w/v solution in *dimethylformamide*.

Impurity A. Determined by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. The upper layer obtained after shaking a mixture of 10 volumes of 50 per cent v/v solution of *ammonia*, 25 volumes of *ethanol* and 65 volumes of *di-isopropyl ether*.

Test solution. Dissolve 0.2 g of the substance under examination in *methanol* and dilute to 10.0 ml with *methanol*.

Reference solution (a). A 0.002 per cent w/v solution of *amisulpiride impurity A IPRS (([(2RS)-1-ethylpyrrolidin-2-yl]methanamine) IPRS)* in *methanol*.

Reference solution (b). Dilute 1.0 ml of the test solution to 10.0 ml with reference solution (a).

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in air, spray with *ninhydrin solution* and heat at 100° for 15 minutes. Any spot corresponding to amisulpride impurity A is not more intense

than the spot in the chromatogram obtained with reference solution (a) (0.1 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 30 volumes of mobile phase A and 70 volumes of mobile phase B.

Test solution. Dissolve 0.1 g of the substance under examination in 30 ml of *methanol* and dilute to 100.0 ml with mobile phase B.

Reference solution (a). Dilute 5.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 25.0 ml with the solvent mixture.

Reference solution (b). Dissolve 5 mg of *amisulpride impurity B IPRS (4-amino-N-[[(2RS)-1-ethylpyrrolidin-2-yl]methyl]-5-(ethylsulfonyl)-2-hydroxybenzamide IPRS)* in 5.0 ml of the test solution and dilute to 50.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: A. *methanol*,
  B. a 0.07 per cent w/v solution of *sodium octanesulphonate* in 0.25 per cent v/v of *sulphuric acid*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	30	70
18	36	64
35	52	48
45	52	48
46	30	70
56	30	70

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to amisulpride and amisulpride impurity B is not less than 2.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). The sum of the area of all the secondary peaks is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

Chlorides (2.3.12). Shake 1.25 g with 30 ml of *water* for 10 minutes and filter. The filtrate complies with the limit test of chlorides (200 ppm).

Heavy metals (2.3.13). Dissolve 4.0 g by gently heating in 5 ml of *dilute acetic acid.* Allow to cool and dilute to 20 ml with *water.* 12 ml of the resulting solution complies with the limit for heavy metals Method D (10 ppm), using 10.0 ml of *lead standard solution (2 ppm).*

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Weigh 0.3 g and dissolve with shaking in a mixture of 5 ml of *acetic anhydride* and 50 ml of *anhydrous acetic acid.* Titrate with *0.1 M perchloric acid* determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03695 g of $C_{17}H_{27}N_3O_4S$.

Amisulpride Tablets

Amisulpride Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of amisulpride, $C_{17}H_{27}N_3O_4S$.

Usual strengths. 50 mg; 100 mg; 200 mg; 300 mg; 400 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Use the filtrate dilute, if necessary, with the dissolution medium. Measure the absorbance of the resulting solution at the maximum at about 280 nm (2.4.7). Calculate the content of $C_{17}H_{27}N_3O_4S$ in the medium from the absorbance obtained from a solution of known concentration of amisulpride RS, prepared by dissolving in minimum quantity of *methanol* and diluted with the dissolution medium to get similar concentration of the test solution.

Q. Not less than 70 per cent of the stated amount of $C_{17}H_{27}N_3O_4S$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 30 volumes of *water* and 70 volumes of *methanol*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 1 g of Amisulpride with 40 ml of *water*. Add about 125 ml of *methanol* and sonicate for 30 minutes with intermittent shaking and dilute to 250.0 ml with the solvent mixture and allow to settle for 10 minutes. Dilute the solution with the solvent mixture to obtain a concentration of 0.1 per cent w/v of amisulpride, filter.

Reference solution. A 0.001 per cent w/v solution of *amisulpride IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: A. 0.07 per cent w/v solution of *1-octane sulphonic acid sodium* in 0.25 per cent v/v of *sulphuric acid*,
  B. *methanol*,
- a gradient programme using the condition given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile Phase A (per cent w/v)	Mobile Phase B (per cent v/v)
0	70	30
18	64	36
35	48	52
45	48	52
46	70	30
56	70	30

Inject the reference solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the 0.3 times the area of the principal peak in the chromatogram obtained with the reference solution (0.3 per cent) and the sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 30 volumes of *water* and 70 volumes of *methanol*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 1000 mg of Amisulpride with 40 ml of *water*. Add about 125 ml of *methanol* and sonicate for 30 minutes with intermittent shaking and dilute to 250.0 ml with the solvent mixture and allow to settle for 10 minutes. Dilute with the solvent mixture to obtain a solution having a known concentration similar to reference solution.

Reference solution. A 0.01 per cent w/v solution of *amisulpride IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 90 volumes of buffer solution containing 0.07 per cent w/v solution of *1-octane sulphonic acid sodium* in 0.25 per cent v/v of *diluted sulphuric acid* and 10 volumes of *methanol*,
  B. a mixture of 10 volumes of buffer solution and 90 volumes of *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile Phase A (per cent w/v)	Mobile Phase B (per cent v/v)
0	70	30
6	70	30
10	55	45
15	70	30
20	70	30

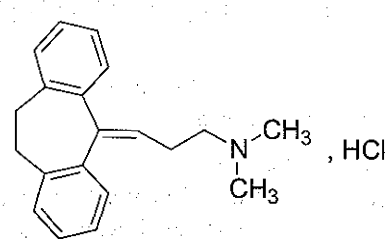
Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates and the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{27}N_3O_4S$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Amitriptyline Hydrochloride



$C_{20}H_{23}N,HCl$ Mol. Wt. 313.9

Amitriptyline Hydrochloride is 3-(10,11-dihydro-5*H*-dibenzo [*a,d*]cyclohept-5-ylidene)propyldimethylamine hydrochloride.

Amitriptyline Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{20}H_{23}N,HCl$, calculated on the dried basis.

Category. Antidepressant.

Description. Colourless crystals or a white or almost white powder.

Identification

Test A may be omitted if tests B, C, and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *amitriptyline hydrochloride IPRS* or with the reference spectrum of amitriptyline hydrochloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.0012 per cent w/v solution in *methanol* shows an absorption maximum only at about 239 nm, about 0.55.

C. To about 50 mg dissolved in 3 ml of *water* add 1 drop of a 2.5 per cent w/v solution of *quinhydrone* in *methanol;* no red colour is produced within 15 minutes (distinction from nortriptyline).

D. It gives the reactions of chlorides (2.3.1).

Tests

Appearance of solution. Dissolve 1.25 g in sufficient *water* to produce 25 ml. The solution is clear (2.4.1) and not more intensely coloured than reference solution BS8 (2.4.1).

pH (2.4.24). 4.5 to 6.0, determined in a 1.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 50.0 ml of the mobile phase.

Reference solution (a). Dissolve 5.0 mg each of *amitriptyline impurity A IPRS* (*dibenzosuberone IPRS*) and *amitriptyline impurity B IPRS (cyclobenzaprine hydrochloride IPRS)* in 5.0 ml of the test solution and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 50.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with endcapped polar– embedded octadecylsilane bonded to amorphous organosilica polymer (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 35 volumes of *acetonitrile* and 65 volumes of 0.52 per cent w/v solution of *dipotassium hydrogen phosphate*, adjusted to pH 7.0 with *orthophosphoric acid*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

The relative retention time with reference to amitriptyline for amitriptyline impurity B is about 0.9 and for amitriptyline impurity A is about 2.2.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to amitriptyline impurity B and the principal peak is not less than 2.0.

Inject reference solution (b) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of the peak due to amitriptyline impurity A is not more than 0.5 times the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.05 per cent). The area of the peak due to amitriptyline impurity B is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The sum of areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in the mobile phase and dilute to 100.0 ml of the mobile phase. Dilute 10.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.02 per cent w/v solution of *amitriptyline hydrochloride IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: a mixture of 30 volumes of buffer solution prepared by dissolving 1.42 g of *dibasic sodium phosphate* in 1000 ml of *water*, adjusted to pH 7.7 with *dilute orthophosphoric acid* and 70 volumes of *methanol*.

- flow rate: 1.5 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for the replicate injection is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{23}N$,HCl.

Storage. Store protected from light.

Amitriptyline Tablets

Amitriptyline Hydrochloride Tablets

Amitriptyline Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of amitriptyline hydrochloride, $C_{20}H_{23}N$, HCl. The tablets are coated.

Usual strengths. 10 mg; 25 mg; 50 mg.

Identification

A. Disperse a quantity of the powdered tablets containing 20 mg of Amitriptyline Hydrochloride with 10 ml of *acetone*, filter and evaporate to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *amitriptyline hydrochloride IPRS* or with the reference spectrum of amitriptyline hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. The residue obtained in test A, gives reaction (A) of chlorides (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the medium if necessary, at the maximum at about 239 nm (2.4.7). Calculate the content of $C_{20}H_{23}N$, HCl in the medium from the absorbance obtained from a solution of known concentration of *amitriptyline hydrochloride IPRS* in the same medium.

Q. Not less than 75 per cent of the stated amount of $C_{20}H_{23}N$,HCl.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing 50 mg of Amitriptyline Hydrochloride in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). A 0.0002 per cent w/v solution of *amitriptyline hydrochloride IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.001 per cent w/v of *amitriptyline hydrochloride IPRS*, 0.00025 per cent w/v of *amitriptyline impurity A IPRS* and 0.001 per cent w/v of *amitriptyline impurity B IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with end-capped polar-embedded octadecylsilane bonded to amorphous organosilica polymer (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 65 volumes of a 0.52 per cent w/v solution of *dipotassium hydrogen orthophosphate*, adjusted to pH 7.0 with *orthophosphoric acid* and 35 volumes of *acetonitrile*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Name	Relative retention time
Amitriptyline impurity B[1]	0.9
Amitriptyline Hydrochloride	1.0
Amitriptyline impurity A[2]	2.7

[1]cyclobenzaprine hydrochloride,

[2]dibenzosuberone.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to amitriptyline impurity B and amitriptyline hydrochloride is not less than 2.0.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 3 times the retention time of the principal peak for test solution. The area of any peak corresponding to amitriptyline impurity A is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.25 per cent), the area of any peak corresponding to amitriptyline impurity B is not more than 0.2 times the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 2.5 times the area of the

principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14).

Test solution. Powder one tablet, shake with 2.5 ml of *0.1 M hydrochloric acid* until completely disintegrated, add 5 ml of *methanol*, shake for 30 minutes, dilute the suspension to 10 ml with *methanol*, centrifuge and use the clear supernatant liquid.

Reference solution. Dissolve 25.0 mg of *amitriptyline hydrochloride IPRS* in 10 ml of *methanol* and dilute to 25.0 ml with *methanol (50 per cent)*.

Chromatographic system

- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane chemically bonded to porous silica or ceramic microparticles (10 µm),
- mobile phase: *0.03 M sodium hexanesulphonate* in a mixture of equal volumes of *acetonitrile* and *water*, adjusted to pH 4.5 with *glacial acetic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 239 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{23}N$,HCl in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. When tablets are film-coated, shake 20 tablets with 50 ml of *0.1 M hydrochloric acid* until completely disintegrated, add 100 ml of *methanol*, shake for 30 minutes, dilute the suspension to 200.0 ml with *methanol*, centrifuge and dilute a volume of the supernatant liquid equivalent to 25 mg of Amitriptyline Hydrochloride to 100.0 ml with *methanol (50 per cent)*.

When tablets are sugar-coated, weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg of Amitriptyline Hydrochloride, shake with 50 ml of *0.1 M hydrochloric acid* for 30 minutes, add 100 ml of *methanol*, shake for 30 minutes, dilute the mixture to 200.0 ml with *water*, centrifuge and use the supernatant liquid.

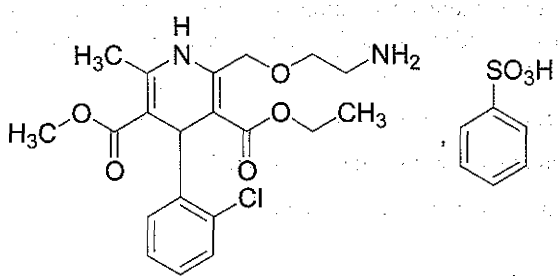
Reference solution. Dissolve 50 mg of *amitriptyline hydrochloride IPRS* in 10 ml of *methanol* and dilute to 200.0 ml with *methanol (50 per cent)*.

Use the procedure chromatographic system as described under Uniformity of content.

Calculate the content of $C_{20}H_{23}N$,HCl in the tablets.

Amlodipine Besylate

Amlodipine Besilate



$C_{26}H_{31}ClN_2O_8S$ Mol. Wt. 567.1

Amlodipine Besylate is 3-ethyl 5-methyl (4*RS*)-2-[(2-aminoethoxy)methyl]-4-(2-chlorophenyl)-6-methyl-1,4-dihydropyridine-3,5-dicarboxylate benzene sulphonate.

Amlodipine Besylate contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{26}H_{31}ClN_2O_8S$, calculated on the anhydrous basis.

Category. Antihypertensive; antianginal.

Description. A white or almost white powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *amlodipine besylate IPRS* or with the reference spectrum of amlodipine besylate.

B. In test A for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (b).

C. When examined in the range 300 nm to 400 nm (2.4.7), a 0.005 per cent w/v solution in a 1 per cent v/v solution of *0.1 M hydrochloric acid* in *methanol* shows an absorption maximum at about 360 nm. The specific absorbance at the maximum is 113 to 121.

Tests

Optical rotation (2.4.22). −0.10° to +0.10°, determined in a 1.0 per cent w/v solution in *methanol*.

Related substances. A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. The upper layer of a mixture of 25 volumes of *glacial acetic acid*, 25 volumes of *water* and 50 volumes of *methyl isobutyl ketone*.

Test solution (a). Dissolve 0.14 g of the substance under examination in 2 ml of *methanol*.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with *methanol*.

Reference solution (a). Dissolve 70 mg of *amlodipine besylate IPRS* in 1.0 ml of *methanol*.

Reference solution (b). Dilute 0.5 ml of reference solution (a) to 5.0 ml with *methanol*.

Reference solution (c). Dilute 3.0 ml of reference solution (b) to 100.0 ml with *methanol*.

Reference solution (d). Dilute 1.0 ml of reference solution (b) to 100.0 ml with *methanol*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate at 80° for 15 minutes and examine under ultraviolet light at 254 nm and 365 nm. The chromatogram obtained with reference solution (a) shows two clearly separated minor spots with R_F values of about 0.18 and 0.22. In the chromatogram obtained with test solution (a) any spot, other than the spots obtained with reference solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.3 per cent) and at most 2 spots are more intense than the spot in the chromatogram obtained with reference solution (d) (0.1 per cent).

B. Determine by liquid chromatography (2.4.14).

Test solution (a). Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Test solution (b). Dilute 5.0 ml of test solution (a) to 100.0 ml with the mobile phase.

Reference solution (a). A solution containing 0.005 per cent w/v of *amlodipine besylate IPRS* in the mobile phase.

Reference solution (b). Dilute 3.0 ml of test solution (a) to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (c). Dissolve 5 mg of the substance under examination in 5 ml of *strong hydrogen peroxide solution*. Heat at 70° for 45 minutes.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 15 volumes of *acetonitrile*, 35 volumes of *methanol* and 50 volumes of a solution prepared by dissolving 7.0 ml of *triethylamine* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 237 nm,
- injection volume: 10 µl.

The relative retention time between amlodipine and amlodipine impurity D (3-ethyl 5-methyl 2-[(2-aminoethoxy)methyl]-4-(2-chlorophenyl)-6-methylpyridine-3,5-dicarboxylate) is about 0.5.

Inject reference solution (c). The test is not valid unless the resolution between the peaks corresponding to amlodipine and amlodipine impurity D is not less than 4.5.

Inject reference solution (b), (c) and test solution (a). Run the chromatogram 3 times the retention time of the principal peak in the chromatogram obtained with test solution (a), the area of any peak due to amlodipine impurity D multiplied by 2 is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent). The sum of the areas of all the other secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent). Ignore any peak due to benzene sulphonate (relative retention about 0.2) and any peak with an area 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.03 per cent).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 3.0 g.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances.

Inject reference solution (a) and test solution (b).

Calculate the content of $C_{26}H_{31}ClN_2O_8S$.

Storage. Store protected from moisture.

Amlodipine Tablets

Amlodipine Besylate Tablets; Amlodipine Besilate Tablets

Amlodipine Tablets contain Amlodipine Besilate.

Amlodipine Tablets contain Amlodipine Besylate equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of amlodipine, $C_{20}H_{25}ClN_2O_5$.

Usual strengths. 5 mg; 10 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution (b) corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 500 ml of *0.01 M hydrochloric acid*,

Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the dissolution medium if necessary, at the maximum at about 239 nm (2.4.7). Calculate the content of $C_{20}H_{25}ClN_2O_5$ in the medium from the absorbance obtained from a solution of known concentration of *amlodipine besilate IPRS* in the same medium.

Q. Not less than 75 per cent of the stated amount of $C_{20}H_{25}ClN_2O_5$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution (a). Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg amlodipine, dissolve in the mobile phase, dilute to 50.0 ml with the mobile phase and centrifuge.

Test solution (b). Dilute 5.0 ml of test solution (a) to 100.0 ml with the mobile phase.

Reference solution (a). A solution of *amlodipine besilate IPRS* containing 0.005 per cent w/v of amlodipine in the mobile phase.

Reference solution (b). Dilute 5.0 ml of test solution (a) to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (c). Dissolve 5 mg of *amlodipine besilate IPRS* in 5 ml of strong *hydrogen peroxide solution*. Heat at 70° for 45 minutes and centrifuge.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 15 volumes of *acetonitrile*, 35 volumes of *methanol* and 50 volumes of a solution prepared by dissolving 7.0 ml of *triethylamine* in 1000 ml of *water*, adjusted to pH 3.0 with *phosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 237 nm,
- injection volume: 10 µl.

The relative retention time between amlodipine and amlodipine impurity D (3-ethyl 5-methyl 2-[(2-aminoethoxy) methyl]-4-(2-chlorophenyl)-6-methylpyridine-3,5-dicarboxylate) is about 0.5.

Inject reference solution (c). The test is not valid unless the resolution between the peaks corresponding to amlodipine and impurity D is at least 4.5.

Inject test solution (a) and reference solution (b). Continue the chromatography for 3 times the retention time of amlodipine. The area of any peak corresponding to amlodipine impurity D multiplied by 2 is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). The sum of the areas of all the other secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak due to benzene sulphonate (relative retention about 0.2) and any peak with an area 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Related substances with the following modification.

Test solution. Disperse one tablet in the mobile phase and dilute with the mobile phase to obtain a solution containing 0.005 per cent w/v of Amlodipine. Filter through a glass fibre filter paper.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{20}H_{25}ClN_2O_5$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances.

Inject reference solution (a) and test solution (b).

Calculate the content of $C_{20}H_{25}ClN_2O_5$ in the tablets.

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the equivalent amount of amlodipine.

Amlodipine and Atenolol Tablets

Amlodipine Besylate and Atenolol Tablets; Amlodipine Besilate and Atenolol Tablets.

Amlodipine and Atenolol Tablets contain amlodipine besylate equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of amlodipine, $C_{20}H_{25}ClN_2O_5$ and atenolol, $C_{14}H_{22}N_2O_3$.

Usual strengths. Amlodipine, 2.5 mg and Atenolol, 25 mg; Amlodipine, 2.5 mg and Atenolol, 50 mg; Amlodipine, 5 mg and Atenolol, 50 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with reference solution (c).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.01 M hydrochloric acid*.

Speed and time. 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of mobile phase A and *acetonitrile*.

Test solution. Use the filtrate, dilute if necessary with the dissolution medium.

Reference solution (a). A 0.112 per cent w/v solution of *atenolol IPRS* in the solvent mixture.

Reference solution (b). A 0.075 per cent w/v solution of *amlodipine besylate IPRS* in the solvent mixture.

Reference solution (c). Dilute a suitable volume of reference solution (a) and reference solution (b) with the dissolution medium to obtain a solution having similar concentration to the test solution.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with phenyl group (5 µm) (Such as Zorbax SB-Phenyl),
- sample temperature: 20°,
- mobile phase: A. a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 5.5 with *dilute sodium hydroxide* or *orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 50 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	75	25
15	20	80
16	75	25
20	75	25

Inject reference solution (c). The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent for amlodipine and atenolol peaks.

Inject reference solution (c) and the test solution.

Calculate the contents of $C_{20}H_{25}ClN_2O_5$ and $C_{14}H_{22}N_2O_3$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{20}H_{25}ClN_2O_5$ and $C_{14}H_{22}N_2O_3$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing 100 mg of Atenolol in 30 ml of mobile phase A with the aid of ultrasound for 15 minutes with intermittent shaking and dilute to 50.0 ml with mobile phase A. Centrifuge the solution at 4000 rpm for 10 minutes and use the supernatant liquid.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Kromasil 100°-5-C18),
- column temperature: 30°,
- mobile phase: A. a mixture of 80 volumes of a buffer solution prepared by dissolving 3.4 g of *potassium dihydrogen phosphate*, 1.0 g of *sodium octane-1 sulphonic acid* and 0.5 g of *tetrabutylammonium hydrogen sulphate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid*, 18 volumes of *methanol* and 2 volumes of *tetrahydrofuran*,
  B. *methanol*,
- a gradient programme using the conditions given below,
- spectrophotometer set at 238 nm (for amlodipine) and 273 nm (for atenolol),
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)	Flow rate (ml per min.)
0	90	10	1.0
20	90	10	1.0
30	60	40	1.5
40	55	45	1.5
75	55	45	1.5
85	90	10	1.0
95	90	10	1.0

The relative retention time with respect to amlodipine peak for amlodipine impurity D is about 0.69.

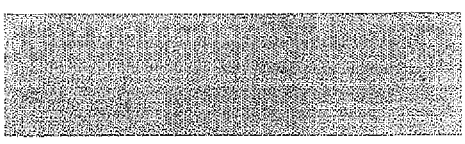
Inject the test solution and record the chromatogram at 238 nm and 273 nm.

For Atenolol —

Atenolol related impurities elutes up to 33 minutes at 273 nm, the area of any secondary peak is not more than 0.5 per cent and the sum of areas of all the secondary peaks is not more than 2.0 per cent, calculated by area normalisation. Ignore any peak corresponding to amlodipine and benzene sulphonate (relative retention time at about 0.25 with respect to atenolol peak).

For Amlodipine —

Amlodipine related impurities elutes after 33 minutes at 238 nm, the area of any peak corresponding to amlodipine impurity D, multiplied with correction factor of 3.03 is not more than 0.5 per cent, the area of any other secondary peak is not more than 0.5 per cent and the sum of areas of all the secondary



peaks, other than amlodipine impurity D is not more than 2.0 per cent, calculated by area normalisation. Ignore any peak corresponding to atenolol and benzene sulphonate (relative retention time at about 0.04 with respect to amlodipine peak).

Uniformity of content. Complies with the test stated under Tablets.

For Amlodipine — Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Disperse one intact tablet in 30 ml of the solvent mixture with the aid of ultrasound for 15 minutes with intermittent shaking, and dilute to 50.0 ml with the solvent mixture, centrifuge at 3000 rpm for 5 minutes. Dilute 5.0 ml of the supernatant liquid to 100.0 ml with *0.01 M hydrochloric acid*.

Inject reference solution (c) and the test solution.

Calculate the content of $C_{20}H_{25}ClN_2O_5$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of mobile phase A and 50 volumes of *acetonitrile*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 50 mg of Atenolol in the solvent mixture with the aid of ultrasound for 15 minutes with intermittent shaking and dilute to 100.0 ml with the solvent mixture, centrifuge at 3000 rpm for 5 minutes. Dilute 5.0 ml of the supernatant liquid to 50.0 ml with *0.01 M hydrochloric acid*.

Reference solution (a). A 0.05 per cent w/v solution of *atenolol IPRS* in the solvent mixture.

Reference solution (b). A 0.007 per cent w/v solution of *amlodipine besylate IPRS* in the solvent mixture.

Reference solution (c). Dilute a suitable volume of reference solution (a) and reference solution (b) with *0.01 M hydrochloric acid* to obtain a solution having similar concentration to the test solution.

Use chromatographic system as described under Dissolution.

Inject reference solution (c). The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent for amlodipine and atenolol peaks.

Inject reference solution (c) and the test solution.

Calculate the content of the $C_{20}H_{25}ClN_2O_5$ and $C_{14}H_{22}N_2O_3$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of amlodipine and atenolol.

Amlodipine and Benazepril Hydrochloride Capsules

Amlodipine Besylate and Benazepril Hydrochloride Capsules; Amlodipine Besilate and Benazepril Hydrochloride Capsules

Amlodipine Besylate and Benazepril Hydrochloride Capsules contain Amlodipine Besylate and Benazepril Hydrochloride equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of amlodipine, $C_{20}H_{25}N_2O_5Cl$ and benazepril hydrochloride, $C_{24}H_{28}N_2O_5,HCl$.

Usual strengths. Amlodipine, 2.5 mg and Benazepril Hydrochloride, 10 mg; Amlodipine, 5 mg and Benazepril Hydrochloride, 20 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peaks in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 500 ml of *0.01 M hydrochloric acid*,
Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate and dilute if necessary, with the dissolution medium.

Reference solution (a). A 0.0385 per cent w/v solution of *amlodipine besylate IPRS* in the dissolution medium.

Reference solution (b). A 0.0225 per cent w/v solution of *benazepril hydrochloride IPRS* in the dissolution medium.

Reference solution (c). Dilute reference solution (a) and reference solution (b) in the dissolution medium to obtain a solution having similar concentration to that of the test solution.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: a mixture of 15 volumes of *acetonitrile*, 35 volumes of *methanol* and 50 volumes of a buffer solution prepared by dissolving 2.72 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, add 2 ml of *triethylamine* mix and adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,

- spectrophotometer set at 237 nm,
- injection volume: 50 µl.

Inject reference solution (c). The test is not valid unless the tailing factor due to amlodipine and benazepril is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (c) and the test solution.

Calculate the content of $C_{20}H_{25}N_2O_5Cl$ and $C_{24}H_{28}N_2O_5,HCl$.

Q. Not less than 80.0 per cent of the stated amounts of $C_{20}H_{25}N_2O_5Cl$ and $C_{24}H_{28}N_2O_5,HCl$.

Related substances. Determine by liquid chromatography (2.4.14).

Solution A. Dilute 7.0 ml of *triethylamine* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and add 1.2 g of *tetrabutyl ammonium hydrogen sulphate,* Filter through a 0.45 µm nylon filter.

Solution B. Dilute 7.0 ml of *triethylamine* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid.* Filter through a 0.45 µm nylon filter.

Solvent mixture. 20 volumes of *acetonitrile*, 30 volumes of *methanol* and 50 volumes of solution B.

Test solution. Weigh a quantity of the mixed contents of 20 capsules containing 25 mg of amlodipine and disperse in 70 ml of solvent mixture mix with the aid of ultrasound for 30 minutes, dilute to 100.0 ml with solvent mixture and filter through a 0.45 µm filter.

Reference solution (a). A solution containing 0.036 per cent w/v each of *amlodipine besylate IPRS, amlodipine impurity A IPRS* and 0.1 per cent w/v each of *benazepril hydrochloride IPRS, benazepril impurity C IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.0001 per cent w/v each of *amlodipine besylate IPRS, amlodipine impurity A IPRS* and 0.0003 per cent w/v, each of, *benazepril hydrochloride IPRS, benazepril impurity C IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. a mixture of 80 volumes of solution A and 20 volumes of *acetonitrile*,
  B. a mixture of 80 volumes of *methanol* and 20 volumes of solution A,
- a gradient programme using the conditions given below,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 237 nm,
- injection volume: 40 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	85	15
100	30	70
101	85	15
110	85	15

Name	Relative retention time
Benazepril impurity C[1]	0.23
Amlodipine impurity A[2]	0.44
Amlodipine	1.0
Benazepril	1.2

[1]{3-[1-carboxy-3-phenyl-(1*S*)-propyl]amino-2,3,4,5-tetrahydro-2-oxo-1H-1-(3S)-benzazepine}-1-acetic acid,

[2]3-ethyl 5-methyl[2-(2-aminoethoxymethyl)-4-(2-chlorophenyl)-6-methyl-3,5-pyridinedicarboxylate].

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to amlodipine and benazepril is not less than 2.0 and the tailing factor is not more than 2.0 for both amlodipine and benazepril peaks.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area any peak corresponding to benazepril impurity C is not morethan 10 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent) and the area of any peak corresponding to amlodipine impurity A is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). The area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of areas of all the secondary peaks is not more than 12.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (5.0 per cent). Ignore any peak with relative retention times of 0.09 and 0.10.

Other tests. Complies with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Use solution (B) and solvent mixture as described under Related substances.

Test solution. Weigh a quantity of the mixed contents of 20 capsules containing 12.5 mg of amlodipine and transfer to a 100-ml volumetric flask, add 70 ml of solvent mixture and keep on rotary shaker for about 45 minutes and further mix sonicate with the aid of ultrasound for 30 minutes with occasional shaking and dilute to volume with solvent mixture, mix and filter, rejecting the first few ml of filtrate.

Reference solution. A solution containing 0.018 per cent w/v of *amlodipine besylate IPRS* and 0.05 per cent w/v of *benazepril hydrochloride IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 10 volumes of *acetonitrile,* 30 volumes of *methanol* and 70 volumes of a buffer solution prepared by diluting 7.0 ml of *triethylamine* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and add 1.2 g of *tetrabutyl ammonium hydrogen sulphate,* Filter through a 0.45 µm nylon filter.
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 237 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{25}N_2O_5Cl$ and $C_{24}H_{28}N_2O_5,HCl$ in the capsules.

Storage. Store protected from light, moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of amlodipine and benazepril hydrochloride.

Amlodipine and Lisinopril Tablets

Amlodipine Besylate and Lisinopril Tablets; Amlodipine Besilate and Lisinopril Tablets

Amlodipine and Lisinopril Tablets contain amlodipine besylate equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of amlodipine, $C_{20}H_{25}ClN_2O_5$ and lisinopril, $C_{21}H_{31}N_3O_5$.

Usual strengths. Amlodipine, 2.5 mg and Lisinopril, 2.5 mg; Amlodipine, 5 mg and Lisinopril, 5 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.1 M hydrochloric acid,*

Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14), using solvent mixture and chromatographic system as described under Assay.

Test solution. Use the filtrate, dilute if necessary with the dissolution medium.

Reference solution. A solution containing 0.028 per cent w/v of *amlodipine besylate IPRS* and 0.02 per cent w/v of *lisinopril IPRS* in the solvent mixture and dilute quantitatively with the dissolution medium to obtain a solution of about the same concentration as the test solution.

Inject the reference solution and the test solution.

Calculate the contents of $C_{20}H_{25}ClN_2O_5$ and $C_{21}H_{31}N_3O_5$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{20}H_{25}ClN_2O_5$ and $C_{21}H_{31}N_3O_5$.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modification.

Test solution. Disperse one intact tablet in 30 ml of the solvent mixture with the aid of ultrasound for 15 minutes with intermittent shaking at room temperature, dilute to 50.0 ml with the solvent mixture and filter. Further, dilute quantitatively with the solvent mixture to obtain a solution of about the same concentration as the standard solution.

Calculate the contents of $C_{20}H_{25}ClN_2O_5$ and $C_{21}H_{31}N_3O_5$ in the tablet.

Other tests. Complies with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of *water* and 20 volumes of *methanol.*

Test solution. Disperse a quantity of intact tablets equivalent to 50 mg of Lisinopril in 300 ml of the solvent mixture, with the aid of ultrasound for 15 minutes with intermittent shaking at room temperature and dilute to 500.0 ml with the solvent mixture and filter. Dilute 5.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution. A solution containing 0.007 per cent w/v of *amlodipine besylate IPRS* and 0.005 per cent w/v of *lisinopril IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 35°,

- mobile phase: a mixture of 82 volumes of 0.27 per cent w/v solution of *potassium dihydrogen phosphate* and 18 volumes of *methanol*, adjusted to pH 7.0 with *triethylamine*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 212 nm,
- injection volume: 50 µl.

The elution order of the peaks is amlodipine and lisinopril.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates for amlodipine and not less than 1500 theoretical plates for lisinopril, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent for both the components.

Inject the reference solution and the test solution.

Calculate the contents of $C_{20}H_{25}ClN_2O_5$ and $C_{21}H_{31}N_3O_5$ in the tablets.

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the equivalent amount of amlodipine and lisinopril.

Amlodipine and Nebivolol Tablets

Amlodipine Besylate and Nebivolol Hydrochloride Tablets; Amlodipine Besilate and Nebivolol Hydrochloride Tablets.

Amlodipine and Nebivolol Tablets contain amlodipine besylate and nebivolol hydrochloride equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of amlodipine, $C_{20}H_{25}ClN_2O_5$ and nebivolol, $C_{22}H_{25}F_2NO_4$.

Usual strength. Amlodipine, 5 mg and Nebivolol, 5 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of 1 per cent w/v solution of *sodium lauryl sulphate* in phosphate buffer pH 6.8 prepared by dissolving 6.9 g of *sodium dihydrogen phosphate* and 0.97 g of *sodium hydroxide* in about 900 ml of *water*, adjusted to pH 6.8 with *sodium hydroxide solution* or *orthophosphoric acid* and dilute to 1000 ml with *water*,

Speed and time. 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary with the dissolution medium.

Reference solution. A solution containing *amlodipine besylate IPRS* and *nebivolol hydrochloride IPRS* equivalent to 0.055 per cent w/v, each of, amlodipine and nebivolol in *methanol* and dilute quantitatively with the dissolution medium to obtain a solution having a similar concentration as the test solution.

Use chromatographic system as described under Assay,

Inject the reference solution and the test solution.

Calculate the contents of $C_{20}H_{25}ClN_2O_5$ and $C_{22}H_{25}F_2NO_4$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{20}H_{25}ClN_2O_5$ and $C_{22}H_{25}F_2NO_4$.

Related substances. Determine by liquid chromatography (2.4.14).

For Nebivolol —

Test solution. Disperse a quantity of the powdered tablets containing 20 mg of Nebivolol in 5 ml of *acetonitrile* with the aid of ultrasound for 5 minutes and dilute to 50.0 ml with the mobile phase and filter.

Reference solution. Dissolve a quantity of *nebivolol hydrochloride IPRS* containing 20 mg of nebivolol in 5 ml of *acetonitrile*, with the aid of ultrasound for 5 minutes and dilute to 50.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with nitrile group bonded to porous silica (5 µm) (Such as Supelcosil LC-CN),
- mobile phase: a mixture of 28 volumes of *acetonitrile* and 72 volumes of a buffer solution prepared by dissolving 3.4 g of *tetrabutylammonium hydrogen sulphate* in 1000 ml of *water*, add 0.3 ml of *diethylamine*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. Run the chromatogram twice the retention time of the principal peak for test solution. The area of any secondary peak is not more than 2.5 times the area of principal peak in the chromatogram obtained with the reference solution (2.5 per cent) and the sum of areas of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with the reference solution (4.0 per cent). Ignore the peak due to amlodipine.

For Amlodipine —

Test solution. Disperse a quantity of the powdered tablets containing 20 mg of Amlodipine in 15 ml of the mobile phase, with the aid of ultrasound for 5 minutes and dilute to 20.0 ml with the mobile phase and filter.

Reference solution. A solution of *amlodipine besylate IPRS* containing 0.1 per cent w/v of amlodipine in the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5µm) (Such as Inertsil ODS-3V),
- mobile phase: a mixture of 15 volumes of *acetonitrile,* 35 volumes of *methanol* and 50 volumes of a buffer solution prepared by mixing 7 ml of *triethylamine* in 1000 ml of *water,* adjusted to pH 3.0 with *orthophosphoric acid,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 237 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. Run the chromatogram twice the retention time of the principal peak for test solution. The area of any secondary peak is not more than 2.5 times the area of principal peak in the chromatogram obtained with the reference solution (2.5 per cent) and the sum of areas of all secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with the reference solution (4.0 per cent). Ignore the peak due to nebivolol.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modification.

Test solution. Disperse one tablet in 2 ml of *water*, add about 20 ml of the mobile phase with the aid of ultrasound for 10 minutes with intermittent shaking, and dilute to 100.0 ml with the mobile phase, filter.

Calculate the content of the $C_{20}H_{25}ClN_2O_5$ and $C_{22}H_{25}F_2NO_4$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 5 mg of Amlodipine in 50 ml of the mobile phase, with the aid of ultrasound for 15 minutes with intermittent shaking, and dilute to 100.0 ml with the mobile phase and filter.

Reference solution. Dissolve a suitable quantity of *amlodipine besylate IPRS* and *nebivolol hydrochloride IPRS* equivalent to amlodipine and nebivolol in the mobile phase to obtain a solution of the similar concentration as the test solution.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with nitrile group bonded to porous silica (5 µm),
- mobile phase: a mixture of 55 volumes of a buffer solution prepared by dissolving 7.7 g of *sodium perchlorate* in 750 ml of *water,* add 1 ml of *triethylamine* and adjusted to pH 6.0 with *orthophosphoric acid*, and 45 volumes of *acetonitrile,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

The elution order of the peaks is amlodipine and nebivolol.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to amlodipine and nebivolol is not less than 3.0, the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent for amlodipine and nebivolol peaks.

Inject the reference solution and the test solution

Calculate the content of the $C_{20}H_{25}ClN_2O_5$ and $C_{22}H_{25}F_2NO_4$ in the tablets.

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the equivalent amount of amlodipine and nebivolol.

Amlodipine and Valsartan Tablets

Amlodipine Besylate and Valsartan Tablets; Amlodipine Besilate and Valsartan Tablets

Amlodipine and Valsartan Tablets contain amlodipine besylate equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of amlodipine, $C_{20}H_{25}ClN_2O_5$ and valsartan, $C_{24}H_{29}N_5O_3$.

Usual strengths. Amlodipine, 5 mg and Valsartan, 80 mg; Amlodipine, 5 mg and Valsartan, 160 mg; Amlodipine, 10 mg and Valsartan, 160 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with test solution (a) (for amlodipine) and test solution (b) (for valsartan) correspond to the principal peaks in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 1000 ml of a buffer solution prepared by dissolving 6.81 g of *monobasic potassium phosphate* and 0.9 g of *sodium hydroxide* in *water* and dilute to 1000 ml with *water*, adjusted to pH 6.8 with *0.2 M sodium hydroxide* or *1M orthophosphoric acid*,
Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Solvent mixture. A 0.1 per cent w/v solution of *polysorbate 80* in the dissolution medium.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution (a). Dissolve 40 mg, each of, *amlodipine besylate IPRS* and *valsartan IPRS* in 40 ml of *methanol* and dilute to 100.0 ml with the dissolution medium.

Reference solution (b). Dissolve 72 mg of *amlodipine besylate IPRS* in 40 ml of *methanol* and dilute to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution (c). A 0.16 per cent w/v solution of *valsartan IPRS* in *methanol.*

Reference solution (d). Dilute a suitable volume of reference solution (b) and reference solution (c) with the solvent mixture to obtain a solution having known concentration similar to the test solution.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with phenyl group bonded to porous silica (4 µm) (Such as Synergi Polar-RP),
- column temperature: 40°,
- mobile phase: a mixture of 50 volumes of *acetonitrile*, 50 volumes of *water* and 0.2 volume of *trifluoroacetic acid*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Inject reference solution (a) and (d). The test is not valid unless the resolution between the peaks due to amlodipine and valsartan is not less than 2.0 in the chromatogram obtained with reference solution (a), the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent for both the peaks in the chromatogram obtained with reference solution (d).

Inject reference solution (d) and the test solution.

Calculate the content of $C_{20}H_{25}ClN_2O_5$ and $C_{24}H_{29}N_5O_3$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{20}H_{25}ClN_2O_5$ and $C_{24}H_{29}N_5O_3$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of mobile phase A and mobile phase B.

Test solution (a). Disperse a quantity of intact tablets containing 50 mg of amlodipine in 50 ml of *water,* with the aid of ultrasound, add 350 ml of the solvent mixture and shake for 45 minutes. Sonicate for 15 minutes with intermittent shaking, dilute with the solvent mixture to obtain 0.02 per cent w/v of amlodipine. Centrifuge the solution for about 10 minutes at 3000 rpm. Use the clear supernatant.

Test solution (b). Dilute a suitable volume of test solution (a) to 100.0 ml with the solvent mixture to obtain a solution containing 0.016 per cent w/v of valsartan.

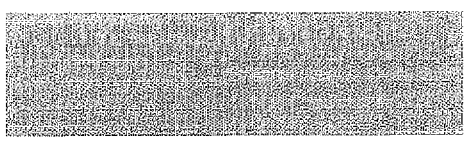
Reference solution (a). Dissolve 70 mg of *amlodipine besylate IPRS* and 80 mg of *valsartan IPRS* in 2.5 ml of *methanol* and dilute to 50.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution (b). A 0.008 per cent w/v solution of *valsartan related compound B IPRS* in reference solution (a).

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution (d). A solution containing 0.005 per cent w/v of *amlodipine related compound A IPRS* (as free base) and 0.003 per cent w/v, each of, *amlodipine besylate IPRS* and *valsartan IPRS,* prepared by dissolving in *methanol* (5 per cent of the final volume) and dilute to volume with the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- sample temperature: 10°
- mobile phase: A. a 1 per cent v/v solution of *triethylamine* in *water,* adjusted to pH 2.8 with *orthophosphoric acid,*
  B. a mixture of 70 volumes of *methanol* and 30 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 237 nm,
- injection volume: 10 µl.



Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	50	50
3	50	50
15	30	70
20	30	70
20.1	50	50
25	50	50

Name	Relative retention time
Devaleryl valsartan[1]	0.24
Amlodipine related compound A[2]	0.50
Valsartan related degradation product 1[3]	0.54
Valsartan related degradation product 2[3]	0.81
Amlodipine	1.00
Valsartan related compound B[4]	1.34
Valsartan related degradation product 3[3]	1.44
Valsartan	1.74
Valsartan related degradation product 4[3]	2.06
Valsartan ethyl ester[5]	2.32

[1]*N*-{[2′-(1*H*-Tetrazole-5-yl)biphenyl-4-yl]methyl}-*L*-valine,

[2]3-Ethyl 5-methyl [2-(2-aminoethoxymethyl)-4-(2-chlorophenyl)-6-methyl-3,5-pyridinedicarboxylate],

[3]These are specified unidentified degradation products. No information is available about chemical structures or chemical names for these impurities,

[4]*N*-Butyryl-*N*-{[2′-(1*H*-tetrazole-5-yl)biphenyl-4-yl]methyl}-*L*-valine,

[5]*N*-Valeryl-*N*-{[2′-(1*H*-tetrazole-5-yl)biphenyl-4-yl]methyl}-*L*-valine ethyl ester.

Inject reference solution (b), (c) and (d). The test is not valid unless the resolution between the peaks due to amlodipine and valsartan related compound B and between the peaks due to valsartan related compound B and valsartan is not less than 4.0 in the chromatogram obtained with reference solution (b), the relative standard deviation for amlodipine related compound A, amlodipine and valsartan peaks is not more than 5.0 per cent in the chromatogram obtained with reference solution (d) and the signal-to- noise ratio for amlodipine and valsartan peaks is not less than 10.0 in the chromatogram obtained with reference solution (c).

Inject reference solution (d), test solution (a) and (b). In the chromatogram obtained with test solution (b), the area of any peak corresponding to devaleryl valsartan, valsartan related degradation product 1, valsartan related degradation product 2, valsartan related degradation product 3, valsartan related degradation product 4 and valsartan ethyl ester, each of, is not more than the area of the valsartan peak in the chromatogram obtained with reference solution (d) (0.2 per cent). In the chromatogram obtained with test solution (a), the area of any peak corresponding to amlodipine related compound A (free base) is not more than 1.25 times the area of amlodipine related compound A peak in the chromatogram obtained with reference solution (d) (0.5 per cent), the area of any other secondary peak is not more than the area of amlodipine peak in the chromatogram obtained with reference solution (d) (0.2 per cent). The sum of all the impurities is not more than 1.2 per cent. If valsartan related compound A is a potential degradation product, then sum of all the impurities other than valsartan related compound A and amlodipine related compound A is not more than 2.0 per cent. Ignore the peaks due to valsartan related compound B, benzene sulphonic acid at relative retention time about 0.19 and any peak with an area less than 0.5 times the area of the amlodipine peak in the chromatogram obtained with reference solution (d) (0.1 per cent).

Limit of valsartan related compound A. Determine by liquid chromatography (2.4.14).

NOTE — Valsartan related compound A is a process impurity and a formulation-specific degradation product.

Test solution. Disperse a quantity of the powdered tablets containing 50 mg of Valsartan in the mobile phase with the aid of ultrasound and dilute to 100.0 ml with the mobile phase.

Reference solution (a). A 0.004 per cent w/v solution, each of *valsartan related compound A IPRS* and *valsartan IPRS* in the mobile phase.

Reference solution (b). A 0.0001 per cent w/v solution of *valsartan related compound A IPRS (N*-Valeryl-*N*-{[2′-(1*H*-tetrazole-5-yl)biphenyl-4-yl]methyl}-D-valine*)* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with cellulose tris-(3,5-dichlorophenyl carbamate bonded to porous silica (5 µm) (Such as Chiracel OD-H),
- sample temperature: 10°,
- mobile phase: a mixture of 85 volumes of *n-hexane,* 15 volumes of *2-propanol* and 0.1 volume of *trifluoroacetic acid,*
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

The relative retention time with reference to valsartan for valsartan related compound A is about 0.7.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to valsartan and valsartan related compound A is not less than 2.0 in the chromatogram obtained with reference solution (a) and the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (b).

Inject reference solution (b) and the test solution. Run the chromatogram 3.5 times the retention time of valsartan related compound A for test solution. The area of any secondary peak corresponding to valsartan related compound A is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Related substances with the following modifications.

Test solution. Disperse 1 tablet in *water* (10 per cent of the final volume) with the aid of ultrasound with intermittent shaking, dilute with the solvent mixture to obtain a solution containing 0.01 per cent w/v of Amlodipine.

Reference solution. A 0.014 per cent w/v solution of *amlodipine besylate IPRS,* prepared by adding *methanol* (upto 5 per cent of the final volume) to dissolve and dilute to volume with the solvent mixture.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{25}ClN_2O_5$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances.

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent for both the peaks.

Inject reference solution (a), test solution (a) and (b).

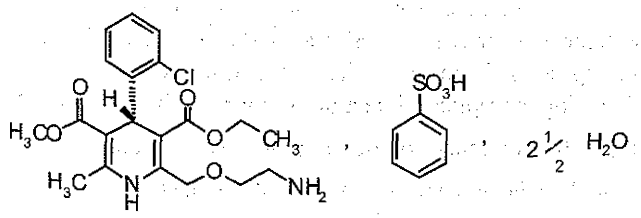
Calculate the content of $C_{20}H_{25}ClN_2O_5$ in test solution (a) and $C_{24}H_{29}N_5O_3$ in test solution (b) in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of amlodipine and valsartan.

S-Amlodipine Besylate

S-Amlodipine Besilate



$C_{26}H_{31}ClN_2O_8S, 2½ H_2O$ Mol. Wt. 612.1

S-Amlodipine Besylate is (*S*)-2-[(2-aminoethoxy)methyl]-4-(2-chlorophenyl)-1,4-dihydro-6-methyl-3,5-pyridinedicarboxylic acid 3-ethyl 5-methyl ester hemipentahydrate.

S-Amlodipine Besylate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{20}H_{25}ClN_2O_5,C_6H_6O_3S$, calculated on the anhydrous basis.

Category. Antihypertensive, antianginal.

Description. A white to pale yellow powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *S-amlodipine besylate IPRS* or with the reference spectrum of *S*-amlodipine besylate.

Tests

Specific optical rotation (2.4.22). −30.0° to −24.0°, determined in a 1.0 per cent w/v solution in *methanol.*

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in the mobile phase and dilute to 100.0 ml of the mobile phase. Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution. A 0.001 per cent w/v solution of *S-amlodipine besylate IPRS* in the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Use the chromatographic system as described under Assay.

The relative retention time with respect to amlodipine for amlodipine impurity D (3-ethyl 5-methyl 2-[(2-aminoethoxy)methyl]-4-(2-chlorophenyl)-6-methylpyridine-3,5-dicarboxylate) is about 0.5 and for benzene sulphonic acid is about 0.14.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to amlodipine impurity D multiplied by 2 is not more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.3 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak corresponding to benzene sulphonic acid.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 8.0 per cent, determined on 0.1 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase. Further dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.001 per cent w/v solution of *S-amlodipine besylate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Thermoquest),
- mobile phase: a mixture of 50 volumes of buffer solution prepared by diluting 7 ml of *triethylamine* to 1000 ml with *water*, adjusted to pH 3.0 with *ortho-phosphoric acid*, 35 volumes of *methanol* and 15 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 237 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{25}ClN_2O_5$,$C_6H_6O_3S$.

S-Amlodipine Tablets

S- Amlodipine Besilate Tablets; *S*- Amlodipine Besylate Tablets

S- Amlodipine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of *S*-amlodipine, $C_{20}H_{25}ClN_2O_5$.

Usual strengths. 1.25 mg; 2.5 mg; 5 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 500 ml of *0.01 M hydrochloric acid*,

Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Use the filtrate, dilute if necessary, with the dissolution medium. Measure the absorbance of the resulting solution at the maximum at about 239 nm (2.4.7). Calculate the content of $C_{20}H_{25}ClN_2O_5$ in the medium from the absorbance obtained from a solution of known concentration of *S-amlodipine besylate IPRS*.

Q. Not less than 70 per cent of the stated amount of $C_{20}H_{25}ClN_2O_5$.

Uniformity of content. Complies with the test stated under tablets.

Determine by liquid chromatography (2.4.14), as described under Assay, using the following solution as the test solution.

Test solution. Disperse 1 tablet in the mobile phase, sonicate and dilute if necessary to obtain a solution containing 0.0025 per cent w/v of S-Amlodipine in the mobile phase.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 5 mg of S- Amlodipine with the mobile phase and dilute to 200.0 ml of the mobile phase. Centrifuge 10.0 ml of the solution at 3500 rpm for 15 minutes.

Reference solution. A solution of *S-amlodipine besylate IPRS* containing 0.0025 per cent w/v of Amlodipine in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of buffer solution pH 3.0 prepared by diluting 7 ml of *triethylamine* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid*, 30 volumes of *acetonitrile* and 20 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 237 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{25}ClN_2O_5$ in the tablets.

Labelling. The label states the strength in terms of the equivalent amount of S-Amlodipine.

Ammonium Chloride

NH_4Cl Mol. Wt. 53.5

Ammonium Chloride contains not less than 99.0 per cent and not more than 100.5 per cent of NH_4Cl, calculated on the dried basis.

Category. Expectorant; diuretic; systemic acidifier.

Description. Colourless crystals or a white, crystalline powder.

Identification

It gives the reactions of chlorides (2.3.1) and 10 ml of a 10 per cent w/v solution in *carbon dioxide-free water* gives reaction of ammonia salts (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *carbon dioxide-free water* (solution A) is clear (2.4.1) and colourless (2.4.1).

pH (2.4.24). 4.5 to 6.0, determined in a 5.0 per cent solution.

Arsenic (2.3.10) Dissolve 2.5 g in 50 ml of *water* and add 10 ml of *stannated hydrochloric acid*. The resulting solution complies with the limit test for arsenic (4 ppm).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method A (10 ppm).

Iron (2.3.14). 2.0 g complies with the limit test for iron (20 ppm).

Calcium. To 0.2 ml of *ethanolic calcium standard solution (100 ppm Ca)* add 1 ml of a 4 per cent w/v solution of *ammonium oxalate*. After 1 minute add 1 ml of *2 M acetic acid* and 15 ml of a solution made by diluting 5 ml of a 10 per cent solution of the substance under examination with 10 ml of *water* and shake. Compare any opalescence produced with that of a standard prepared in a similar manner but using a mixture of 10 ml of *calcium standard solution (10 ppm Ca)* and 5 ml of *water* instead of the solution of the substance under examination (200 ppm).

Sulphates (2.3.17). 1.0 g complies with the limit test for sulphates (150 ppm).

Thiocyanate. Acidify 10 ml of a 10 per cent w/v solution with *hydrochloric acid* and add a few drops of *ferric chloride solution*; no red colour is produced.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

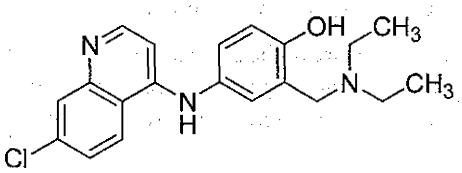
Loss on drying (2.4.19). Not more than 1.0 per cent determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.1 g in 20 ml of *water* and add a mixture of 5 ml of *formaldehyde solution*, previously neutralised to *dilute phenolphthalein solution*, and 20 ml of *water*. After 2 minutes, titrate slowly with *0.1 M sodium hydroxide* using a further 0.2 ml of *dilute phenolphthalein solution* as indicator.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.005349 g of NH_4Cl.

Amodiaquine Hydrochloride

Amodiaquine Dihydrochloride



, 2HCl, $2H_2O$

$C_{20}H_{22}ClN_3O$, 2HCl, $2H_2O$ Mol. Wt. 464.8

Amodiaquine Hydrochloride is 4-(7-chloro-4-quinolylamino)-2-(diethylaminomethyl)phenol dihydrochloride dihydrate.

Amodiaquine Hydrochloride contains not less than 98.0 per cent and not more than 101.5 per cent of $C_{20}H_{22}ClN_3O$, 2HCl, calculated on the anhydrous basis.

Category. Antimalarial.

Description. A yellow, crystalline powder.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests C and D may be omitted if tests A, B and E are carried out.

A. Dissolve 20 mg in 10 ml of *water* and add 1 ml *of strong ammonia solution*. Extract with two quantities, each of 25 ml, of *chloroform*, wash the combined *chloroform* extracts with *water*, dry with *anhydrous sodium sulphate*, evaporate the *chloroform* and dry the residue at 105° for 2 hours. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *amodiaquine hydrochloride IPRS* treated in the same manner or with the reference spectrum of amodiaquine.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.0015 per cent w/v solution in *0.1 M hydrochloric acid* shows an absorption maximum at about 343 nm, about 0.55.

C. To 1 ml of a 2 per cent w/v solution add 0.5 ml of *cobalt thiocyanate solution*; a green precipitate is produced.

D. To 20 ml of a 2 per cent w/v solution, add 1 ml of *dilute ammonia solution*. Shake and filter; the filtrate gives the reactions of chlorides (2.3.1).

E. The undried material melts at about 158° (2.4.21).

Tests

pH (2.4.24). 3.6 to 4.6, determined in a 2.0 per cent w/v solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 90 volumes of *chloroform* saturated with *strong ammonia solution* and 10 volumes of *ethanol*.

Test solution. Add to 0.2 g of the substance under examination in a glass-stoppered test-tube 10 ml of *chloroform* saturated with *strong ammonia solution*, shake vigorously for 2 minutes, allow the solids to settle and decant the supernatant liquid.

Reference solution (a). Prepare in the same manner as the test solution but using 0.2 g of *amodiaquine hydrochloride IPRS* and 10 ml of *chloroform* saturated with *strong ammonia solution*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) with sufficient *chloroform* saturated with *strong ammonia solution* to obtain 200.0 ml.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a) and no secondary spot in the chromatogram obtained with the test solution is more intense than the principal spot in the chromatogram obtained with reference solution (b).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 6.0 to 10.0 per cent, determined on 0.5 g.

Assay. Dissolve 0.3 g in sufficient *0.1 M hydrochloric acid* to produce 200.0 ml. Dilute 10.0 ml of the solution to 1000.0 ml with *0.1 M hydrochloric acid*. Measure the absorbance of the resulting solution at the maximum at about 343 nm (2.4.7), using *0.1 M hydrochloric acid* as the blank.

Calculate the content of $C_{20}H_{22}ClN_3O$, 2HCl from the absorbance obtained by carrying out the Assay simultaneously on *amodiaquine hydrochloride IPRS*.

Amodiaquine Tablets

Amodiaquine Hydrochloride Tablets

Amodiaquine Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of amodiaquine, $C_{20}H_{22}ClN_3O$.

Usual strength. The equivalent of 200 mg of amodiaquine. (1 g of Amodiaquine Hydrochloride anhydrous is approximately equivalent to 0.83 g of amodiaquine).

Identification

A. Extract the powdered tablets with *water* and filter. To 1 ml of the filtrate add 0.5 ml of *cobalt thiocyanate solution*; a green precipitate is produced.

B. The powdered tablets give the reactions of chlorides (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with *water* if necessary, at the maximum at about 343 nm (2.4.7). Calculate the content of $C_{20}H_{22}ClN_3O$ in the medium from the absorbance obtained from a known concentration of *amodiaquine hydrochloride IPRS* in the same medium.

Q. Not less than 70 per cent of the stated amount of $C_{20}H_{22}ClN_3O$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 90 volumes of *chloroform* saturated with *strong ammonia solution* and 10 volumes of *ethanol*.

Test solution. Disperse a quantity of the powdered tablets containing 40 mg of Amodiaquine Hydrochloride with 20 ml of *water* for 1 minute, add 25 ml of *chloroform* and 1 ml of *strong ammonia solution* and shake vigorously for 2 minutes. Filter the chloroform extract through a cotton plug previously soaked in *chloroform*, evaporate the filtrate to dryness and dissolve the residue in 2 ml of *chloroform* saturated with *strong ammonia solution*.

Reference solution (a). Prepare in the same manner as the test solution but using 0.2 g of *amodiaquine hydrochloride IPRS* and 10 ml of *chloroform* saturated with *strong ammonia solution*

Reference solution (b). Dilute 1.0 ml of reference solution (a) with sufficient *chloroform* saturated with *strong ammonia solution* to obtain 200.0 ml.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a) and no secondary spot in the chromatogram obtained with the test solution is more intense than the principal spot in the chromatogram obtained with reference solution (b).

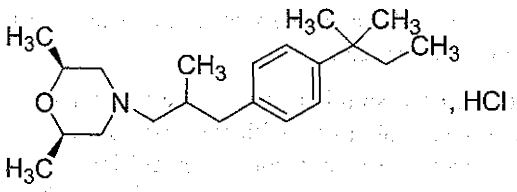
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.3 g of amodiaquine, add 100 ml of *0.1 M hydrochloric acid* and heat on a water-bath for about 15 minutes with occasional stirring. Cool, transfer to a 200-ml graduated flask and dilute to volume with *0.1 M hydrochloric acid*. To 10.0 ml of the clear supernatant liquid in a separator, add 10 ml of *0.1 M hydrochloric acid* and extract with 20 ml of *chloroform*. Discard the chloroform extract. Add 4.5 ml of *1 M sodium hydroxide* and extract with four quantities, each of 25 ml of *chloroform*. Extract the combined chloroform solutions with three quantities, each of 50 ml, of *0.1 M hydrochloric acid* and dilute with sufficient *0.1 M hydrochloric acid* to produce 200.0 ml. Dilute 10.0 ml with sufficient *0.1 M hydrochloric acid* to produce 100.0 ml. Measure the absorbance of the resulting solution at the maximum at about 343 nm (2.4.7), using *0.1 M hydrochloric acid* as the blank.

Calculate the content of $C_{20}H_{22}ClN_3O$, 2HCl from the absorbance obtained by carrying out the Assay simultaneously on *amodiaquine hydrochloride IPRS*. Multiply the result by 0.830 to get the equivalent quantity of $C_{20}H_{22}ClN_3O$.

Labelling. The label states the strength in terms of the equivalent amount of amodiaquine.

Amorolfine Hydrochloride



$C_{21}H_{35}NO$, HCl Mol. Wt. 354.0

Amorolfine Hydrochloride is (2*R**,6*S**)-2,6-Dimethyl-4-{2-methyl-3-[4-(2-methylbutan-2-yl)phenyl]propyl}morpholine.

Amorolfine Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{21}H_{35}NO$, HCl, calculated on the dried basis.

Category. Antifungal.

Description. A white to off-white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *amorolfine hydrochloride IPRS* or with the reference spectrum of amorolfine hydrochloride.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, 30 volumes of *acetonitrile* and 30 volumes of *tetrahydrofuran*, adjusted to pH 6.5 with *1 M sodium hydroxide*,
- flow rate: 2 ml per minute.
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Inject the test solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution. The area of any secondary peak is not more than 1.0 per cent and the sum of areas of all the secondary peaks is not more than 2.0 per cent, calculated by area normalisation.

Heavy metals (2.3.13). 1 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.5 per cent.

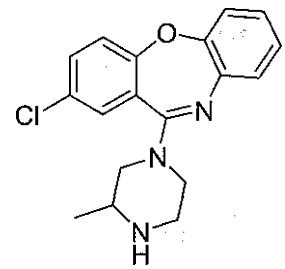
Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Dissolve 0.2 g in 50 ml of *1.0 per cent w/v mercuric acetate solution* in *glacial acetic acid*. Titrate with *0.1M perchloric acid* determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.0354 g of $C_{21}H_{35}NO$, HCl.

Calculate the content of $C_{21}H_{35}NO$, HCl.

Amoxapine



$C_{17}H_{16}ClN_3O$ Mol. Wt. 313.8

Amoxapine is Dibenz [b,f] [1,4] oxazepine, 2-chloro-11-(1-piperazinyl)-; 2-chloro-11-(1-piperazinyl) dibenz[b,f] [1,4] oxazepine.

Amoxapine contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{17}H_{16}ClN_3O$, calculated on the dried basis.

Category. Antidepressant.

Description. A white to yellowish crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained from *amoxapine IPRS* or with the reference spectrum of amoxapine.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Buffer solution. Dissolve 3.9 g of *ammonium acetate* in 1000 ml of *water*, adjusted to pH 7.3 with *acetic acid* or *dilute ammonia*.

Solvent mixture. 30 volumes of buffer solution and 70 volumes of *acetonitrile*.

Test solution. Dissolve 100 mg of the substance under examination in solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). A solution containing 0.1 per cent w/v of *amoxapine IPRS* and 0.00015 per cent w/v of *amoxapine related compound G IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.0001 per cent w/v of *amoxapine IPRS* and 0.00015 per cent w/v, each of, *amoxapine related compound G IPRS* and *amoxapine related compound D IPRS* in the solvent mixture.

Use the chromatographic system as described under Assay except gradient programme.

Time (in min.)	Buffer solution (per cent v/v)	Acetonitrile (per cent v/v)
0	70	30
5	70	30
7.5	60	40
15	60	40
20	20	80
25	20	80
30	70	30
35	70	30

Name	Relative retention time
Chlorophenoxyanilineurea analog[1]	0.57
Amoxapine	1.0
Amoxapine related compound G[2]	1.4
Amoxapine related compound D[3]	1.7
Chlorophenoxyaniline[4]	2.9
Chlorophenoxyaniline carbamate[5]	3.8
N-Carbamoyl amoxapine[6]	4.3
Amoxapine dimer[7]	5.0

[1]N-[2-(4-Chlorophenoxy) phenyl] piperazine-1-carboxamide,

[2]3-chloro-11-(piperazin-1-yl) dibenzo [b,f][1,4] oxazepine.

[3]*2-chlorodibenzo {b,f}-[1,4]-oxazepin-11-one.*

[4]2-(4-Chlorophenoxy) aniline,

[5]Ethyl [2-(4-Chlorophenoxy) phenyl] carbamate,

[6]4-(2-Chlorodibenzo {b,f} [1,4] oxazepin-11-yl)-N-[2-(4-chlorophenoxy) phenyl] piperazine-1-carboxamide,

[7]1,4-Bis(2-chlorodibenzo[b,f] [1,4] oxazepine-11-yl) piperazine.

Inject reference solution (a). The peak to valley ratio between the peaks due to amoxapine and amoxapine related compound G is not less than 3.

Inject reference solution (b). The test is not valid unless the relative standard deviation for amoxapine, amoxapine related compound G and amoxapine related compound D peaks is not more than 5.0 per cent.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to chlorophenoxyaniline urea analog, chlorophenoxyaniline, chlorophenoxyaniline carbamate, N-carbamoyl amoxapine, amoxapine dimer and any other secondary peak is not more than the area of the principal peak due to amoxapine in the chromatogram obtained with reference solution (b) (0.1 per cent). The area of any peak due to amoxapine related compound G and D is not more than the area of the principal peak due to amoxapine related compound G and D respectively in the chromatogram obtained with reference solution (b) (0.15 per cent). The sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak due to amoxapine in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.2 times the area of the principal peak due to amoxapine in the chromatogram obtained with reference solution (b) (0.02 per cent).

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Determine by liquid chromatography (2.4.14).

Buffer solution. Dissolve 3.9 g of *ammonium acetate* in 1000 ml of *water*, adjusted to pH 7.3 with *acetic acid or dilute ammonia solution*.

Solvent mixture. 30 volumes of buffer solution and 70 volumes of *acetonitrile*.

Test solution. Dissolve 10 mg of the substance under examination in 50 ml of the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). A solution containing 0.01 per cent w/v of *amoxapine IPRS* and *amoxapine related compound G IPRS [3-chloro-11-(piperazin-1-yl) dibenzo [b,f] [1,4] oxazepine]* in the solvent mixture.

Reference solution (b). A 0.01 per cent w/v solution of *amoxapine IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 7.5 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (2.7 µm),
- column temperature: 35°,
- mobile phase: a mixture of 70 volumes of a buffer solution and 30 volumes of *acetonitrile*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Name	Relative retention time
Amoxapine	1.0
Amoxapine related compound G	1.3

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to amoxapine and amoxapine related compound G is not less than 1.5 in the chromatogram obtained with reference solution (a). The tailing factor is between 0.8 to 1.8 and the relative standard deviation for replicate injections is not more than 0.73 per cent in the chromatogram obtained with reference solution (b).

Inject reference solution (b) and the test solution.

Calculate the content of $C_{17}H_{16}ClN_3O$.

Storage. Store protected from moisture.

Amoxapine Tablets

Amoxapine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of amoxapine, $C_{17}H_{16}ClN_3O$.

Usual strengths. 25 mg; 50 mg; 100 mg; 150 mg.

Identification

A. Triturate a quantity of powered tablets containing 50 mg of Amoxapine with 10 ml of *chloroform* and filter. Evaporate to dryness on water bath. The residue complies with the following test. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *amoxapine IPRS* or with the reference spectrum of amoxapine.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of gastric juice, artificial (without pepsin) prepared by dissolving 2.0 g of *sodium chloride* in 80 ml of *1 M hydrochloric acid* and dilute to 1000 ml with *water*,

Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the dissolution medium and filter. Measure the absorbance of the filtrate, suitably diluted with dissolution medium if necessary, at the maximum at about 294 nm (2.4.7). Calculate the content of $C_{17}H_{16}ClN_3O$ in the medium from the absorbance obtained by repeating the determination using a solution of known concentration of *amoxapine IPRS* in dissolution medium.

Q. Not less than 80 per cent of the stated amount of $C_{17}H_{16}ClN_3O$.

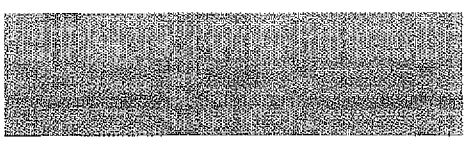
Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg of *amoxapine* add 25 ml of mobile phase and shake vigorously with the aid of ultrasound for 20 minutes and dilute to 50.0 ml with the mobile phase and filter. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. Dissolve a quantity of *amoxapine IPRS* in the *acetonitrile* to obtain a solution containing 0.1 per cent w/v of amoxapine. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecyl silane bonded to porous silica (5 µm),
- mobile phase: mix 20 ml of 11.3 per cent w/v of *tetramethylammonium chloride* with 4.0 ml of *dilute orthophosphoric acid* (1 in 5), and 720 ml of *acetonitrile* diluted to 2000 ml with 0.138 per cent w/v of *monobasic sodium phosphate*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.



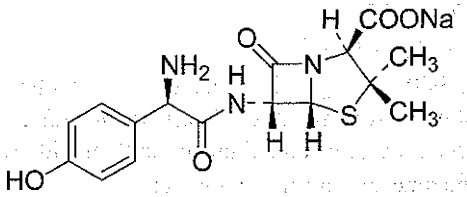
Inject the reference solution. The test is not valid unless the column efficiency is not less than 1200 theoretical plates, the tailing factor is not more than 1.8 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{16}ClN_3O$.

Storage. Store protected from moisture.

Amoxycillin Sodium



$C_{16}H_{18}N_3NaO_5S$ Mol. Wt. 387.4

Amoxycillin Sodium is sodium (6*R*)-6-(α-4-hydroxyphenyl-D-glycylamino)penicillanate.

Amoxycillin Sodium contains not less than 85.0 per cent and not more than 100.5 per cent of $C_{16}H_{18}N_3NaO_5S$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white or almost white powder; very hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *amoxycillin sodium IPRS* or with the reference spectrum of amoxycillin sodium.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. A 5.0 per cent w/v solution gives the reactions of sodium salts (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution is not more opalescent than opalescence standard OS2 (2.4.1) when examined immediately after preparation. The solution may initially show a pink colour and its absorbance after 5 minutes at about 430 nm is not more than 0.20 (2.4.7).

pH (2.4.24). 8.0 to 10.0, determined in a 10.0 per cent w/v solution.

Specific optical rotation (2.4.22). +240° to +290°, determined in a 0.25 per cent w/v solution in a 0.4 per cent w/v solution of *potassium hydrogen phthalate*.

***N,N*-Dimethylaniline** (2.3.21). Not more than 20 ppm, determined by Method A.

Sodium chloride. Not more than 2.0 per cent, calculated on the anhydrous basis, determined by the following method. Dissolve 1.0 g in 50 ml of *water*; add 10 ml of *2 M nitric acid* and titrate with *0.1 M silver nitrate*, determining the end-point potentiometrically (2.4.25) using a silver indicator electrode and a mercury-mercurous sulphate reference electrode or any other suitable electrode.

1 ml of *0.1 M silver nitrate* is equivalent to 0.005845 g of NaCl.

2-Ethylhexanoic acid (2.3.51). Not more than 0.8 per cent.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Water (2.3.43). Not more than 4.0 per cent, determined on 0.4 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 6.8 g of *monobasic potassium phosphate* in 1000 ml of *water* and adjusted to pH 5.0 with 4.5 per cent w/v solution of *potassium hydroxide*.

Test solution. Dissolve a quantity containing 120 mg of Amoxycillin in the solvent mixture and dilute to 100.0 ml with the solvent mixture. Use the solution within 6 hours.

Reference solution. Dissolve a suitable quantity of *amoxycillin trihydrate IPRS* in the solvent mixture by shaking and mixing if necessary, with the aid of ultrasound and dilute to obtain a solution having a known concentration of about 1.2 mg per ml. Use the solution within 6 hours.

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane chemically bonded to porous silica or ceramic microparticles (5 µm),
- mobile phase: a mixture of 4 volumes of *acetonitrile* and 96 volumes of the solvent mixture,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1700 theoretical plates, the tailing factor is not more than 2.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{18}N_3NaO_5S$ by multiplying the content of $C_{16}H_{19}N_3O_5S$ by 1.06.

Amoxycillin Sodium intended for use in the manufacture of parenteral preparations without a further appropriate

procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.25 Endotoxin Unit per mg of amoxycillin.

Amoxycillin Sodium intended for use in the manufacture of parenteral preparations without a further appropriate sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from moisture, at a temperature not exceeding 30°. If it is intended for use in the manufacture of parenteral preparations, the container should be sterile, tamper-evident and sealed so as to exclude micro-organisms.

Labelling. The label states whether or not the material is intended for use in the manufacture of parenteral preparations.

Amoxycillin Injection

Amoxicillin Sodium Injection; Amoxycillin Sodium Injection

Amoxycillin Injection is a sterile material consisting of Amoxycillin Sodium with or without excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Amoxycillin Injection contains Amoxycillin Sodium equivalent to not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of amoxycillin, $C_{16}H_{19}N_3O_5S$.

Usual strengths. The equivalent of 100 mg, 250 mg, 500 mg and 1 g of amoxycillin.

Description. A white or almost white powder; very hygroscopic.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *amoxycillin sodium IPRS* or with the reference spectrum of amoxycillin sodium.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. A 5.0 per cent w/v solution gives the reactions of sodium salts (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution is not more opalescent than opalescence standard OS2 (2.4.1) when examined immediately after preparation. The solution may initially show a pink colour and its absorbance after 5 minutes at about 430 nm is not more than 0.20 (2.4.7).

pH (2.4.24). 8.0 to 10.0, determined in a 10.0 per cent w/v solution.

Specific optical rotation (2.4.22). +240° to +290°, determined in a 0.25 per cent w/v solution in a 0.4 per cent w/v solution of *potassium hydrogen phthalate*.

N,N-Dimethylaniline (2.3.21). Not more than 20 ppm, determined by Method A.

Sodium chloride. Not more than 2.0 per cent, calculated on the anhydrous basis, determined by the following method. Weigh 1.0 g, dissolve in 50 ml of *distilled water*; add 10 ml of *2 M nitric acid* and titrate with *0.1 M silver nitrate*, determining the end-point potentiometrically (2.4.25) using a silver indicator electrode and a mercury-mercurous sulphate reference electrode or any other suitable electrode.

1 ml of *0.1 M silver nitrate* is equivalent to 0.005845 g of NaCl.

Bacterial endotoxins (2.2.3). Not more than 0.25 Endotoxin Unit per mg of amoxycillin.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

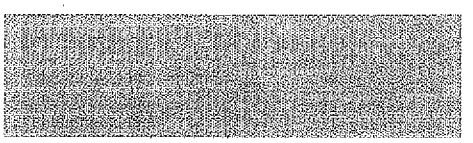
Water (2.3.43). Not more than 4.0 per cent, determined on 0.4 g.

Other tests. Comply with the tests stated under Parenteral Preparations (Injection).

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 6.8 g of *monobasic potassium phosphate* in 1000 ml of *water* and adjusted to pH 5.0 with a 4.5 per cent w/v solution of *potassium hydroxide*.

Test solution. Determine the weight of the contents of 10 containers. Transfer a weighed quantity of the mixed contents of the 10 containers containing 100 mg of amoxycillin to a 100-ml volumetric flask, add 80 ml of the solvent mixture and dissolve by shaking and mixing if necessary, with the aid of ultrasound. Dilute to 100.0 ml with the solvent mixture and filter. Use the solution within 6 hours.



Reference solution. Dissolve a quantity of *amoxycillin trihydrate IPRS* in the solvent mixture by shaking and mixing if necessary, with the aid of ultrasound and dilute to obtain a solution having a known concentration of about 1.2 mg per ml. Use the solution within 6 hours.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica or ceramic microparticles (5 µm),
- mobile phase: a mixture of 4 volumes of *acetonitrile* and 96 volumes of the solvent mixture,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1700 theoretical plates, the tailing factor is not more than 2.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

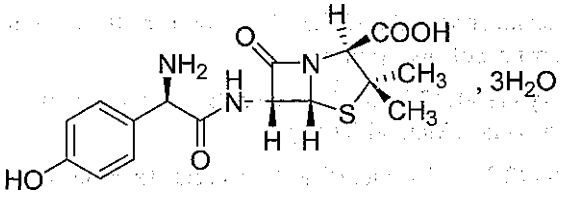
Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{19}N_3O_5S$ in the injection.

Storage. Store protected from moisture, in a sterile, tamper-evident container sealed so as to exclude micro-organisms, at a temperature not exceeding 30°.

Labelling. The label states the quantity of Amoxycillin Sodium contained in the sealed container in terms of the equivalent amount of amoxycillin.

Amoxycillin Trihydrate



$C_{16}H_{19}N_3O_5S,3H_2O$ Mol. Wt. 419.4

Amoxycillin Trihydrate is (6*R*)-6-(α-4-hydroxyphenyl-D-glycylamino)penicillanic acid trihydrate.

Amoxycillin Trihydrate contains not less than 95.0 per cent and not more than 102.0 per cent of $C_{16}H_{19}N_3O_5S$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *amoxycillin trihydrate IPRS* or with the reference spectrum of amoxycillin trihydrate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. Place about 2 mg in a test-tube. Moisten with 0.05 ml of *water* and add 2 ml of *sulphuric acid-formaldehyde reagent*. Mix the contents of the tube by swirling; the solution is practically colourless. Place the tube in a water-bath for 1 minute; a dark yellow colour develops.

Tests

Appearance of solution. Dissolve 1.0 g in 10 ml of *0.5 M hydrochloric acid*, and a further 1.0 g in a mixture of 3 ml of *dilute ammonia solution* and 7 ml of *water*. Both solutions when freshly prepared are not more opalescent than opalescence standard OS2 (2.4.1).

pH (2.4.24). 3.5 to 5.5, determined in a 0.2 per cent w/v solution.

Specific optical rotation (2.4.22). +290° to +315°, determined in a 0.2 per cent w/v solution in *carbon dioxide-free water*.

***N,N*-Dimethylaniline** (2.3.21). Not more than 20 ppm, determined by Method A.

NOTE —Test to be performed only if N,N Dimethylaniline is used in the synthesis.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 1.0 per cent.

Water (2.3.43). 11.5 to 14.5 per cent, determined on 0.1 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 6.8 g of *monobasic potassium phosphate* in 1000 ml of *water* and adjusted to pH 4.5 with a 4.5 per cent w/v solution of *potassium hydroxide*.

Test solution. Transfer a weighed quantity of about 0.12 g of the substance under examination to a 100-ml volumetric flask, dissolve in the solvent mixture by shaking and mixing if necessary, with the aid of ultrasound and dilute to 100.0 ml with the solvent mixture. Use the solution within 6 hours.

Reference solution. Weigh a suitable quantity of *amoxycillin trihydrate IPRS*, dissolve in the solvent mixture by shaking and mixing if necessary, with the aid of ultrasound and dilute to obtain a solution having a known concentration of about 1.2 mg per ml. Use the solution within 6 hours.

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane chemically bonded to porous silica or ceramic microparticles (5 µm),
- mobile phase: a mixture of 4 volumes of *acetonitrile* and 96 volumes of the solvent mixture,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1700 theoretical plates, the tailing factor is not more than 2.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{19}N_3O_5S$.

Storage. Store at a temperature not exceeding 30°.

Amoxycillin Capsules

Amoxycillin Trihydrate Capsules; Amoxicillin Trihydrate Capsules; Amoxicillin Capsules

Amoxycillin Capsules contain Amoxycillin Trihydrate equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of amoxycillin, $C_{16}H_{19}N_3O_5S$.

Usual strengths. The equivalent of 250 mg and 500 mg of amoxycillin.

Identification

Disperse a quantity of the contents of the capsules containing about 0.5 g of amoxycillin with 5 ml of *water* for 5 minutes, filter, wash the residue first with *ethanol* and then with *ether* and dry at a pressure not exceeding 0.7 kPa for 1 hour. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *amoxycillin trihydrate IPRS* or with the reference spectrum of amoxycillin trihydrate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 100 rpm and 60 minutes.

Use one capsule in the vessel for each test.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc having an average pore diameter not greater than 1.0 µm, rejecting the first 1 ml of the filtrate. Dilute the filtrate, if necessary, with the same solvent. Measure the absorbance of the resulting solution at the maximum at about 272 nm (2.4.7). Similarly measure the absorbance of a standard solution of known concentration of *amoxicillin trihydrate IPRS* at about 272 nm and calculate the content of $C_{16}H_{19}N_3O_5S$.

Q. Not less than 80 per cent of the stated amount of $C_{16}H_{19}N_3O_5S$.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 6.8 g of *monobasic potassium phosphate* in 1000 ml of *water* and adjusted to pH 5.0 with a 4.5 per cent w/v solution of *potassium hydroxide*.

Test solution. Weigh a quantity of the mixed contents of 20 capsules containing 0.1 g of amoxicillin, add about 80 ml of the solvent mixture and dissolve by shaking for 15 minutes and mixing if necessary, with the aid of ultrasound. Dilute to 100.0 ml with the solvent mixture and filter. Use the solution within 6 hours.

Reference solution. Dissolve a suitable quantity of *amoxycillin trihydrate IPRS* in the solvent mixture by shaking and mixing if necessary, with the aid of ultrasound and dilute to obtain a solution having a known concentration of about 1.2 mg per ml. Use the solution within 6 hours.

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica or ceramic microparticles (5 µm),
- mobile phase: a mixture of 4 volumes of *acetonitrile* and 96 volumes of the solvent mixture,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1700 theoretical plates, the tailing factor is not more than 2.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{19}N_3O_5S$ in the capsules.

Storage. Store protected from moisture.

Labelling. The label states the quantity of the active ingredient in terms of the equivalent amount of amoxycillin.

Amoxycillin Dispersible Tablets

Amoxycillin Trihydrate Dispersible Tablets; Dispersible Amoxicillin Tablets

Amoxycillin Dispersible Tablets contain Amoxycillin Trihydrate in a suitable dispersible base.

Amoxycillin Dispersible Tablets contain Amoxycillin Trihydrate equivalent to not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of amoxycillin, $C_{16}H_{19}N_3O_5S$.

Usual strengths. The equivalent of 125 mg and 250 mg of amoxycillin.

Identification

Disperse a quantity of the powdered tablets containing about 0.5 g of amoxycillin with 5 ml of *water* for 5 minutes, filter, wash the residue first with *ethanol* and then with *ether* and dry for 1 hour at a pressure not exceeding 0.7 kPa. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *amoxycillin trihydrate IPRS* or with the reference spectrum of amoxycillin trihydrate.

Tests

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 6.8 g of *monobasic potassium phosphate* in 1000 ml of *water* and adjusted to pH about 4.5 with a 4.5 per cent w/v solution of *potassium hydroxide*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.1 g of amoxicillin and dissolve in the solvent mixture by shaking for 15 minutes and mixing if necessary, with the aid of ultrasound. Dilute to 100.0 ml with the solvent mixture and filter. Use the solution within 6 hours.

Reference solution. Weigh a suitable quantity of *amoxycillin trihydrate IPRS*, dissolve in the solvent mixture by shaking and mixing if necessary, with the aid of ultrasound and dilute to obtain a solution having a known concentration of about 0.12 per cent. Use the solution within 6 hours.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane chemically bonded to porous silica or ceramic microparticles (5 µm),
- mobile phase: a mixture of 4 volumes of *acetonitrile* and 96 volumes of the solvent mixture,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1700 theoretical plates, the tailing factor is not more than 2.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{19}N_3O_5S$ in the tablets.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Labelling. The label states (1) the strength in terms of the equivalent amount of amoxycillin; (2) that the tablets should be dispersed in water immediately before use.

Amoxycillin Oral Suspension

Amoxicillin Oral Suspension

Amoxycillin Oral Suspension is a mixture consisting of Amoxycillin Trihydrate with buffering agents and other excipients. It contains a suitable flavouring agent. It is filled in a sealed container.

The suspension is constituted by dispersing the contents of the sealed container in the specified volume of *Water* just before use.

Amoxycillin Oral Suspension contains Amoxycillin Trihydrate equivalent to not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of amoxicillin $C_{16}H_{19}N_3O_5S$.

When stored at the temperature and for the period stated on the label during which the constituted suspension may be expected to be satisfactory for use, it contains not less than 80.0 per cent of the stated amount of amoxycillin $C_{16}H_{19}N_3O_5S$.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Usual strengths. Amoxycillin 125 mg per 5 ml; Amoxycillin 250 mg per 5 ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

The constituted suspension complies with the tests stated under Oral liquids and with the following tests.

Tests

pH (2.4.24). 5.0 to 7.5.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 6.8 g of *monobasic potassium phosphate* in 1000 ml of *water* and adjusted to pH 4.5 with a 4.5 per cent w/v solution of *potassium hydroxide*.

Test solution. Transfer a quantity containing 0.1 g of amoxicillin to a 100-ml volumetric flask, dissolve in the solvent mixture and dilute to 100.0 ml with the solvent mixture and filter. Dilute 10.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. Dissolve a quantity of *amoxycillin trihydrate IPRS* in the solvent mixture by shaking and mixing if necessary, with the aid of ultrasound and dilute to obtain a solution having a known concentration of about 0.2 mg per ml of amoxycillin. Use the solution within 6 hours.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane chemically bonded to porous silica or ceramic microparticles (5 µm),
- mobile phase: a mixture of 4 volumes of *acetonitrile* and 96 volumes of the solvent mixture,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1700 theoretical plates, the tailing factor is not more than 2.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Determine the weight per ml of the oral suspension (2.4.29) and calculate the content of $C_{16}H_{19}N_3O_5S$ weight in volume.

Repeat the procedure using a portion of the constituted suspension that has been stored at the temperature and for the period stated on the label.

Labelling. The label states (1) the quantity of active ingredient in terms of the equivalent amount of amoxicillin; (2) the temperature of storage and the period during which the constituted suspension may be expected to be satisfactory for use.

Amoxycillin and Potassium Clavulanate Injection

Amoxicillin and Potassium Clavulanate injection

Amoxycillin and Potassium Clavulanate injection is a sterile material consisting of Amoxycillin Sodium and Potassium Clavulanate with or without excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Amoxycillin and Potassium Clavulanate Injection contains not less than 90.0 per cent and not more than 107.5 per cent of the stated amounts of amoxycillin, $C_{16}H_{19}N_3O_5S$ and of clavulanic acid, $C_8H_9NO_5$.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Usual strengths. 0.3 g per 10 ml; 0.6 g per 10 ml; 1.2 g per 10 ml.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254* (such as Merck silica gel 60 GF254 plates).

Mobile phase. A mixture of 1 volume of *butan-1-ol*, 2 volumes of a 0.1 per cent w/v solution of *disodium edetate* in *mixed phosphate buffer pH 4.0*, 6 volumes of *glacial acetic acid* and 10 volumes of *butyl acetate*.

Test solution. Disperse a quantity of the contents of the sealed container containing about 0.4 g of clavulanic acid in 100 ml of a mixture of 4 volumes of *methanol* and 6 volumes of *0.1 M mixed phosphate buffer pH 7.0* and filter.

Reference solution. A solution containing 0.4 per cent w/v of *lithium clavulanate IPRS* and 0.8 per cent w/v of *amoxycillin trihydrate IPRS* in a mixture of 4 volumes of *methanol* and 6 volumes of *0.1 M mixed phosphate buffer pH 7.0*.

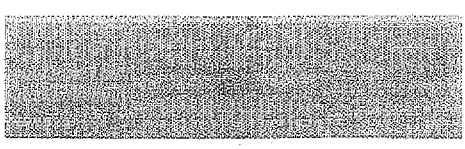
Apply to the plate 1 µl of each of the solutions after impregnating the plate by spraying it with a 0.1 per cent w/v solution of *disodium edetate* in *mixed phosphate buffer pH 4.0* and allowing to dry overnight and activating the plate by heating at 105° for 1 hour just before use. After development, allow it to dry in air and examine under ultraviolet light at 254 nm. The principal spots in the chromatogram obtained with the test solution correspond to those in the chromatogram obtained with the reference solution.

B. In the Assay, the retention time of the two principal peaks in the chromatogram obtained with the test solution correspond to those in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 8.0 to 10.0, determined in a solution containing about 10 per cent w/v of amoxycillin.

Bacterial endotoxins (2.2.3). Not more than 0.25 Endotoxin Unit per mg of amoxycillin.



Water (2.3.43). Not more than 3.5 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Determine the weight of the contents of 10 containers. Dissolve, with shaking, a quantity of the mixed contents of the 10 containers containing about 60 mg of amoxycillin in *water* and dilute to 100.0 ml with the same solvent, mix and filter.

Reference solution. A solution containing 0.06 per cent w/v of *amoxycillin trihydrate IPRS* and 0.012 per cent w/v of *lithium clavulanate IPRS* in *water*.

Chromatographic system
- a stainless steel column 30 cm × 3.9 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture 5 volumes of *methanol* and 95 volumes of *phosphate buffer pH 4.4*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to amoxycillin and clavulanic acid is not less than 3.5, the tailing factor is not more than 1.5, the column efficiency is not less than 550 theoretical plates for both component and the relative standard deviation is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{19}N_3O_5S$ and $C_8H_9NO_5$.

1 mg of $C_8H_8LiNO_5$ is equivalent to 0.9711 mg of $C_8H_9NO_5$.

Labelling. The label states the quantity of Amoxycillin Sodium contained in it, in terms of the equivalent amount of amoxycillin, and the quantity of Potassium Clavulanate, in terms of the equivalent amount of clavulanic acid.

Amoxycillin and Potassium Clavulanate Oral Suspension

Amoxicillin and Potassium Clavulanate Oral Suspension

Amoxycillin and Potassium Clavulanate Oral Suspension is a mixture of Amoxycillin Trihydrate and Potassium Clavulanate or Potassium Clavulanate Diluted with buffering agents and other excipients. It contains a suitable flavouring agent.

The suspension is constituted by dispersing the contents of the sealed container in the specified volume of Water just before use.

Amoxycillin and Potassium Clavulanate Oral Suspension contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of amoxycillin, $C_{16}H_{19}N_3O_5S$ and not less than 90.0 per cent and not more than 125.0 per cent of the stated amount of clavulanic acid, $C_8H_9NO_5$.

When stored at the temperature and for the period stated on the label during which the constituted suspension may be expected to be satisfactory for use, it contains not less than 80.0 per cent of the stated amounts of amoxycillin, $C_{16}H_{19}N_3O_5S$ and clavulanic acid, $C_8H_9NO_5$.

Usual strength. Amoxycillin 200 mg and Clavulanic acid 28.5 mg per 5 ml.

Identification

In the Assay, the retention time of the two principal peaks in the chromatogram obtained with the test solution correspond to those in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 3.8 to 6.6.

Water (2.3.43). Not more than 7.5 per cent where the label indicates that after reconstitution as directed, the suspension contains an amount of amoxycillin that is less than 40 mg per ml; not more than 8.5 per cent where the label indicates that after reconstitution as directed, the suspension contains an amount of amoxicillin that is equal to or more than 40 mg per ml and is less than or equal to 50 mg per ml; not more than 11.0 per cent where the label indicates that after reconstitution as directed, the suspension contains an amount of amoxycillin that is more than 50 mg per ml and is less than or equal to 80 mg per ml; not more than 12.0 per cent where the label indicates that after reconstitution as directed, the suspension contains an amount of amoxycillin that is more than 80 mg per ml.

The constituted suspension complies with the tests stated under Oral liquids and with the following tests.

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Transfer a weighed quantity containing about 50 mg of amoxycillin to a 100-ml volumetric flask, dissolve in *water*, dilute to 100.0 ml with the same solvent and filter. Use the filtrate as the test solution within 1 hour.

Reference solution. A solution containing 0.05 per cent w/v of *amoxycillin trihydrate IPRS* and 0.0075 per cent w/v of *lithium clavulanate IPRS* in *water*.

Chromatographic system
- a stainless steel column 30 cm x 4 mm, packed with octadecylsilane bonded to porous silica (3 to 10 µm),
- mobile phase: a mixture 5 volumes of *methanol* and 95 volumes of *phosphate buffer pH 4.4*,

- flow rate: 2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution. The relative retention times are about 0.5 for clavulanic acid and 1.0 for amoxycillin. The resolution between the amoxycillin and clavulanic acid peaks is not less than 3.5. The test is not valid unless the column efficiency determined from each analyte peak is not less than 550 theoretical plates, the tailing factor for each analyte peak is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Determine the weight per ml of the oral suspension (2.4.29) and calculate the content of $C_{16}H_{19}N_3O_5S$ and $C_8H_9NO_5$, weight in volume.

1 mg of $C_8H_8LiNO_5$ is equivalent to 0.9711 mg of $C_8H_9NO_5$.

Repeat the procedure using a portion of the constituted suspension that has been stored at the temperature and for the period stated on the label.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states (1) the quantity of Amoxycillin Trihydrate contained in it, in terms of the equivalent amount of amoxycillin, and the quantity of Potassium Clavulanate, in terms of the equivalent amount of clavulanic acid; (2) the temperature of storage and the period during which the constituted suspension may be expected to be statisfactory use.

Amoxycillin and Potassium Clavulanate Tablets

Amoxicillin and Potassium Clavulanate Tablets

Amoxycillin and Potassium Clavulanate Tablets contain Amoxycillin Trihydrate and Potassium Clavulanate or Potassium Clavulanate Diluted. The tablets are coated.

Amoxycillin and Potassium Clavulanate Tablets contain not less than 90.0 per cent and not more than 120.0 per cent of the stated amounts of amoxycillin, $C_{16}H_{19}N_3O_5S$ and clavulanic acid, $C_8H_9NO_5$.

Usual strength. Amoxycillin 500 mg and Clavulanic acid 125 mg.

Identification

In the Assay, the retention time of the two principal peaks in the chromatogram obtained with the test solution correspond to those in the chromatogram obtained with the reference solution.

Tests

Disintegration (2.5.1). 30 minutes, for tablets labelled for veterinary use only, simulated gastric juice, artificial being substituted for water in the test.

Dissolution (2.5.2). (*Tablets labelled for veterinary use only are exempt from this requirement*).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *water*,

Speed and time. 75 rpm and 30 minutes or 45 minutes where the Tablets are labelled as chewable.

Withdraw a suitable volume of the medium and filter. Carry out the method described under Assay.

Q. Not less than 85 per cent of the stated amount of $C_{16}H_{19}N_3O_5S$ and not less than 80 per cent of the stated amount of $C_8H_9NO_5$.

For tablets labelled as chewable. Not less than 80 per cent of the stated amount of the $C_{16}H_{19}N_3O_5S$ and $C_8H_9NO_5$ is dissolved in 45 minutes.

Uniformity of content. Complies with the test stated under Tablets, determining the content of clavulanic acid in the tablets.

Use chromatographic procedure described under Assay using the following test solution.

Powder one tablet and transfer to a 100-ml flask. Dissolve in *water* and dilute to 100.0 ml with the same solvent and filter. Further dilute to obtain a solution containing 0.05 per cent w/v of amoxycillin. Use the solution within 1 hour.

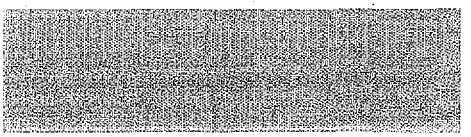
Calculate the content of $C_8H_9NO_5$ in the tablet.

Water (2.3.43). Not more than 7.5 per cent, where the labelled amount of amoxycillin in each tablet is 250 mg or less; not more than 10.0 per cent where the labelled amount of amoxycillin in each tablet is more than 250 mg but less than or equal to 500 mg; not more than 11.0 per cent where the labelled amount of amoxycillin in each tablet is more than 500 mg. Where the tablets are labelled as chewable, not more than 6.0 per cent where the labelled amount of amoxycillin in each tablet is 125 mg or less; not more than 8.0 per cent where the labelled amount of amoxycillin in each tablet is more than 125 mg. Where the tablets are labelled for veterinary use only, not more than 10.0 per cent.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powdered tablet containing about 50 mg of amoxycillin, dissolve in *water*, dilute to 100.0 ml with *water* and filter. Use the filtrate as the test solution within 1 hour.



Reference solution. A solution containing 0.05 per cent w/v of *amoxycillin trihydrate IPRS* and 0.013 per cent w/v of *lithium clavulanate IPRS* in *water*.

Chromatographic system

- a stainless steel column 30 cm x 4 mm, packed with octadecylsilane bonded to porous silica (3 to 10 µm),
- mobile phase: a mixture 5 volumes of *methanol* and 95 volumes of *phosphate buffer pH 4.4*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution. The relative retention times are about 0.5 for clavulanic acid and 1.0 for amoxycillin. The resolution between the amoxycillin and clavulanic acid peaks is not less than 3.5. The test is not valid unless the column efficiency determined from each analyte peak is not less than 550 theoretical plates, the tailing factor for each analyte peak is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

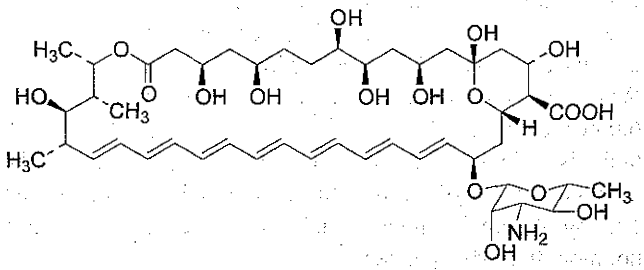
Calculate the content of $C_{16}H_{19}N_3O_5S$ and $C_8H_9NO_5$ in the tablets.

1 mg of $C_8H_8LiNO_5$ is equivalent to 0.9711 mg of $C_8H_9NO_5$.

Storage. Store protected from moisture.

Labelling. The label includes the word "chewable" in juxtaposition to the official name in the case of Chewable Tablets. The label also indicates that Chewable Tablets may be chewed before being swallowed or may be swallowed whole. Tablets intended for veterinary use only are so labelled.

Amphotericin B



$C_{47}H_{73}NO_{17}$ Mol. Wt. 924.1

Amphotericin B is a mixture consisting mainly of amphotericin B which is (3*R*,5*R*,8*R*,9*R*,11*S*,13*R*,15*S*,16*R*,17*S*,19*R*,34*S*,35*R*,36*R*,37*S*)-19-(3-amino-3,6-dideoxy-β-D-mannopyranosyloxy)-16-carboxy-3,5,8,9,11,13,15, 35-octahydroxy-34,36-dimethyl-13,17-epoxyoctatriaconta- 20,22,24,26,28,30,32-heptaen-37-olide and other antifungal polyenes produced by the growth of certain strains of *Streptomyces nodosus* or by any other means.

Amphotericin B has a potency of not less than 750 µg of $C_{47}H_{73}NO_{17}$ per mg, calculated on the dried basis.

Category. Antifungal.

Description. A yellow to orange powder. Even in the absence of light, it is gradually decomposed in a humid environment, degradation being faster at higher temperatures. In solutions, it is inactivated in the presence of light and at low pH values.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *amphotericin B IPRS* or with the reference spectrum of amphotericin B.

B. Dissolve 25 mg in 5 ml of *dimethyl sulphoxide*, add sufficient *methanol* to produce 50 ml, and dilute 2 ml to 200 ml with *methanol*. When examined in the range 300 nm to 450 nm (2.4.7), the resulting solution shows absorption maxima at about 362 nm, 381 nm, and 405 nm. The ratio of the absorbance at the maximum at about 362 nm to the absorbance at the maximum at about 381 nm, 0.5 to 0.6; the ratio of the absorbance at the maximum at about 381 nm to the absorbance at the maximum at about 405 nm, about 0.9.

C. To 1 ml of a 0.05 per cent w/v solution in *dimethyl sulphoxide* add 5 ml of *phosphoric acid* to form a lower layer; a blue ring is immediately formed at the junction of the liquids. Mix; the mixture becomes intensely blue. Add 15 ml of *water* and mix; the solution becomes pale straw-coloured.

Tests

Tetraenes. Not more than 15.0 per cent (for parenteral use, not more than 10.0 per cent), determined by the following method. Weigh 50 mg, dissolve in 5 ml of *dimethyl sulphoxide*, dilute to 50.0 ml with *methanol* and dilute 4.0 ml of the resulting solution to 50.0 ml with *methanol* (solution 1). Prepare solution (2) in a similar manner using 50 mg of *amphotericin B IPRS*, weighed, instead of the substance under examination. For solution (3) dissolve 25 mg of *nystatin IPRS*, weighed, in 25 ml of *dimethyl sulphoxide*, dilute to 250.0 ml with *methanol* and dilute 4.0 ml to 50.0 ml with *methanol*. Using as the blank a 0.8 per cent v/v solution of *dimethyl sulphoxide* in *methanol*, measure the absorbances of solutions (1), (2) and (3) at the maxima at about 282 nm and about 304 nm (2.4.7).

Calculate the absorbance for the substance under examination, *amphotericin B IPRS* and *nystatin IPRS* at both wavelengths and calculate the content of tetraenes from the expression

$$\frac{25\,W_N[(A_{B282}\times A_{U304})-(A_{B304}\times A_{U282})}{[(A_{B282}\times A_{N304})-(A_{B304}\times A_{N282})]W_U}$$

where W_N is the weight, in mg, of nystatin RS, A_{B282} and A_{B304} are the absorbance of *amphotericin B IPRS* at about 282 nm and 304 nm, respectively, A_{N282} and A_{N304} are the absorbance of *nystatin IPRS* at about 282 nm and 304 nm respectively, A_{U282} and A_{U304} are the absorbance of the substance under examination at about 282 nm and 304 nm respectively and W_U is the weight in mg of the sample taken.

Sulphated ash (2.3.18). Not more than 3.0 per cent; for parenteral use, not more than 0.5 per cent.

Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 1.0 g by drying in an oven at 60° at a pressure not exceeding 0.7 kPa.

Assay. Determine by the microbiological assay of antibiotics, Method A (2.2.10). Express the result in µg per mg.

Amphotericin B intended for use in the manufacture of parenteral preparations without a further appropriate procedure for removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 1.0 Endotoxin Unit per mg, using the supernatant liquid obtained after shaking 50 mg with 25 ml of *water BET* and centrifuging.

Storage. Store protected from light in a refrigerator (2° to 8°). Do not freeze.

Labelling. The label states (1) the number of Units per mg; (2) whether the material is intended for use in the manufacture of parenteral preparations.

Amphotericin B Injection

Amphotericin B Injection is a sterile freeze dried mixture of Amphotericin B and deoxycholate sodium with one or more buffering agents. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate Matter stated under Parenteral Preparations (Injections)

Storage. The constituted solution should be used immediately after preparation but, in any case within the period recommended by the manufacturer.

Amphotericin B Injection contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of amphotericin B, $C_{47}H_{73}NO_{17}$.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Usual strength. 50 mg per ml.

Identification

Dissolve a quantity of powder for injection containing 25 mg of Amphotericin B in 5 ml of *dimethyl sulphoxide*, add sufficient *methanol* to produce 50 ml, and dilute 2 ml to 200 ml with *methanol*. When examined in the range 300 nm to 450 nm (2.4.7), the resulting solution shows absorption maxima at about 362 nm, 381 nm, and 405 nm. The ratio of the absorbance at the maximum at about 362 nm to the absorbance at the maximum at about 381 nm, 0.5 to 0.6; the ratio of the absorbance at the maximum at about 381nm to the absorbance at the maximum at about 405 nm, about 0.9.

Tests

pH (2.4.24). 7.2 to 8.0 determined in a solution containing 10 mg per ml of Amphotericin B.

Loss on drying (2.4.19). Not more than 8.0 per cent, determined on 0.1 g by drying in an oven at 60° at a pressure not exceeding 0.7 kPa.

Bacterial Endotoxins (2.2.3). Not more than 5.0 Endotoxin unit per mg of amphotericin B. For products used or labelled for intrathecal injection, not more than 0.9 Endotoxin unit per mg.

Sterility (2.2.11). Complies with the test for sterility.

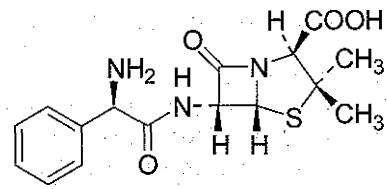
Assay. Determine by the microbiological assay of antibiotics, Method A (2.2.10) on a solution prepared in the following manner.

Mix the contents of 10 containers, dissolve in *dimethyl-sulphoxide*. Express the results in mg per vial, taking each 1000 µg found to be equivalent to 1 mg of amphotericin B.

Storage. Store in tightly closed containers between 2° to 8°, protected from light.

Labelling. Label it to state that it is intended for use by intravenous infusion to hospitalised patients only, and that the solution should be protected from light during administration.

Ampicillin



$C_{16}H_{19}N_3O_4S$ Mol. Wt. 349.4

Ampicillin is (6*R*)-6-(α-phenyl-D-glycylamino)penicillanic acid.

Ampicillin contains not less than 96.0 per cent and not more than 100.5 per cent of $C_{16}H_{19}N_3O_4S$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ampicillin IPRS* or with the reference spectrum of ampicillin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Appearance of solution. Dissolve 1.0 g in 10 ml of *1 M hydrochloric acid* and a further 1.0 g in a mixture of 3 ml of *dilute ammonia solution* and 7 ml of *water*. Both solutions when freshly prepared are not more opalescent than opalescence standard OS2 (2.4.1).

pH (2.4.24). 3.5 to 5.5, determined in a 0.25 per cent w/v solution.

Specific optical rotation (2.4.22). +280° to +305°, determined in a 0.25 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Dissolve 27 mg of the substance under examination in mobile phase A and dilute to 10.0 ml with mobile phase A.

Reference solution (a). A 0.054 per cent w/v solution of *anhydrous ampicillin IPRS* in mobile phase A.

Reference solution (b). A 0.004 per cent w/v solution of *cefradine IPRS* in mobile phase A. To 5.0 ml of the solution, add 5.0 ml of reference solution (a).

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 20.0 ml with mobile phase A.

Reference solution (d). To 0.2 g of the substance under examination, add 1.0 ml of *water*. Heat the solution at 60° for 1 hour. Dilute the solution to 50.0 ml with mobile phase A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 0.5 ml of *dilute acetic acid*, 50 ml of *0.2 M potassium dihydrogen phosphate* and 50 ml of *acetonitrile*, dilute to 1000 ml with *water*,
  B. a mixture of 0.5 ml of *dilute acetic acid*, 50 ml of *0.2 M potassium dihydrogen phosphate* and 400 ml of *acetonitrile*, dilute to 1000 ml with *water*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 50 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	85	15
t_R	85	15
(t_R+30)	0	100
(t_R+45)	0	100
(t_R+60)	85	15

t_R is the retention time of ampicillin determined with reference solution (c).

Inject reference solution (b) with isocratic elution at the initial mobile phase composition to determine t_R.

The relative retention time with reference to ampicillin for ampicillin dimer is about 2.8.

Inject reference solution (b) and (d). The test is not valid unless in the chromatogram obtained with reference solution (b) the resolution between the peaks due to ampicillin and cefradine is not less than 3.0, if necessary adjust the ratio A:B of the mobile phase. The chromatogram obtained with reference solution (d) shows two peaks, due to ampicillin and ampicillin dimer.

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent).

***N, N*-Dimethylaniline** (2.3.21). Not more than 20 ppm, determined by Method B.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.5 per cent.

Water (2.3.43). Not more than 2.0 per cent, determined on 0.3 g.

Assay. Determine by liquid chromatography (2. 4.14).

Solvent mixture. Mix 10 ml of *1 M monobasic potassium phosphate* and 1 ml of *1 M acetic acid* and dilute to 1000 ml with *water*.

Test solution. Transfer a weighed quantity containing about 0.1 g of ampicillin to a 100-ml volumetric flask, add about 80 ml of the solvent mixture, shake and mix with the aid of ultrasound if necessary to achieve complete dissolution and dilute to 100.0 ml with the solvent mixture. Use the solution promptly after preparation.

Reference solution (a). Weigh a suitable quantity of *ampicillin IPRS*, dissolve in the solvent mixture by shaking and mixing if necessary, with the aid of ultrasound to obtain a

solution having a known concentration of about 1 mg per ml. Use the solution promptly after preparation.

Reference solution (b). Dissolve *caffeine IPRS* in reference solution (a) to obtain a solution containing about 0.12 mg per ml.

Chromatographic system
- a stainless steel column 30 cm x 4.0 mm, packed with octadecylsilane chemically bonded to porous silica or ceramic microparticles (5 µm),
- mobile phase: a mixture of 90.9 volumes of *water*, 8 volumes of *acetonitrile*, 1 volume of *1 M monobasic potassium phosphate*, and 0.1 ml of *1 M acetic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

The relative retention time with reference to caffeine for ampicillin is about 0.5.

Inject reference solution (b). The resolution between the caffeine and ampicillin peaks is not less than 2.0.

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 1.4 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{16}H_{19}N_3O_4S$.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Ampicillin Capsules

Ampicillin Capsules contain Ampicillin or Ampicillin Trihydrate equivalent to not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of ampicillin, $C_{16}H_{19}N_3O_4S$.

Usual strengths. 250 mg; 500 mg.

Identification

The contents of the capsules comply with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ampicillin IPRS* or with the reference spectrum of ampicillin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 100 rpm and 45 minutes.

Use one capsule in the vessel for each test.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc having an average pore diameter not greater than 1.0 µm, rejecting the first 1 ml of the filtrate. Transfer a measured portion of the filtrate, estimated to contain about 1 mg of ampicillin to a 50-ml volumetric flask, dilute with a 1 per cent v/v solution of *formaldehyde* in *0.3 M hydrochloric acid*. Heat the solution to 90° ± 5° in a constant temperature bath for 60 minutes. Measure the absorbance of the resulting solution at the maximum at about 352 nm (2.4.7). Calculate the content of $C_{16}H_{19}N_3O_4S$ in the medium from the absorbance obtained from a solution of known concentration of *ampicillin IPRS*.

Q. Not less than 75 per cent of the stated amount of $C_{16}H_{19}N_3O_4S$.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2. 4.14).

Solvent mixture. Mix 10 ml of *1 M monobasic potassium phosphate* and 1 ml of *1 M acetic acid* and dilute to 1000 ml with *water*.

Test solution. Weigh a quantity of the mixed contents of 20 capsules containing about 0.1 g of ampicillin, add about 80 ml of the solvent mixture and dissolve by shaking for 15 minutes and mixing if necessary, with the aid of ultrasound. Dilute to 100.0 ml with the solvent mixture and filter. Use the solution promptly after preparation.

Reference solution (a). Weigh a suitable quantity of *ampicillin IPRS*, dissolve in the solvent mixture by shaking and mixing if necessary, with the aid of ultrasound to obtain a solution having a known concentration of about 1 mg per ml. Use the solution promptly after preparation.

Reference solution (b). Dissolve *caffeine IPRS* in reference solution (a) to obtain a solution containing about 0.12 mg per ml.

Chromatographic system
- a stainless steel column 30 cm x 4.0 mm, packed with octadecylsilane chemically bonded to porous silica or ceramic micro particles (5 µm),
- mobile phase: a mixture of 90.9 volumes of *water*, 8 volumes of *acetonitrile*, 1 volume of *1 M monobasic potassium phosphate*, and 0.1 ml of *1 M acetic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The resolution between the caffeine and ampicillin peaks is not less than 2.0. The relative retention times are about 0.5 for ampicillin and 1.0 for caffeine.

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 1.4 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{16}H_{19}N_3O_4S$ in the capsules.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of ampicillin (when Ampicillin Trihydrate is used).

Ampicillin Oral Suspension

Ampicillin Oral Suspension is a mixture consisting of Ampicillin or Ampicillin Trihydrate with buffering agents and other excipients. It contains a suitable flavouring agent. It is filled in a sealed container.

The suspension is constituted by dispersing the contents of the sealed container in the specified volume of Water just before issue.

Ampicillin Oral Suspension contains Ampicillin Trihydrate equivalent to not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of ampicillin, $C_{16}H_{19}N_3O_4S$.

The constituted suspension, when stored at the temperature and for the period stated on the label during which it may be expected to be satisfactory for use, contains not less than 80.0 per cent of the stated amount of ampicillin, $C_{16}H_{19}N_3O_4S$.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Usual strengths. Ampicillin 125 mg per 5 ml; Ampicillin 250 mg per 5 ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.24). 4.0 to 7.0.

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2. 4.14).

Solvent mixture. Mix 10 ml of *1 M monobasic potassium phosphate* and 1 ml of *1 M acetic acid* and dilute to 1000 ml with *water*.

Test solution. Transfer a weighed quantity containing about 0.1 g of ampicillin to a 100-ml volumetric flask and dilute to 100.0 ml with the solvent mixture and filter. Use the solution promptly after preparation.

Reference solution (a). Weigh a suitable quantity of *ampicillin IPRS,* dissolve in the solvent mixture by shaking and mixing with the aid of ultrasound if necessary, to obtain a solution having a known concentration of about 1 mg per ml. Use the solution promptly after preparation.

Reference solution (b). Dissolve *caffeine IPRS* in reference solution (a) to obtain a solution containing about 0.12 mg per ml.

Chromatographic system

- a stainless steel column 30 cm x 4.0 mm, packed with octadecylsilane chemically bonded to porous silica or ceramic microparticles (5 µm),
- mobile phase: a mixture of 90.9 volumes of *water,* 8 volumes of *acetonitrile,* 1 volume of *1 M monobasic potassium phosphate* and 0.1 ml of *1 M acetic acid,*
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The resolution between the caffeine and ampicillin peaks is not less than 2.0. The relative retention times are about 0.5 for ampicillin and 1.0 for caffeine.

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 1.4 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Determine the weight per ml (2.4.29) of the suspension and calculate the content of $C_{16}H_{19}N_3O_4S$, weight in volume.

Repeat the procedure using a portion of the constituted suspension that has been stored at the temperature and for the period stated on the label.

Labelling. The label states (1) the quantity of active ingredient in terms of the equivalent amount of ampicillin when the active ingredient is Ampicillin Trihydrate; (2) the temperature of storage and the period during which the constituted suspension may be expected to be satisfactory for use.

Ampicillin Dispersible Tablets

Dispersible Ampicillin Tablets

Ampicillin Dispersible Tablets contain Ampicillin or Ampicillin Trihydrate in a suitable dispersible base.

Ampicillin Dispersible Tablets contain Ampicillin or Ampicillin Trihydrate equivalent to not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of ampicillin, $C_{16}H_{19}N_3O_4S$.

Usual strengths. The equivalent of 125 mg and 250 mg of ampicillin.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Uniformity of dispersion. Place 2 tablets in 100 ml of *water* and stir until completely dispersed. A smooth dispersion is produced, which passes through a sieve screen with a nominal mesh aperture of 710 µm.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2. 4.14).

Solvent mixture. Mix 10 ml of *1 M monobasic potassium phosphate* and 1 ml of *1 M acetic acid* and dilute to 1000 ml with *water*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.1 g of ampicillin to a 100-ml volumetric flask, add about 80 ml of the solvent mixture, shake for 15 minutes and mix with the aid of ultrasound to achieve complete dissolution. Dilute to 100.0 ml with the solvent mixture and filter. Use the solution promptly after preparation.

Reference solution (a). Weigh a suitable quantity of *ampicillin IPRS,* dissolve in the solvent mixture by shaking and mixing if necessary, with the aid of ultrasound to obtain a solution having a known concentration of about 1 mg per ml. Use the solution promptly after preparation.

Reference solution (b). Dissolve *caffeine IPRS* in reference solution (a) to obtain a solution containing about 0.12 mg per ml.

Chromatographic system

- a stainless steel column 30 cm x 4.0 mm, packed with octadecylsilane chemically bonded to porous silica or ceramic microparticles (5 µm),
- mobile phase: a mixture of 90.9 volumes of *water,* 8 volumes of *acetonitrile,* 1 volume of *1 M monobasic potassium phosphate* and 0.1 ml of *1 M acetic acid,*
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

The relative retention times with reference to ampicillin for caffeine is about 2.0.

Inject reference solution (b). The resolution between the caffeine and ampicillin peaks is not less than 2.0.

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 1.4 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

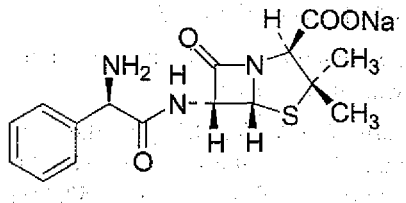
Inject reference solution (a) and the test solution.

Calculate the content of $C_{16}H_{19}N_3O_4S$ in the tablets.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Labelling. The label states (1) the strength in terms of the equivalent amount of ampicillin (when Ampicillin Trihydrate is used); (2) that the tablets should be dispersed in water immediately before use.

Ampicillin Sodium



$C_{16}H_{18}N_3NaO_4S$ Mol. Wt. 371.4

Ampicillin Sodium is sodium (6*R*)-6-(α-phenyl-D-glycylamino)penicillinate

Ampicillin Sodium contains not less than 92.5 per cent and not more than 100.5 per cent of $C_{16}H_{18}N_3NaO_4S$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white, crystalline powder; hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ampicillin sodium IPRS* or with the reference spectrum of ampicillin sodium.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

C. A 5 per cent w/v solution gives the reactions of sodium salts (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution is clear, when examined immediately after preparation (2.4.1), and the absorbance of the solution at about 430 nm (2.4.7) is not more than 0.15.

pH (2.4.24). 8.0 to 10.0, determined 10 minutes after dissolution in a 10.0 per cent w/v solution.

Specific optical rotation (2.4.22). + 258° to + 287°, determined in a 0.25 per cent w/v solution in a 0.4 per cent w/v solution of *potassium hydrogen phthalate.*

Related substances. Determine by liquid chromatography (2.4.14).

NNOTE —Prepare the solutions immediately before use.

Test solution. Dissolve 31 mg of the substance under examination in mobile phase A and dilute to 10.0 ml with mobile phase A.

Reference solution (a). A 0.054 per cent w/v solution of *anhydrous ampicillin IPRS* in mobile phase A.

Reference solution (b). A 0.004 per cent w/v solution of *cefradine IPRS* in mobile phase A. To 5.0 ml of the solution, add 5.0 ml of reference solution (a).

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 20.0 ml with mobile phase A.

Reference solution (d). To 0.2 g of the substance under examination, add 1.0 ml of *water*. Heat the solution at 60° for 1 hour. Dilute 0.5 ml of the solution to 50.0 ml with mobile phase A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 0.5 ml of *dilute acetic acid*, 50 ml of *0.2 M potassium dihydrogen phosphate* and 50 ml of *acetonitrile*, dilute to 1000 ml with *water*;
  B. a mixture of 0.5 ml of *dilute acetic acid*, 50 ml of *0.2 M potassium dihydrogen phosphate* and 400 ml of *acetonitrile*, dilute to 1000 ml with *water*;
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 50 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	85	15
t_R	85	15
(t_R+30)	0	100
(t_R+45)	0	100
(t_R+60)	85	15

t_R is the retention time of ampicillin determined with reference solution (c).

Inject reference solution (b) with isocratic elution at the initial mobile phase composition to determine t_R.

The relative retention time with reference to ampicillin for ampicillin dimer is about 2.8.

Inject reference solution (b) and (d). The test is not valid unless in the chromatogram obtained with reference solution (b) the resolution between the peaks due to ampicillin and cefradine is not less than 3.0, if necessary adjust the ratio A:B of the mobile phase. The chromatogram obtained with reference solution (d) shows two peaks, due to ampicillin and ampicillin dimer.

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution, the area of the peak corresponding to ampicillin dimer is not more than 4.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (4.5 per cent) and the area of any other secondary peak is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (2.0 per cent).

***N,N*-Dimethylaniline** (2.3.21). Not more than 20 ppm, determined by Method B.

Dichloromethane. Not more than 0.2 percent w/w, determined by gas chromatography (2.4.13).

Test solution. Dissolve 250 mg of the substance under examination in 2.0 ml of *water* into a headspace vial.

Reference solution. A 0.026 per cent w/v solution of *dichloromethane* in *water*. Transfer 2.0 ml of the solution to a headspace vial.

Chromatographic system.

- a capillary column 30 m x 0.25 mm packed with 6.0 per cent polycyanopropylphenyl siloxane and 94.0 per cent of polydimethyl siloxane (1.4 µm) (Such as DB-624),
- temperature:
  column 50° for 10 minutes, 50° to 130° @ 12° per minute and hold at 130° for 5 minutes. Post run 220° for 5 minutes,
- inlet port at 180° and detector at 250°,
- flame ionization detector,
- split ratio: 25:1,
- flow rate: 0.5 ml per minute using nitrogen as carrier gas.

Headspace conditions

- incubation/equilibrium temperature: 80°,
- incubation /equilibrium time: 1200 seconds,
- syringe temperature/transfer line temperature: 90°,
- injection volume: 500 µl,

Inject the reference solution and the test solution.

The test is not valid unless the relative standard deviation for replicate injections is not more than 15.0 per cent

NOTE — Can be reduced to 8.0 per cent.

Calculate the content of dichloromethane.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Water (2.3.43). Not more than 2.0 per cent, determined on 0.3 g.

Assay. Determine by liquid chromatography (2. 4.14).

Solvent mixture. Mix 10 ml of *1 M monobasic potassium phosphate* and 1 ml of *1 M acetic acid* and dilute to 1000 ml with *water*.

Test solution. Transfer a weighed quantity containing about 0.1 g of ampicillin to a 100-ml volumetric flask and dissolve in the solvent mixture by shaking and mixing if necessary, with the aid of ultrasound and dilute to 100.0 ml with the solvent mixture. Use the solution promptly after preparation.

Reference solution (a). Weigh a suitable quantity of *ampicillin IPRS*, dissolve in the solvent mixture by shaking and mixing if necessary, with the aid of ultrasound to obtain a solution having a known concentration of about 1 mg per ml. Use the solution promptly after preparation.

Reference solution (b). Dissolve *caffeine IPRS* in reference solution (a) to obtain a solution containing about 0.12 mg per ml.

Chromatographic system

- a stainless steel column 30 cm x 4.0 mm, packed with octadecylsilane chemically bonded to porous silica or ceramic microparticles (5 µm),
- mobile phase: a mixture of 90.9 volumes of *water*, 8 volumes of *acetonitrile*, 1 volume of *1 M monobasic potassium phosphate*, and 0.1 ml of *1 M acetic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The resolution between the caffeine and ampicillin peaks is not less than 2.0. The relative retention times are about 0.5 for ampicillin and 1.0 for caffeine.

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 1.4 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{16}H_{19}N_3NaO_4S$ by multiplying the content of $C_{16}H_{19}N_3O_4S$ by 1.063.

Ampicillin Sodium intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial Endotoxins (2.2.3). Not more than 0.15 Endotoxin Unit per mg.

Ampicillin Sodium intended for use in the manufacture of parenteral preparations without a further appropriate sterilization procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from moisture at a temperature not exceeding 30°. If it is intended for use in the manufacture of parenteral preparations, the container should be sterile, tamper-evident and sealed so as to exclude micro-organisms.

Labelling. The label states whether or not the material is intended for use in the manufacture of parenteral preparations.

Ampicillin Injection

Ampicillin Sodium Injection

Ampicillin Injection is a sterile material consisting of Ampicillin Sodium with or without buffering agents and other excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Ampicillin Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of ampicillin, $C_{16}H_{19}N_3O_4S$.

Category. Antibacterial

Usual strengths. The equivalent of 100 mg, 250 mg, 500 mg and 1 g of ampicillin.

Description. A white or almost white powder; hygroscopic.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injections) and with the following requirements.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ampicillin sodium IPRS* or with the reference spectrum of ampicillin sodium.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

C. A 5 per cent w/v solution gives the reactions of sodium salts (2.3.1).

Tests

Appearance of solution. A 10 per cent w/v solution is clear, when examined immediately after preparation (2.4.1), and the absorbance of the solution at about 430 nm is not more than 0.15.

pH (2.4.24). 8.0 to 10.0, determined 10 minutes after dissolution in a 10 per cent w/v solution.

Specific optical rotation (2.4.22). + 258° to + 287°, determined in a 0.25 per cent w/v solution in a 0.4 per cent w/v solution of *potassium hydrogen phthalate*.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE —Prepare the solutions immediately before use.

Test solution. Dissolve a quantity of the injection containing about 27 mg of the substance under examination in mobile phase A and dilute to 10.0 ml with mobile phase A.

Reference solution (a). A 0.054 per cent w/v solution of *anhydrous ampicillin IPRS* in mobile phase A.

Reference solution (b). A 0.004 per cent w/v solution of *cefradine IPRS* in mobile phase A. To 5.0 ml of the solution, add 5.0 ml of reference solution (a).

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 20.0 ml with mobile phase A.

Reference solution (d). To a quantity of the injection containing about 0.2 g of ampicillin, add 1.0 ml of *water*. Heat the solution at 60° for 1 hour. Dilute 0.5 ml of the solution to 50.0 ml with mobile phase A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 0.5 ml of *dilute acetic acid*, 50 ml of *0.2 M potassium dihydrogen phosphate* and 50 ml of *acetonitrile*, dilute to 1000 ml with *water*,
  B. a mixture of 0.5 ml of *dilute acetic acid*, 50 ml of *0.2 M potassium dihydrogen phosphate* and 400 ml of *acetonitrile*, dilute to 1000 ml with *water*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 50 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	85	15
t_R	85	15
(t_R+30)	0	100
(t_R+45)	0	100
(t_R+60)	85	15

t_R is the retention time of ampicillin determined with reference solution (c).

Inject reference solution (b) with isocratic elution at the initial mobile phase composition to determine t_R.

The relative retention time with reference to ampicillin for ampicillin dimer is about 2.8.

Inject reference solution (b) and (d). The test is not valid unless in the chromatogram obtained with reference solution (b) the resolution between the peaks due to ampicillin and cefradine is not less than 3.0, if necessary adjust the ratio A:B of the mobile phase. The chromatogram obtained with reference solution (d) shows two peaks, due to ampicillin and ampicillin dimer.

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution, the area of the peak corresponding to ampicillin dimer is not more than 4.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (4.5 per cent) and the area of any other secondary peak is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (2.0 per cent).

***N,N*-Dimethylaniline** (2.3.21). Not more than 20 ppm, determined by Method B.

Dichloromethane. Not more than 0.2 percent w/w, determined by gas chromatography (2.4.13).

Test Solution. Dissolve 250 mg of the substance under examination in 2.0 ml of *water* into a headspace vial.

Reference solution. A 0.026 per cent w/v solution of dichloromethane in *water*. Transfer 2.0 ml of the solution to a headspace vial.

Chromatographic system.

- a capillary column 30 m x 0.25 mm packed with 6.0 per cent polycyanopropylphenyl siloxane and 94.0 per cent of polydimethyl siloxane (1.4 µm) (Such as DB-624),
- temperature:
  column 50° for 10 minutes, 50° to 130° @ 12° per minute and hold at 130° for 5 minutes. Post run 220° for 5 minutes,
- inlet port at 180° and detector at 250°,
- flame ionization detector,
- split ratio: 25:1,
- flow rate: 0.5 ml per minute using nitrogen as carrier gas.

Headspace conditions

- incubation/equilibrium temperature: 80°,
- incubation /equilibrium time: 1200 seconds,
- syringe temperature/transfer line temperature: 90°,
- injection volume: 500 µl,

Inject the reference solution and the test solution.

The test is not valid unless the relative standard deviation for replicate injections is not more than 15.0 per cent *(NOTE — can be reduced to 8.0 per cent)*.

Calculate the content of dichloromethane.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Bacterial Endotoxins (2.2.3). Not more than 0.15 Endotoxin Unit per mg of ampicillin.

Sterility (2.2.11). Complies with the test for sterility.

Water (2.3.43). Not more than 2.0 per cent, determined on 0.3 g.

Assay. Determine by liquid chromatography (2. 4.14).

Solvent mixture. Mix 10 ml of *1 M monobasic potassium phosphate* and 1 ml of *1 M acetic acid* and dilute to 1000 ml with *water*.

Test solution. Determine the weight of the contents of 10 containers. Transfer a weighed quantity of the mixed contents of the 10 containers containing 0.1 g of ampicillin to a 100-ml volumetric flask, add about 80 ml of the solvent mixture and dissolve by shaking and mixing if necessary, with the aid of ultrasound. Dilute to 100.0 ml with the solvent mixture and filter. Use the solution promptly after preparation.

Reference solution (a). Weigh a suitable quantity of *ampicillin IPRS*, dissolve in the solvent mixture by shaking and mixing if necessary, with the aid of ultrasound to obtain a solution having a known concentration of about 1 mg per ml. Use the solution promptly after preparation.

Reference solution (b). Dissolve *caffeine IPRS* in reference solution (a) to obtain a solution containing about 0.12 mg per ml.

Chromatographic system

- a stainless steel column 30 cm x 4.0 mm, packed with octadecylsilane chemically bonded to porous silica or ceramic microparticles (5 µm),
- mobile phase: a mixture of 90.9 volumes of *water*, 8 volumes of *acetonitrile*, 1 volume of *1 M monobasic potassium phosphate* and 0.1 ml of *1 M acetic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The resolution between the caffeine and ampicillin peaks is not less than 2.0. The relative retention times are about 0.5 for ampicillin and 1.0 for caffeine.

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 1.4 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

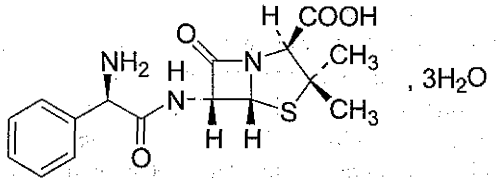
Inject reference solution (a) and the test solution.

Calculate the content of $C_{16}H_{19}N_3O_4S$ in the injection.

Storage. Store protected from moisture, in a sterile, tamper-evident container sealed so as to exclude micro-organisms, at a temperature not exceeding 30°.

Labelling. The label states the quantity of Ampicillin Sodium contained in the sealed container in terms of the equivalent amount of anhydrous ampicillin.

Ampicillin Trihydrate



$C_{16}H_{19}N_3O_4S,3H_2O$ Mol. Wt. 403.5

Ampicillin Trihydrate is (6*R*)-6-(α-phenyl-D-glycylamino)penicillanic acid trihydrate.

Ampicillin Trihydrate contains not less than 96.0 per cent and not more than 100.5 per cent of $C_{16}H_{19}N_3O_4S$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ampicillin trihydrate IPRS* or with the reference spectrum of ampicillin trihydrate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Appearance of solution. Dissolve 1.0 g in 10 ml of *1 M hydrochloric acid* and a further 1.0 g in a mixture of 3 ml of *dilute ammonia solution* and 7 ml of *water*. Both solutions when freshly prepared are not more opalescent than opalescence standard OS2 (2.4.1).

pH (2.4.24). 3.5 to 5.5, determined in a 0.25 per cent w/v solution.

Specific optical rotation (2.4.22). +280° to +305°, determined in a 0.25 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use.

Test solution. Dissolve 31 mg of the substance under examination in mobile phase A and dilute to 10.0 ml with mobile phase A.

Reference solution (a). A 0.054 per cent w/v solution of *anhydrous ampicillin IPRS* in mobile phase A.

Reference solution (b). A 0.004 per cent w/v solution of *cefradine IPRS* in mobile phase A. To 5.0 ml of the solution, add 5.0 ml of reference solution (a).

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 20.0 ml with mobile phase A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 0.5 ml of *dilute acetic acid*, 50 ml of *0.2 M potassium dihydrogen phosphate* and 50 ml of *acetonitrile*, diluted to 1000 ml with *water*,
  B. a mixture of 0.5 ml of *dilute acetic acid*, 50 ml of *0.2 M potassium dihydrogen phosphate* and 400 ml of *acetonitrile*, diluted to 1000 ml with *water*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 50 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	85	15
t_R	85	15
(t_R+30)	0	100
(t_R+45)	0	100
(t_R+60)	85	15

t_R is the retention time of ampicillin determined with reference solution (c).

Inject reference solution (b) with isocratic elution at the initial mobile phase composition to determine t_R.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to ampicillin and cefradine is not less than 3.0.

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent).

***N,N*-Dimethylaniline** (2.3.21). Not more than 20 ppm, determined by Method B.

NOTE — Test to be performed only if N,N Dimethylaniline is used in the synthesis.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.5 per cent.

Water (2.3.43). 12.0 per cent to 15.0 per cent, determined on 0.1 g.

Assay. Determine by liquid chromatography (2. 4.14).

Solvent mixture. Mix 10 ml of *1 M monobasic potassium phosphate* and 1 ml of *1 M acetic acid* and dilute to 1000 ml with *water*.

Test solution. Transfer a weighed quantity containing about 0.1 g of ampicillin to a 100-ml volumetric flask and dissolve in the solvent mixture by shaking and mixing if necessary, with the aid of ultrasound and dilute to 100.0 ml with the solvent mixture. Use the solution promptly after preparation.

Reference solution (a). Weigh a suitable quantity of *ampicillin IPRS*, dissolve in the solvent mixture by shaking and mixing if necessary, with the aid of ultrasound to obtain a solution having a known concentration of about 1 mg per ml. Use the solution promptly after preparation.

Reference solution (b). Dissolve *caffeine IPRS* in reference solution (a) to obtain a solution containing about 0.12 mg per ml.

Chromatographic system

- a stainless steel column 30 cm x 4.0 mm, packed with octadecylsilane chemically bonded to porous silica or ceramic microparticles (5 µm),
- mobile phase: a mixture of 90.9 volumes of *water*, 8 volumes of *acetonitrile*, 1 volume of *1 M monobasic potassium phosphate*, and 0.1 ml of *1 M acetic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The resolution between the caffeine and ampicillin peaks is not less than 2.0. The relative retention times are about 0.5 for ampicillin and 1.0 for caffeine.

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 1.4 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{16}H_{19}N_3O_4S$.

Storage. Store at a temperature not exceeding 30°.

Alpha Amylase

Diastase

Alpha Amylase is an amylolytic enzyme or a mixture of enzymes obtained from fungi such as *Aspergillus oryzae* or from a non-pathogenic variant of bacteria such as *Bacillus subtilis* and with the specific activity for converting starch into dextrin and maltose. It may contain suitable harmless diluents such as Lactose or Dibasic Calcium Phosphate.

Alpha Amylase has amylase activity of not less than 800 Units which represents the number of grams of dry, soluble maize or corn starch digested by 1.0 g of Alpha Amylase under the conditions of the Assay.

Category. Digestive enzyme

Description. A cream to light brown-coloured powder; hygroscopic.

Tests

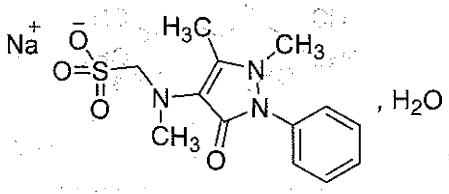
Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 1.0 g by drying in an oven at 105° for 1 hour.

Assay. Weigh a quantity containing 100 Units of amylase activity and triturate with 200 ml of *buffer solution pH 6.0* (*for bacterial amylase*) or of *acetate buffer pH 5.0* (*for fungal amylase*) and add sufficient *buffer solution pH 6.0* or *acetate buffer pH 5.0*, as appropriate, to produce 1000.0 ml. Dilute 10.0 ml to 100.0 ml with *buffer solution pH 6.0* or *acetate buffer pH 5.0*, as appropriate, to give the test solution; filter if necessary (1 ml of the test solution should be capable of digesting about 10 mg of dry soluble maize or corn starch). Into each of six stoppered test-tubes add 5.0 ml of *starch substrate* without touching the sides of the test-tube. Place the test-tubes in a water-bath maintained at 40° ± 0.1°. When the temperature of the solution in the tubes has reached 40°, add 0.35 ml, 0.4 ml, 0.45 ml, 0.5 ml, 0.55 ml and 0.6 ml of the test solution to each of the test-tubes marked 1 to 6 respectively and record the time of addition. Mix thoroughly and replace the tubes in the water-bath. After exactly 60 minutes remove the tubes and cool rapidly in cold *water*. Add to each tube 0.05 ml of *0.02 M iodine* and mix well. Note the tube containing the lowest volume of test solution that does not show a bluish or violet tinge (if there is doubt, warm the solution slightly, when the colour distinction is prominent). From this volume calculate the number of grams of dry soluble maize or corn starch digested by 1.0 g of the substance under examination. This represents the number of Units of amylase activity per g.

Storage. Store protected from light and moisture.

Analgin

Metamizole Sodium Monohydrate; Dipyrone



$C_{13}H_{16}N_3NaO_4S,H_2O$ Mol. Wt. 351.4

Analgin is Sodium [*N*-(2,3-dihydro-1,5-dimethyl-3-oxo-2-phenyl-1*H*-pyrazol-4yl)-*N*-methylamino]methanesulphonate monohydrate.

Analgin contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{13}H_{16}N_3NaO_4S$, calculated on the dried basis.

Category. Analgesic.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *metamizole sodium IPRS* or with the reference spectrum of metimazole sodium.

B. Dissolve 50 mg in 1 ml of *hydrogen peroxide solution(100 vol)*. A blue color is produced which fades rapidly and turns to intense red in a few minutes.

C. Dissolve 100 mg in 1.5 ml of *water* in test tube and add some glass beads. Add 1.5 ml of dilute *hydrochloric acid* and place a filter paper wetted with a solution prepared by 20 mg of *potassium iodate* in 2 ml of *starch solution* at the open end of the test tube. Heat gently, the evolving vapour of *sulphur dioxide* colours the filter paper blue. After heating gently for 1 min, take a glass rod with a drop of a solution prepared by 10 g of *chromotropic acid*, *sodium salt* in 1000 ml of *sulphuric acid* and place in the opening of the tube. Within 10 minutes, a blue-violet colour develops in the drop of the reagent.

D. 0.5 ml of solution A (See tests) gives reaction (A) of sodium (2.3.1).

Tests

Solution A. A 5.0 per cent w/v solution in *carbon dioxide free water*.

Appearance of solution. Solution A is clear (2.4.1), and not more intensely coloured than reference solution BYS5 (2.4.1).

Acidity or alkalinity. To 5 ml of solution A, add 0.1 ml of *phenolphthalein solution*. The solution is colourless. Not more than 0.1 ml of *0.02 M sodium hydroxide* is required to change the colour of the indicator to pink.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of substance under examination in *methanol* and dilute to 10.0 ml with *methanol*.

Reference solution (a). Dissolve 5 mg of *metamizole impurity A IPRS* in *methanol* and dilute to 10.0 ml with *methanol*.

Reference solution (b). Dissolve 5 mg of *metamizole impurity E IPRS* in *methanol* and dilute to 10.0 ml with *methanol*.

Reference solution (c). In order to prepare metamizole impurity C in situ, dissolve 40 mg of substance under examination in *methanol*, dilute to 20.0 ml with *methanol* and boil under reflux for 10 minutes. Allow to cool to room temperature and dilute to 20.0 ml with *methanol*.

Reference solution (d). Dilute 1.0 ml of reference solution (a) to 100.0 ml with *methanol*.

Reference solution (e). Mix 0.4 ml each of reference solution (a) and reference solution (b) and dilute to 20.0 ml with *methanol*.

Chromatographic system

- a stainless steel column 5 cm x 4.6 mm, packed with end capped octadecylsilane bonded to porous silica (1.8µm),
- mobile phase: a mixture of 28 volumes of *methanol* and 72 volumes of buffer solution prepared by mixing 1000 volumes of 0.6 per cent w/v solution of *sodium dihydrogen phosphate* and 1 volume of *triethylamine*, adjusted to pH 7.0 with strong *sodium hydroxide solution*.
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 5µl.

Name	Relative retention time	Correction factor
Metamizole impurity A[1]	0.6	—
Metamizole impurity E[2]	0.7	1.5
Metamizole (Retention time: about 2 minutes)	1.0	—
Metamizole impurity C[3]	2.9	—

[1]4-(formylamino)-1,5-dimethyl-2-phenyl-2,3-dihydro-1*H*-pyrazol-3-one,

[2][(1,5-dimethyl-3-oxo-2-phenyl-2,3-dihydro-1*H*-pyrazol-4-yl)amino]methanesulfonic acid (4-*N*-desmethylmetamizole),

[3]1,5-dimethyl-4-(methylamino)-2-phenyl-2,3-dihydro-1*H*-pyrazol-3-one.

Inject reference solution (e). The test is not valid unless the peak to valley ratio is not less than 3.0

Inject reference solution (c) and (e). Use chromatogram obtained with reference solution (e) to identify the peak due to impurities A and E, use the chromatogram obtained with reference solution (c) to identify the peak due impurity C.

Inject reference solution (d) and the test solution. Run the chromatogram 4.5 times the retention time of the principal peak.In the chromatogram obtained with the test solution, the area of any peak corresponding to metimazole impurity C is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.5 per cent), the area of any peak corresponding to metimazole impurity E is not more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (d) (0.15 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (d) (0.05 per cent). The sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with the reference solution (d) (0.5 per cent). Ignore any peak with an area less than 0.3 times the area of the principal peak in the chromatogram obtained with the reference solution (d) (0.03 per cent).

Sulphates (2.3.17). Not more than 0.1 per cent, dissolving 0.15 g in *water* and dilute to 15.0 ml with *water*.

Heavy metals (2.3.13). Dissolve 2 g of substance under examination in 20 ml of *water*.12 ml of the solution complies with the limit test for heavy metals, Method D (20 ppm), using 10 ml of lead standard solution (2 ppm Pb).

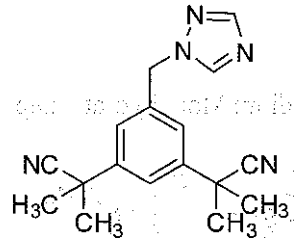
Loss on drying (2.4.19). 4.9 per cent to 5.3 per cent, determined on 1 g by drying in an oven at 105°.

Assay. Dissolve 200 mg of substance under examination in 10 ml of *0.01 M hydrochloric acid* previously cooled in ice *water* and titrate immediately, dropwise with *0.05 M iodine*. Before each addition of *0.05 M iodine* dissolve the precipitate by swirling. At the end of the titration, add 2 ml of *starch solution* and titrate until the blue colour of the solution persists for at least 2 min. The temperature of the solution during the titration must not exceed 10°.

1 ml of *0.05 M iodine* is equivalent to 0.01667 g of $C_{13}H_{16}N_3NaO_4S$.

Storage. Store protected from light.

Anastrozole



$C_{17}H_{19}N_5$ Mol. Wt. 293.4

Anastrozole is α,α,α′,α′-tetramethyl-5-(1*H*-1,2,4-triazol-1-ylmethyl)-1,3-benzene diacetonitrile

Anastrozole contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{17}H_{19}N_5$, calculated on the anhydrous basis.

Category. Anticancer.

Description. A white to off white, crystalline powder.

CAUTION — Anastrozole is cytotoxic; extra care required to prevent inhaling particles and exposing the skin to it.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *anastrozole IPRS* or with the reference spectrum of anastrozole.

Tests

Melting range (2.4.21). 81° to 84°.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of *acetonitrile* and 50 volumes of *water*.

Test solution. Dissolve 50 mg of the substance under examination in 100.0 ml of the solvent mixture.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with phenyl group (5 µm),
- mobile phase: a mixture of 65 volumes of *water*, 35 volumes of *acetonitrile* and 0.5 volume of *orthophosphoric acid*, adjusted to pH 3.0 with *1 M sodium hydroxide*,
- flow rate: 1 ml per minute,
- spectrophometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent). The sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the peak in the chromatogram obtained with the reference solution (0.1 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 100.0 ml of the solvent mixture. Dilute 10.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.01 per cent w/v solution of *anastrozole IPRS* in the solvent mixture.

Use the chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{19}N_5$.

Storage. Store protected from light and moisture.

Anastrozole Tablets

Anastrozole Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of anastrozole, $C_{17}H_{19}N_5$.

Usual strength. 1 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 50 rpm and 30 minutes.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium to obtain a solution containing 0.0001 per cent w/v of Anastrozole.

Reference solution (a). A 0.01 per cent w/v solution of *anastrazole IPRS* in *acetonitrile*. Dilute 1.0 ml of the solution to 100.0 ml with the dissolution medium.

Reference solution (b). A solution containing 0.01 per cent w/v of *anastrozole IPRS* and 0.003 per cent w/v of *methyl paraben IPRS* in *acetonitrile*. Dilute 1.0 ml of the solution to 100.0 ml with the dissolution medium.

Chromatographic system

- a stainless steel column 10 cm x 3.2 mm, packed with octadecylsilane bonded to multi-alkyl silica (5 µm) (Such as Hichrom RPB C18),
- mobile phase: a mixture of 70 volumes of *water*, 30 volumes of *acetonitrile* and 0.1 volume of *trifluoro acetic acid*,

– flow rate: 0.75 ml per minute,
– spectrophotometer set at 215 nm,
– injection volume: 100 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to methylparaben and anastrozole is not less than 4.0,

Inject reference solution (a) and the test solution.

Calculate the content of $C_{17}H_{19}N_5$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{17}H_{19}N_5$.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14).

Test solution. Disperse 1 tablet in 10.0 ml of the solvent mixture.

Reference solution. A 0.01 per cent w/v solution of *anastrozole IPRS* in the solvent mixture.

Use chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{19}N_5$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of *acetonitrile* and 50 volumes of *water.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 10 mg of Anastrozole, shake with 70 ml of the solvent mixture, dilute to 100.0 ml with the solvent mixture and filter.

Reference solution. A 0.01 per cent w/v solution of *anastrozole IPRS* in the solvent mixture.

Chromatographic system
– a stainless steel column 25 cm x 4.6 mm, packed with phenyl group (5 µm),
– mobile phase: a mixture of 65 volumes of *water*, 35 volumes of *acetonitrile* and 0.5 volume of *orthophosphoric acid*, adjusted to pH 3.0 with *1 M sodium hydroxide*,
– flow rate: 1.5 ml per minute,
– spectrophotometer set at 220 nm,
– injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the theoretical plates is not less than 2000 and tailing factor is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{19}N_5$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Anticoagulant Citrate Dextrose Solution

ACD Solution

Anticoagulant Citrate Dextrose Solution is a sterile solution of Sodium Citrate, Citric Acid and Dextrose in Water for Injections.

Anticoagulant Citrate Dextrose Solution contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amounts of sodium citrate, $C_6H_5Na_3O_7,2H_2O$ and dextrose, $C_6H_{12}O_6,H_2O$, not less than 90.0 per cent and not more than110.0 per cent of the stated amount of citric acid monohydrate, $C_6H_8O_7,H_2O$ (or anhydrous citric acid, $C_6H_8O_7$),. It contains no antimicrobial agent.

Category. Anticoagulant for storage of whole blood.

Usual strengths.

	Solution A	Solution B
Sodium Citrate	2.20 g	1.32 g
Citric Acid (Anhydrous)	0.73 g	0.44 g
or Citric Acid (Monohydrate)	0.80 g	0.48 g
Dextrose (Monohydrate)	2.45 g	1.47 g
Water for Injection	100 ml	100 ml

NOTE — 15 ml of solution A or 25 ml of solution B are to be used for 100 ml of whole blood.

Description. A clear, colourless or faintly straw-coloured liquid.

Identification

A. To 1 ml add 0.05 ml of *potassium cupri-tartrate solution*; the solution remains blue and clear. Heat to boiling, a copious red precipitate is formed.

B. It gives the reactions of sodium salts (2.3.1).

C. To 2 ml (for Solution A) add 3 ml of *water* or to 4 ml (for Solution B) add 1 ml of *water*. The resulting solution gives reaction (A) of citrates (2.3.1).

Tests

pH (2.4.24). 4.5 to 5.5.

Sterility (2.2.11). Complies with the test for sterility.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Bacterial Endotoxins (2.2.3). Not more than 5.56 Endotoxin Units per ml.

Assay. *For sodium citrate* — Pipette 50.0 ml into a beaker and titrate with *1.3 M hydrochloric acid* to a pH of 1.98 ± 0.02, determining the end-point potentiometrically (2.4.25). Carry out a blank titration with 50 ml of *water*.

1 ml of *1.3 M hydrochloric acid* is equivalent to 0.1274 g of $C_6H_5Na_3O_7,2H_2O$.

For free citric acid — Pipette 20.0 ml into a conical flask and titrate with *0.1 M sodium hydroxide* using *phenolphthalein solution* as indicator.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.006404 g of $C_6H_8O_7$ or 0.007005 g of $C_6H_8O_7,H_2O$.

For dextrose — Determine the optical rotation in a 2-dm tube (2.4.22). The observed rotation multiplied by 1.0425, represents the weight of $C_6H_{12}O_6,H_2O$ in 100 ml of the solution.

Storage. Store protected from light in a single dose, tamper-evident container of colourless, transparent glass or of a suitable plastic material.

Labelling. The label states (1) whether the contents are Solution A or Solution B; (2) volume of the solution required per 100 ml of whole blood or the volume of the solution required per volume of whole blood to be collected; (3) where applicable, the maximum amount of blood to be collected in the container.

Anticoagulant Citrate Phosphate Dextrose Solution

CPD Solution

Anticoagulant Citrate Phosphate Dextrose Solution is a sterile solution of Sodium Citrate, Citric Acid, Sodium Dihydrogen Phosphate Dihydrate and Dextrose in Water for Injection.

Anticoagulant Citrate Phosphate Dextrose Solution contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amounts of sodium citrate, $C_6H_5Na_3O_7,2H_2O$, sodium dihydrogen phosphate dihydrate, $NaH_2PO_4,2H_2O$ and dextrose, $C_6H_{12}O_6,H_2O$, not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of citric acid monohydrate, $C_6H_8O_7,H_2O$ (or anhydrous citric acid, $C_6H_8O_7$). It contains no antimicrobial agent.

Category. Anticoagulant for storage of whole blood.

Usual strengths.

Sodium Citrate	2.630 g
Citric Acid (Monohydrate)	0.327 g
Dextrose (Monohydrate)	2.550 g
Sodium Dihydrogen Phosphate (Dihydrate)	0.251 g
Water for Injection to	100 ml

NOTE — 14 ml are to be used for 100 ml of whole blood.

Description. A clear, colourless or faintly straw-coloured liquid.

Identification

A. To 1 ml add 0.05 ml of *potassium cupri-tartrate solution*; the solution remains blue and clear. Heat to boiling, a copious red precipitate is formed.

B. It gives the reactions of sodium salts and reaction (B) of phosphates (2.3.1).

C. To 2 ml add 3 ml of *water*. The resulting solution gives reaction (A) of citrates (2.3.1).

Tests

pH (2.4.24). 5.0 to 6.0.

Sterility (2.2.11). Complies with the test for sterility.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Bacterial Endotoxins (2.2.3). Not more than 5.56 Endotoxin Units per ml.

Assay. *For sodium citrate* — Dilute 25.0 ml to 100.0 ml with *water* and mix. Dilute 5.0 ml of the resulting solution to 100.0 ml with *water* and mix. Transfer 1.0 ml of the solution to a test-tube, add 1.3 ml of *pyridine*, swirl to mix, add 5.7 ml of *acetic anhydride*, mix and immediately place in a water-bath at 31° ± 0.5°. Allow the colour to develop for 35 minutes and measure the absorbance of the resulting solution at about 425 nm (2.4.7) using as the blank solution 1 ml of *water* treated in the same manner. Prepare a calibration curve by measuring the absorbance of solutions prepared by treating in the same manner 1 ml quantities of suitable dilutions of a solution in *water* containing 2.5 mg per ml of $C_6H_8O_7$, prepared by using *anhydrous citric acid*, previously dried for 3 hours at 90°. Calculate the total citrate content, as $C_6H_8O_7$, in mg per ml of the solution under examination from the expression 0.2 C, where C is the concentration in µg per ml of $C_6H_8O_7$, read from the curve.

Calculate the quantity, in mg, of $C_6H_5Na_3O_7,2H_2O$ in 1 ml of the solution under examination from the expression 1.53 $(A - B)$, where A is the concentration in mg per ml of total citrate as $C_6H_8O_7$ and B is the concentration in mg per ml of free citric acid in the solution.

For free citric acid — Pipette 20.0 ml into a conical flask and titrate with *0.1 M sodium hydroxide* using *phenolphthalein solution* as indicator.

From the volume of *0.1 M sodium hydroxide* required subtract a volume, in ml, equal to 1.28 times the number of mg of $NaH_2PO_4,2H_2O$ present, as determined in the Assay for sodium acid phosphate.

1 ml of the remainder is equivalent to 0.007005 g of $C_6H_8O_7,H_2O$.

For sodium dihydrogen phosphate dihydrate — Dilute 5.0 ml to 100.0 ml with *water*. Transfer 5.0 ml to a 25-ml graduated flask and add 10.0 ml of a 2.8 per cent w/v solution of *sulphuric acid* followed by 2.0 ml of a 2.5 per cent w/v solution of *ammonium molybdate*, mixing after each addition. Add 1.0 ml of *aminohydroxynaphthalenesulphonic acid solution* and

sufficient *water* to produce 25.0 ml, mix and keep aside at 25° for 10 minutes. Measure the absorbance (A_1) of the resulting solution at the maximum at about 660 nm (2.4.7) using as the blank 5 ml of *water* treated in the same manner. Calculate the content of $NaH_2PO_4,2H_2O$ in each ml of the solution under examination from the absorbance (A_2) obtained by simultaneously carrying out the operation using 5.0 ml of a solution of *potassium dihydrogen phosphate* containing 0.11 mg of KH_2PO_4 per ml (C) and from the expression

$$22.92\ C\ (A_1/A_2).$$

For dextrose — Weigh a clean, medium- porosity sintered-glass crucible containing a few glass beads. To 50 ml of *potassium cupri-tartrate solution* add the glass beads from the weighed crucible, 45 ml of *water* and 5.0 ml of the solution under examination. Heat the solution at such a rate that it begins to boil in 3.5 to 4 minutes, boil the solution for exactly 2 minutes and filter immediately through the weighed crucible, taking care to transfer all the glass beads to the crucible, along with the precipitate. Wash the precipitate with hot *water* and then with 10 ml of *ethanol (95 per cent)* and dry it to constant weight at 110°. Carry out a blank determination.

1 mg of the precipitate is equivalent to 0.000496 g of $C_6H_{12}O_6,H_2O$.

Storage. Store in a single dose, tamper-evident container of colourless, transparent glass or of a suitable plastic material, protected from light.

Labelling. The label states (1) the composition and volume of the solution; (2) volume of the solution required per 100 ml of whole blood or the volume of the solution required per volume of whole blood to be collected; (3) where applicable, the maximum amount of blood to be collected in the container.

Anticoagulant Citrate Phosphate Dextrose Adenine Solution

CPDA Solution

Anticoagulant Citrate Phosphate Dextrose Adenine Solution is a sterile solution of Citric Acid, Sodium Citrate, Sodium Dihydrogen Phosphate Dihydrate, Dextrose and Adenine in Water for Injections.

Anticoagulant Citrate Phosphate Dextrose Adenine Solution contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amounts of total Sodium, Na, Sodium Dihydrogen Phosphate Dihydrate, $NaH_2PO_4,2H_2O$ and Dextrose Monohydrate, $C_6H_{12}O_6,H_2O$, not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of total Citrate, $C_6H_5O_7$ and Adenine, $C_5H_5N_5$. It contains no antimicrobial agent.

Category. Anticoagulant for storage of whole blood.

Usual strengths.

Citric Acid (Anhydrous)	0.2990 g
Sodium Citrate (Dihydrate)	2.6300 g
Sodium Dihydrogen Phosphate (Dihydrate)	0.2510 g
Adenine	0.0275 g
Dextrose (Monohydrate)	3.1900 g
Water for Injection to	100 ml

NOTE — 14 ml is to be used for 100 ml of whole blood.

Description. A clear, colourless or faintly straw-coloured liquid.

Identification

A. To 1 ml add 0.05 ml of *potassium cupri-tartrate solution*; the solution remains blue and clear. Heat to boiling, a copious red precipitate is formed.

B. It gives the reaction (B) of phosphates and the reactions of sodium salts (2.3.1).

C. To 2 ml add 3 ml of *water*. The resulting solution gives reaction (A) of citrates (2.3.1).

D. In the test for adenine in the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (c).

Tests

pH (2.4.24). 5.0 to 6.0.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Bacterial endotoxins (2.2.3). Not more than 5.56 Endotoxin Units per ml.

Assay. *For total sodium* — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.3), measuring at 589 nm and using *sodium solution FP* or *sodium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For total citrate — Dilute 5.0 ml of the solution under examination to 1000.0 ml with *water* and mix. Transfer 1.0 ml of the solution to a test-tube, add 1.3 ml of *pyridine*, swirl to mix, add 5.7 ml of *acetic anhydride*, mix and immediately place in a water-bath at 31° ± 1°. Allow the colour to develop for 33 ± 1 minutes and measure the absorbance of the resulting solution at about 425 nm (2.4.7), using as the blank 1 ml of *water* treated in the same manner. Prepare a calibration curve by measuring the absorbance of the solutions prepared by treating in the same manner 1 ml quantities of suitable dilutions of a solution in *water* containing 1.0 mg per ml of $C_6H_8O_7$,

prepared by using *anhydrous citric acid*, previously dried for 3 hours at 90°. Calculate the total citrate content, as $C_6H_8O_7$, in mg per ml of the solution under examination from the expression 0.2 C, where C is the concentration in µg per ml of $C_6H_8O_7$, read from the curve.

For sodium dihydrogen phosphate dihydrate — Dilute 5.0 ml to 100.0 ml with *water*. Transfer 5.0 ml of the solution to a 25-ml volumetric flask and add 10.0 ml of a 2.8 per cent w/v solution of *sulphuric acid* followed by 2.0 ml of a 2.5 per cent w/v solution of *ammonium molybdate*, mixing after each addition. Add 1.0 ml of *aminohydroxynaphthalenesulphonic acid solution* and sufficient *water* to produce 25.0 ml. Mix and keep aside at 25° for 10 minutes. Measure the absorbance (A_1) of the resulting solution at about 660 nm (2.4.7), using as the blank 5 ml of *water* treated in the same manner. Calculate the content of $NaH_2PO_4,2H_2O$ in each ml of the solution under examination from the absorbance (A_2) obtained by simultaneously carrying out the operation using 5.0 ml of a solution of *potassium dihydrogen phosphate* containing 0.11 mg of KH_2PO_4 per ml (C) using the expression

$$22.92\ C\ (A_1/A_2).$$

For adenine — Determine by liquid chromatography (2.4.14).

Test solution. Substance under examination.

Reference solution (a), (b) and (c) are prepared by dissolving weighed quantities of *adenine IPRS* in *dilute hydrochloric acid* in three separate volumetric flasks, diluting with the same solvent to volume and mixing to obtain reference solutions having known concentrations of about 0.25 mg, 0.275 mg and 0.30 mg of adenine per ml respectively.

Reference solution (d). A solution containing 0.0275 per cent w/v each of *adenine IPRS* and *purine* in *dilute hydrochloric acid.*

Chromatographic system

- a stainless steel column 30 cm x 4 mm, packed with irregular or spherical, totally porous silica gel (10 µm) having a chemically bonded strongly acidic cation-exchange coating,
- mobile phase: dissolve 3.45 g of *ammonium dihydrogen phosphate* in 950 ml of *water* in a 1000-ml volumetric flask, add 10 ml of *glacial acetic acid*, dilute to volume with *water* and mix,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (d) at least four times and record the chromatograms. The test is not valid unless the relative standard deviation of the peak response of adenine is not more than 2.5 per cent, the relative standard deviation of the retention time of adenine is not more than 2.0 per cent and the resolution factor of adenine and purine is not less than 3.0.

Inject separately the test solution and reference solution (a), (b) and (c). Record the chromatograms and measure the responses for the major peaks. Plot the responses against the concentrations in mg of adenine per ml of reference solution (a), (b) and (c).

Calculate the quantity, in mg, of $C_5H_5N_5$ in each ml of the solution under examination as the value read directly from the standard curve corresponding to the response obtained with the test solution.

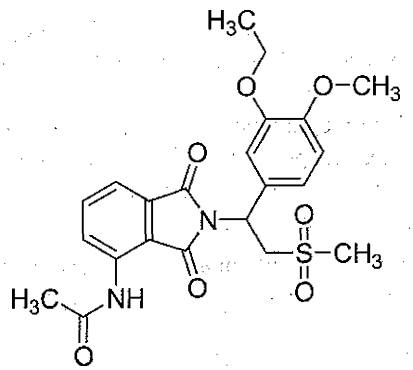
For dextrose — Weigh a clean, medium porosity sintered-glass crucible containing a few glass beads. To 50 ml of *potassium cupri-tartrate solution* add the glass beads from the weighed crucible, 45 ml of *water* and 5.0 ml of the solution under examination. Heat the solution at such a rate that it begins to boil in 3.5 to 4 minutes, boil the solution for exactly 2 minutes and filter immediately through the weighed crucible, taking care to transfer all the glass beads with the precipitate to the crucible. Wash the precipitate with hot *water* and then with 10 ml of *ethanol (95 per cent)* and dry it to constant weight at 110°. Carry out a blank determination.

1 mg of the precipitate is equivalent to 0.000496 g of $C_6H_{12}O_6.H_2O$.

Storage. Store protected from light, in single dose, tamper-proof containers made of a suitable plastic material in a cool place.

Labelling. The label states (1) the composition and volume of the solution; (2) volume of the solution required per 100 ml of whole blood or the volume of the solution required per volume of whole blood to be collected; (3) where applicable, the maximum amount of blood to be collected in the container.

Apremilast



$C_{22}H_{24}N_2O_7S$ Mol. Wt. 460.5

Apremilast is N-(2-(1-(3-ethoxy-4-methoxyphenyl)-2-(methylsulfonyl) ethyl)-1,3-dioxoisoindolin-4-yl) acetamide.

Apremilast contains not less than 98.0 per cent and not more than 102. 0 per cent of $C_{22}H_{24}N_2O_7S$, calculated on the dried basis.

Category. Anti-inflammatory.

Description. A white to pale yellow powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *apremilast IPRS* or with the reference spectrum of apremilast.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in 100.0 ml of *acetonitrile*.

Reference solution (a). A solution containing 0.02 per cent w/v of *apremilast IPRS* and 0.0001 per cent w/v of *apremilast impurity B ((S)-4amino-2(1-(3-ethoxy-4-methoxyphenyl)-2-(methylsulfonyl)ethyl)isoindoline-1,3-dione) IPRS* in *acetonitrile*.

Reference solution (b). A 0.003 per cent w/v solution of *apremilast IPRS* in *acetonitrile*. Dilute 1.0 ml of the solution to 50.0 ml with *acetonitrile*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with phenyl group bonded to porous silica (5 µm) (Such as Zorbax SB phenyl),
- mobile phase: A. a 0.05 per cent v/v solution of *trifluoroacetic acid*,
  B. a mixture of 70 volumes of *acetonitrile*, 30 volumes of *methanol* and 0.05 volume of *trifluoroacetic acid*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0.01	95	5
30	10	90
45	10	90
45.1	95	5
50	95	5

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to apremilast impurity B and apremilast is not less than 1.5 in the chromatogram obtained with reference solution (a), the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 10.0 per cent in the chromatogram obtained with reference solution (b).

Inject reference solution (b) and the test solution. In the chromatogram obtained with test solution, the area of any peak corresponding to apremilast impurity B, multiplied by correction factor 1.54, is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent), the area of any other secondary peak is not more than 0.33 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 1.67 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.17 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Chiral purity. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 10 ml of *methanol* and dilute to 25.0 ml with *methanol*.

Reference solution. A solution containing 0.2 per cent w/v of *apremilast IPRS* and 0.001 per cent w/v of *apremilast R-isomer IPRS* in *methanol*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with cellulose tris (3,5-dimethylphenylcarbamate) bonded to porous silica (10 µm) (Such as Chiralcel OD),
- column temperature: 40°,
- mobile phase: a mixture of 60 volumes of *hexane*, 20 volumes of *isopropanol* and 20 volumes of *ethanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to apremilast *R*-isomer and *S*- isomer is not less than 1.5.

Inject the test solution. The area of any peak corresponding to *R*-isomer is not more than 0.5 per cent, calculated by area normalization.

Acetic acid content. Not more than 0.5 per cent.

Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of *acetonitrile* and 50 volumes of *water*.

Test solution. Dissolve 50 mg of the substance under examination in 25.0 ml of the solvent mixture.

Reference solution. A 0.025 per cent w/v solution of *sodium acetate trihydrate* in the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm, packed with polyvinyl alcohol with quarternary ammonium groups (5 µm) (Such as Metrosep A Supp-5),
- mobile phase: a solution of *1.5 mM sodium carbonate* containing *0.3 mM sodium bicarbonate*,
- flow rate: 0.7 ml per minute,
- conductivity detector,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of CH_3COOH by multiplying the content of $C_2H_9NaO_5$ with 0.44.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of the substance under examination in 100.0 ml of *acetonitrile*.

Reference solution. A 0.01 per cent w/v solution of *apremilast IPRS* in *acetonitrile*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with phenyl group bonded to porous silica (5 µm) (Such as Zorbax SB phenyl),
- mobile phase: a mixture of 50 volumes of *acetonitrile*, 50 volumes of *water* and 0.05 volume of *trifluoroacetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{24}N_2O_7S$.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Apremilast Tablets

Apremilast Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of apremilast, $C_{22}H_{24}N_2O_7S$.

Usual strengths. 10 mg; 20 mg and 30 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of phosphate buffer prepared by dissolving 3.4 g of *monobasic sodium phosphate* in 100 ml of *water*, adjusted to pH 6.8 with *1 M sodium hydroxide*, add 5 g of *sodium lauryl sulphate*, mix.

Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Solvent mixture. 95 volumes of *acetonitrile* and 5 volumes of *water*.

Test solution. Use the filtrate, dilute if necessary with the dissolution medium.

Reference solution. Dissolve a quantity of *apremilast IPRS* in the solvent mixture, and dilute with the dissolution medium to obtain a solution having similar concentration to the test solution.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3.5 µm),
- mobile phase: a mixture of 50 volumes of *acetonitrile*, 50 volumes of *water* and 1 volume of *trifluoroacetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 25 µl.

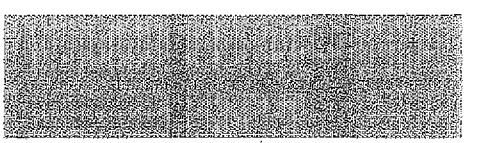
Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{24}N_2O_7S$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{22}H_{24}N_2O_7S$.

Related substances. Determine by liquid chromatography (2.4.14).



Solvent mixture. 95 volumes of *acetonitrile* and 5 volumes of *water*.

Test solution. Disperse a quantity of the powdered tablets containing 20 mg of Apremilast in 5 ml of *water* and add 75 ml of the solvent mixture, sonicate for 20 minutes and dilute to 100.0 ml with the solvent mixture, centrifuge and use the clear supernatant liquid.

Reference solution (a). A 0.01 per cent w/v solution of *apremilast IPRS* in the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v of *apremilast impurity B ((S)-4 amino -2(1-(3-ethoxy-4-methoxyphenyl)-2-(methylsulfonyl)ethyl)isoindoline-1,3-dione) IPRS* and 0.02 per cent w/v of *apremilast IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with phenyl group bonded to porous silica (5 µm) (Such as Zorbax SB Phenyl),
- sample temperature: 10°,
- mobile phase: A. a 0.05 per cent v/v solution of *trifluoroacetic acid*,
  B. a mixture of 70 volumes of *acetonitrile*, 30 volumes of *methanol* and 0.025 volume of *trifluoroacetic acid*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	95	5
30	10	90
45	10	90
45.1	95	5
50	95	5

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to apremilast impurity B and apremilast is not less than 1.5 in the chromatogram obtained with reference solution (b), the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 10.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to apremilast impurity B is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Disperse one tablet in 5 ml of *water*, add 75 ml of *acetonitrile*, sonicate for 30 minutes and dilute to 100.0 ml with *acetonitrile*. Centrifuge and dilute a suitable volume of the supernatant liquid with 95 per cent v/v of *acetonitrile* to obtain a solution having similar concentration to the reference solution.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{24}N_2O_7S$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 5 mg of Apremilast in 5 ml of *water* and add 75 ml of *acetonitrile*, sonicate for 10 minutes and dilute to 100.0 ml with *acetonitrile*, centrifuge and use the clear supernatant liquid.

Reference solution. A 0.005 per cent w/v solution of *apremilast IPRS* in 95 per cent v/v of *acetonitrile*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with phenyl group bonded to porous silica (5 µm) (Such as Zorbax SB Phenyl),
- mobile phase: a mixture of 10 volumes of *water*, 10 volumes of *acetonitrile* and 0.01 volume of *trifluoroacetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

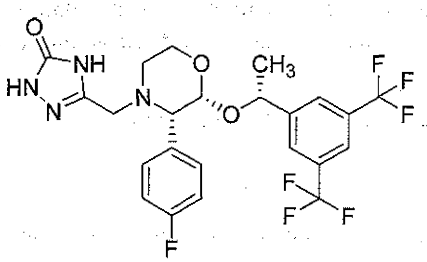
Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{24}N_2O_7S$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Aprepitant



$C_{23}H_{21}F_7N_4O_3$ Mol. Wt. 534.4

Aprepitant is 3*H*-1,2,4-triazol-3-one, 5-[[(2*R*,3S)-2-[(1*R*)-1-[3,5-bis(trifluoromethyl)phenyl]ethoxy]-3-(4-fluorophenyl)-4-morpholinyl]methyl]-1,2-dihydro.

Aprepitant contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{23}H_{21}F_7N_4O_3$, calculated on the anhydrous and solvent-free basis.

Category. Antiemetic.

Description. A white to off-white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *aprepitant IPRS* or with the reference spectrum of aprepitant.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). + 66.0° to + 71.0°, determined in a 1.0 per cent w/v solution in *methanol*.

S,R,S-Enantiomer (if present). Determine by liquid chromatography (2.4.14).

Perform this test if this impurity is possible from the manufacturing process.

Test solution. Dissolve 50 mg of the substance under examination in 100.0 ml of mobile phase.

Reference solution. A 0.008 per cent w/v solution of *aprepitant IPRS* and 0.008 per cent w/v solution of *aprepitant related compound B IPRS* (*S,R,S*-Enantiomer: 3-[[(2*S*,3*R*)-2-[(*S*)-1-[3,5-Bis(trifluoromethyl)phenyl]ethoxy]-3-(4-fluorophenyl) morpholino]methyl]-1*H*-1,2,4-triazol-5(4*H*)-one *IPRS*) in mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with amylose tris-3,5-dimethylphenylcarbamate coated to porous spherical silica particles (5-10 µm),
- mobile phase: 90 volumes of *hexane* and 10 volumes of *ethanol*,
- flow rate: 0.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between the enantiomer peaks is more than 2.0. (The elution order is the S,R,S-enantiomer followed by aprepitant peak, which is R,S,R-enantiomer).

Inject the test solution. The area of S,R,S-enantiomer peaks are not more than 0.10 per cent, calculated by area normalization.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and *dilute orthophosphoric acid* prepared by dissolving 1 ml of *orthophosphoric acid* in 1000 ml of *water*.

Test solution. Dissolve 0.2 g of the substance under examination in 100.0 ml of the solvent mixture and sonicate.

Reference solution (a). A 0.0003 per cent w/v solution of *aprepitant IPRS* in solvent mixture.

Reference solution (b). Dilute reference solution (a) to obtain a 0.0001 per cent w/v solution of *aprepitant IPRS* in solvent mixture.

Reference solution (c). A 0.2 per cent w/v solution of *aprepitant IPRS* and 0.0003 per cent w/v solution of *desfluoro aprepitant IPRS* (*5-[[(2R ,3S)-2-[(R)-1-[3,5-Bis(trifluoromethyl)phenyl]ethoxy]-3-phenylmorpholino] methyl]-2H -1,2,4-triazol-3(4H)-one IPRS*) in solvent mixture and sonicate.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: A. a solution prepared by dissolving 1 ml of *orthophosphoric acid* in 1000 ml of *water*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	58	42
25	58	42
45	30	70
50	30	70
50.1	58	42
55	58	42

Name	Relative retention time
Desfluoro aprepitant	0.85
Aprepitant	1.0

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to desfluoro aprepitant and aprepitant is not less than 3.0, signal to noise ratio for the principal peak is not less than 10.0 with reference solution (b).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of the peak due to desfluoro aprepitant is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent) and the area of any other secondary peak is not more than 0.67 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). The sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent). Ignore any peak with an area less than 0.33 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Water (2.4.43). Not more than 0.5 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and *dilute orthophosphoric acid* prepared by dissolving 1 ml of *orthophosphoric acid* in 1000 ml of *water*.

Test solution. Dissolve 20 mg of the substance under examination in 100.0 ml of solvent mixture and sonicate.

Reference solution. A 0.02 per cent w/v solution of *aprepitant IPRS* in solvent mixture and sonicate.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: 48 volumes of *acetonitrile* and 52 volumes of *dilute orthophosphoric acid*, prepared by dissolving 1 ml of *orthophosphoric* acid in 1000 ml of *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 0.73 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{23}H_{21}F_7N_4O_3$.

Storage. Store protected from moisture and light, at a temperature not exceeding 30°.

Aprepitant Capsules

Aprepitant Capsules contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of aprepitant, $C_{23}H_{21}F_7N_4O_3$.

Usual strengths. 40 mg; 80 mg; 125 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with that of reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of 2.2 per cent w/v solution of *sodium dodecyl sulphate* in *water*,
Speed and time. 100 rpm and 20 minutes.
Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *aprepitant IPRS* in minimum quantity of *methanol* and fruther dilute with dissolution medium to obtain a solution of known concentration similar to the expected concentration of the test solution.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: equal volumes of *acetonitrile* and *dilute orthophosphoric acid* prepared by dissolving 1 ml of *orthophosphoric acid* in 1000 ml of *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent

Inject the reference solution and the test solution.

Q. Not less than 80 per cent of the stated amount of $C_{23}H_{21}F_7N_4O_3$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and *dilute orthophosphoric acid* prepared by dissolving 1 ml of *orthophosphoric acid* in 1000 ml of *water*.

Test solution. Disperse a quantity of the mixed contents of 20 capsules containing 0.12 g of Aprepitant in 150 ml of solvent mixture, sonicate for about 10 minutes with intermittent shaking, cool and dilute to 200.0 ml with solvent mixture. Filterthrough a 0.45 µm nylon filter.

Reference solution(a). A 0.00012 per cent w/v solution of *aprepitant IPRS* in solvent mixture.

Referencesolution(b). A 0.06 per cent w/v solution of *aprepitant IPRS* and 0.00012 per cent w/v solution of *desfluoro aprepitant IPRS (5-[[(2R,3S)-2-[(R)-1-[3,5-Bis(trifluoro-methyl)phenyl]ethoxy]-3-phenylmorpholino] methyl]-2H -1,2,4-triazol-3(4H)-one IPRS*) in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: A. a mixture of 5 volumes of *acetonitrile* and 95 volumes of *dilute orthophosphoric acid*, prepared by dissolving 1 ml of *orthophosphoric* acid in 1000 ml of *water*,

  B. a mixture of 95 volumes of *acetonitrile* and 5 volumes of *dilute orthophosphoric acid*, prepared by dissolving 1 ml of *orthophosphoric* acid in 1000 ml of *water*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	60	40
20	58	42
25	35	65
33	35	65
33.1	60	40
38	60	40

Name	Relative retention time
Desfluoro aprepitant	0.85
Aprepitant	1.0
Aprepitant diastereomers (R,R,R and R,S,S)	1.3

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to desfluoro aprepitant and aprepitant is not less than 3.0 with reference solution (b).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). The sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the mixed contents of 20 capsules containing 100 mg of Aprepitant in 75 ml of mobile phase, sonicate for about 20 minutes with intermittent shaking, cool and dilute to 100 ml with the mobile phase. Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase. Filter through a 0.45 µm nylon filter.

Reference solution. A 0.005 per cent w/v solution of *aprepitant IPRS* in mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: 45 volumes of *acetonitrile* and 55 volumes of *dilute orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

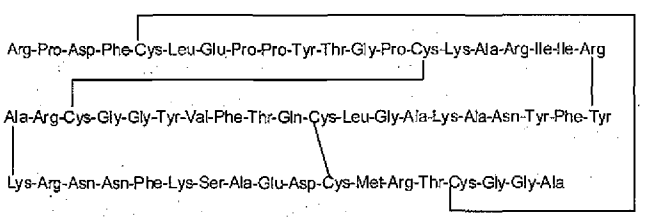
Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{23}H_{21}F_7N_4O_3$ in the capsules.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Aprotinin



$C_{284}H_{432}N_{84}O_{79}S_7$ Mol. Wt. 6511.4

Aprotinin is a polypeptide consisting of a chain of 58 amino acids. It inhibits stoichiometrically the activity of several proteolytic enzymes such as chymotrypsin, kallikrein, plasmin and trypsin.

Aprotinin contains not less than 3.0 IU of aprotinin activity per mg, calculated on the dried basis.

Category. Antifibrinolytic.

Production

The animals from which aprotinin is derived must fulfil the requirements for the health of animals suitable for human consumption. The method of manufacture is validated to demonstrate that the product if tested, would comply with the following tests.

Description. An almost white hygroscopic powder.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 80 volumes of *water*, 100 volumes of *glacial acetic acid* containing 10 per cent w/v of *sodium acetate*.

Solution A. Prepare a solution of the substance under examination containing 15 IU per ml, calculated from the activity stated on the label.

Test solution. Use solution A.

Reference solution. Dilute *aprotinin solution* in *water* to obtain a concentration of 15 IU per ml.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in air and spray with a solution of 0.1 g of *ninhydrin* in a mixture of 6 ml of a 1.0 per cent w/v solution of *cupric chloride*, 21 ml of *glacial acetic acid* and 70 ml of *ethanol (95 per cent)*. Dry the plate at 60°. The principal spot in the chromatogram obtained with the test solution corresponds to the spot in the chromatogram obtained with the reference solution.

B. Determine the ability of the substance under examination to inhibit trypsin activity using the following method.

Test solution. Dilute 1 ml of solution A to 50 ml with *buffer solution pH 7.2*.

Trypsin solution. Dissolve 10 mg of *trypsin* in *0.002 M hydrochloric acid* and dilute to 100.0 ml with *0.002 M hydrochloric acid*.

Casein solution. Dissolve 0.2 g of *casein* in *buffer solution pH 7.2* and dilute to 100.0 ml with *buffer solution pH 7.2*.

Precipitating solution. A mixture of 1 volume of *glacial acetic acid*, 49 volumes of *water* and 50 volumes of *ethanol (95 per cent)*.

Mix 1 ml of the test solution with 1 ml of the trypsin solution. Allow to stand for 10 minutes and add 1 ml of the casein solution. Incubate at 35° for 30 minutes. Cool in iced *water* and add 0.5 ml of the precipitating solution. Shake and allow to stand at room temperature for 15 minutes. The solution is cloudy. Carry out a blank test under the same conditions using *buffer solution pH 7.2* instead of the test solution. The solution is not cloudy.

Tests

Appearance of solution. Solution A is clear (2.4.1).

Absorbance. Not more than 0.8 at the absorption maxima at 277 nm (2.4.7), determined on a solution of the substance under examination containing 3.0 IU per ml.

Histamine (2.2.7). Not more than 0.2 µg of histamine base per 3 IU.

Des-Ala-aprotinin and des-Ala.-des-Gly-aprotinin. Determine by capillary zone electrophoresis (2.4.32).

Test solution. Prepare a solution of the substance under examination in *water* containing not less than 1 IU per ml.

Reference solution. Dilute *aprotinin solution IPRS* in *water* to obtain the same concentration as the test solution.

Chromatographic system

- a capillary column 45 to 60 cm x 75 µm, packed with uncoated fused silica,
- temperature: 25°,
- CZE buffer: dissolve 8.21 g of *potassium dihydrogen phosphate* in 400 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid*, dilute to 500.0 ml with *water*,
- spectrophotometer set at 214 nm,
- injection: under pressure or vacuum,
- migration: apply field strength of 0.2 kV/cm.

For identification of impurities, use the electropherogram supplied with aprotinin solution and the electropherogram obtained with the reference solution to identify the peaks corresponding to aprotinin impurities A and B.

The relative migration time with reference to aprotinin (migration time: about 22 minutes) for aprotinin impurity A is about 0.98 and for aprotinin impurity B is about 0.99.

Between-run, rinse the capillary for at least 1 minute with filtered *0.1 M sodium hydroxide* and for 2 minutes with the CZE buffer.

Inject the reference solution. Run the electropherogram for about 30 minutes. The test is not valid unless the resolution between the peaks corresponding to aprotinin impurities A and B is not less than 0.8 and between the peaks corresponding to aprotinin impurity B and aprotinin is not more than 0.5 and the height of the principal peak is not less than 1000 times the height of the baseline noise.

Inject the test solution. The area of any peak corresponding to aprotinin impurity A is not more than 8.0 per cent and the area of any peak corresponding to aprotinin impurity B is not more than 7.5 per cent, calculated by area normalization.

Pyroglutamyl-aprotinin and related compounds. Determine by liquid chromatography (2.4.14).

Test solution. Prepare a solution of the substance under examination in mobile phase A containing about 5 IU per ml.

Reference solution. Dissolve the contents of a vial of *aprotinin for system suitability IPRS* in 2.0 ml of mobile phase A.

Chromatographic system
- a stainless steel column 7.5 cm x 7.5 mm, packed with strong cation-exchange silica (10 µm),
- column temperature: 40°,
- mobile phase: A. dissolve 3.52 g of *potassium dihydrogen phosphate* and 7.26 g of *disodium hydrogen phosphate dihydrate* in 1000 ml of *water*,
  B. dissolve 3.52 g of *potassium dihydrogen phosphate*, 7.26 g of *disodium hydrogen phosphate dihydrate* and 66.07 g of *ammonium sulphate* in 1000 ml of *water*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 40 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	92	8
21	64	36
30	0	100
32	92	8

The relative retention time with reference to aprotinin (retention time: about 17 to 20 minutes) for aprotinin impurity C (pyroglutamaylaprotinin) is about 0.9.

Inject the reference solution. The test is not valid unless the resolution between the peaks corresponding to aprotinin impurity C and aprotinin is not less than 1.5 and the tailing factor is not more than 2.0 for the principal peak.

Inject the test solution. The area of the peak corresponding to aprotinin impurity C is not more than 1.0 per cent. The area of any other secondary peak is not more than 0.5 per cent. The sum of areas of all the secondary peaks other than aprotinin impurity C is not more than 1.0 per cent, calculated by area normalization.

Aprotinin oligomers. Determine by size-exclusion chromatography (2.4.16).

Test solution. Prepare a solution of the substance under examination in *water* containing about 5 IU per ml.

Reference solution. Treat the substance under examination to obtain about 2.0 per cent aprotinin oligomers. (heat freeze-dried aprotinin at about 110° for about 4 hours, then dissolve in *water* to obtain a concentration of about 5 IU per ml).

Chromatographic system
- 3 column coupled in series 30 cm x 7.8 mm, packed with hydrophilic silica gel of a grade suitable for fractionation of globular proteins in the relative molecular mass range of 20 000 to 10 000 000 (8 µm),
- mobile phase: a mixture of 20 volumes of *acetonitrile*, 20 volumes of *glacial acetic acid* and 60 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 277 nm,
- injection volume: 100 µl.

The relative retention time with reference to aprotinin monomer (retention time: about 25 minutes) for aprotinin dimer is about 0.9.

Inject the reference solution. The test is not valid unless the resolution between the peaks corresponding to aprotinin dimer and monomer is not less than 1.3 and the tailing factor of the peak corresponding to aprotinin monomer is not more than 2.5.

Inject the test solution. Run the chromatogram for about 40 minutes. The sum of all the oiligomers is not more than 1.0 per cent, calculated by area normalization.

Loss on drying (2.4.19). Not more than 6.0 per cent, determined on 0.1 g by drying in vacuum.

Assay. The estimated activity is not less than 90 per cent and not more than 110 per cent of the activity stated on the label.

The inhibiting activity of aprotinin is expressed in IU. 1 IU inhibits 50 per cent of the enzymatic activity of 2 microkatals of trypsin. The activity of aprotinin is determined by measuring its inhibitory action on a solution of trypsin of known activity. The inhibiting activity of the aprotinin is calculated from the difference between the initial activity and the residual activity of the trypsin.

Use a reaction vessel with a capacity of about 30 ml, provided with the following options:
- device that will maintain a temperature of 25°,
- a stirring device (Such as magnetic stirrer),
- a lid with 5 holes for accommodating the electrodes, the tip of a burette, a tube for the admission of nitrogen and the introduction of the reagents.

An automatic or manual titration apparatus may be used. In the latter case the burette is graduated in 0.05 ml and the pH meter is provided with a wide reading scale and glass and calomel or glass-silver-silver chloride electrodes.

Test solution. Prepare a solution of the substance under examination in *0.0015 M borate buffer solution pH 8.0* to contain 1.67 IU per ml (about 0.6 mg (*m* mg) per ml).

Trypsin solution. Prepare a solution of *trypsin* containing about 0.8 microkatals per ml (about 1 mg per ml), using *0.001 M*

hydrochloric acid. (Use a freshly prepared solution and keep in iced water).

Trypsin and aprotinin solution. To 4.0 ml of the trypsin solution, add 1.0 ml of the test solution. Dilute immediately to 40.0 ml with *0.0015 M borate buffer solution pH 8.0*. (Allow to stand at room temperature for 10 minutes and then keep in iced water. Use within 6 hours of preparation).

Dilute trypsin solution. Dilute 0.5 ml of the trypsin solution to 10.0 ml with *0.0015 M borate buffer solution pH 8.0*. (Allow to stand at room temperature for 10 minutes and then keep in iced water).

Maintain an atmosphere of nitrogen in the reaction flask and stir continuously; introduce 9.0 ml of *0.0015 M borate buffer solution pH 8.0* and 1.0 ml of a freshly prepared 0.69 per cent w/v solution of *benzoylarginine ethyl ester hydrochloride*, adjusted to pH 8.0 with *0.1 M sodium hydroxide*. When the temperature has reached equilibrium at 25°, add 1.0 ml of the trypsin and aprotinin solution and start a timer. Maintain at pH 8.0 by the addition of *0.1 M sodium hydroxide* and note the volume added every 30 seconds. Continue the reaction for 6 minutes. Determine the number of ml of 0.1 M sodium hydroxide used per second (n_1 ml). Carry out, under the same conditions, a titration using 1.0 ml of the dilute trypsin solution. Determine the number of ml of *0.1 M sodium hydroxide* used per second (n_2 ml).

Calculate the aprotinin activity in IU per mg using the following expression:

$$\frac{4000\,(2n_2 - n_1)}{m}$$

If intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

Bacterial endotoxins (2.2.3). Not more than 0.14 Endotoxin Units per IU of aprotinin.

Storage. Store protected from light and moisture.

Labelling. The label states the number of IU of aprotinin activity per mg and where applicable, that the substance is suitable for use in the manufacture of parenteral preparations.

Aprotinin Injection

Aprotinin Injection is a sterile solution of Aprotinin in Water for Injection that also contains Sodium Chloride. One Aprotinin Unit is equivalent to 1800 Kallikrein Inhibition Units (K.I.U.)

Aprotinin Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of aprotinin, $C_{284}H_{432}N_{84}O_{79}S_7$, expressed in K.I.U. per ml.

Usual strength. 20000 K.I.U. per ml.

Identification

In the limit of *N*-Pyroglutamyl-Aprotinin and Related compounds, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 4.5 to 6.5.

Limit of *N*-Pyroglutamyl-Aprotinin and Related compounds. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a suitable volume of the injection with mobile phase A to obtain a solution containing 5 Aprotinin units per ml.

Reference solution. Dissolve a suitable quantity of *aprotinin system suitability IPRS* in mobile phase A to obtained a solution containing 5 Aprotinin units per ml.

Chromatographic system

- a stainless steel column 7.5 cm x 7.5 mm, packed with a strong cation exchange resin with sulfopropyl groups bonded to porous silica (5 µm) (Such as Supelcosil LC-SCX),
- column temperature: 40°,
- mobile phase: A. a buffer solution prepared by dissolving 3.52 g of *monobasic potassium phosphate* and 7.26 g of *dibasic sodium phosphate* in 1000 ml of *water*,

  B. a buffer solution prepared by dissolving 3.52 g of *monobasic potassium phosphate*, 7.26 g of *dibasic sodium phosphate* and 66.07 g of *ammonium sulphate* in 1000 ml of *water*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 40 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	92	8
21	64	36
30	0	100
31	92	8
40	92	8

The relative retention time with reference to aprotinin for *N*-pyroglutamyl-aprotinin is about 0.9.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to *N*-pyroglutamyl-aprotinin and aprotinin is not less than 1.0 and the tailing factor is not more than 2.0 for aprotinin peak.

Inject the test solution. The area of any peak corresponding to *N*-pyroglutamyl-aprotinin is not more than 1.0 per cent, the area of any other secondary peak is not more than 0.5 per cent and the sum of the areas of all the secondary peaks other than *N*-pyroglutamyl-aprotinin, is not more than 1.0 per cent, calculated by area normalization.

High molecular weight proteins. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a suitable volume of the injection in *water* to obtain a solution containing 5 Aprotinin Units per ml.

Reference solution. A solution containing 5 Aprotinin Units per ml with about 2 per cent w/v of aprotinin oligomers. *(NOTE — This solution can be obtained by heating lyophilized aprotinin at 112° for about 2 hours and dissolving the solid at the specified concentration in water).*

Chromatographic system

- a series of three stainless steel column 30 cm x 7.8 mm, packing having the capacity to separate dextrans by molecular size over a range of 4,000 to 500,000 Da (Such as TSK gel Ultra SW Aggregate),
- mobile phase: a mixture of 20 volumes of *acetonitrile*, 20 volumes of *glacial acetic acid* and 60 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 100 µl.

The relative retention times with reference to aprotinin for dimer is about 0.9.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to dimer and aprotinin is not less than 1.3 and the tailing factor is not more than 2.5 for aprotinin peak.

Inject the test solution. The sum of the areas of all the peaks with retention time less than that of aprotinin monomer is not more than 1.5 per cent, calculated by area normalization.

Content of sodium chloride. 42.5 to 47.5 mg.

Dilute 5.0 ml of the injection with 50.0 ml with *water*. Add 10 ml of 25 per cent v/v of *nitric acid*. Titrate with *0.1 M silver nitrate*, determining the endpoint potentiometrically (2.4.25. Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.005844 g of NaCl.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Bacterial endotoxins (2.2.3). Not more than 0.14 Endotoxin Units per aprotinin unit.

Sterility (2.2.11). Complies with the test for sterility.

Assay.

NOTE — Prepare the solutions immediately before use.

Solvent mixture. Dissolve 0.93 g of *boric acid* in 900 ml of *water*, adjusted to pH 8.0 with *sodium hydroxide* and dilute to 1000.0 ml with *water*. Dilute 10.0 ml of the solution to 100.0 ml with *water*.

Test solution. Dilute a suitable volume of the injection with the solvent mixture to obtain a solution containing 1.67 Aprotinin Units per ml.

Reference solution (a). A solution containing 4300 Trypsin Units per ml of *trypsin crystallized IPRS* in *0.001M hydrochloric acid*. Use a freshly prepared solution, and store in ice-water.

Reference solution (b). Dilute 4.0 ml of reference solution (a) and 1.0 ml of the test solution to 40.0 ml with the solvent mixture. Allow to stand the solution at room temperature for 10 minutes and then keep in ice-water. Use the solution within 6 hours of preparation.

Reference solution (c). Dilute 0.5 ml of reference solution (a) to 10.0 ml with the solvent mixture. Allow to stand the solution at room temperature for 10 minutes then store in ice-water.

Reference solution (d). A 0.69 per cent w/v solution of *N-benzoyl-L-arginine ethyl ester hydrochloride* in the solvent mixture. Use the solution within 2 hours.

Dilute 1.0 ml of reference solution (d) with 9.0 ml of the solvent mixture in a jacketed-glass vessel with a capacity of about 30 ml and containing a stirring device. The lid of the reaction vessel should contain five holes to accommodate the electrodes, the tip of a burette, a tube for the admission of nitrogen, and the introduction of reactants. An automated or manual titration apparatus may be used. Adjusted to pH 8.0 with *0.1M sodium hydroxide*. Maintain an atmosphere of nitrogen within the vessel, and stir continuously. When the temperature has reached equilibrium at 25 ± 0.1°, add 1.0 ml of reference solution (b), and start a timer. Maintain at a pH of 8.0 by the addition of *0.1 M sodium hydroxide*, and record the volume added every 30 seconds. Continue the reaction for 6 minutes. Carry out a similar titration using 1.0 ml of reference solution (c).

Calculate the potency in Aprotinin units per ml by using following expression.

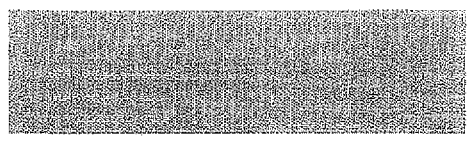
$$\text{Potency (Aprotinin units per ml)} = C_1 \times (C_2 \times V_2 - V_1) \times D$$

where, C_1 = conversion factor, 4000;

C_2 = difference in the amount of trypsin used in reference solution (b) and reference solution (c), 2;

V_1 = volume of *0.1 M sodium hydroxide* added per second, after adding reference solution (b) (ml per second);

V_2 = volume of *0.1 M sodium hydroxide* added per second, after adding reference solution (c) (ml per second);

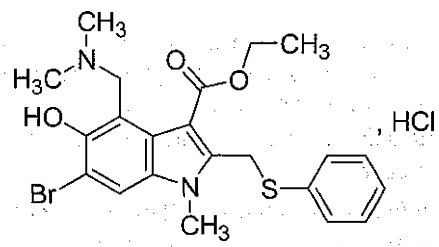


D = dilution factor used to prepare the test solution.

Storage. Store protected from moisture, in a single dose containers, at a temperature not exceeding 25°, do not freeze.

Arbidol Hydrochloride

Arbidol Hydrochloride Monohydrate



$C_{22}H_{25}BrN_2O_3S$, HCl, H_2O Mol Wt. 531.9

Arbidol Hydrochloride is Ethyl 6-bromo-5-hydroxy-4-[(dimethylamino)methyl]-1-methyl-2-[(phenylthio)methyl]-1*H*-indole-3-carboxylate hydrochloride.

Arbidol Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{22}H_{25}BrN_2O_3S$, HCl, calculated on the anhydrous basis.

Category. Antiviral.

Description. An off white to yellow colour powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *arbidol hydrochloride monohydrate IPRS* or with the reference spectrum of arbidol hydrochloride monohydrate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 90 volumes *acetonitrile* and 10 volumes of *water.*

Test solution. Dissolve 10 mg of the substance under examination in the solvent mixture and dilute to 10.0 ml with solvent mixture.

Reference solution. A 0.001 per cent w/v solution of *arbidol hydrochloride monohydrate IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- sample temperature: 5°,
- mobile phase: A. dissolve 1.36 g of *potassium dihydrogen orthophosphate monohydrate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid*, B. a mixture of 90 volumes of *acetonitrile* and 10 volumes of *water*,
- a gradient programme using the conditions given below,
- flow rate: 0.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0.01	55	45
15	45	55
25	25	75
50	10	90
55	55	45
60	55	45

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.3 times the area of the principal peak in the chromatogram obtained with the reference solution (0.3 per cent) and the sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Chlorides. 6.5 per cent to 8.5 per cent.

Dissolve 0.1 g in 100 ml of *methanol* and titrate with *0.1 M silver nitrate*, determining the end point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of chloride.

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 3.0 per cent to 4.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of the substance under examination in *acetonitrile* and dilute to 50.0 ml with *acetonitrile.*

Reference solution. A 0.02 per cent w/v solution of *arbidol hydrochloride monohydrate IPRS* in *acetonitrile.*

Chromatographic system
- a stainless steel column 15cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- sample temperature: 5°,
- mobile phase: A. dissolve 1.36 g of *potassium dihydrogen orthophosphate monohydrate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid*, B. a mixture of 90 volumes of *acetonitrile* and 10 volumes of *water*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0.01	55	45
8	55	45
20	10	90
25	10	90
30	55	45
35	55	45

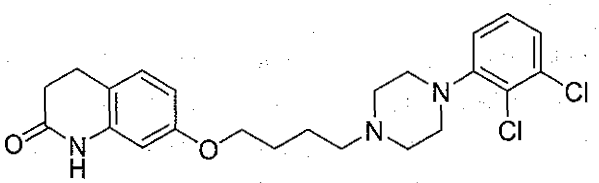
Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates., the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{25}BrN_2O_3S$, HCl.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Aripiprazole



$C_{23}H_{27}Cl_2N_3O_2$ Mol. Wt. 448.4

Aripiprazole is 7-{4-[4-(2,3-Dichlorophenyl)piperazin-1-yl]butoxy}-3,4-dihydroquinolin-2(1*H*)-one.

Aripiprazole contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{23}H_{27}Cl_2N_3O_2$, calculated on the anhydrous basis.

Category. Antipsychotic; Neuroleptic.

Description. A white to light yellow powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *aripiprazole IPRS* or with the reference spectrum of aripiprazole.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 50 volumes of buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, add 2 ml of *triethylamine*, adjusted to pH 3.0 with *orthophosphoric acid*, 25 volumes of *methanol* and 25 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the test solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution. The area of any secondary peak is not more than 0.5 per cent and the sum of areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalization.

Heavy metals (2.3.13). 1 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 0.1 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 80 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase. Further dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.0004 per cent w/v solution of *aripiprazole IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{23}H_{27}Cl_2N_3O_2$.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Aripiprazole Tablets

Aripiprazole Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of aripiprazole, $C_{23}H_{27}Cl_2N_3O_2$.

Usual strengths. 5 mg; 10 mg; 15 mg; 20 mg; 30 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 1000 ml of *0.1M hydrochloric acid*,
Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium.

Determine by liquid chromatography (2.4.14).

Test solution. Centrifuge the medium at 3500 rpm for 15 minutes and use the supernatant solution. Dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *aripiprazole IPRS* in *acetonitrile* and dilute with the dissolution medium to obtain a solution of the same concentration as that of the test solution.

Use chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{23}H_{27}Cl_2N_3O_2$ in the medium.

Q. Not less than 65 per cent of the stated amount of $C_{23}H_{27}Cl_2N_3O_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 10 tablets. Disperse a quantity of powder containing 25 mg of Aripiprazole in 70 ml of the mobile phase with the aid of ultrasound for 45 minutes and dilute to 100.0 ml with the mobile phase. Centrifuge the solution at 3500 rpm for 15 minutes. Dilute 5.0 ml of the supernatant liquid to 25.0 ml with the mobile phase.

Reference solution. A 0.003 per cent w/v solution of *aripiprazole IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as YMC ODS),
- mobile phase: a mixture of 50 volumes of buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, add 2 ml of *triethylamine*, adjusted to pH 3.0 with *orthophosphoric acid*, 25 volumes of *acetonitrile* and 25 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution. The area of any secondary peak is not more than 1.0 per cent and the sum of areas of all the secondary peaks is not more than 2.0 per cent, calculated by area normalization method.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), using the chromatographic conditions as described under Assay.

Test solution. Disperse one tablet in 10 ml of *acetonitrile* with the aid of ultrasound for 20 minutes. Add 80 ml of the mobile phase in the solution, further sonicate for 50 minutes and dilute to 100.0 ml with the mobile phase. Centrifuge the solution at 3500 rpm for 15 minutes. Dilute 5.0 ml of the supernatant liquid to 50.0 ml with the mobile phase.

Reference solution. Dissolve a quantity of *aripiprazole IPRS* in *acetonitrile* and dilute with the mobile phase to obtain a solution of the same concentration as that of the test solution.

Calculate the content of $C_{23}H_{27}Cl_2N_3O_2$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 30 mg of Aripiprazole in 10 ml of *acetonitrile* with the aid of ultrasound for 20 minutes. Add 75 ml of the mobile phase in the solution, further sonicate for 40 minutes and dilute to 100.0 ml with the mobile phase. Centrifuge this solution at 3500 rpm for 15 minutes. Dilute 5.0 ml of the supernatant liquid to 50.0 ml with the mobile phase.

Reference solution. Dissolve 30 mg of Aripiprazole in 10 ml of *acetonitrile* with the aid of ultrasound and dilute to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as YMC ODS),
- mobile phase: a mixture of 50 volumes of buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, add 2 ml of *triethylamine*, adjusted to pH 3.0 with *orthophosphoric acid*, 25 volumes of *acetonitrile* and 25 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume: 20 µl.

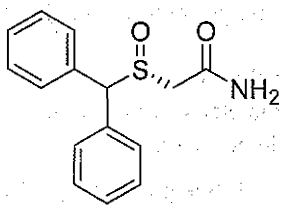
Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{23}H_{27}Cl_2N_3O_2$ in the tablets.

Storage. Store protected from light and moisture.

Armodafinil



$C_{15}H_{15}NO_2S$ Mol. Wt. 273.4

Armodafinil is 2-[(*R*)-(diphenylmethyl)sulfinyl]acetamide.

Armodafinil contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{15}H_{15}NO_2S$, calculated on the dried basis.

Category. Wakefulness-promoting agent.

Description. A white to off white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *armodafinil IPRS* or with the reference spectrum of armodafinil.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of mobile phase A and mobile phase B.

Test solution. Dissolve 50 mg of the substance under examination and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). A 0.01 per cent w/v solution of *armodafinil IPRS* in solvent mixture.

Reference solution (b). A 0.0075 per cent w/v solution containing each of *armodafinil impurity A IPRS, armodafinil impurity B IPRS, armodafinil impurity C IPRS and armodafinil impurity D IPRS* in solvent mixture.

Reference solution (c). Dilute 2.0 ml of reference solution (b) and 1.0 ml of reference solution (a) in 100.0 ml of solvent mixture.

Reference solution (d). Dissolve 50 mg of *armodafinil IPRS* in about 30 ml of solvent mixture, add 1.0 ml of reference solution (b), and dilute to 50.0 ml with solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5µm) (Such as X-Terra C18),
- mobile phase: A. dissolve 2.72 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 4.0 with *dilute orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	75	25
10	75	25
20	35	65
35	35	65
38	75	25
45	75	25

Name	Relative retention time
Impurity A[1]	0.5
Armodafinil (Retention time: about 8 minutes)	1
Impurity B[2]	2.0
Impurity C[3]	2.3
Impurity D[4]	2.4

[1](*R*)-(-)-(Diphenylmethanesulfinyl) acetic acid,

[2]2-(Benzhydrylsulfonyl) acetamide,

[3](*R*)-(-)-Methyl(Diphenylmethanesulfinyl) acetate,

[4]2-(Benzhydrylsulfanyl) acetamide.

Inject reference solution (c). The test is not valid unless the relative standard deviation for replicate injections is not more than 5.0 per cent for armodafinil peak.

Inject reference solution (d) and the test solution. In the chromatogram obtained with test solution, the area of any secondary peak is not more than 0.15 per cent, calculated by area normalization. The test is not valid unless the resolution between the peaks due to armodafinil impurity C and armodafinil impurity D is not less than 1.5, the column efficiency is not less than 3000 theoretical plates and the tailing factor is not more than 2.0 for armodafinil peak.

2-[(S)-(diphenylmethyl)sulfinyl]acetamide (S-isomer). Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of the substance under examination in 100.0 ml of mobile phase.

Reference solution (a). Dissolve 1 mg of *S*-isomer in 10.0 ml of the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 10 mg of *armodafinil IPRS* in sufficient mobile phase and add 1.0 ml of reference solution (a) and dilute to 100.0 ml with mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.0 mm, packed with immobilised α-1 acid glycoprotein on spherical silica particles (Such as Chiral-AGP) (5µm),
- mobile phase; dissolve 3.9 g of *ammonium acetate* in 1000 ml of *water* and add 8 ml of *1-butanol*, adjusted to pH 6.75 with *sodium hydroxide solution* or *dilute acetic acid*,
- flow rate: 0.9 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Name	Relative retention time
Armodafinil (Retention time: about 7.2 minutes)	1
S-isomer	1.3

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to *S*-isomer and armodafinil is not less than 1.5 and the related standard deviation for replicate injections is not more than 5.0 per cent.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of the peak due to *S*-isomer is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in oven at 105° for 2 hours.

Assay. Determine by liquid chromatography (2.4.14)

Solvent mixture. A mixture of equal volumes of mobile phase A and mobile phase B.

Test solution. Dissolve 50 mg of the substance under examination and dilute to 50.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.01 per cent w/v solution of *armodafinil IPRS* in solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5µm) (Such as X-Terra C18),
- mobile phase: A. dissolve 2.72 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 4.0 with *dilute orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	75	25
10	75	25
20	35	65
25	35	65
26	75	25
30	75	25

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.5 per cent.

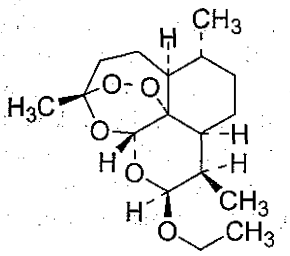
Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{15}NO_2S$.

Storage. Store protected from moisture.

Arteether

α-β Arteether



$C_{17}H_{28}O_5$ Mol. Wt. 312.4

α-arteether is (3*R*,5a*S*,6*R*,10*R*,12*S*,12a*R*)-10-Ethoxydecahydro-3,6,9-trimethyl-3,12-epoxy-12*H*-pyrano[4,3-j]-1,2-benzodioxepin.

β-arteether is (3*R*,5a*S*,6*R*,10*S*,12*S*,12a*R*)-10-Ethoxydecahydro-3,6,9-trimethyl-3,12-epoxy-12*H*-pyrano[4,3-j]-1,2-benzodioxepin.

Arteether contains α-isomer not less than 25.0 per cent and not more than 35.0 per cent and β-isomer not less than 65.0 per cent and not more than 75.0 per cent and total arteether is not less than 95.0 per cent and not more than 105.0 per cent of $C_{17}H_{28}O_5$, calculated on the dried basis.

Category. Antimalarial.

Description. A light yellow coloured lipophilic semi-solid.

Identification

Test A may be omitted if test B is carried out. Test B may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *arteether IPRS* or with the reference spectrum of arteether.

B. In the Assay, the principal peaks in the chromatogram obtained with the test solution corresponds to the peaks in the chromatogram obtained with the reference solution.

Tests

Appearance of solution. A 5.0 per cent w/v solution in *hexane* is clear (2.4.1).

Specific optical rotation (2.4.22). + 100.0° to + 120.0°, at 20°, determined in a 1.0 per cent w/v solution in *methanol*.

Related substances. Determine by thin layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 90 volumes of *hexane* and 10 volume of *ethyl acetate*.

Test solution. Dissolve 0.5 g of the substance under examination in 10.0 ml of *chloroform*.

Reference solution (a). A 0.15 per cent w/v solution of *arteether IPRS* in *chloroform*.

Reference solution (b). A 0.10 per cent w/v solution of β-*arteether IPRS* in *chloroform*.

Reference solution (c). Dilute 5.0 ml of reference solution (b) to 10.0 ml with *chloroform*.

Apply to the plate 6 µl of each solution. After development, dry the plate at 60° for 15 minutes. Spray with a 4 per cent w/v solution of *vanillin* in *sulphuric acid* and examine in daylight. Any spot in the chromatogram obtained with the test solution other than the principal spots is not more intense than the spot in the chromatogram obtained with reference solution (b). Not more than one such spot is more intense than that in the chromatogram obtained with reference solution (c).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 2 per cent, determined on 1.0 g at 35° under vacuum for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.15 g of the substance under examination in 100.0 ml of *acetonitrile*.

Reference solution. A 0.15 per cent w/v solution of *arteether IPRS* in *acetonitrile*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of *acetonitrile* and 30 volumes of *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

The relative retention time with respect to β-arteether, for α-arteether is about 0.7.

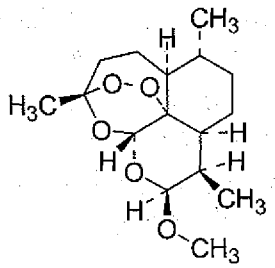
Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of total arteether, $C_{17}H_{28}O_5$, and of the α- and β-isomers.

Storage. Store protected from light and moisture.

Artemether



$C_{16}H_{26}O_5$ Mol. Wt. 298.4

Artemether is (3*R*,5a*S*,6*R*,8a*S*,9*R*,10*S*,12*R*,12a*R*)-Decahydro-10-methoxy-3,6,9-trimethyl-3,12-epoxy-12*H*-pyrano[4,3-*j*]-1,2-benzodioxepin.

Artemether contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{16}H_{26}O_5$, calculated on the dried basis.

Category. Antimalarial.

Description. A white crystals or a white crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *artemether IPRS* or with the reference spectrum of artemether.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. Dissolve 30 mg in 1 ml of *anhydrous ethanol* and add 0.1 g of *potassium iodide*. Heat the mixture on a water-bath. A yellow colour is produced.

D. Dissolve 30 mg in 6 ml of *anhydrous ethanol*. Add a few drops on a white porcelain dish and add 1 drop of *vanillin sulphuric acid TS*. A pink colour is produced.

Tests

Specific optical rotation (2.4.22). +166.0° to +173.0° at 20°, determined in a 1.0 per cent w/v solution in *anhydrous ethanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in 10.0 ml of the mobile phase.

Reference solution. A 0.005 per cent w/v solution of the substance under examination in the mobile phase.

Use chromatographic system as described under Assay.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent). The area of not more than one such peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.25 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak with an area less than 0.1 times that of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying over *phosphorous pentaoxide* under vacuum at 2.67 kPa.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in the mobile phase and dilute to 10.0 ml of the mobile phase.

Reference solution. A 1.0 per cent w/v solution of *artemether IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 62 volumes of *acetonitrile*, 38 volumes of *water*,
- flow rate:1.5 ml per minute,
- spectrophotometer set at 216 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{26}O_5$.

Storage. Store protected from light and moisture.

Artemether and Lumefantrine Tablets

Artemether and Lumefantrine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of artemether, $C_{16}H_{26}O_5$ and lumefantrine, $C_{30}H_{32}Cl_3NO$.

Usual strengths. 20 mg Artemether and 120 mg Lumefantrine; 40 mg Artemether and 240 mg Lumefantrine; 60 mg Artemether

and 360 mg Lumefantrine; 80 mg Artemether and 480 mg Lumefantrine

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2)

For Artemether —

Apparatus No. 2 (Paddle),

Medium. 1000 ml of a buffer solution prepared by dissolving 1.4 g of *disodium hydrogen phosphate anhydrous* in 1000 ml of *water*, add 10 g of *sodium lauryl sulphate* and adjusted to pH 7.2 with *dilute hydrochloric acid,*

Speed and time. 100 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve 20 mg of *artemether IPRS* in 2 ml of *acetonitrile*, with the aid of ultrasound and dilute to 100.0 ml with the dissolution medium. Dilute 1.0 ml of the solution to 10.0 ml with the dissolution medium.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS-3V),
- column temperatue: 40°,
- sample temperature: 10°,
- mobile phase: A. a buffer solution prepared by mixing 12 ml of *triethylamine* with 1000 ml of *water*, adjusted to pH 2.3 with *orthophosphoric acid,*
  B. a mixture of 95 volumes of *acetonitrile* and 5 volumes of *water*,
- a gradient programme using the conditions given below,
- flow rate: 2.0 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 100 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	27	73
9	30	70
9.5	27	73
12	27	73

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 3.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{26}O_5$ in the medium.

Q. Not less than 60 per cent of the stated amount of $C_{16}H_{26}O_5$.

For Lumefantrine —

Apparatus No. 2 (Paddle),

Medium. 1000 ml of 2 per cent v/v of *benzalkonium chloride solution* in *0.1M hydrochloric acid,*

Speed and time. 100 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A 0.12 per cent w/v solution of *lumefantrine IPRS* in the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the dissolution medium.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Waters symmetry),
- sample temperature: 10°,
- mobile phase: a mixture of 25 volumes of a buffer solution prepared by dissolving 5.65 g of *sodium-1-hexane sulphonate* and 2.75 g of *sodium dihydrogen phosphate monohydrate* in 800 ml of *water*, add 5.0 ml of *triethylamine* and adjusted to pH 2.3 with *dilute orthophosphoric acid,* dilute to 1000 ml with *water* and 75 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 380 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless he relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

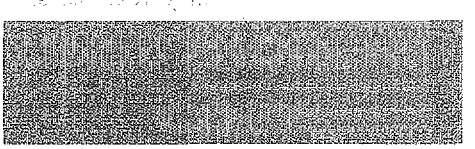
Calculate the content of $C_{30}H_{32}Cl_3NO$ in the medium.

Q. Not less than 60 per cent of the stated amount of $C_{30}H_{32}Cl_3NO$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of 0.1 per cent v/v solution of *orthophosphoric acid* and *acetonitrile.*

Test solution. Disperse a quantity of powdered tablets containing 360 mg of Lumefantrine in 15 ml of the solvent mixture, with the aid of ultrasound for 5 minutes with intermittent shaking and dilute to 25.0 ml with the solvent mixture and filter.



Reference solution (a). A 0.012 per cent w/v solution of *artemether IPRS* in the solvent mixture.

Reference solution (b). A 0.0144 per cent w/v solution of *lumefantrine IPRS* in the solvent mixture.

Reference solution (c). Dilute 25.0 ml of reference solution (a) and 5.0 ml of reference solution (b) to 50.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS 3V),
- mobile phase: a mixture of 40 volumes of 0.1 per cent v/v solution of *orthophosphoric acid* and 60 volumes of *acetonitrile*,
- flow rate: 0.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 25 µl.

Inject reference solution (c). The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation of replicate injections is not more than 5.0 per cent for both the peaks.

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 5 times the area of the principal peak due to lumefantrine in the chromatogram obtained with reference solution (c) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than 20 times the area of the principal peak due to lumefantrine in the chromatogram obtained with reference solution (c) (2.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Buffer solution. Mix 12 ml of *triethylamine* with 1000 ml of *water*, adjusted to pH 2.3 with *orthophosphoric acid.*

Solvent mixture. Dilute 20 ml of the buffer solution, 6 ml of *water,* 20 ml of *isopropyl alcohol* to 100.0 ml with *acetonitrile.*

Test solution. Transfer 5 intact tablets into 1000-ml volumetric flask, add 60 ml of *water*, 200 ml of *isopropyl alcohol* and dissolve with the aid of ultrasound for 15 minutes, add 200 ml of buffer solution and 400 ml of *acetonitrile*, dissolve with the aid of ultrasound for 45 minutes by maintaining water temperature of sonicator at 15° and dilute to volume with *accetonitrile*. Dilute a suitable volume of the solution with the solvent mixture to obtain the concentration similar to the reference solution.

Reference solution. A solution containing 0.01 per cent w/v of *artemether IPRS* and 0.06 per cent w/v of *lumefantrine IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS-3V),
- column temperatue: 40°,
- sample temperature: 10°,
- mobile phase: A. buffer solution,
  B. a mixture of 95 volumes of *acetonitrile* and 5 volumes of *water*,
- a gradient programme using the conditions given below,
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm for artemether and 380 nm for lumefantrine,
- injection volume: 30 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	27	73
9	30	70
9.5	27	73
12	27	73

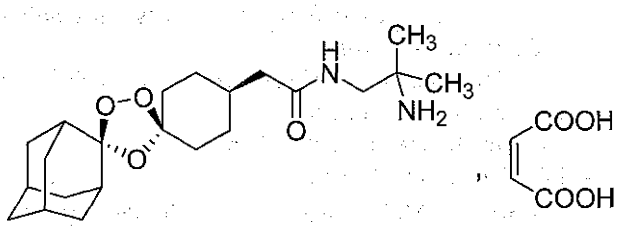
Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent for lumefantrine and not more than 3.0 per cent for artemether.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{26}O_5$ and $C_{30}H_{32}Cl_3NO$ in the tablets.

Storage. Store protected from light, at a temperature not exceeding 30°.

Arterolane Maleate



$C_{26}H_{40}N_2O_8$ Mol Wt. 508.6

Arterolane Maleate is [(*N*-(2-amino-2-methylpropyl)-2-*cis*-dispiro(adamantane-2,3'-[1,2,4]trioxolane-5',1"-cyclohexane)-4"- yl]acetamide maleate.

Arterolane Maleate contains not less than 96.0 per cent and not more than 102.0 per cent of $C_{26}H_{40}N_2O_8$, calculated on the anhydrous basis.

Category. Antimalarial.

Description. A white to off- white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *arterolane maleate IPRS* or with the reference spectrum of arterolane maleate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of *acetonitrile* and 50 volumes of *water.*

Test solution. Dissolve 25 mg of the substance under examination in the solvent mixture and dilute to 5.0 ml with the solvent mixture.

Reference solution. A 0.0025 per cent w/v solution of *arterolane maleate IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. dissolve 1.36 g of *potassium dihydrogen orthophosphate* into 1000 ml of *water*, add 1.0 ml of *triethylamine*, adjusted to pH 4.5 with *orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 25 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
7	90	10
20	60	40
30	20	80
40	15	85
50	15	85
55	90	10
70	90	10

Inject the reference solution. The test is not valid unless the column efficiency is not less than 10000 theoretical plates and tailing factor is not more than 3.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the twice the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent).

Maleic acid. 22.0 per cent to 24.5 per cent w/w, calculated on anhydrous basis. Weigh 0.25 g and dissolve in 10 ml of *methanol* and 70 ml of *water.* Titrate with *0.1 M sodium hydroxide,* determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.011607 g of maleic acid

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.5 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution. A 0.1 per cent w/v solution of *arterolane maleate IPRS* in the mobile phase.

Chromatographic system

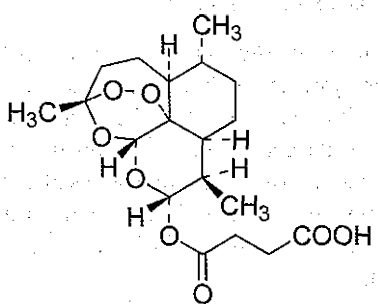
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 50°,
- mobile phase: a mixture of 50 volumes of 0.2 per cent v/v *triethylamine* in *water*, and adjusted to pH 3.0, with *orthophosphoric acid* and 50 volumes of *acetonitrile,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 600 theoretical plates, the tailing factor is not more than 3.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution and the test solution.

Calculate the content of $C_{26}H_{40}N_2O_8$.

Artesunate



$C_{19}H_{28}O_8$ Mol. Wt. 384.4

Artesunate is (3*R*,5a*S*,6*R*,8a*S*,9*R*,10*R*,12*R*,12a*R*)-decahydro-3,6,9-trimethyl-3,12-epoxy-12*H*-pyrano-[4,3-*j*]-1,2-benzodioxepin-10-ol hydrogen succinate.

Artesunate contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{19}H_{28}O_8$, calculated on the dried basis.

Category. Antimalarial.

Description. A white crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *artesunate IPRS* or with the reference spectrum of artesunate.

Tests

pH (2.4.24). 3.5 to 4.5, determined on 1.0 per cent w/v solution.

Specific optical rotation (2.4.22). + 4.5° to + 6.5°, determined in a 1.0 per cent w/v solution in *dichloromethane* at 20°.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 40 mg of the substance under examination in *acetonitrile* and dilute to 10.0 ml with *acetonitrile*.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *acetonitrile*.

Reference solution (b). A solution containing 0.1 per cent w/v of *artesunate IPRS* and 0.01 per cent w/v each of *artenimol IPRS* and *artemisinin IPRS* in *acetonitrile*.

Chromatographic system
- a stainless steel column 10 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: a mixture of 56 volumes of a buffer solution prepared by dissolving 1.36 g *of potassium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and 44 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 216 nm,
- injection volume: 20 µl.

Name	Relative retention time
Artesunate impurity A (10-epi-artenimol)[1]	0.58
Artenimol	0.91
Artesunate (Retention time: about 9 minutes)	1.0
Artesunate impurity B (artemisinin)[2]	1.3
Artesunate impurity C (anhydrodihydroartemisinin)[3]	2.7

[1](3R,5aS,6R,8aS,9R,12R,12aR)-3,6,9-trimethyldecahydro-12*H*-3,12-epoxypyrano[4,3-j]-1,2-benzodioxepin-10-ol(dihydroartemisinins: artenimol and (10R)-artenimol),

[2](3R,5aS,6R,8aS,9R,12S,12aR)-3,6,9-trimethyloctahydro-3,12-epoxypyrano[4,3-j]-1,2-benzodioxepin-10(3*H*)-one (artemisinin),

[3](3R,5aS,6R,8aS,12R,12aR)-3,6,9-trimethyl-3,4,5,5a,6,7,8,8a-octahydro-12*H*-3,12-epoxypyrano[4,3-j]-1,2-benzodioxepine (anhydrodihydroartemisinin).

Inject reference solution (b). The test is not valid unless the peak-to-valley ratio (Hp/Hv) is not less than 5.0, where Hp is the height above the baseline of the peak due to artenimol and Hv is the height above the baseline of the lowest point of the curve separating the peak due to artenimol from the peak due to artesunate.

Inject reference solution (a) and the test solution. Run the chromatogram 4 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the combined area of any peak due to 10-epi-artenimol and artenimol is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent), the area of any peak due to impurity B (artemisinin) is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent), the area of any peak due to impurity C multiplied by correction factor 0.07, is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the area of any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). The sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of mobile phase and 50 volumes of *methanol.*

Test solution. Dissolve about 0.4 g of the substance under examination in 70 ml of the solvent mixture, sonicate for 15 minutes and dilute to 100.0 ml with the solvent mixture.

Reference solution. A 0.4 per cent w/v solution of *artesunate IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- mobile phase: a mixture of 30 volumes of a solution containing 3.85 g of *ammonium acetate* and 1 ml of *triethylamine* in 1000 ml of *water*, adjusted to pH 5.5 with *acetic acid* and 70 volumes of *methanol*,
- flow rate: 0.6 ml per minute,
- spectrophotometer set at 216 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{28}O_8$.

Storage. Store protected from light and moisture.

Artesunate Injection

Artesunate Injection is a sterile material consisting of Artesunate with or without buffering agents and other excipients. It is filled in a sealed container.

Artesunate injection is constituted by dissolving the contents of the sealed container in the requisite amount of 5 per cent w/v sodium bicarbonate injection, shake vigorously for 5 minutes and add requisite amount of 0.9 per cent w/v sodium chloride injection, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Artesunate Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of artesunate, $C_{19}H_{28}O_8$.

Usual strengths. 60 mg per vial and 120 mg per vial.

Description. A white or almost white crystalline powder.

The content of the sealed container comply with the requirements stated under Parenteral Preparations (powder for Injection) and with the following requirements.

Identification

Test A may be omitted if test B, C and D are carried out. Test B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *artesunate IPRS* or with the reference spectrum of artesunate.

B. Determine by thin layer chromatography (2.4.17), coating the plate with *silica gel G.*

Mobile phase. A mixture of 70 volumes of *ethanol (95 per cent)*, 30 volumes of *toluene* and 1.5 volumes of *strong ammonium solution.*

Test solution. Dissolve a quantity of the content of the sealed container containing about 0.1 g of Artesunate in 100.0 ml of *methanol.*

Reference solution. A 0.1 per cent w/v solution of *artesunate IPRS* in *methanol.*

Apply to the plate 1 µl of each solution. After development, dry the plate in a current of warm air. Spray with *anisaldehyde methanol solution* and heat the plate at 120° for five minutes and examine in day light. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

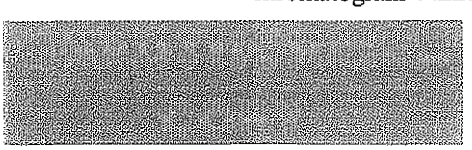
C. Dissolves a quantity of powder containing about 0.1 g of Artesunate in 40 ml of *ethanol*, shake and filter. To half of the filtrate (keep the remaining filtrate for test D), add about 0.5 ml of *hydroxylamine hydrochloride* and 0.25 ml of *2 M sodium hydroxide*. Heat the mixture in a water-bath to boiling, cool, add 2 drops of *1 M hydrochloric acid* and 2 drops of *ferric chloride test solution*; a light red violet colour is produced.

D. Evaporate the remaining filtrate on a water-bath to a volume of about 5.0 ml. place a few drops of the mixture on a white porcelain dish, add one drop of *vanillin sulphuric acid solution*, a reddish-brown colour is produced.

Tests

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Inject reference solution (b), (c) and the test solution. Run the chromatogram 4 times the retention time of artesunate.



The relative retention time with reference to artesunate for α-artenimol is about 0.58, for β-artenimol is about 0.91, for impurity B (artemisinin) is about 1.3 and for artesunate impurity C (anhydrodihydroartemisinin) is about 2.7.

Inject the reference solution (b), the test is not valid unless the peak to valley ratio (Hp/Hv) is 5.0, where Hp is the height above the baseline of the peak due to β-artenimol and Hv is the height above the baseline of the lowest point of the curve separating this peak due to artesunate.

Inject the reference solution (c) and the test solution. Run the chromatogram 4 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak due to α-artenimol and β-artenimol (impurity A) is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent), the area of any peak due to impurity B is not more than 0.5 times the area of the principal peak obtained with reference solution (c) (0.5 per cent), the area of any peak due to impurity C multiplied by correction factor of 0.07, is not more than 0.3 times the area of the principal peak obtained with reference solution (c) (0.3 per cent) and the area of any other secondary peak is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.3 per cent). The sum of the areas of all the secondary peaks including impurity C is not more than twice the area of the principal peak obtained with reference solution (c) (2.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent).

Bacterial endotoxins (2.2.3). Not more than 2.5 Endotoxin Units per mg of artesunate.

Water (2.3.43). Not more than 0.5 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Determine the weight of the content of 10 containers. Transfer a weighed quantity of the mixed content of the 10 containers containing 40 mg of Artesunate in to a 10.0 ml volumetric flask, add about 7 ml of *acetonitrile* and dilute to volume with same solvent and filter.

Reference solution (a). A 0.4 per cent w/v solution of *artesunate IPRS* in *acetonitrile*.

Reference solution (b). A solution containing 0.01 per cent w/v solution of *artenimol IPRS*, 0.01 per cent w/v of *artemisinin IPRS* and 0.1 per cent w/v of *artesunate IPRS* in *acetonitrile*.

Reference solution (c). Dilute 1.0 ml of the test solution to 100.0 ml with *acetonitrile*.

Chromatographic systems

- a stainless column 10 cm x 4.6 mm, packed with octadecysilane bonded to porous silica (3μm),
- mobile phase: a mixture of 44 volumes of *acetonitrile* and 56 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 216 nm,
- injection volume: 20 μl.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 4 times the retention time of artesunate.

The relative retention time with reference to artesunate for α-artenimol is about 0.58, for β-artenimol is about 0.91 and for artemisinin (artesunate impurity b) is about 1.3.

Inject reference solution (b) and the test solution. The test is not valid unless the peak-to-valley ratio (Hp/Hv) is not less than 5.0, where Hp is the height above the baseline of the peak due to β-artenimol and Hv is the height above the baseline of the lowest point of the curve separating this peak due to artesunate. The chromatogram obtained with test solution may show a peak due to impurity C eluting at a relative retention time of about 2.7 with reference to artesunate.

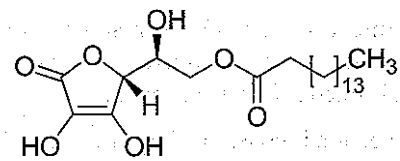
Inject reference solution (a) and the test solution.

Calculate the content of $C_{19}H_{28}O_8$ In the injection.

Storage. Store protected from moisture.

Labelling. The label states (1) the direction for constituting the solution; (2) the name of any added buffering agent or pharmaceutical aids.

Ascorbyl Palmitate



$C_{22}H_{38}O_7$ Mol. Wt. 414.5

Ascorbyl Palmitate is (2*S*)-2-[(2*R*)-3,4-Dihydroxy-5(2*H*)-oxo-2-furyl]-2-hydroxyethyl hexadecanoate.

Ascorbyl Palmitate contains not less than 95.0 per cent and not more than 100.5 per cent of $C_{22}H_{38}O_7$, calculated on the dried basis.

Category. Pharmaceutical aid.

Description. A white or yellowish-white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ascorbyl*

palmitate IPRS or with the reference spectrum of ascorbyl palmitate.

Tests

Specific optical rotation (2.4.22). +21° to +24°, determined on 10.0 per cent w/v solution in *methanol*.

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

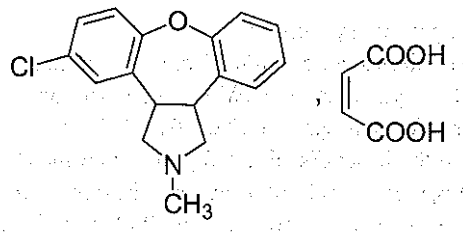
Loss on drying (2.4.19). Not more than 2.0 per cent, determined on 1.0 g by drying under vacuum at 60° for 1 hours.

Assay. Weigh 0.16 g and dissolve in 50 ml of *methanol*. Add 30 ml of *water* and 1 ml of *starch solution*. Titrate with *0.05 M iodine* until a persistent violet-blue colour is obtained.

1 ml of *0.05 M iodine* is equivalent to 0.02073 g of $C_{22}H_{38}O_7$.

Storage. Store protected from light and moisture.

Asenapine Maleate



$C_{21}H_{20}ClNO_5$ Mol Wt.401.8

Asenapine Maleate is 5-chloro-2,3,3a,12b-tetrahydro-2-methyl-1*H*-dibenz[2,3:6,7]oxepino[4,5-c]pyrrole maleate.

Asenapine Maleate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{17}H_{16}ClNO.C_4H_4O_4$, calculated on the dried basis.

Category. Antipsychotic.

Description. A white to off white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *asenapine maleate IPRS* or with the reference spectrum of asenapine maleate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 60 volumes of *acetonitrile* and 40 volumes of *water*.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with solvent mixture.

Reference solution. A 0.1 per cent w/v solution of *asenapine maleate IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a 0.1 per cent v/v solution of *triethylamine* in *water*, adjusted to pH 2.5 with *perchloric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.0 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	70	30
5	70	30
20	20	80
30	20	80
32	70	30
40	70	30

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0.

Inject the test solution. The area of any secondary peak is not more than 0.5 per cent and the sum of areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalization.

Maleic acid. 28.0 to 32.0 per cent.

Dissolve 0.1 g in 50.0 ml of *methanol*. Titrate with *0.1 M sodium hydroxide*, determining the end point Potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.011607 g $C_4H_4O_4$.

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°, for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 60 volumes of *acetonitrile* and 40 volumes of *water*.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture. Dilute 10.0 ml of the solution to 50.0 ml with solvent mixture.

Reference solution. A 0.02 per cent w/v solution of *asenapine maleate IPRS* in the solvent mixture.

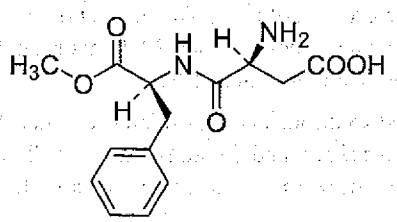
Chromatographic system
- a stainless steel column 25cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of 0.1 per cent v/v solution of *triethylamine* in *water*, adjusted to pH 2.5 with *perchloric acid* and 40 volumes of *acetonitrile*,
- flow rate: 1.0 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates and the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{16}ClNO.C_4H_4O_4$.

Aspartame



$C_{14}H_{18}N_2O_5$ Mol. Wt. 294.3

Aspartame is *N*-L-α-aspartyl-L-phenylalanine-1-methyl ester.

Aspartame contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{14}H_{18}N_2O_5$, calculated on the dried basis.

Category. Pharmaceutical aid (sweetening agent).

Description. A white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *aspartame IPRS*.

B. When examined in the range 230 nm to 300 nm (2.4.7), a 0.1 per cent w/v solution in *ethanol (95 per cent)* shows absorption maxima at about 247 nm, 252 nm, 258 nm and 264 nm.

Tests

pH (2.4.24). 4.0 to 6.0, determine in a 0.8 per cent w/v solution.

Specific optical rotation (2.4.22). +14.5° to +16.5°, determined at 20° in a 4.0 per cent w/v solution in *15 M formic acid* within 30 minutes of preparing the solution.

Light absorption (2.4.7). Absorbance of a 1.0 per cent w/v solution in *2 M hydrochloric acid*, prepared with the aid of ultrasound, at the maximum at about 430 nm, not more than 0.022.

5-Benzyl-3,6-dioxo-2-piperazineacetic acid. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.5 g of the substance under examination in 100 ml of a mixture of 10 volumes of *methanol* and 90 volumes of *water*.

Reference solution. A 0.0075 per cent w/v solution of *5-benzyl-3,6-dioxo-2-piperazine-acetic acid IPRS* in a mixture of 10 volumes of *methanol* and 90 volumes of *water*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane chemically bonded to porous silica or ceramic microparticles (3 to 10 µm),
- mobile phase: dissolve 5.6 g of *potassium dihydrogen phosphate* in 820 ml of *water*, adjusted to pH 4.3 with *phosphoric acid* and dilute to 1000 ml with *methanol*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviations for replicate injections is not more than 4.0 per cent and the tailing factor of the principal peak is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the response obtained for any peak at a retention time corresponding to that of *5-benzyl-3,6-dioxo-2-piperazineacetic acid IPRS* is not greater than the response obtained for the peak in the chromatogram of the reference solution corresponding to not more than 1.5 per cent of 5-benzyl-3,6-dioxo-2-piperazineacetic acid.

Other Related substances. Carry out the test for 5-Benzyl-3,6-dioxo-2-piperazineacetic acid, using reference solution (b) prepared by diluting 2.0 ml of the test solution to 100 ml with a mixture of 10 volumes of *methanol* and 90 volumes of *water*.

Inject 20 µl of reference solution (b) and the test solution, record the chromatograms and measure the peak responses. Continue elution of the test solution for twice the retention time of the aspartame peak. The sum of the areas of any peaks observed in the chromatogram obtained with the test solution, other than the peaks for aspartame and 5-benzyl-3,6-dioxo-2-piperazineacetic acid, is not more than the area of the aspartame peak obtained with reference solution (b) (2.0 per cent).

Arsenic (2.3.10). Mix 3.3 g with 3 g of *anhydrous sodium carbonate*, add 10 ml of *bromine solution* and mix thoroughly. Evaporate to dryness on a water-bath, gently ignite, dissolve the cooled residue in 16 ml of *brominated hydrochloric acid AsT* and add 45 ml of *water*. Remove the excess of *bromine* with 2 ml of *stannous chloride AsT*. The resulting solution complies with the limit test for arsenic (3 ppm).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent, determined on 2.0 g.

Loss on drying (2.4.19). Not more than 4.5 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

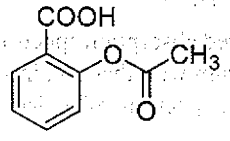
Assay. Dissolve 0.3 g in 1.5 ml of *anhydrous formic acid*, add 60 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration. A blank titration of more than 0.1 ml may be indicative of excessive water content. In such a case, repeat the test after taking precautions to maintain anhydrous conditions throughout.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02943 g of $C_{14}H_{18}N_2O_5$.

Storage. Store protected from light and moisture.

Aspirin

Acetylsalicylic Acid



$C_9H_8O_4$ Mol. Wt. 180.2

Aspirin is 2-acetoxybenzoic acid.

Aspirin contains not less than 99.5 per cent and not more than 100.5 per cent of $C_9H_8O_4$, calculated on the dried basis.

Category. Non-steroidal antiinflammatory; antirheumatic; antithrombotic.

Description. Colourless crystals or a white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6) Compare the spectrum with that obtained with *aspirin IPRS* or with the reference spectrum of aspirin.

B. Boil about 0.5 g with 10 ml of *sodium hydroxide solution* for 3 minutes, cool and add 10 ml of *dilute sulphuric acid*; a white, crystalline precipitate is produced and the odour of acetic acid is perceptible. Filter, dissolve the precipitate in about 2 ml of *water* and add *ferric chloride test solution*; a deep violet colour is produced.

C. To the filtrate obtained in test B add 3 ml of *ethanol (95 per cent)* and 3 ml of *sulphuric acid* and warm; the odour of ethyl acetate is perceptible.

Tests

Appearance of solution. A 1.0 per cent w/v solution in *ethanol (95 per cent)* is clear (2.4.1) and not more intensely coloured than reference solution BS8 (2.4.1).

Clarity of solution in alkali. A 5.0 per cent w/v solution in a warm 5 per cent w/v solution of *sodium carbonate* is clear (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Dissolve 0.1 g of the substance under examination in *acetonitrile* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 50 mg of *salicylic acid IPRS* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 10 mg of *salicylic acid IPRS* in the mobile phase and dilute to 10.0 ml with the mobile phase. To 1.0 ml of the solution, add 0.2 ml of the test solution and dilute to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 0.2 volume of *orthophosphoric acid*, 40 volumes of *acetonitrile* and 60 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 237 nm,
- injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the resolution between the 2 principal peaks is not less than 6.0.

The relative retention time with reference to acetylsalicylic acid for 4-hydroxybenzoic acid (aspirin impurity A) is about 0.7; for 4-hydroxyisophthalic acid (aspirin impurity B) is about 0.8; for salicylic acid (aspirin impurity C) is about 1.3; for acetylsalicylsalicylic acid (aspirin impurity D) is about 2.3; for salicylsalicylic acid (aspirin impurity E) is about 3.2; for acetylsalicylic anhydride (aspirin impurity F) is about 6.0.

Inject reference solution (a) and the test solution. Run the chromatogram 7 times the retention time of the acetylsalicylic acid peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to aspirin impurities A, B, C, D, E and F is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent). The area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent). The sum of areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent). Ignore any peak with an area less than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.03 per cent).

Arsenic (2.3.10). Mix 5.0 g with 3 g of *anhydrous sodium carbonate*, add 10 ml of *bromine solution* and mix thoroughly. Evaporate to dryness on a water-bath, gently ignite, and dissolve the cooled residue in 16 ml of *brominated hydrochloric acid* and 45 ml of *water*. Remove the excess of bromine with 2 ml of *stannous chloride AsT*. The resulting solution complies with the limit test for arsenic (2 ppm).

Chlorides (2.3.12). Boil 1.75 g with 75 ml of *water* for 5 minutes, cool, add sufficient *water* to restore the original volume and filter. 25 ml of the filtrate complies with the limit test for chlorides (430 ppm).

Sulphates (2.3.17). 10 ml of the filtrate obtained in the test for Chlorides complies with the limit test for sulphates (650 ppm).

Readily carbonisable substances. Dissolve 0.5 g in 5 ml of *sulphuric acid* (containing 94.5 per cent to 95.5 per cent w/w of H_2SO_4); any colour produced is not more intense than that of reference solution BYS4 (2.4.1).

Heavy metals. Not more than 10 ppm, determined by the following method. Dissolve 2.0 g in 25 ml of *acetone*, add 1 ml of *water* and 10 ml of *hydrogen sulphide solution*; any colour produced is not more intense than that produced by mixing 25 ml of *acetone*, 1.0 ml of *lead standard solution (20 ppm Pb)* and 10 ml of *hydrogen sulphide solution*.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* at a pressure of 1.5 to 2.5 kPa.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 25.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.05 per cent w/v solution of *aspirin IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 600 volumes of *water* and 400 volumes of *acetonitrile*, add 2 ml of *orthophosphoric acid*, filter,
- flow rate: 1 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume: 10 µl.

The retention time of the principal peak is about 4.0 minutes.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent

Inject the reference solution and the test solution.

Calculate the content of $C_9H_8O_4$.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Aspirin Tablets

Acetylsalicylic Acid Tablets

Aspirin Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of aspirin, $C_9H_8O_4$.

Usual strengths. 75 mg; 150 mg; 300 mg; 600 mg.

Identification

Disperse a quantity of powdered tablets containing 0.5 g Aspirin with 20.0 ml of *ethanol,* Filter. Evaporate the filtrate and dry the residue at 60° for 1 hour. The residues comply with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *aspirin IPRS* or with the reference spectrum of aspirin.

Tests

Dissolution (2.5.2).
Apparatus No. 2 (Paddle),
Medium: 500 ml of a buffer solution pH 4.5 prepared by dissolving 2.99 g of *sodium acetate* and 1.66 ml of *glacial acetic acid* with sufficient *water* and dilute to 1000 ml with *water,*

Speed and time. 50 rpm for 45 minutes.

Withdraw a suitable volume of the medium and filter. Dilute a suitable volume of the filtrate with the dissolution medium and measure the absorbance of the resulting solution at the maximum at about 265 nm (2.4.7). Calculate the content of $C_9H_8O_4$ in the medium from the absorbance obtained from a solution of known concentration of *aspirin IPRS* in the same medium.

Q. Not less than 70 per cent of the stated amount of $C_9H_8O_4$

Related substances. Determine by liquid chromatography (2.4.14),

NOTE — Prepare the solutions immediately before use.

Test solution. Disperse a quantity of the powdered tablets containing 0.1 g of Aspirin in 40 ml of *acetonitrile* with the aid of ultrasound for 15 minutes and dilute to 100.0 ml with *water*.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). A 0.003 per cent w/v solution of *salicylic acid (aspirin impurity C)* in the mobile phase.

Reference solution (c). Dilute 5.0 ml of reference solution (b) and 1.0 ml of the test solution to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of *acetonitrile*, 60 volumes of *water* and 0.2 volume of *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 237 nm,
- injection volume: 20 µl.

Name	Relative retention time
Aspirin impurity A[1]	0.6
Aspirin impurity B[2]	0.7
Aspirin (Retention time: about 5 minutes)	1.0
Aspirin impurity C[3]	1.4
Aspirin impurity F[4]	8.0

[1]4-hydroxybenzoic acid,

[2]4-hydroxyisophthalic acid,

[3]salicylic acid,

[4]acetylsalicylic anhydride.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to aspirin and aspirin impurity C is not less than 6.0.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 1.2 times the retention time of aspirin impurity F. In the chromatogram obtained with the test solution, the area of any peak corresponding to aspirin impurity C is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all other secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14), using chromatographic system and reference solution (c) as described under Related substances.

NOTE — Prepare the solutions immediately before use.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 60 mg of Aspirin in 40 ml of *acetonitrile,* with the aid of ultrasound for 15 minutes and dilute to 100.0 ml with *water*.

Reference solution. A 0.06 per cent w/v solution of *aspirin IPRS* in the mobile phase.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to aspirin and aspirin impurity C is not less than 6.0.

Inject the reference solution and the test solution.

Calculate the content of $C_9H_8O_4$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states, if the tablets are dispersible should be dispersed in water immediately before use.

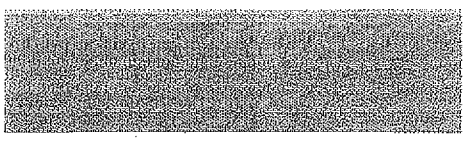
Soluble Aspirin Tablets

Soluble Acetylsalicylic Acid Tablets; Effervescent Soluble Aspirin Tablets; Effervescent Aspirin Tablets; Calcium Aspirin Tablets.

Soluble Aspirin Tablets contain Aspirin in a suitable soluble, effervescent base.

Soluble Aspirin Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of aspirin, $C_9H_8O_4$.

Usual strength. 300 mg.



Identification

A. Disperse a quantity of powdered tablets containing 0.5 g Aspirin with 20.0 ml of *ethanol* and filter.Evaporate the filtrate and dry the residue at 60° for 1 hour. The residues comply with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *aspirin IPRS* or with the reference spectrum of aspirin.

B. Dissolve with vigorous effervescence on the addition of warm *water* to produce a clear solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14),

NOTE — Prepare the solutions immediately before use.

Test solution. Disperse a quantity of the powdered tablets containing 0.1 g of Aspirin in 40 ml of *acetonitrile* with the aid of ultrasound for 15 minutes and dilute to 100.0 ml with *water*.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). A 0.003 per cent w/v solution of *salicylic acid (aspirin impurity C)* in the mobile phase.

Reference solution (c). Dilute 5.0 ml of reference solution (b) and 1.0 ml of the test solution to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of *acetonitrile*, 60 volumes of *water* and 0.2 volume of *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 237 nm,
- injection volume: 20 µl.

Name	Relative retention time
Aspirin impurity A[1]	0.6
Aspirin impurity B[2]	0.7
Aspirin (Retention time: about 5 minutes)	1.0
Aspirin impurity C[3]	1.4
Aspirin impurity F[4]	8.0

[1]4-hydroxybenzoic acid,

[2]4-hydroxyisophthalic acid,

[3]salicylic acid,

[4]acetylsalicylic anhydride.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to aspirin and aspirin impurity C is not less than 6.0.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 1.2 times the retention time of aspirin impurity F. In the chromatogram obtained with the test solution, the area of any peak corresponding to aspirin impurity C is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all other secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14), using chromatographic system and reference solution (c) as described under Related substances.

NOTE —Prepare the solutions immediately before use.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 60 mg of Aspirin in 40 ml of *acetonitrile,* with the aid of ultrasound for 15 minutes and dilute to 100.0 ml with *water*.

Reference solution. A 0.06 per cent w/v solution of *aspirin IPRS* in the mobile phase.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to aspirin and aspirin impurity C is not less than 6.0.

Inject the reference solution and the test solution.

Calculate the content of $C_9H_8O_4$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Aspirin Gastro-resistant Tablets

Acetylsalicylic Acid Gastro-resistant Tablets

Aspirin Gastro-resistant Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of aspirin, $C_9H_8O_4$.

Usual strength. 75 mg; 150 mg.

Identification

Boil a quantity of the powdered tablets containing 0.3 g of Aspirin for 2 to 3 minutes with 10 ml of *5 M sodium hydroxide*, cool and add an excess of *1 M sulphuric acid*;a crystalline

precipitate is produced. To a solution of the precipitate in *water* add *iron(III) chloride solution;* a deep violet colour is produced.

Tests

Dissolution (2.5.2).

A. Apparatus No. 1 (Basket),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 100 rpm and 120 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution immediately, suitably diluted with the dissolution medium, if necessary, at the maximum at about 276 nm (2.4.7). Calculate the content of $C_9H_8O_4$ in the medium from the absorbance obtained from a solution of known concentration of *aspirin IPRS,* prepared by dissolving in *0.1 M hydrochloric acid.*

Complies with the acceptance criteria given under acid stage.

B. Apparatus No. 1 (Basket),

Medium. 900 ml of *0.1 M hydrochloric acid* replace with *mixed phosphate buffer pH 6.8,*
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution immediately, suitably diluted with the dissolution medium, if necessary, at the maximum at about 265 nm (2.4.7). Calculate the content of $C_9H_8O_4$ in the medium from the absorbance obtained from a solution of known concentration of *aspirin IPRS,* prepared by dissolving in the dissolution medium.

Q. Not less than 70 per cent of the stated amount of $C_9H_8O_4$.

Salicylic acid. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing 0.3 g of Aspirin in 60 ml of *acetonitrile* and 1 ml of *formic acid* for 15 minutes and dilute to 100.0 ml with *acetonitrile*, filter.

Reference solution (a). A 0.009 per cent w/v solution of *salicylic acid IPRS* in a mixture of 99 volumes of *acetonitrile* and 1 volume of *formic acid.*

Reference solution (b). A solution containing 0.3 per cent w/v of *aspirin IPRS* and 0.009 per cent w/v of *salicylic acid IPRS* in a mixture of 99 volumes of *acetonitrile* and 1 volume of *formic acid.*

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 25 volumes of *acetonitrile* and 75 volumes of *0.05 M sodium dihydrogen orthophosphate*, adjusted to pH 2.0 with *orthophosphoric acid,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 3.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of the peak corresponding to salicylic acid is not more than the area of the peak in the chromatogram obtained with reference solution (a) (3.0 per cent).

Other tests. Comply with the tests under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 99 volumes of *acetonitrile* and 1 volume of *formic acid.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 0.3 g of Aspirin with 60 ml of *acetonitrile* and 1 ml of *formic* for 15 minutes and dilute to 100.0 ml with *acetonitrile,* filter. Dilute 1.0 ml of the solution to 4.0 ml with the solvent mixture.

Reference solution (a). A 0.075 per cent w/v solution of *aspirin IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.075 per cent w/v of *aspirin IPRS* and 0.0015 per cent w/v of *salicylic acid* in the solvent mixture.

Use chromatographic system as described in test for Salicylic acid.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 3.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_9H_8O_4$ in the tablets.

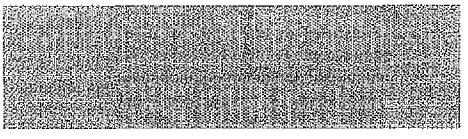
Storage. Store protected from moisture.

Labelling. The label states that the tablets should be swallowed whole and not chewed.

Aspirin Gastro-resistant and Atorvastatin Capsules

Aspirin Gastro-resistant and Atorvastatin Calcium Capsules; Acetylsalicylic Acid Gastro-resistant and Atorvastatin Calcium Capsules

Aspirin Gastro resistant and Atorvastatin Capsules contain atorvastatin calcium equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of atorvastatin, $C_{33}H_{35}FN_2O_5$ and aspirin, $C_9H_8O_4$.



Usual strengths. Aspirin, 75 mg and Atorvastatin, 10 mg; Aspirin, 150 mg and Atorvastatin, 10 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with reference solution (c).

Tests

Dissolution (2.5.2).

For Aspirin —

A. Apparatus No. 1 (Basket),
Medium. 1000 ml of *0.1 M hydrochloric acid*,
Speed and time. 100 rpm and 120 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve 15 mg of *aspirin IPRS* in 40 ml of *methanol* and dilute to 100.0 ml with the dissolution medium. Dilute 5.0 ml of the solution to 100.0 ml with the dissolution medium.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- sample temperature: 15°.
- mobile phase: a mixture of 75 volumes of a buffer solution prepared by dissolving 7.8 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water* and adjusted to pH 2.0 with *orthophosphoric acid* and 25 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 10 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_9H_8O_4$ in the medium.

Complies with the acceptance criteria given under acid stage.

B. Apparatus No. 1 (Basket),
Medium. 1000 ml of *mixed phosphate buffer pH 6.8*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve 15 mg of *aspirin IPRS* in 40 ml of *methanol* and dilute to 100.0 ml with the dissolution medium. Dilute 5.0 ml of the solution to 100.0 ml with the dissolution medium.

Use chromatographic system as described in stage A.

Inject the reference solution and the test solution.

Calculate the content of $C_9H_8O_4$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_9H_8O_4$.

For Atorvastatin —

Apparatus No. 2 (Paddle),
Medium. 900 ml of *phosphate buffer pH 6.8*,
Speed and time. 100 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a weighed quantity of *atorvastatin calcium IPRS* in *methanol*, and dilute with the dissolution medium to obtain a solution having a known concentration similar to the test solution.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- sample temperature 15°,
- mobile phase: a mixture of 50 volumes of a buffer solution prepared by dissolving 1.54 g of *ammonium acetate* in 1000 ml of *water* and adjusted to pH 4.0 with *glacial acetic acid* and 50 volumes of a mixture of 92.5 volumes of *acetonitrile* and 7.5 volumes of *tetrahydrofuran*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 246 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{33}H_{35}FN_2O_5$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{33}H_{35}FN_2O_5$.

Related substances. Determine by liquid chromatography (2.4.14).

For Aspirin —

Use the solvent mixture and chromatographic system as described under Assay.

Test solution. Disperse a quantity of the mixed content containing 300 mg of Aspirin with 60 ml of the solvent mixture, with the aid of ultrasound for 15 minutes and dilute to 100.0 ml with the solvent mixture, filter.

Reference solution (a). A 0.009 per cent w/v solution of *salicylic acid* in the solvent mixture.

Reference solution (b). A solution containing 0.009 per cent w/v of *salicylic acid* and 0.3 per cent w/v of *aspirin IPRS* in the solvent mixture.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to salicylic acid and aspirin is not less than 3.0 in the chromatogram obtained with reference solution (b), the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to salicylic acid is not more than the area of the peak in the chromatogram obtained with reference solution (a) (3.0 per cent).

For Atorvastatin —

Solvent mixture. 40 volumes of *acetonitrile* and 60 volumes of *water.*

Solution A. Dissolve 5.75 g of *ammonium dihydrogen orthophosphate* in 1000 ml of *water.*

Solution B. 92.5 volumes of *acetonitrile* and 7.5 volumes of *tetrahydrofuran.*

NOTE — Prepare the solutions immediately before use.

Test solution. Disperse a quantity of the mixed content containing 50 mg of Atorvastatin with 10 ml of *methanol*, add 20 ml of the solvent mixture, with the aid of ultrasound for 20 minutes and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). Dissolve 55 mg of *atorvastatin calcium IPRS* in 5 ml of *methanol* and dilute to 100.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- sample temperature: 15°,
- mobile phase: A. a mixture of 58 volumes of solution A and 42 volumes of solution B;
  B. a mixture of 20 volumes of solution A, 20 volumes of solution B and 60 volumes of *methanol*,
- a gradient programme using the conditions given below,
- spectrophotometer set at 246 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)	Flow rate (ml/minute)
0	100	0	1.8
20	100	0	1.8
35	25	75	1.5
40	25	75	1.5
55	0	100	1.5
60	100	0	1.8
70	100	0	1.8

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent), and the sum of areas of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (4.0 per cent). Ignore any peak with an area less than 0.05 times the area of principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent). Ignore peaks due to aspirin and salicylic acid.

Uniformity of content. Complies with the test stated under Capsules.

For Atorvastatin —

Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Disperse content of one capsule in 20 ml of *methanol*, with the aid of ultrasound for 30 minutes and dilute to obtain a solution having the similar concentration of the reference solution with the solvent mixture.

Calculate the content of $C_{33}H_{35}FN_2O_5$ in the capsule.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 60 volumes of mobile phase A and 40 volumes of *acetonitrile.*

Test solution. Weigh and mix the content of 20 capsules. Disperse a quantity of mixed content containing 75 mg of Aspirin in 20 ml of *methanol*, with the aid of ultrasound for 10 minutes and dilute to 100.0 ml with the solvent mixture and filter. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution (a). A 0.15 per cent w/v solution of *aspirin IPRS* in the solvent mixture.

Reference solution (b). A 0.055 per cent w/v solution of *atorvastatin calcium IPRS* in *methanol.*

Reference solution (c). Dilute a suitable volume of reference solution (a) and reference solution (b) with the solvent mixture to obtain a solution having a concentration similar to the test solution.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- sample temperature: 15°,

- mobile phase: A. a buffer solution prepared by dissolving 1.4 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 2.5 with *orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	70	30
15	70	30
17	40	60
30	40	60
32	70	30
35	70	30

The elution order of peaks is aspirin and atorvastatin.

Inject reference solution (c). The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent for both the peaks.

Inject reference solution (c) and the test solution.

Calculate the content of $C_9H_8O_4$ and $C_{33}H_{35}FN_2O_5$ in the capsules.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the quantity of atorvastatin calcium in the terms of the equivalent amount of atorvastatin and aspirin.

Aspirin Gastro-resistant and Rosuvastatin Capsules

Aspirin Gastro-resistant and Rosuvastatin Calcium Capsules; Acetylsalicylic Acid Gastro-resistant and Rosuvastatin Calcium Capsules

Aspirin Gastro resistant and Rosuvastatin Capsules contain rosuvastatin calcium equivalent to not less than 90.0 per cent and not more than 110.0 percent of the stated amount of rosuvastatin, $C_{22}H_{28}FN_3O_6S$ and aspirin, $C_9H_8O_4$.

Usual strengths. Aspirin, 75 mg and Rosuvastatin, 5 mg; Aspirin, 75 mg and Rosuvastatin, 10 mg; Aspirin, 150 mg and Rosuvastatin, 10 mg; Aspirin, 75 mg and Rosuvastatin, 20 mg; Aspirin, 150 mg and Rosuvastatin, 20 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

For Aspirin —

A. Apparatus No. 1 (Basket),
Medium. 1000 ml of *0.1 M hydrochloric acid*,
Speed and time. 100 rpm and 120 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve 15 mg of *aspirin IPRS* in 5 ml of *acetonitrile* and dilute with the dissolution medium to obtain a solution having a concentration similar to the test solution.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS 2),
- sample temperature: 15°.
- mobile phase: a mixture of 55 volumes of a buffer solution prepared by dissolving 1.74 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 2.3 with *orthophosphoric acid*, 35 volumes of *acetonitrile* and 10 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_9H_8O_4$ in the medium.

Complies with the acceptance criteria given under acid stage.

B. Apparatus No. 1 (Basket),
Medium. 1000 ml of a buffer solution prepared by mixing 75 volumes of *0.1 M hydrochloric acid* and 25 volumes of *0.2 M trisodium phosphate dodecahydrate*, adjusted to pH 6.8 with *2 M hydrochloric acid* or *2 M sodium hydroxide*,
Speed and time. 100 rpm and 90 minutes.

Withdraw a suitable volume of the medium and filter.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve 15 mg of *aspirin IPRS* in 5 ml of *acetonitrile* and dilute with the dissolution medium to obtain a solution having a concentration similar to the test solution.

Use chromatographic system and system suitability as described under stage A.

Inject the reference solution and the test solution.

Calculate the content of $C_9H_8O_4$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_9H_8O_4$.

For Rosuvastatin —

Apparatus No. 2 (Paddle),

Medium. 900 ml of phosphate buffer pH 6.8 prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 6.8 with *sodium hydroxide solution*,

Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A 0.055 per cent w/v solution of *rosuvastatin calcium IPRS* in equal volumes of *acetonitrile* and *water*. Dilute the solution with the dissolution medium to obtain a solution having a concentration similar to the test solution.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of a buffer solution prepared by dissolving 1.74 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water* and adjusted to pH 2.2 with *orthophosphoric acid*, 42.5 volumes of *acetonitrile* and 7.5 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 248 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{28}FN_3O_6S$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{22}H_{28}FN_3O_6S$.

Related substances. Determine by liquid chromatography (2.4.14).

For Aspirin —

Solvent mixture. 90 volumes of *acetonitrile* and 10 volumes of *water*.

Test solution. Disperse a quantity of the mixed powdered content of capsules containing 375 mg of Aspirin in 75 ml of the solvent mixture, with the aid of ultrasound with intermittent shaking and dilute to 100.0 ml with the solvent mixture. Dilute a suitable volume of the solution with the solvent mixture to obtain a concentration of 0.075 per cent w/v of Aspirin.

Reference solution. A 0.00075 per cent w/v solution of *aspirin IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS 3V),
- sample temperature: 15°,
- mobile phase: A. *0.01 M potassium dihydrogen orthophosphate*, adjusted to pH 2.5 with *orthophosphoric acid*,

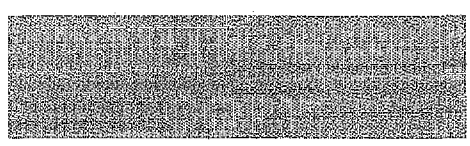
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	60	40
15	60	40
25	20	80
26	60	40
35	60	40

Name	Relative retention time	Correction factor
Aspirin	1.0	---
Salicylic acid	1.48	0.86

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to salicylic acid is not more than 3 times the area of the principal peak in the chromatogram obtained with the reference solution (3.0 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak obtain with the reference solution (0.5 per cent) and the sum of areas of all the secondary peaks except salicylic acid is not more than twice the area of the principal peak in the



chromatogram obtained with the reference solution (2.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent). Ignore any peak due to rosuvastatin.

For Rosuvastatin —

Test solution. Disperse a quantity of the mixed powdered content of capsules containing 25 mg of Rosuvastatin in 30 ml of the mobile phase, with the aid of ultrasound for 30 minutes with intermittent shaking and dilute to 50.0 ml with the mobile phase.

Reference solution. A 0.00055 per cent w/v solution of *rosuvastatin calcium IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 59 volumes of a buffer solution prepared by dissolving 1.54 g of *ammonium acetate* in 900 ml of *water*, adjusted to pH 4.0 with *glacial acetic acid* and dilute to 1000.0 ml with *water*, 36 volumes of *acetonitrile* and 5 volumes of *tetrahydrofuran*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 248 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. Run the chromatogram 6 times the retention time of the rosuvastatin peak. The area of any secondary peak is not more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent) and the sum of areas of all the secondary peaks is not more than 3 times the area of principal peak in the chromatogram obtained with the reference solution (3.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent). Ignore any peak due to salicylic acid and aspirin.

Uniformity of content. Complies with the test stated under Capsules.

For Rosuvastatin —

Determine by liquid chromatography (2.4.14), as described under Assay for Rosuvastatin with the following modifications.

Test solution. Disperse content of one capsule in 60 ml of the mobile phase, with the aid of ultrasound for 30 minutes and dilute to obtain a solution having the similar concentration of the reference solution with the mobile phase.

Calculate the content of $C_{22}H_{28}FN_3O_6S$ in the capsule.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

For Aspirin —

Solvent mixture. 90 volumes of *acetonitrile* and 10 volumes of *water*.

Test solution. Weigh and mix the content of 20 capsules. Disperse a quantity of powder containing 375 mg of Aspirin in 75 ml of the solvent mixture, with the aid of ultrasound with intermittent shaking and dilute to 100.0 ml with the solvent mixture. Dilute a suitable volume of the solution with the solvent mixture to obtain a concentration of 0.075 per cent w/v of Aspirin.

Reference solution. A 0.075 per cent w/v solution of *aspirin IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- sample temperature: 15°,
- mobile phase: a mixture of 60 volumes of *0.01M potassium dihydrogen orthophosphate*, adjusted to pH 2.5 with *orthophosphoric acid*, and 40 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_9H_8O_4$ in the capsules.

For Rosuvastatin —

Test solution. Disperse a quantity of the mixed powered content of capsules containing 50 mg of Rosuvastatin in 200 ml of the mobile phase, with the aid of ultrasound for 30 minutes with intermittent shaking and dilute to 250.0 ml with the mobile phase. Dilute a suitable volume of the solution with the mobile phase to obtain a concentration of 0.005 per cent w/v of Rosuvastatin.

Reference solution. A 0.0055 per cent w/v solution of *rosuvastatin calcium IPRS* in the mobile phase.

Use chromatographic system as described under Related substances of Rosuvastatin.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the

tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{28}FN_3O_6S$ in the capsules.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Labelling. The label states the quantity of rosuvastatin calcium in term of the equivalent amount of rosuvastatin and aspirin.

Aspirin and Caffeine Tablets

Acetylsalicylic Acid and Caffeine Tablets

Aspirin and Caffeine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of aspirin, $C_9H_8O_4$ and caffeine, $C_8H_{10}N_4O_2$.

Usual strength. Aspirin 0.4 g and caffeine 30 mg.

Identification

A. Boil 1 g of the powdered tablets with 10 ml of *1 M sodium hydroxide*, cool and filter. Acidify the filtrate with *1 M sulphuric acid*; a white precipitate is produced. Dissolve the precipitate in about 2 ml of *water* and add *ferric chloride test solution*; a deep violet colour is produced.

B. Shake 0.5 g of the powdered tablets with 10 ml of *water* for 5 minutes, filter and add 10 ml of *1 M sodium hydroxide*. Extract with three quantities, each of 30 ml of *chloroform*, washing each extract with the same 10 ml of *water*. Filter the combined extracts through absorbent cotton and evaporate the filtrate to dryness. Reserve a quantity of the residue for test C. Dissolve 10 mg of the residue in 1 ml of *hydrochloric acid*, add 0.1 g of *potassium chlorate* and evaporate to dryness in a porcelain dish; a reddish residue remains which becomes purple on exposure to ammonia vapour.

C. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001per cent w/v solution of the residue reserved in Test B shows an absorption maximum at about 273 nm.

Tests

Dissolution (2.5.2).

For aspirin —

Apparatus No. 2 (Paddle),
Medium. 500 ml of a pH 4.5 buffer prepared by dissolving 2.99 g of *sodium acetate* and 1.66 ml of *glacial acetic acid* in sufficient *water* and dilute to 1000 ml with *water*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the dissolution medium, if necessary, at the maximum at about 265 nm (2.4.7). Calculate the content of $C_9H_8O_4$ in the medium from the absorbance obtained from a solution of known concentration of *aspirin IPRS* in the dissolution medium in such manner to get similar concentration of the test solution.

Q. Not less than 75 per cent of the stated amount of $C_9H_8O_4$.

Salicylic acid. Disperse a quantity of the powdered tablets containing 0.5 g of Aspirin with 50.0 ml of *chloroform* and 10 ml of *water* and allow to separate. Filter the chloroform layer through a dry filter paper and evaporate 10 ml of the filtrate to dryness at room temperature using a rotary evaporator. To the residue add 4 ml of *ethanol (95 per cent)*, stir well, dilute to 100 ml with *water* at a temperature not exceeding 10°, filter immediately, rapidly transfer 50 ml to a Nessler cylinder, add 1 ml of freshly prepared *acid ferric ammonium sulphate solution*, mix and allow to stand for 1 minute; the violet colour produced is not more intense than that produced by adding 1 ml of *acid ferric ammonium sulphate solution* to a mixture of 3.0 ml of a freshly prepared 0.05 per cent w/v solution of *salicylic acid*, 2 ml of *ethanol (95 per cent)* and sufficient *water* to produce 50 ml contained in a second Nessler cylinder (3.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets.

For aspirin — Weigh a quantity of the powder containing about 0.7 g of Aspirin, add 20 ml of *water* and 2 g of *sodium citrate* and heat under a reflux condenser for 30 minutes. Cool, wash the condenser with 30 ml of warm *water* and titrate with *0.5 M sodium hydroxide* using *phenolphthalein solution* as indicator.

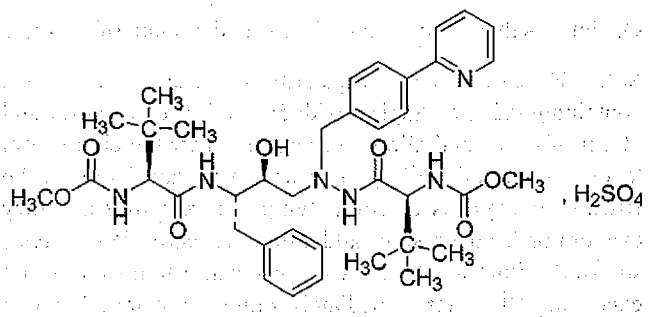
1 ml of *0.5 M sodium hydroxide* is equivalent to 0.04504 g of $C_9H_8O_4$.

For caffeine — Weigh a quantity of the powder containing about 30 mg of Caffeine add 200 ml of *water* and shake for 30 minutes. Add sufficient *water* to produce 250.0 ml and filter. To 10.0 ml of the filtrate add 10 ml of *1 M sodium hydroxide* and extract immediately with five quantities, each of 30 ml, of *chloroform*, washing each extract with the same 10 ml of *water*. Filter the combined chloroform extracts, if necessary, through absorbent cotton previously moistened with *chloroform*. Evaporate the solution to dryness and dissolve the residue as completely as possible in *water*, warming gently if necessary. Cool, add sufficient *water* to produce 100.0 ml, mix and filter if necessary. Measure the absorbance of the resulting solution at the maximum at about 273 nm (2.4.7).

Calculate the content of $C_8H_{10}N_4O_2$ taking 504 as the specific absorbance at 273 nm.

Storage. Store protected from moisture.

Atazanavir Sulphate



$C_{38}H_{52}N_6O_7.H_2SO_4$ Mol. Wt. 802.9

Atazanavir Sulphate is salt with sulphuric acid of (3*S*,8*S*,9S,12*S*)-3,12-bis(1,1-dimethylethyl)-8-hydroxy-4,11-dioxo-9-(phenylmethyl)-6-[[4-(2-pyridinyl)phenyl]methyl]-2,5,6,10,13-pentaazatetradecanedioic acid dimethyl ester.

Atazanavir Sulphate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{38}H_{52}N_6O_7.H_2SO_4$, calculated on the dried basis.

Category. Antiretroviral.

Description. A white to pale yellow crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *atazanavir sulphate IPRS* or with the reference spectrum of atazanavir sulphate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). – 48° to – 44°, determined on 1.0 per cent w/v solution in a mixture of equal volumes of *methanol* and *water* at 22°.

Sulphuric acid. Not less than 11.0 per cent w/w and not more than 13.0 per cent w/w.

Weigh 0.2 g and sonicate with 30 ml of *methanol*, add 30 ml of *water*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.0049 g of sulphuric acid.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of mobile phase A and mobile phase B.

Test solution. Dissolve 0.1 g of the substance under examination in 100.0 ml of the solvent mixture.

Reference solution. A 0.0005 per cent w/v solution of *atazanavir sulphate IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS-3),
- column temperature: 45°,
- mobile phase: A. dissolve 6.0 g of *sodium dihydrogen orthophosphate monohydrate* in *water*, add 2.0 ml of *orthophosphoric acid* and dilute to 1000 ml with *water*, adjusted to pH 2.5 with *triethylamine*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	60	40
15	60	40
32	30	70
44	30	70
45	60	40
55	60	40

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *atazanavir sulphate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (Such as Inertsil ODS-3),
- column temperature: 45°,
- mobile phase. a mixture of 45 volumes of buffer solution prepared by dissolving 6.0 g of *sodium dihydrogen orthophosphate monohydrate* in *water*, add 2.0 ml of *orthophosphoric acid* and dilute to 1000 ml with *water*, adjusted to pH 2.5 with *triethylamine* and 55 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency are not less than 2500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{38}H_{52}N_6O_7.H_2SO_4$.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Atazanavir Capsules

Atazanavir Sulphate Capsules

Atazanavir Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of atazanavir, $C_{38}H_{52}N_6O_7$.

Usual strengths. 150 mg; 200 mg; 300 mg; 400 mg.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with that of reference solution.

B. When examined in the range from 200 nm to 400 nm (2.4.7), a 0.012 per cent w/v solution in 0.2 per cent v/v solution of *hydrochloric acid* shows an absorption maximum as obtained with *atazanavir sulphate IPRS* of the same concentration.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle) (Use sinkers, if required),
Medium. 1000 ml of *0.025 M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Dilute the filtrate, if necessary, with the dissolution medium. Measure the absorbance at the maximum at about 300 nm (2.4.7). Calculate the content of $C_{38}H_{52}N_6O_7$ in the medium from the absorbance obtained from a solution of known concentration of *atazanavir sulphate IPRS*.

Q. Not less than 75 per cent of the stated amount of $C_{38}H_{52}N_6O_7$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 10 volumes of mobile phase A and 10 volumes of mobile phase B.

Test solution. Mix the contents of 20 capsules. Disperse the content of capsules containing about 50 mg of Atazanavir with 30 ml of the solvent mixture, sonicate for 15 minutes and dilute to 50.0 ml with the solvent mixture and filter.

Reference solution. A solution of *atazanavir sulphate IPRS* containing 0.001 per cent w/v of atazanavir in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS-3),
- column temperature: 45°,
- mobile phase: A. dissolve 6.0 g of *sodium dihydrogen orthophosphate monohydrate* and 2 ml of *orthophosporic acid* in 1000 ml of *water*, adjusted to pH 2.5 with *triethylamine or orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume:20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	60	40
15	60	40
32	30	70
44	30	70
45	60	40
55	60	40

Inject the reference solution. The test is not valid unless the theoretical plates of the principal peak is not less than 2000 and the tailing factor is not more than 2.0. The relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution the area of any

secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and mix the contents of 20 capsules. Disperse a quantity of the mixed content containing about 20 mg of Atazanavir with 150 ml of the mobile phase, sonicate for 15 minutes and dilute to 250.0 ml with the mobile phase, filter.

Reference solution. A 0.009 per cent w/v solution of *atazanavir sulphate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS),
- column temperature: 40°,
- mobile phase: a mixture of 60 volumes of *acetonitrile* and 40 volumes of *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume: 5 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0. The relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{38}H_{52}N_6O_7$ in the capsules.

Storage. Store at a temperature not exceeding 30°.

Atazanavir and Ritonavir Tablets

Atazanavir Sulphate and Ritonavir Tablets

Atazanavir and Ritonavir Tablets contain atazanavir sulphate equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of atazanavir, $C_{38}H_{52}N_6O_7$ and ritonavir, $C_{37}H_{48}N_6O_5S_2$.

Usual strength. Atazanavir, 300 mg and Ritonavir, 100 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the principal peaks in the chromatogram obtained with reference solution (c).

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),

Medium. 900 ml of a solution prepared by dissolving 37.7 g of *polyoxyethylene 10 lauryl ether* in 1000 ml of *water* and add 2.1 ml of *hydrochloric acid*,

Speed and time. 100 rpm and 45 minutes for atazanavir and 120 minutes for ritonavir.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14),

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve 95 mg of *atazanavir sulphate IPRS* and 28 mg of *ritonavir IPRS* in 10 ml of *methanol*, with the aid of ultrasound and dilute to 50.0 ml with the dissolution medium. Further, dilute 10.0 ml of the solution to 50.0 ml with the dissolution medium.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 49 volumes of a buffer solution prepared by dissolving 3.4 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and 51 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3500 theoretical plates for atazanavir, the tailing factor is not more than 1.5 and the relative standard deviation of replicate injections is not more than 2.0 per cent for both peaks.

Inject the reference solution and the test solution.

Calculate the content of $C_{38}H_{52}N_6O_7$ and $C_{37}H_{48}N_6O_5S_2$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{38}H_{52}N_6O_7$ and 80 per cent of the stated amount of $C_{37}H_{48}N_6O_5S_2$.

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Disperse a quantity of the powdered tablets containing 300 mg of Atazanavir in 140 ml of the mobile phase with the aid of ultrasound for 30 minutes with intermittent shaking, dilute to 200.0 ml with the mobile phase and filter.

Inject the test solution. The area of any secondary peak is not more than 2.5 per cent and the sum of areas of all the secondary peaks is not more than 5.0 per cent, calculated by area normalization.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 300 mg of atazanavir in 140 ml of the mobile phase with the aid of ultrasound and intermittent shaking and dilute to 200.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (a). A 0.085 per cent w/v of *atazanavir sulphate IPRS* in the mobile phase.

Reference solution (b). A 0.025 per cent w/v of *ritonavir IPRS* in the mobile phase.

Reference solution (c). Dilute 5.0 ml each of reference solution (a) and (b) to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as Zorbax Eclips XDB C-8),
- mobile phase: a mixture of 55 volumes of *water* and 45 volumes of *acetonitrile,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 10 µl.

Inject reference solution (c).The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent for each components.

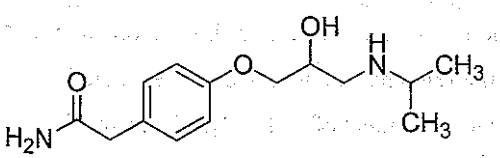
Inject reference solution (c) and the test solution.

Calculate the contents of $C_{38}H_{52}N_6O_7$ and $C_{37}H_{48}N_6O_5S_2$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the quantity of atazanavir sulphate in the terms of the equivalent amount of atazanavir and ritonavir.

Atenolol



$C_{14}H_{22}N_2O_3$ Mol. Wt. 266.3

Atenolol is (*RS*)-4-(2-hydroxy-3-isopropylaminopropoxy) phenylacetamide.

Atenolol contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{14}H_{22}N_2O_3$, calculated on the dried basis.

Category. Antihypertensive.

Description. A white or almost white powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *atenolol IPRS* or with the reference spectrum of atenolol.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.01 per cent w/v solution in *methanol* shows absorption maxima at about 275 nm and 282 nm. The ratio of the absorbance at the maximum at about 275 nm to that at the maximum at about 282 nm is 1.15 to 1.20.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 99 volumes of *methanol* and 1 volume of *strong ammonia solution.*

Test solution. Dissolve 1.0 g of the substance under examination in sufficient *methanol* to produce 100 ml.

Reference solution. A 1.0 per cent w/v solution of *atenolol IPRS* in *methanol.*

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate in a current of warm air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Appearance of solution. A 1.0 per cent w/v solution is clear (2.4.1), and not more intensely coloured than degree 6 of the appropriate range of reference solutions.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),

- mobile phase: dissolve 1.1 g of *sodium 1-heptanesulphonate* and 0.71 g of *anhydrous dibasic sodium phosphate* in 700 ml of *water*. Add 2 ml of *dibutylamine*, and adjusted to pH 3.0 with *0.8 M orthophosphoric acid*, add 300 ml of *methanol*,
- flow rate: 0.6 ml per minute,
- spectrophotometer set at 226nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. Run the chromatogram 6 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (0.25 per cent). The sum of areas of all the secondary peaks is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (0.5 per cent).

Chlorides (2.3.12). Dissolve 0.25 g in a mixture of 1 ml of *2 M nitric acid* and 15 ml of *water*. The solution complies with the limit test for chlorides without further addition of *2 M nitric acid* (0.1 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.2 g in 80 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02663 g of $C_{14}H_{22}N_2O_3$.

Atenolol Tablets

Atenolol Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of atenolol, $C_{14}H_{22}N_2O_3$.

Usual strengths. 50 mg; 100 mg.

Identification

A. Heat a quantity of the powdered tablets containing about 0.1 g of Atenolol with 15 ml of *methanol* to 50°, shake for 5 minutes, filter (Whatman No. 42 paper is suitable) and evaporate the filtrate to dryness on a water-bath. Warm the residue with 10 ml of *0.1 M hydrochloric acid*, shake and filter. Add to the filtrate sufficient *1 M sodium hydroxide* to make it alkaline, extract with 10 ml of *chloroform*, dry by shaking with *anhydrous sodium sulphate*, filter, evaporate the filtrate to dryness on a water-bath and dry the residue at 105° for 1hour. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *atenolol IPRS* or with the reference spectrum of atenolol.

B. When examined in the range 230 nm to 360 nm (2.4.7), the solution obtained in the Assay shows absorption maxima at about 275 nm and 282 nm.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of acetate buffer pH 4.6 prepared by mixing 45 volumes of *0.1M sodium acetate* and 55 volumes of *0.1M acetic acid*, adjusted to pH 4.6 with *dilute sodium hydroxide* or *dilute acetic acid*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the mobile phase to obtain a solution containing 0.001 per cent w/v of Atenolol.

Reference solution. A 0.001 per cent w/v solution of *atenolol IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 30 cm × 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of a buffer solution prepared by dissolving 1.57 g *sodium1-heptanesulphonate* and 1.0 g of *anhydrous dibasic sodium phosphate* and 2.85 ml of *dibutylamine* in 700ml of *water*, adjusted to pH 3.0 with *0.8 M phosphoric acid*, diluted to 1000 ml with *water* and 30 volumes of *methanol*,
- flow rate: 0.6 ml per minute,
- spectrophotometer set at 226 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_{22}N_2O_3$ in the medium

Q. Not less than 80 per cent of the stated amount of $C_{14}H_{22}N_2O_3$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 25 mg of Atenolol with 25 ml of the mobile phase and mix with the aid of ultrasound for 20 minutes, filter (Such as Whatman GF/C filter) and use the filtrate.

Reference solution (a). Dilute 1 volume of the test solution to 200 volumes with the mobile phase.

Reference solution (b). Dissolve 10 mg of *atenolol impurity standard IPRS* in 0.1 ml of *dimethyl sulphoxide* with the aid of gentle heat, dilute to 10 ml with the mobile phase and mix.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane chemically bonded to porous silica or ceramic microparticles (5 µm),
- mobile phase: dissolve 0.8 g of *sodium octanesulphonate* and 0.4 g of *tetrabutylammonium hydrogen sulphate* in 1000 ml of a mixture of 20 volumes of *tetrahydrofuran*, 180 volumes of *methanol* and 800 volumes of a 0.34 per cent w/v solution of *potassium dihydrogen phosphate* and adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 226 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the chromatogram obtained with reference solution (b) resembles the reference chromatogram supplied with the atenolol impurity standard RS in that the peak due to bis-ether precedes and is separated from that due to tertiary amine, which is normally a doublet. If necessary, adjust the concentration of sodium octanesulphonate in the mobile phase; if its concentration is increased, the retention time of the tertiary amine is prolonged.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to 4-(2-hydroxy-3-isopropylamino-propoxy)phenylacetic acid (blocker acid) is not more than the area of the peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the area of any peak corresponding to either tertiary amine or bis-ether is not more than half the area of the peak in the chromatogram obtained with reference solution (a) (0.25 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.2 g of Atenolol, transfer to a 500-ml volumetric flask using 300 ml of *methanol*, heat the resulting suspension to 60° and shake for 15 minutes. Cool, dilute to 500.0 ml with *methanol*, filter through a fine glass micro-fibre filter paper (Whatman GF/C) and dilute a suitable volume of the filtrate with sufficient *methanol* to produce a solution containing 0.01 per cent w/v of Atenolol. Measure the absorbance of the resulting solution at the maximum at about 275 nm (2.4.7). Calculate the content of $C_{14}H_{22}N_2O_3$ taking 53.7 as the value of the specific absorbance at 275 nm.

Atenolol and Chlorthalidone Tablets

Atenolol and Chlorthalidone Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of atenolol, $C_{14}H_{22}N_2O_3$ and not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of chlorthalidone, $C_{14}H_{11}ClN_2O_4S$.

Usual Strengths. Atenolol, 25 mg and Chlorthalidone, 6.25 mg; Atenolol, 50 mg and Chlorthalidone, 12.5 mg; Atenolol, 100 mg and Chlorthalidone, 25 mg.

Identification

A. Determine by thin layer chromatography (2.4.17), using the plate coated with *silica gel GF254*.

Mobile phase. A mixture of 30 volumes of *18 M ammonia* and 150 volumes of *butan-1-ol*.

Test solution. Remove any film coating from the tablets. Disperse a quantity of the powdered tablets containing 0.1 g of Atenolol with 10.0 ml of *methanol* for 15 minutes and filter.

Reference solution (a). A 1.0 per cent w/v solution of *atenolol IPRS* in *methanol*.

Reference solution (b). A 0.25 per cent w/v solution of *chlorthalidone IPRS* in *methanol*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. After development, dry the plate in a current of warm air and examine under ultraviolet light at 254 nm. The two principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a) and reference solution (b).

B. In the Assay, the principal peaks in the chromatogram obtained with test solution correspond the principal peaks in the chromatograms obtained with reference solution (c).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.01 M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Solvent mixture. 100 volumes of *acetonitrile* and 3.2 volumes of 1.8 M *sulphuric acid*.

Test solution. Use the filtrate and, if necessary, dilute with the solvent mixture.

Reference solution. Dissolve a suitable quantity of *atenolol IPRS* and *chlorthalidone IPRS* in a mixture of 75 volumes of *water* and 22.5 volumes of the solvent mixture to obtain a solution having known concentration similar to the test solution.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 74 volumes of *water* and 25 volumes of *acetonitrile,* 0.8 volume of *1.8 M sulphuric acid,* and 9.3 mg of *sodium octyl sulphate,*
- flow rate: 1.7 ml per minute,
- spectrophotometer set at 275 nm,
- injection volume: 10 µl.

The relative retention times are about 0.8 for atenolol and 1.0 for chlorthalidone.

Inject the reference solution. The test is not valid unless the resolution between atenolol and chlorthalidone peaks is not less than 3.0 and the relative standard deviation of replicate injections is not more than 2.0 per cent for both peaks.

Inject the reference solution and the test solution

Calculate the content of $C_{14}H_{22}N_2O_3$ and $C_{14}H_{11}ClN_2O_4S$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{14}H_{22}N_2O_3$ and not less than 70 per cent of the stated amount of $C_{14}H_{11}ClN_2O_4S$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Remove any film coating from the tablets, powder and disperse a quantity of the powder containing 0.1 g of atenolol with 25.0 ml of the mobile phase for 30 minutes with the aid of ultrasound. Filter through a suitable filter (Whatman No 1 is suitable) and use the filtrate.

Reference solution(a). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Reference solution(b). Dissolve 10.0 mg of *atenolol impurity IPRS* in 0.1 ml of *dimethyl sulfoxide*, with the aid of gentle heat, and dilute to 20.0 ml with the mobile phase.

Reference solution(c). A 0.002 per cent w/v solution of *2-(4-chloro-3-sulfamoylbenzoyl)benzoic acid IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column, 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A mixture of 2 volumes of *tetrahydrofuran*, 18 volumes of *methanol* and 80 volumes of *0.025 M potassium dihydrogen orthophosphate* containing 1.0 g of *sodium octanesulphonate* and 0.4 g of *tetrabutylammonium hydrogen sulphate* in 1000 ml and adjusted to pH 3.0 with *orthophosphoric acid* ,
- flow rate: 2 ml per minute,
- spectrophotometer set at 226 nm,
- injection volume: 20 µl

Inject reference solution (b). The test is not valid unless the chromatogram obtained with reference solution (b) resembles the reference chromatogram obtained with the *atenolol impurity standard IPRS* and the peaks due to tertiary amine, which is normally a doublet and bis ether are clearly separated. If necessary, adjust the concentration of sodium octanesulphonate in the mobile phase; if its concentration is increases, the retention time of the tertiary amine is prolonged.

Inject reference solution (a), (c) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to 2-(4-chloro-3-sulfamoyl-benzoyl) benzoic acid is not more than the area of the peak in the chromatogram obtained with reference solution (c) (2 per cent, with reference to the content of chlorthalidone), the area of any peak corresponding to blocker acid is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent, with reference to the content of atenolol) and the area of any peak corresponding to either tertiary amine or bis ether is not more than half of the area of the principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent, with reference to the content of atenolol).

Uniformity of content. Complies with the test stated under Tablets. (*For chlorthalidone*)

Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Disperse one tablet in 15 ml of the mobile phase, and disperse with the aid of ultrasound for about 30 minutes, allow to cool, dilute to volume with 25.0 ml with mobile phase shake and filter, rejecting the first few ml of the filtrate. Use the filtrate.

Inject reference solution (b) and the test solution.

Calculate the content of $C_{14}H_{11}ClN_2O_4S$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.1 g of atenolol and transfer to a 100.0 ml volumetric flask. Add about 70.0 ml of the mobile phase and disperse with the aid of ultrasound for about 30 minutes, allow to cool, dilute to volume with mobile phase and filter, rejecting the first few ml of filtrate. Dilute 5.0 ml of the solution to 50.0 ml with mobile phase.

Reference solution (a). A 0.1 per cent w/v solution of *atenolol IPRS* in mobile phase.

Reference solution (b). A 0.025 per cent w/v solution of *chlorthalidone IPRS* in mobile phase.

Reference solution (c). Transfer 5.0 ml reference solution (a) and 5.0 ml reference solution (b) in 50.0 ml volumetric flask and dilute to volume up to the mark with mobile phase and mix.

Chromatographic system

- a stainless steel column 20 cm x 4.6 mm, packed with end capped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 74 volumes of 0.05 per cent w/v solution of *sodium octanesulphonate*, 20 volumes of *acetonitrile*, 5 volumes of *propan-2-ol* and 1 volume of *sulphuric acid* (10 per cent v/v) and adjusted to pH 3.0 with *2 M sodium hydroxide*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 275 nm,
- injection volume: 20 µl.

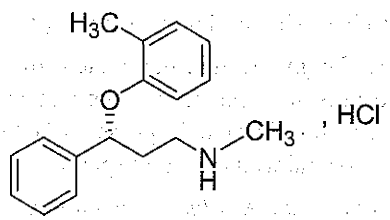
Inject the reference solution(c). The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution(c) and the test solution.

Calculate the content of $C_{14}H_{22}N_2O_3$ and $C_{14}H_{11}ClN_2O_4S$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Atomoxetine Hydrochloride



$C_{17}H_{21}NO,HCl$ Mol. Wt. 291.8

Atomoxetine Hydrochloride is (*R*)-*N*-Methyl-3-phenyl-3-(*o*-tolyloxy)propylamine hydrochloride.

Atomoxetine Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{17}H_{21}NO,HCl$ calculated on the anhydrous basis.

Category. Cerebral activator.

Description. A white to creamish yellow powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *atomoxetine hydrochloride IPRS* or with the reference spectrum of atomoxetine hydrochloride.

Tests

Specific optical rotation (2.4.22). −42.0° to −36.0°, determined in a 1.0 per cent w/v solution in *methanol.*

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 12 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution. A 0.012 per cent w/v solution of *atomoxetine hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of a buffer solution prepared by dissolving *0.05 M potassium dihydrogen orthophosphate* in *water*, add 2 ml of *triethylamine*, adjusted to pH 2.5 with *orthophosphoric acid* and 30 volumes of *acetonitrile*,
- flow rate: 1 ml per minute.
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 4000 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution. The area of any secondary peak is not more than 0.5 per cent and the sum of areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalization.

Heavy metals (2.3.13). 1 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 0.1 g.

Assay. Dissolve 0.25 g in 40 ml of *glacial acetic acid* and add 10 ml of 5 per cent w/v of *mercuric acetate solution* in *glacial acetic acid.* Titrate with *0.1M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02918 g of $C_{17}H_{21}NO,HCl$.

Atomoxetine Capsules

Atomoxetine Capsules contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of atomoxetine, $C_{17}H_{21}NO$.

Usual strengths. 18 mg; 25 mg; 40 mg; 60 mg; 80 mg; 100 mg.

Identification

A. Dissolve the content of capsules containing 60 mg of atomoxetine in 10 ml of *methanol*, centrifuge at 4000 rpm for 5 minutes, Evaporate the solution to a dry powder with the aid of a stream of air or nitrogen. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *atomoxetine hydrochloride IPRS* treated in the same manner or with the reference spectrum of atomoxetine hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle) (Use sinker, if required),
Medium. 1000 ml of *0.1M hydrochloric acid*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary with the dissolution medium.

Reference solution. Dissolve a quantity of *atomoxetine hydrochloride IPRS* in the dissolution medium and dilute with the dissolution medium to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Use chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{21}NO$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{17}H_{21}NO$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and mix the content of 20 capsules. Disperse a quantity of the mixed content containing 0.1 g of atomoxetine in 50 ml of the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution. Disperse 0.1 g each of *atomoxetine hydrochloride IPRS* and *urea* in 10 ml of *water*, mix with the aid of ultrasound for 3 minutes, heat at 85° in an oven for 40 minutes, and allow to cool to room temperature. Dilute the resulting solution to 100.0 ml with the mobile phase.

NOTE—The oven temperature and time in the oven can be adjusted to give a suitable level of atomoxetine N-amide peak.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (3.5 µm),
- mobile phase: a mixture of 59 volumes of buffer solution prepared by dissolving 4.9 g of *sodium 1-decanesulphonate* and 6.9 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 3.1 with *orthophosphoric acid* and 41 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 10 µl.

Name	Relative retention time
Desmethyl atomoxetine[1]	0.76
Atomoxetine	1.0
Atomoxetine N-amide[2]	1.2

[1](R)-N-Methyl-3-phenoxy-3-phenylpropan-1-amine.

[2](R)-1-Methyl-1-(3-phenyl-3-(o-tolyloxy)propyl)urea (For system suitability purposes only).

Inject the reference solution. The test is not valid unless the resolution between the peaks due to atomoxetine N-amide and atomoxetine is not less than 2.6.

Inject the test solution. The area of any peak corresponding to desmethyl atomoxetine is not more than 0.3 per cent, the area of any other secondary peak is not more than 0.2 per cent and the sum of the areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalization.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and mix the content of 20 capsules. Disperse a quantity of the mixed contents containing 10 mg of atomoxetine in 65 ml of the mobile phase, shake for 20 minutes and dilute to 100.0 ml with the mobile phase.

Reference solution (a). A *solution containing* 0.01 per cent w/v of *atomoxitine hydrochloride IPRS* and 0.002 per cent w/v of *o-cresol* in the mobile phase.

Reference solution (b). A 0.0114 per cent w/v solution of *atomoxitine hyrochloride IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 7.5 cm x 4.6 mm, packed with octylsilane bonded to porous silica (3.5 µm),
- column temperature: 35°,
- mobile phase: dilute 3 ml of triethylamine in a solution contaning a mixture of 62 volumes of buffer solution

prepared by dissolving 5.8 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 2.5 with *orthophosphoric acid* and 38 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

The relative retention time with reference to atomoxetine for o-cresol is 1.3.

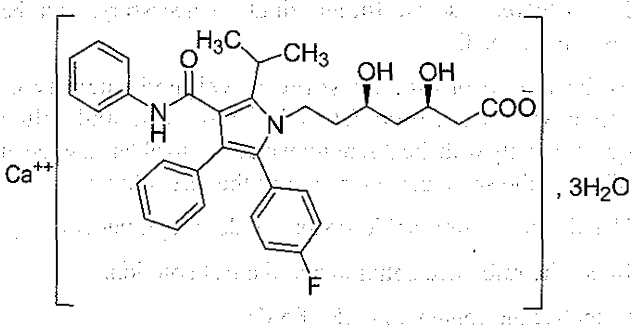
Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to atomoxetine and o-cresol is not less than 3.5, the tailing factor for the principal peak is not more than 2.0 in the chromatogram obtained with reference solution (a) and the relative standard deviation for replicate injections is not more than 1.0 per cent in the chromatogram obtained with reference solution (b).

Inject reference solution (b) and the test solution.

Calculate the content of $C_{17}H_{21}NO$ in the capsules.

Storage. Store protected from moisture.

Atorvastatin Calcium



$C_{66}H_{68}CaF_2N_4O_{10},3H_2O$ Mol. Wt. 1209.4

Atorvastatin Calcium is calcium salt of (β*R*,8*R*)-2-(4-fluorophenyl)-α,δ-dihydroxy-5-(1-methylethyl)-3-phenyl-4-[(phenylamino)carbonyl]-1*H*-pyrrole-1-heptanoic acid trihydrate.

Atorvastatin Calcium contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{66}H_{68}CaF_2N_4O_{10}$, calculated on the anhydrous basis.

Category. Antihyperlipidaemic.

Description. A white to off-white, crystalline powder. It shows polymorphism (2.5.11).

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *atorvastatin calcium IPRS* or with the reference spectrum of atorvastatin calcium.

B. Determine by atomic absorption spectro-photometry (2.4.2). A 0.005 per cent w/v solution of the substance under examination in a mixture of 75 volumes of *methanol*, 25 volumes of *water* and 2 volumes of *hydrochloric acid* using air-acetylene flame, shows absorption at the calcium emission line at 422.7 nm.

Tests

Specific optical rotation (2.4.22). −12.0° to −6.0°, determined in a 1.0 per cent w/v solution in *dimethylsulphoxide*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 40 volumes of *acetonitrile* and 60 volumes of *water*.

Test solution. Dissolve 50 mg of the substance under examination in 10 ml of *methanol* and dilute to 100 ml with the solvent mixture.

Reference solution (a). A 0.5 per cent w/v solution of *atorvastatin calcium IPRS* in *methanol*. Dilute 5 ml of the solution to 50 ml with the solvent mixture.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 92.5 volumes of *acetonitrile* and 7.5 volumes *tetrahydrofuran*,
  B. a mixture of 58 volumes of a buffer solution prepared by dissolving 5.75 g of *ammonium dihydrogen orthophosphate* in 1000 ml of *water* and 42 volumes of mobile phase A,
  C. a mixture of 20 volumes of the buffer solution, 20 volumes of mobile phase A and 60 volumes of *methanol*,
- a gradient programme using the conditions given below,
- spectrophotometer set at 246 nm,
- injection volume: 20 µl,
- injection delay 10 minutes.

Time (in min.)	Flow rate (ml per min.)	Mobile phase B (per cent v/v)	Mobile phase C (per cent v/v)
0	1.8	100	0
20	1.8	100	0
35	1.5	25	75
40	1.5	25	75
55	1.5	0	100
60	1.8	100	0

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 5000 theoretical plates and the tailing factor is not more than 1.5.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any individual secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than 2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak obtained in the chromatogram obtained in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Water (2.3.43). Not more than 6.0 per cent.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 40 volumes of *acetonitrile* and 60 volumes of *water*.

Test solution. Dissolve 80 mg of the substance under examination in 20 ml of *methanol* and dilute to 200 ml with the solvent mixture. Dilute the solution with the solvent mixture to produce a solution containing 0.008 per cent w/v of Atorvastatin Calcium.

Reference solution. Dissolve 20 mg of *atorvastatin calcium IPRS* in 5 ml of *methanol* and dilute to 50 ml with the solvent mixture. Dilute the solution with the solvent mixture to produce a solution containing 0.008 per cent w/v of Atorvastatin Calcium.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 58 volumes of a buffer solution prepared by dissolving 5.75 g of *ammonium dihydrogen orthophosphate* in 1000 ml of *water* and 42 volumes of a mixture of 92.5 volumes of *acetonitrile* and 7.5 volumes of *tetrahydrofuran.*,
- flow rate: 1.8 ml per minute,
- spectrophotometer set at 246 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{66}H_{68}CaF_2N_4O_{10}$.

Storage. Store protected from light at a temperature not exceeding 30°.

Atorvastatin Tablets

Atorvastatin Calcium Tablets

Atorvastatin Tablets contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of atorvastatin, $C_{33}H_{35}FN_2O_5$.

Usual strengths. 10 mg; 20 mg; 40 mg; 80 mg (1 mg of Atorvastatin Calcium ($C_{66}H_{68}CaF_2N_4O_{10}.3H_2O$) is equivalent to 923.8 µg of atorvastatin $C_{33}H_{35}FN_2O_5$.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *phosphate buffer pH 6.8*,
Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a weighed quantity of *atorvastatin calcium IPRS* in *methanol*, and dilute quantitatively with the dissolution medium to obtain a solution of about the same concentration as the test solution.

Use the chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{33}H_{35}FN_2O_5$.

Q. Not less than 70 per cent of the stated amount of $C_{33}H_{35}FN_2O_5$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 40 volumes of *acetonitrile* and 60 volumes of *water*.

Test solution. Weigh a quantity of the powdered tablets containing 50 mg of atorvastatin, disperse in 10 ml of *methanol*, add 20 ml of the solvent mixture, disperse with the aid of ultrasound, if required, and dilute to 100.0 ml with the solvent mixture and filter.

Reference solution (a). Weigh a suitable quantity of *atorvastatin calcium IPRS*, dissolve in 5 ml of *methanol* and dilute to 50.0 ml with the solvent mixture, to produce 0.05 per cent w/v of atorvastatin.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 92.5 volumes of *acetonitrile* and 7.5 volumes *tetrahydrofuran*,
  B. a mixture of 58 volumes of a buffer solution prepared by dissolving 5.75 g of *ammonium dihydrogen orthophosphate* in 1000 ml of *water* and 42 volumes of mobile phase A,
  C. a mixture of 20 volumes of the buffer solution, 20 volumes of mobile phase A and 60 volumes of *methanol*,
- a gradient programme using the conditions given below,
- spectrophotometer set at 246 nm,
- injection volume: 20 µl,
- injection delay 10 minutes.

Time (in min.)	Flow rate (ml per min.)	Mobile phase B (per cent v/v)	Mobile phase C (per cent v/v)
0	1.8	100	0
20	1.8	100	0
35	1.5	25	75
40	1.5	25	75
55	1.5	0	100
60	1.8	100	0

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 5000 theoretical plates and the tailing factor is not more than 1.5.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of the areas of all the secondary peaks is not more than 4 times the area of the peak in the chromatogram obtained with reference solution (b) (4.0 per cent). Ignore any peak with an area less than 0.05 times the area of the peak obtained with reference solution (b) (0.05 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14) as described under Assay using the following test solution.

Test solution. Disperse one tablet in 3 ml of *water*, add 25 ml of *methanol* and mix with the aid of ultrasound, make up to 50 ml with the solvent mixture, filter. Dilute sufficient amount of the the filtrate with solvent mixture to produce a solution containing 0.008 per cent w/v of atorvastatin.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. A solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* and 0.9 g of *sodium hydroxide* in 1000 ml of *water*, adjusted to pH 6.8 with *phosphoric acid* or *sodium hydroxide*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powdered tablets containing about 80 mg of atorvastatin, add 3 ml to 5 ml of *water* and disperse in sufficient *methanol* to produce a solution containing 0.016 per cent w/v of atorvastatin. Disperse with the aid of ultrasound, if required, and filter. Dilute the filtrate with sufficient of the solvent mixture to produce a solution containing 0.008 per cent w/v of atorvastatin.

Reference solution. Weigh a suitable quantity of *atorvastatin calcium IPRS* and dissolve in sufficient *methanol* to produce a solution containing 0.08 per cent of atorvastatin. To 5 ml of the solution, add 20 ml of *methanol* and dilute to 50 ml with the solvent mixture to produce a solution containing 0.008 per cent w/v of atorvastatin.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of a buffer solution prepared by dissolving 1.54 g of *ammonium acetate* in 1000 ml of *water*, adjusted to pH 4.0 with *glacial acetic acid*, and 50 volumes of a mixture of 92.5 volumes of *acetonitrile* and 7.5 volumes of *tetrahydrofuran*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 246 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution the test solution.

Calculate the content of $C_{33}H_{35}FN_2O_5$ in the tablets.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of atorvastatin.

Atorvastatin and Fenofibrate Tablets

Atorvastatin Calcium and Fenofibrate Tablets

Atorvastatin and Fenofibrate Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of atorvastatin, $(C_{33}H_{35}FN_2O_5)_2$, and fenofibrate, $C_{20}H_{21}ClO_4$.

Usual strengths. Atorvastatin Calcium equivalent to Atorvastatin, 10 mg and Fenofibrate, 72.5 mg; Atorvastatin, 20 mg and Fenofibrate, 145 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (c).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of a solution prepared by dissolving 7.21 g of *sodium lauryl sulphate* in 1000 ml of *water*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14), using the chromatographic system described under Assay.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution (a). Weigh accurately about 55 mg of *atorvastatin calcium IPRS* in a 50 ml volumetric flask, add 30.0 ml of *methanol,* sonicate and make up the volume with *methanol.*

Reference solution (b). Weigh accurately about 80 mg of *fenofibrate IPRS* in a 25-ml volumetric flask, add 15 ml of *methanol,* sonicate and make up the volume with *methanol.*

Reference solution (c). Dilute a suitable volume of reference solution (a) and reference solution (b) with dissolution medium to obtain a solution having similar concentration to the test solution.

Inject reference solution (c) and the test solution.

Calculate the content of $(C_{33}H_{35}FN_2O_5)_2$, and $C_{20}H_{21}ClO_4$ in the medium.

Q. Not less than 70 per cent of the stated amounts of $(C_{33}H_{35}FN_2O_5)_2$ and $C_{20}H_{21}ClO_4$.

Related substances. Determine by liquid chromatography (2.4.14).

Use chromatographic system and test solution as described under Assay, except injection volume, use 50 µl.

Inject the test solution. The area of any secondary peak is not more than 1.0 per cent and the sum of the areas of all the secondary peaks is not more than 2.0 per cent, calculated by area normalisation.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14).

Test solution. Disperse 1 tablet in 10 ml of *water* with the aid of ultrasound. Add about 30 ml of *methanol* and disperse with aid of ultrasound for 15 minutes, cool and dilute to 50.0 ml with *methanol* and mix. Centrifuge at 2500 rpm for 10 minutes, rejecting the first few ml of filtrate. Dilute 5.0 ml of the solution to 25.0 ml with the mobile phase.

Reference solution. A 0.08 per cent w/v solution of *atorvastatin IPRS* in *methanol*. Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

Carry out the chromatographic system described under Assay.

Calculate the content of $(C_{33}H_{35}FN_2O_5)_2$, in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 0.2 g of fenofibrate into a 250-ml volumetric flask, add 100 ml of *methanol* and sonicate for 25 minutes with intermittent shaking. Make up the volume with *methanol*, mix and centrifuge. Dilute 4.0 ml of clear supernatant to 10.0 ml with mobile phase.

Reference solution (a). Weigh accurately about 60 mg of *atorvastatin calcium IPRS* in a 50-ml volumetric flask, add 30 ml of *methanol,* sonicate it to dissolve and make up the volume with *methanol.*

Reference solution (b). Weigh accurately about 80 mg of *fenofibrate IPRS* in a 25-ml volumetric flask, add 15 ml of *methanol,* sonicate it to dissolve and make up the volume with *methanol.*

Reference solution (c). Dilute a suitable volume of reference solution (a) and reference solution (b) with mobile phase to obtain a solution having similar concentration to the test solution.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil BDS C18),
- mobile phase: a mixture of 35 volumes of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 2.5 with *orthophosphoric acid*, 35 volumes of *acetonitrile* and 30 volumes of *methanol,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless the resolution between atorvastatin and fenofibrate peaks is not less than 27, the column efficiency is not less than 7000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation of replicate injections is not more than 2.0 per cent for atorvastatin peak.

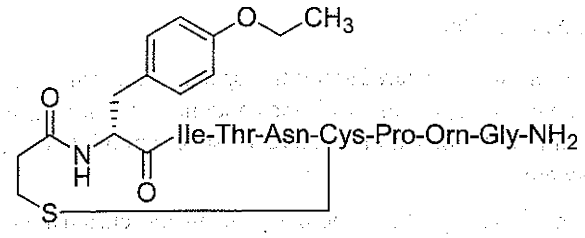
Inject reference solution (c) and the test solution.

Calculate the content of $(C_{33}H_{35}FN_2O_5)_2$, and $C_{20}H_{21}ClO_4$ in the tablets.

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the equivalent amount of atorvastatin, and fenofibrate.

Atosiban Acetate



$C_{43}H_{67}N_{11}O_{12}S_2$ Mol Wt. 994.2

Atosiban Acetate is [1-(3-Sulfanylpropanoyl)-2-(4-*O*-ethyl-*D*-tyrosine)-4-threonine-8-ornithine]oxytocin.

Atosiban Acetate contains not less than 93.0 per cent and not more than 107.0 per cent of $C_{43}H_{67}N_{11}O_{12}S_2$, calculated on the anhydrous and acetic acid free basis.

Category. Oxytocin antagonist.

Description. A white to off white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *atosiban acetate IPRS* or with the reference spectrum of Atosiban acetate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). – 53.0° to – 43.0°, calculated on anhydrous and acetic acid free basis, determined in 1.0 per cent w/v solution of 1.0 per cent v/v *acetic acid* in *water*.

Related substances. Determine by liquid chromatography (2.4.14).

Buffer solution. Dissolve 1.94 g *ammonium acetate* in 1000 ml of *water*, adjusted to pH 4.0 with *trifluoroacetic acid*.

Test solution. Dissolve 20 mg of the substance under examination in mobile phase B and diluted to 5.0 ml with mobile phase B.

Reference solution. A 0.004 per cent w/v solution of *Atosiban acetate IPRS* in mobile phase B.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, such as ZIC HILIC (5 µm),
- column temperature: 60°,
- mobile phase: A . a mixture of 5 volumes of the buffer solution and 95 volumes of *acetonitrile*,
  B. a mixture of 40 volumes of the buffer solution and 60 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 0.7 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	85	15
30	70	30
40	60	40
50	60	40
51	85	15
65	85	15

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with test solution the area of any secondary peak is not more than the area of reference solution (1.0 per cent), and the sum of areas of all the secondary peaks is not more than the area of 3 times the area of reference solution (3.0 per cent).

Acetic acid. Not more than 14 per cent w/w on anhydrous basis.

Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in *water* and dilute to 5.0 ml with *water*.

Reference solution. A 0.07 per cent w/v solution of *acetic acid IPRS* in *water*.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a 0.1 per cent v/v solution of *orthophosphoric acid* in *water* and
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.0 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl,

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	99	1
15	99	1
22	5	95
23	99	1
35	99	1

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates , the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of CH_3COOH.

Water (2.3.43). Not more than 15.0 per cent, determined on 0.05g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in mobile phase B and dilute to 25.0 ml with mobile phase B.

Reference solution. A 0.1 per cent w/v solution of *atosiban acetate IPRS* in mobile phase B.

Use chromatographic system as described under Related substances.

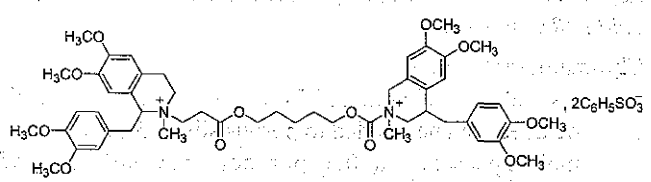
Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{43}H_{67}N_{11}O_{12}S_2$.

Storage. Store protected from moisture, at a temperature between 2° to 8°.

Atracurium Besylate



$C_{65}H_{82}N_2O_{18}S_2$ Mol. Wt.1243.5

Atracurium Besylate is isoquinolinium, 2,2'-[1,5-pentanediyl bis[oxy(3-oxo-3,1-propanediyl)]]bis [1-[(3,4-dimethoxy-phenyl)methyl]-1,2,3,4-tetrahydro-6,7-dimethoxy-2-methyl-, dibenzenesulphonate.

Atracurium Besylate contains not less than 96.0 per cent and not more than 102.0 per cent of $C_{65}H_{82}N_2O_{18}S_2$, calculated on the anhydrous basis.

It contains not less than 5.0 per cent and not more than 6.5 per cent of the *trans-trans* isomer, not less than 34.5 per cent and not more than 38.5 per cent of the *cis-trans* isomer, and not less than 55.0 per cent and not more than 60.0 per cent of the *cis-cis* isomer.

Category. Neuromuscular blocking agent.

Description. A white to off-white solid.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *atracurium besylate IPRS* or with the reference spectrum of atracurium besylate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Methyl benzenesulphonate. Determine by liquid chromatography (2.4.14).

Buffer solution. Dissolve 10.2 g of *monobasic potassium phosphate* in about 950 ml of *water*, adjusted to pH 3.1 with *orthophosphoric acid* and dilute to 1000 ml with *water*.

Test solution. Dissolve 0.1 g of Atracurium Besylate in mobile phase A and dilute to 10 ml with mobile phase A.

Reference solution (a). A 0.02 per cent w/v solution of *methyl benzenesulphonate* in *acetonitrile*. Dilute this solution to obtain a 0.0001 per cent w/v solution with mobile phase A.

Reference solution (b). Transfer 1 ml of the test solution and 5 ml of 0.02 per cent w/v solution of *methyl benzenesulphonate* in *acetonitrile* and dilute to 100.0 ml with mobile phase A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with base deactivated octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 75 volumes of the buffer solution, 20 volumes of *acetonitrile* and 5 volumes of *methanol*,

  B. a mixture of 50 volumes of the buffer solution, 30 volumes of *methanol* and 20 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 217 nm,
- injection volume: 100 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
5	80	20
15	75	25
25	55	45
30	55	45
38	0	100
45	0	100
47	80	20

Inject reference solution (a) and (b). The test is not valid unless the resolution between the *trans-trans* isomer and methyl benzenesulphonate is not less than 12.0 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 12 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of the peak corresponding to methyl benzenesulphonate is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.01 per cent).

Toluene. Determine by gas chromatography (2.4.13).

Test solution. Dissolve 20 mg of the substance under examination in 1 ml of *water*.

Reference solution. A 0.01 per cent w/v solution of *toluene* in *water*.

Chromatographic system

- a fused silica column 30 m x 0.53 mm, coated with chemically cross-linked 5 per cent Phenyl- 95 per cent methylpolysiloxane (5 µm),
- temperature:
  column. 35° for 5 minutes, then raised at the rate of 8° per minute to 175°, followed by an increase at a rate of 35° per minute to 260°, and maintained at 260° for at least 16 minutes,
- inlet port. 70° and detector at 260°,
- flame ionization detector,
- linear velocity: 35 cm per second using nitrogen as carrier gas.

Inject 1 µl of the reference solution. The test is not valid unless the relative standard deviation of the toluene peak for replicate injections is not more than 15 per cent.

Inject 1 µl of the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of peak corresponding to toluene is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

Buffer solution. Dissolve 10.2 g of *monobasic potassium phosphate* in 950 ml of *water*, adjusted to pH 3.1 with *orthophosphoric acid* and dilute to 1000 ml with *water*.

Test solution. Dissolve 0.1 g of the substance under examination in mobile phase A and dilute to 100.0 ml with mobile phase A.

Reference solution (a). A 0.1 per cent w/v solution of *atracurium besylate IPRS* in mobile phase A.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with mobile phase A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 75 volumes of the buffer solution, 20 volumes of *acetonitrile* and 5 volumes of *methanol*,
  B. a mixture of 50 volumes of the buffer solution, 30 volumes of *methanol* and 20 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

[3]1-(3,4-Dimethoxybenzyl)-6,7-dimethoxy-2-methyl-1,2,3,4-tetrahydroisoquinoline,

[4]trans isomer of 1-(3,4-dimethoxybenzyl)-2-[3-[(5-hydroxypentyl) oxy]-3-oxopropyl]-6,7-dimethoxy-2-methyl-1,2,3,4-tetrahydroisoquinolinium,

[5]cis isomer of 1-(3,4-dimethoxybenzyl)-2-[3-[(5-hydroxypentyl)oxy]-3-oxopropyl]-6,7-dimethoxy-2-methyl-1,2,3,4-tetrahydroisoquinolinium,

[6]cis-trans isomer of 1-(3,4-dimethoxybenzyl)-2-[13-[1-(3,4-dimethoxybenzyl)-6,7-dimethoxy-3,4-dihydroisoquinolin-2(1H)-yl]-3,11-dioxo-4,10-dioxatridecyl]-6,7-dimethoxy-2-methyl-1,2,3,4-tetrahydroisoquinolinium,

[7]cis-cis Isomer of 1-(3,4-dimethoxybenzyl)-2-[13-[1-(3,4-dimethoxybenzyl)-6,7-dimethoxy-3,4-dihydroisoquinolin-2(1H)-yl]-3,11-dioxo-4,10-dioxatridecyl]-6,7-dimethoxy-2-methyl-1,2,3,4-tetrahydroisoquinolinium,

[8]cis-trans isomer of 2,2'-[(3-methylpentane-1,5)-diylbis[oxy(3-oxopropane-1,3-diyl)]]bis[1-(3,4-dimethoxybenzyl)-6,7-dimethoxy-2-methyl-1,2,3,4-tetrahydroisoquinolinium],

[9]cis-cis isomer of 2,2'-[(3-methylpentane-1,5)-diylbis[oxy(3-oxopropane-1,3-diyl)]]bis[1-(3,4-dimethoxybenzyl)-6,7-dimethoxy-2-methyl-1,2,3,4-tetrahydroisoquinolinium],

[10]cis-trans isomer of 2,2'-[hexane-1,6-diylbis[oxy(3-oxopropane-1,3-diyl)]]bis[1-(3,4-dimethoxybenzyl)-6,7-dimethoxy-2-methyl-1,2,3,4-tetrahydroisoquinolinium],

[11]cis-cis isomer of 2,2'-[hexane-1,6-diylbis[oxy(3-oxopropane-1,3-diyl)]]bis[1-(3,4-dimethoxybenzyl)-6,7-dimethoxy-2-methyl-1,2,3,4-tetrahydroisoquinolinium],

[12]2,2'-[(Hexane-1,5)-diylbis(3-oxopropane-1,3-diyl)]]bis[1-(3,4-dimethoxybenzyl)-6,7-dimethoxy-2-methyl-1,2,3,4-tetrahydroisoquinolinium],

[13]Pentane-1,5-diyl bis[3-[1-(3,4-dimethoxybenzyl)-6,7-dimethoxy-3,4-dihydroisoquinolin-2(1H)-yl)propanoate],

[14]trans isomer of 1-(3,4-dimethoxybenzyl)-2-(3,11-dioxo-4,10-dioxatridec-12-enyl)-6,7-dimethoxy-2-methyl-1,2,3,4-tetrahydroisoquinolinium benzenesulfonate,

[15] cis isomer of 1-(3,4-dimethoxybenzyl)-2-(3,11-dioxo-4,10-dioxatridec-12-enyl)-6,7-dimethoxy-2-methyl-1,2,3,4-tetrahydroisoquinolinium benzenesulfonate.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to atracurium trans-trans isomer and the cis-trans isomer is not less than 1.5 and the resolution between the peaks due to atracurium cis-trans isomer and the cis-cis isomer is not less than 1.5.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the sum of the areas of the two isomer peaks corresponding to atracurium impurity A and D is not more than 1.5 times the sum of the areas of three principal peaks in the chromatogram obtained with reference solution (b) (1.5 per cent), the area of any peak corresponding to atracurium impurity E is not more than 1.5 times the sum of the areas of three principal peaks in the chromatogram obtained with reference solution (b) (1.5 per cent), the area of the peaks corresponding to atracurium impurity F and G is not more than the sum of the areas of three principal peaks in the chromatogram obtained with reference solution (b) (1.0 per cent), the sum of the areas of the two isomer peaks corresponding to atracurium impurity C, I, H and K is not more than the sum of the areas of three principal in the chromatogram obtained with reference solution (b) (1.0 per cent), the area of any other secondary peak is not more than 0.1 times the sum of the areas of three principal peaks in the chromatogram obtained with reference solution (b) (0.1 per cent). The sum of the areas of all the secondary peaks is not more than 3.5 times the sum of the areas of three principal peaks in the chromatogram obtained with reference solution (b) (3.5 per cent). Ignore any peak with an area less than 0.05 times the sum of the areas of three principal peaks in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 5.0 per cent.

Assay. Determine by liquid chromatography (2.4.14).

Buffer solution. Dissolve 10.2 g of *monobasic potassium phosphate* in about 950 ml of *water*, adjusted to pH 3.1 with *orthophosphoric acid* and dilute to 1000 ml with *water*.

Test solution. Dissolve 0.1 g of the substance in mobile phase A and dilute to 100.0 ml with mobile phase A.

Reference solution. A 0.1 per cent w/v solution of *atracurium besylate IPRS* in mobile phase A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 75 volumes of the buffer solution, 20 volumes of *acetonitrile* and 5 volumes of *methanol*,

  B. a mixture of 50 volumes of the buffer solution, 30 volumes of *methanol* and 20 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
5	80	20
15	40	60
25	40	60
30	0	100
35	80	20

The relative retention time with reference to *cis-cis* isomer for *trans-trans* isomer is about 0.8 and for *cis-trans* isomer is about 0.9.

Inject the reference solution. The test is not valid unless the resolution between the *trans-trans* isomer and the *cis-trans* isomer and between the *cis-trans* isomer and the *cis-cis* isomer is not less than 1.1 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{65}H_{82}N_2O_{18}S_2$ and measure the responses for the 3 isomeric peaks.

Storage. Store protected from light and moisture at a temperature between 2° to 8°.

Atracurium Besylate Injection

Atracurium Besylate Injection is a sterile solution containing not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of atracurium besylate, $C_{65}H_{82}N_2O_{18}S_2$.

Atracurium Besylate Injection contains an amount of the *trans-trans*-isomer equivalent to not less than 5.0 per cent and not more than 6.5 per cent of the stated amount of atracurium besylate, an amount of the *cis-trans*-isomer equivalent to not less than 34.5 per cent and not more than 38.5 per cent of the stated amount of atracurium besylate and an amount of the *cis-cis*-isomer equivalent to not less than 55.0 per cent and not more than 60.0 per cent of the stated amount of atracurium besylate.

NOTE— The injection is unstable at room teimperature. Store all samples in the refrigerator. Analyze all preparation as soon as possible or use a refrigerated sample.

Usual strength. 10 mg per ml.

Identification

In the Assay, the principal peaks of three isomers of atracurium besylate in the chromatogram obtained with the test solution corresponds to the peaks in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 3.0 to 3.65.

Related substances. Determine by liquid chromatography.

Buffer solution. Dissolve 10.2 g of *monobasic potassium phosphate* in 950 ml of *water*, adjusted to pH 3.1 with *orthophosphoric acid* and dilute to 1000 ml with *water*.

Test solution. Dilute a volume of injection containing 50 mg of atracurium besylate in mobile phase A and dilute to 50.0 ml with mobile phase A.

Reference solution. A 0.002 per cent w/v solution of *atracurium besylate IPRS* in mobile phase A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 75 volumes of the buffer solution, 20 volumes of *acetonitrile* and 5 volumes of *methanol*,

  B. a mixture of 50 volumes of the buffer solution, 30 volumes of *methanol* and 20 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Monoacrylate *cis*- isomers	1.33	---

Inject the reference solution. The test is not valid unless the resolution between the peaks due to atracurium *trans-trans* isomer and the *cis-trans* isomer is not less than 1.5 and the resolution between the peaks due to atracurium *cis-trans* isomer and the *cis-cis* isomer is not less than 1.5.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any

peak corresponding to acidic compound is not more than 3 times the sum of the areas of three principal peaks in the chromatogram obtained with the reference solution (6.0 per cent), the sum of the areas of any peaks corresponding to *cis*- and *trans*-isomers of the hydroxy compound is not more than 3 times the sum of the areas of three principal peaks in the chromatogram obtained with the reference solution (6.0 per cent), and the area of any peak corresponding to laudanosine is not more than 1.5 times the sum of the areas of three principal peaks in the chromatogram obtained with the reference solution (3.0 per cent).The sum of the areas of any peaks corresponding to *cis*- and *trans*-isomers of the monoacrylate is not more than 1.5 times the sum of the areas of three principal peaks in the chromatogram obtained with the reference solution (3.0 per cent). The area of any other unspecified degradation product is not more than 0.05 times the sum of the areas of three principal peaks in the chromatogram obtained with the reference solution (0.1 per cent). The sum of the areas of all the secondary peaks is not more than 7.5 times the sum of the areas of three principal peaks in the chromatogram obtained with the reference solution (15.0 per cent). Ignore the peak due to benzene sulphonic acid.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Bacterial endotoxins (2.2.3). Not more than 5.56 Endotoxin Units per mg of atracurium besylate.

Assay. Determine by liquid chromatography (2.4.14).

Buffer solution. Dissolve 10.2 g of *monobasic potassium phosphate* in about 950 ml of *water*, adjusted to pH 3.1 with *orthophosphoric acid* and dilute to 1000 ml with *water*.

Test solution. Dilute a volume of injection containing 50 mg of Atracurium Besylate in mobile phase A and dilute to 50.0 ml with mobile phase A.

Reference solution. A 0.1 per cent w/v solution of *atracurium besylate IPRS* in mobile phase A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with base deactivated octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 75 volumes of the buffer solution, 20 volumes of *acetonitrile* and 5 volumes of *methanol*,

  B. a mixture of 50 volumes of the buffer solution, 30 volumes of *methanol* and 20 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,

Inject the reference solution. The test is not valid unless the resolution between the *trans-trans* isomer and the *cis-trans* isomer and between the *cis-trans* isomer and the *cis-cis* isomer is not less than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

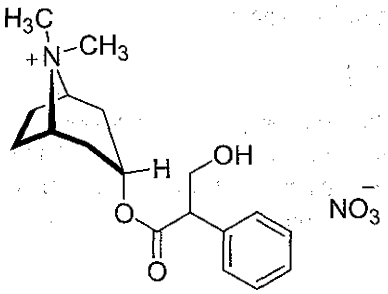
Inject the reference solution and the test solution.

Calculate the content of $C_{65}H_{82}N_2O_{18}S_2$.

Storage. Store protected from light. Preserve in single-dose or multiple-dose containers, preferably of Type I glass, in a refrigerator and protect from freezing.

Atropine Methonitrate

Methylatropine Nitrate



$C_{18}H_{26}N_2O_6$ Mol. Wt. 366.4

Atropine Methonitrate is (*RS*)-(1*R*,3*r*,5*S*)-8-methyl-3-tropoyloxytropanium nitrate.

Atropine Methonitrate contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{18}H_{26}N_2O_6$, calculated on the dried basis.

Category. Anticholinergic.

Description. Colourless crystals or a white, crystalline powder.

Identification

Test A may be omitted if tests B, C, and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *atropine methonitrate IPRS* or with the reference spectrum of atropine methonitrate.

B. To 0.05 ml of a 1 per cent w/v solution add 0.05 ml of a 0.1 per cent w/v solution of *diphenylamine* in *nitrogen-free sulphuric acid*; an intense blue colour is produced.

C. To 2.5 ml of a 10 per cent w/v solution add 2.5 ml of *water* and 2 ml of *dilute sodium hydroxide solution*; no precipitate is produced.

D. Add 1 mg to 4 drops of *fuming nitric acid* and evaporate to dryness on a water-bath; a yellow residue is obtained. To the cooled residue add 2 ml of *acetone* and 4 drops of a 3 per cent w/v solution of *potassium hydroxide* in *methanol*; a violet colour is produced.

Tests

Appearance of solution. A 5.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1) and not more intensely coloured than reference solution BS8 (2.4.1).

pH (2.4.24). 6.0 to 7.5, determined in a 5.0 per cent w/v solution.

Specific optical rotation (2.4.22). −0.25° to +0.05°, determined in a 10.0 per cent w/v solution, using a 2-dm tube (distinction from hyoscyamine).

Silver. To 10 ml of a 10.0 per cent w/v solution add 0.1 ml of *sodium sulphide solution*. The solution is not more intensely coloured than reference solution BS8 (2.4.1).

Halides (2.3.12). 15 ml of a 5.0 per cent w/v solution in *carbon dioxide-free water* complies with the limit test for chlorides, using 0.3 ml of *chloride standard solution (25 ppm Cl)* for preparing the standard.

Apomethylatropine. A 0.1 per cent w/v solution in *0.01 M hydrochloric acid* shows absorption maxima at about 252 nm and 257 nm (2.4.7). The ratio of the absorbance at about 257 nm to that at about 252 nm is not less than 1.17.

Related substances. Determine by thin-layer chromatography (2.4.17) coating the plate with *silica gel G*.

Mobile phase. A mixture of 60 volumes of *ethyl acetate*, 15 volumes of *anhydrous formic acid*, 15 volumes of *water* and 10 volumes of *methanol*.

Test solution. A 4.0 per cent w/v solution of the substance under examination in *methanol (90 per cent)*.

Reference solution. Dilute 5 ml of the test solution to 100 ml with *methanol (90 per cent)*, mix and dilute 10 ml of the resulting solution to 100 ml with *methanol (90 per cent)*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate at 105° until the odour of the solvent is not detectable. Allow it to cool to room temperature and spray with *dilute potassium iodobismuthate solution* until spots appear. Any secondary spot in the chromatogram obtained with test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

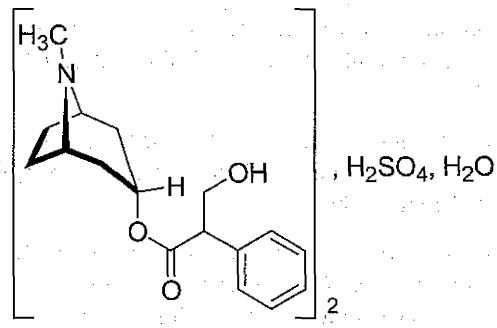
Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.3 g and dissolve in 50 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03664 g of $C_{18}H_{26}N_2O_6$.

Storage. Store protected from light.

Atropine Sulphate



$(C_{17}H_{23}NO_3)_2,H_2SO_4,H_2O$ Mol. Wt. 694.8

Atropine Sulphate is (*RS*)-(1*R*,3*r*,5*S*)-3-tropoyloxytropanium sulphate monohydrate.

Atropine Sulphate contains not less than 99.0 per cent and not more than 101.0 per cent of atropine sulphate, $(C_{17}H_{23}NO_3)_2$, H_2SO_4, calculated on the anhydrous basis.

Category. Anticholinergic; antidote to cholinesterase inhibitors.

Description. Colourless crystals or a white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Test B may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *atropine sulphate IPRS* or with the reference spectrum of atropine sulphate.

B. To a 2 per cent w/v solution add *sodium hydroxide solution*, filter and transfer the precipitate with *water*. Dry the precipitate at 60°. To 5 mg of the residue add 5 drops of *fuming nitric acid* and evaporate to dryness on a water-bath. Cool the faintly yellow coloured residue and add 2 ml of *acetone* and 4 drops of a 3 per cent w/v solution of *potassium hydroxide* in *methanol*; a violet colour is produced.

C. A 5 per cent w/v solution gives the reactions of sulphates (2.3.1).

Tests

pH (2.4.24). 4.5 to 6.2, determined in a 2.0 per cent w/v solution.

Specific optical rotation (2.4.22). −0.50° to +0.05°, determined in a 10.0 per cent w/v solution, using a 2-dm tube (distinction from hyoscyamine).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 24 mg of the substance under examination in mobile phase A and dilute to 100.0 ml with mobile phase A.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A. Dilute 1.0 ml of the solution to 10.0 ml with mobile phase A.

Reference solution (b). A 0.025 per cent w/v solution of *noratropine (atropine impurity A IPRS)* in the test solution. Dilute 5 ml of the solution to 25 ml with mobile phase A.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: A. dissolve 3.5 g of *sodium lauryl sulphate* in 606 ml of a 0.7 per cent w/v solution of *potassium dihydrogen phosphate*, adjusted to pH 3.3 with *0.05 M orthophosphoric acid* and mix with 320 ml of *acetonitrile*,

  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	95	5
2	95	5
20	70	30
22	95	5

The relative retention time with reference to atropine for atropine impurity A is about 0.89.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to atropine impurity A and atropine is not less than 2.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent). The sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Apoatropine. Absorbance of a 0.1 per cent w/v solution in *0.01 M hydrochloric acid* at about 245 nm, not more than 0.4 (2.4.7).

Foreign alkaloids and decomposition products. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 90 volumes of *acetone*, 7 volumes of *water* and 3 volumes of *strong ammonia solution*.

Test solution. A 2.0 per cent w/v solution of the substance under examination in *methanol*.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with *methanol*.

Reference solution (b). Dilute 25 ml of reference solution (a) to 50 ml with *methanol*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate at 105° for 15 minutes. Allow it to cool to room temperature and spray with *dilute potassium iodobismuthate solution*. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 4.0 per cent, determined on 0.5 g.

Assay. Weigh 0.5 g, dissolve in 30 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.06768 g of $(C_{17}H_{23}NO_3)_2,H_2SO_4$.

Storage. Store protected from light.

Atropine Injection

Atropine Sulphate Injection

Atropine Injection is a sterile solution of Atropine Sulphate in Water for Injections.

Atropine Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of atropine sulphate, $(C_{17}H_{23}NO_3)_2,H_2SO_4,H_2O$.

Usual strengths. 500 µg per ml; 600 µg per ml; 1 mg per ml.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 50 volumes of *chloroform*, 40 volumes of *acetone* and 10 volumes of *diethylamine*.

Test solution. Evaporate a volume of the injection containing 5 mg of Atropine Sulphate to dryness on a water-bath, triturate the residue with 1 ml of *ethanol (95 per cent)*, allow to stand and use the supernatant liquid.

Reference solution. A 0.5 per cent w/v solution of *atropine sulphate IPRS* in *ethanol (95 per cent)*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate at 105° for 20 minutes, allow it to cool to room temperature and spray with *potassium iodobismuthate solution*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 3.0 to 5.5.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Bacterial endotoxins (2.2.3). Not more than 55.6 Endotoxin Units per mg of atropine sulphate.

Assay. Determine by liquid chromatography (2.4.14).

For injections containing less than 0.1 per cent w/v of Atropine Sulphate —

Test solution. Use the injection under examination. Inject 100 µl.

Reference solution. A solution containing *atropine sulphate IPRS* and *homatropine hydrobromide IPRS* in the mobile phase, both at the same concentration as the solution under examination. Inject 100 µl.

For injections containing 0.1 per cent w/v or more of Atropine Sulphate -

Test solution. Dilute the injection, if necessary, to obtain 0.1 per cent w/v of Atropine Sulphate with *water*. Inject 20 µl.

Reference solution. A solution containing 0.1 per cent w/v each of *atropine sulphate IPRS* and *homatropine hydrobromide IPRS* in the mobile phase. Inject 20 µl.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Nucleosil C18),
- mobile phase: a solution containing *0.01 M sodium acetate* and 0.005 M *dioctyl sodium sulphosuccinate* in *methanol (60 per cent)*, adjusted to pH 5.5 with *glacial acetic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 257 nm.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to atropine sulphate and homatropine hydrobromide is not less than 2.5.

Inject the reference solution and the test solution.

Calculate the content of $(C_{17}H_{23}NO_3)_2,H_2SO_4,H_2O$ in the injection.

Storage. Store protected from light.

Atropine Eye Ointment

Atropine Sulphate Eye Ointment

Atropine Eye Ointment is a sterile preparation of Atropine Sulphate in an eye ointment base.

Atropine Eye Ointment contains not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of atropine sulphate, $(C_{17}H_{23}NO_3)_2,H_2SO_4,H_2O$.

Usual strength. 1.0 per cent w/w.

Identification

Determine by thin- layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 50 volumes of *chloroform*, 40 volumes of *acetone* and 10 volumes of *diethylamine*.

Test solution. Dissolve a quantity of the ointment containing 10 mg of Atropine Sulphate as completely as possible in 10 ml of *light petroleum (40° to 60°)* and extract with two quantities, each of 10 ml, of *0.05 M sulphuric acid*, washing each acid solution with the same 5 ml of *light petroleum (40° to 60°)*. Mix the acid solutions, make alkaline with *dilute ammonia solution*, and extract with two quantities, each of 15 ml, of *chloroform*. Remove the *chloroform* and dissolve the residue in 2 ml of *ethanol (95 per cent)*.

Reference solution. A 0.5 per cent w/v solution of *atropine sulphate IPRS* in *ethanol (95 per cent)*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate at 105° for 20 minutes, allow it to cool to room temperature and spray with *potassium iodobismuthate solution*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Other tests. Comply with the tests stated under Eye Ointments.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve a quantity of the eye ointment containing about 10 mg of Atropine Sulphate in 10 ml of *ether* and extract with two 10 ml quantities of *0.01 M hydrochloric acid*. Use the combined extracts.

Reference solution. A solution containing 0.05 per cent w/v each of *atropine sulphate IPRS* and *homatropine hydrobromide IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Nucleosil C18),
- mobile phase: a solution containing *0.01 M sodium acetate* and 0.005 M *dioctyl sodium sulphosuccinate* in *methanol (60 per cent)*, adjusted to pH 5.5 with *glacial acetic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 257 nm,
- injection volume: 100 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to atropine sulphate and homatropine hydrobromide is not less than 2.5.

Inject the reference solution and the test solution.

Calculate the content of $(C_{17}H_{23}NO_3)_2,H_2SO_4,H_2O$ in the eye ointment.

Storage. Store at a temperature not exceeding 30°.

Atropine Tablets

Atropine Sulphate Tablets

Atropine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of atropine sulphate, $(C_{17}H_{23}NO_3)_2,H_2SO_4,H_2O$.

Identification

A. Determine by thin- layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 50 volumes of *chloroform*, 40 volumes of *acetone* and 10 volumes of *diethylamine*.

Test solution. Disperse a quantity of the powdered tablets containing 5 mg of Atropine Sulphate with 1 ml of *ethanol (95 per cent)*, centrifuge and use the supernatant liquid.

Reference solution. A 0.5 per cent w/v solution of *atropine sulphate IPRS* in *ethanol (95 per cent)*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate at 105° for 20 minutes, allow it to cool to room temperature and spray with *potassium iodobismuthate solution*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. The powdered tablets give the reactions of sulphates (2.3.1).

Tests

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modification.

Test solution. Disperse one tablet in 2 ml of the mobile phase with the aid of ultrasound, filter.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing about 30 mg of atropine in 100.0 ml of the mobile phase.

Reference solution. A solution containing 0.03 per cent w/v each of *atropine sulphate IPRS* and *homatropine hydrobromide IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Nucleosil C18),
- mobile phase: a solution containing *0.01 M sodium acetate* and *0.005 M dioctyl sodium sulphosuccinate* in *methanol* (60 per cent), adjusted to pH 5.5 with *glacial acetic acid*,

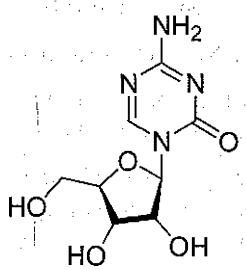
- flow rate: 2 ml per minute,
- spectrophotometer set at 257 nm,
- injection volume: 100 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to atropine sulphate and homatropine hydrobromide is not less than 2.5.

Inject the reference solution and the test solution.

Calculate the content of $(C_{17}H_{23}NO_3)_2,H_2SO_4,H_2O$ in the tablet.

Azacitidine



$C_8H_{12}N_4O_5$ Mol Wt. 244.2

Azacitidine is 4-amino-1-β-*D*-ribofuranosyl-1,3,5-triazin-2(1*H*)-one.

Azacitidine contains not less than 98.0 per cent and not more than 102.0 per cent of $C_8H_{12}N_4O_5$, calculated on the dried basis.

Category. Anticancer.

Description. A white to off white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *azacitidine IPRS* or with reference spectrum of azacitidine.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). + 6.0° to + 10.0°, calculated on as is basis and determined in 2.0 per cent w/v solution in *dimethyl sulphoxide*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.2 g of the substance under examination in *dimethyl sulphoxide* and dilute to 10.0 ml with *dimethyl sulphoxide*.

Reference solution. A 0.01 per cent w/v solution of *azacitidine IPRS* in *dimethyl sulphoxide*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, (5 µm) (Such as HILIC),
- mobile phase: a mixture of 20 volumes of buffer solution prepared by dissolving 0.77 g of *ammonium acetate* in 1000 ml of *water*, adjusted to pH 4.0 with *acetic acid*, 180 volumes of *methanol* and 800 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 242 nm,
- injection volume: 5 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0.

Inject the reference solution and test solution. In the chromatogram obtained with test solution the the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of areas of all the secondary peaks is not more than the twice the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 60° under vacuum for 3 hour.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in *dimethyl sulphoxide* and dilute to 25.0 ml with *dimethyl sulphoxide*.

Reference solution. A 0.08 per cent w/v solution of *azacitidine IPRS* in *dimethyl sulphoxide*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 10°,
- mobile phase: dissolve 1.54 g of *ammonium acetate* in 1000 ml of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 242 nm,
- injection volume: 5 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1200 theoretical plates

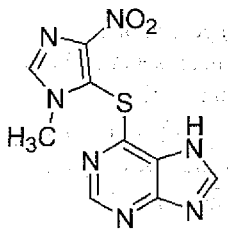
and the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{12}N_4O_5$.

Storage. Store protected from moisture, at a temperature between 15° to 30°.

Azathioprine



$C_9H_7N_7O_2S$ Mol. Wt. 277.3

Azathioprine is 6-[(1-methyl-4-nitro-1*H*-imidazol-5yl) sulphanyl]-7*H*-purine.

Azathioprine contains not less than 98.5 per cent and not more than 101.0 per cent of $C_9H_7N_7O_2S$, calculated on the dried basis.

Category. Immunosuppressant.

Description. A pale-yellow powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *azathioprine IPRS* or with the reference spectrum of azathioprine.

Tests

Acidity or alkalinity. To 0.5 g add 25 ml of *carbon dioxide free water*, shake for 15 minutes and filter. To 20 ml of the filtrate add 0.1 ml of *methyl red solution*. Not more than 0.2 ml of *0.01 M hydrochloric acid* or *0.01 M sodium hydroxide* is required to change the colour of the indicator.

5-Chloro-1-methyl-4-nitroimidazole and 6-mercaptopurine. Determine by thin-layer chromatography (2.4.17), coating the plate with *cellulose GF254*.

Mobile phase. *Butanol* saturated with *dilute ammonia solution*.

NOTE – Prepare the following solutions immediately before use.

Test solution. Dissolve 0.2 g of the substance under examination in *dilute ammonia solution* and add sufficient *dilute ammonia solution* to produce 10 ml.

Reference solution (a). A 0.02 per cent w/v solution of *chloromethylnitroimidazole IPRS* in *dilute ammonia solution*.

Reference solution (b). A 0.02 per cent w/v solution of *mercaptopurine* in *dilute ammonia solution*.

Apply to the plate 5 µl of each solution. After development, dry the plate at 50° and examine under ultraviolet light at 254 nm. In the chromatogram obtained with the test solution, any spots corresponding to chloromethylnitroimidazole and mercaptopurine are not more intense than the spots in the chromatograms obtained with reference solution (a) (1.0 per cent) and reference solution (b) (1.0 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 0.5 g by drying in an oven at 105°.

Assay. Dissolve 0.25 g in 25 ml of *dimethylformamide*. Titrate with *0.1 M tetrabutylammonium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.02773 g of $C_9H_7N_7O_2S$.

Storage. Store protected from light.

Azathioprine Tablets

Azathioprine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of azathioprine, $C_9H_7N_7O_2S$.

Usual strength. 50 mg.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *cellulose F 254*.

Mobile phase. A mixture of *butan-1-ol* saturated with *6 M ammonia*.

Test solution. Disperse a quantity of the powdered tablets containing 0.2 g of Azathioprine with 50 ml of *6 M ammonia*, filter through a glass micro fibre paper (such as Whatman GF/C) and use the filtrate.

Reference solution. A 0.4 per cent w/v solution of *azathioprine IPRS* in *6 M ammonia*.

Apply to the plate 5 µl of each solution. After removal of the plate, dry the plate at 50° and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with

the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. Heat a quantity of the powdered tablets containing 20 mg of Azathioprine with 100 ml of *water* and filter. To 5 ml of the filtrate add 1 ml of *hydrochloric acid* and 10 mg of *zinc powder* and allow to stand for 5 minutes; a yellow colour is produced. Filter, cool in ice, add 0.1 ml of a 10 per cent w/v solution of *sodium nitrite* and 0.1 g of *sulphamic acid* and shake until the bubbles disappear. Add 1 ml of *2-naphthol solution*; a pale pink precipitate is produced.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium: 900 ml of *water*,
Speed and time. 50 rpm for 30 minutes.

Withdraw a suitable volume of the medium and filter, rejecting the first few ml of filtrate. Dilute a suitable volume of the filtrate with the medium, if necessary. Measure the absorbance of the resulting solution at the maximum at about 280 nm (2.4.7). Calculate the content of azathioprine, $C_9H_7N_7O_2S$ in the medium from the absorbance obtained from a solution of known concentration of *azathioprine IPRS* in the dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_9H_7N_7O_2S$.

5-Chloro-1-methyl-4-nitroimidazole and 6-mercaptopurine. Determine by thin-layer chromatography (2.4.17), coating the plate with *cellulose F 254*.

Mobile phase. A mixture of *butan-1-ol* saturated with *6 M ammonia*.

Test solution. Disperse a quantity of the powdered tablets containing 0.2 g of Azathioprine with 10 ml of *6 M ammonia* and filter through a glass micro fibre filter paper (such as Whatman GF/C).

Reference solution (a). A solution containing 2.0 per cent w/v of *azathioprine IPRS* and 0.02 per cent w/v of *6-mercaptopurine* in *6 M ammonia*.

Reference solution (b). A 0.02 per cent w/v solution of *6-mercaptopurine* in *6 M ammonia*.

Reference solution (c). A 0.02 per cent w/v solution of *chloromethylnitroimidazole IPRS* in *6 M ammonia*.

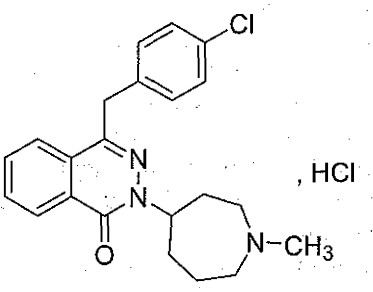
Apply to the plate 5 µl of each solution. After removal of the plate, dry the plate at 50° and examine under ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution corresponding to 6-mercaptopurine in the chromatogram obtained with reference solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b). Any spot corresponding to 5-chloro-1-methyl-4-nitroimidazole in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (c).

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.15 g of Azathioprine with 20 ml of *dimethyl sulphoxide* for 15 minutes and dilute to 500.0 ml with *0.1 M hydrochloric acid*, filter. Dilute 25.0 ml of the filtrate to 1000.0 ml with *0.1 M hydrochloric acid*. Measure the absorbance of the resulting solution at the maximum at about 280 nm (2.4.7) using *0.1 M hydrochloric acid* as the blank. Calculate the content of $C_9H_7N_7O_2S$ using a solution of *azathioprine IPRS* of the same concentration in *0.1 M hydrochloric acid*.

Storage. Store protected from light.

Azelastine Hydrochloride



$C_{22}H_{24}ClN_3O,HCl$ Mol. Wt.418.4

Azelastine Hydrochloride is (*RS*)-4-(4-Chlorobenzyl)-2-(1-methylazepan-4-yl)phthalazin-1(2*H*)-one hydrochloride.

Azelastine Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{22}H_{24}ClN_3O,HCl$, calculated on the dried basis.

Category. Antihistamine.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6).Compare the spectrum with that obtained with *azelastine hydrochloride IPRS* or with the reference spectrum of azelastine hydrochloride.

B. Solution A gives reaction (A) of chlorides (2.3.1).

Tests

Solution A. A 1.0 per cent w/v solution in *carbon dioxide-free water*.

Appearance of solution. Solution A is clear and colourless (2.4.1).

Acidity or alkalinity. To 10 ml of solution A, add 0.2 ml of *bromothymol blue solution*. Not more than 0.1 ml of *0.01 M hydrochloric acid* or *0.01 M sodium hydroxide* is required to change the colour of the solution.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 45 volumes of *acetonitrile* and 55 volumes of *water*.

Test solution. Dissolve 0.125 g of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution (b). A solution containing 0.005 per cent w/v each of *azelastine impurity B IPRS*, *azelastine impurity D IPRS* and *azelastine impurity E IPRS* in the test solution.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with nitrile groups bonded to porous silica (10 µm),
- mobile phase: dissolve 2.16 g of *sodium octanesulphonate* and 0.68 g of *potassium dihydrogen phosphate* in 740 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid*, add 260 ml of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Azelastine impurity A[1]	0.2	—
Azelastine impurity B[2]	0.3	—
Azelastine impurity C[3]	0.4	—
Azelastine impurity D[4]	0.6	0.7
Azelastine (retention time: about 8 to 9 minutes)	1.0	—
Azelastine impurity E[5]	1.4	2.1

[1] benzohydrazide,

[2] 1-benzoyl-2-[(4*RS*)-1-methylhexahydro-1*H*-azepin-4-yl]diazane,

[3] 2-[(4-chlorophenyl)acetyl]benzoic acid,

[4] 4-(4-chlorobenzyl)phthalazin-1(2*H*)-one,

[5] 3-(4-chlorobenzylidene)isobenzofuran-1(3*H*)-one.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to azelastine impurities B and D is not less than 4.0 and the peaks due to azelastine impurities D and E are baseline separated from the principal peak.

Inject reference solution (a) and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). The sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. *NOTE — In order to avoid overheating in the reaction medium, mix thoroughly throughout and stop the titration immediately after the end-point has been reached.*

Dissolve 0.3 g in 5 ml of *anhydrous formic acid*. Add 30 ml of *acetic anhydride*. Titrate quickly with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1.0 ml of *0.1 M perchloric acid* is equivalent to 0.04184 g of $C_{22}H_{25}ClN_3O$.

Azelastine Eye Drops

Azelastine Hydrochloride Eye Drops

Azelastine Eye Drops is a sterile solution of Azelastine Hydrochloride in purified water.

Azelastine Eye Drops Contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of azelastine hydrochloride, $C_{22}H_{24}ClN_3O,HCl$.

Usual strength. 0.5 mg per ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 3.5 to 6.5.

Light absorption. The absorbance of the eye drop at 420 nm (2.4.7) is not more than 0.1.

Related substances. Determine by liquid chromatography (2.4.14) as described under Assay.

Inject the test solution. The sum of areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalization.

Other tests. Comply with the tests stated under Eye Drops.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a suitable volume of the eye drops containing 2.5 mg of Azelastine Hydrochloride to 50.0 ml with the mobile phase.

Reference solution. A 0.005 per cent w/v solution of *azelastine hydrochloride IPRS* in the mobile phase.

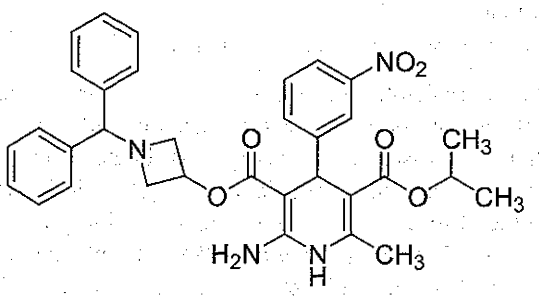
Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with cyanopropyl groups bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of *water*, 50 volumes of *acetonitrile*, 0.4 volume of *triethylamine* and 0.2 volume of *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 4500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{24}ClN_3O,HCl$. in the eye drops.

Azelnidipine



$C_{33}H_{34}N_4O_6$ Mol. Wt. 582.7

Azelnidipine is 3-[1-(Diphenylmethyl)azetidin-3-yl] 5-(1-methylethyl)(4RS)-2-amino-6-methyl-4-(3-nitrophenyl)-1,4-dihydropyridine-3,5-dicarboxylate.

Azelnidipine contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{33}H_{34}N_4O_6$, calculated on the dried basis.

Category. Calcium channel blocker

Description. A light yellow to yellow crystalline powder. It shows polymorphism (2.5.11).

Identification

A. Determine by infrared adsorption spectrophotometry (2.4.6).Compare the spectrum with that obtained with *azelnidipine IPRS* or with the reference spectrum of azelnidipine.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of *acetonitrile* and 20 volumes of *water.*

Test solution. Dissolve 100 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 35 volumes of a buffer solution prepared by dissolving 3.0 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water,* adjusted to pH 5.5 with *orthophosphoric acid,* 45 volumes of *acetonitrile* and 20 volumes of *methanol,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume:10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 15000 theoretical plates, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 1.0.

Inject the reference solution and the test solution. Run the chromatogram twice the retention time of the principal peak for the test solution. The area of any secondary peak eluting at a relative retention time of about 0.5 is not more than 0.2 times the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent), the area of any secondary peak eluting at a relative retention time of about 1.42 is not more than 0.3 times the area of the principal peak in the chromatogram obtained the with the reference solution (0.3 per cent), the area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of areas of all the secondary peaks is not

more than 0.7 times the area of the principal peak in the chromatogram obtained with the reference solution (0.7 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying under vacuum at 70° for 5 hours.

Assay. Determine by liquid chromatography (2.4.14)

Solvent mixture. Equal volumes of *water* and *acetonitrile.*

Test solution. Dissolve 20 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.002 per cent w/v solution of *azelnidipine IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a *0.03M potassium dihydrogen orthophosphate* in *water*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 256 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
5	80	20
12	30	70
20	30	70
25	80	20
30	80	20

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{33}H_{34}N_4O_6$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Azelnidipine Tablets

Azelnidipine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of azelnidipine, $C_{33}H_{34}N_4O_6$.

Usual strengths. 8 mg; 16 mg.

Identification

A. Weigh a quantity of the powdered tablets containing 4 mg of Azelnidipine, disperse in 150.0 ml of *anhydrous ethanol*, with the aid of ultrasound for 15 minutes with shaking and dilute to 200.0 ml with *anhydrous ethanol*, centrifuge and filter. When examined in the range 200 nm to 400 nm (2.4.7), the resulting solution shows absorption maxima between 253 nm and 257 nm and between 339 nm and 346 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

Tests

Dissolution (2.5.2).

NOTE — Perform the tests and assay in subdued light and use low-actinic glassware.

Apparatus No. 2 (Paddle),
Medium. 900 ml of *hydrochloric acid* buffer solution pH 1.2 prepared by dissolving 2.0 g of *sodium chloride* in 7.0 ml of *hydrochloric acid* and 500.0 ml of *water*, and diluted to 1000 ml with *water*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the medium if necessary, at the maximum at about 270 nm (2.4.7). Calculate the content of azelnidipine, $C_{33}H_{34}N_4O_6$ in the medium from the absorbance obtained from a solution prepared by dissolving 45 mg of *azelnidipine IPRS in* 10 ml of *anhydrous ethanol* and diluted to 25.0 ml with same solvent. Dilute 1.0 ml of the solution to 200.0 ml with the dissolution medium.

Q. Not less than 75 per cent of the stated amount $C_{33}H_{34}N_4O_6$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of *acetonitrile* and 20 volumes of *water.*

Test Solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 10 mg of Azelnidipine, disperse in 5 ml of solvent mixture with the aid of ultrasound for 15 minutes with intermediate shaking and dilute to 10.0 ml with solvent mixture and centrifuge.

Reference solution (a). A 0.002 per cent w/v solution of *azelnidipine IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the reference solution (a) to 20.0 ml with solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 35 volumes of a buffer solution prepared by dissolving 3.0 g *potassium dihydrogen orthophosphate* in 1000 ml of *water* and 65 volumes of solvent mixture prepared by mixing 70 volumes of *acetonitrile* and 30 volumes of *methanol*, adjusted to pH 5.5 with *orthophosphoric acid*,
- flow rate: 0.9 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

The retention time of azelnidipine is about 36 minutes.

Inject reference solution (a) and (b). The test is not valid unless the column efficiency is not less than 15000 theoretical plates, the tailing factor is not more than 1.5 and relative standard deviation for replicate injections is not more than 1.0 per cent with reference solution (a) and the area of principal peak in the chromatogram obtained reference solution (b) is between 3.5 to 6.5 per cent of the area of principal peak in chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with test solution, the area of any secondary peak eluting with an relative retention time of about 0.10 is not more than 0.45 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.9 per cent), the area of any secondary peak eluting with an relative retention time of about 0.13 is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent), the area of any secondary peak eluting with an relative retention time of about 0.50 is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.8 per cent) and the area of any secondary peak eluting with an relative retention time of about 1.42 is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.8 per cent). The area of any other secondary is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). The sum of areas of all the secondary peaks is not more than 1.75 times the area of the principal peak in the chromatogram obtained with reference solution (a) (3.5 per cent).

Uniformity of content. Complies with the tests stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Disperse one tablet in sufficient quantity of reference solution (a) and sufficient volume of solvent mixture with the aid of ultrasound for 10 minutes with intermediate shaking, centrifuge and dilute supernatant solution to obtain a solution containing 0.005 per cent w/v of azelnidipine and 0.0025 w/v of *2,2'-dinaphthylether*.

Inject reference solution (b) and the test solution.

Calculate the content of $C_{33}H_{34}N_4O_6$ in the tablets.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of *acetonitrile* and 20 volumes of *water.*

Test Solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 50 mg of Azelnidipine, disperse in 25.0 ml of reference solution (a) and 50 ml solvent mixture with the aid of ultrasound for 10 minutes with intermediate shaking and dilute to 100.0 ml with solvent mixture and mix. Centrifuge this solution and dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution (a). A 0.1 per cent w/v solution of *2, 2'-dinaphthylether* in the solvent mixture.

Reference solution (b). A 0.005 per cent w/v solution of *azelnidipine IPRS* and 0.0025 per cent w/v solution of reference solution (a) in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5µm),
- column temperature: 40°,
- mobile phase: a mixture of 30 volumes of a buffer solution prepared by dissolving 3.0 g of *potasium dihydrogen orthophosphate* in 1000 ml of *water* and 70 volumes of *acetonitrile,* adjusted to pH 6.0 with *dilute sodium hydroxide solution*,
- flow rate: 1ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

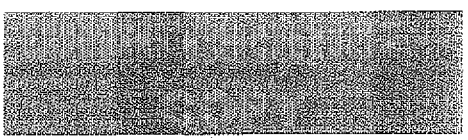
The retention time of azelnidipine and *2, 2'- dinaphthylether* are about 13 minutes and about 25 minutes respectively.

Inject reference solution (b). The test is not valid unless the resolution between azelnidipine and *2, 2'- dinaphthylether* is not less than 12.0 and the relative standard deviation for *2, 2'-dinaphthylether* and azelnidipine is not more than 1.0 per cent.

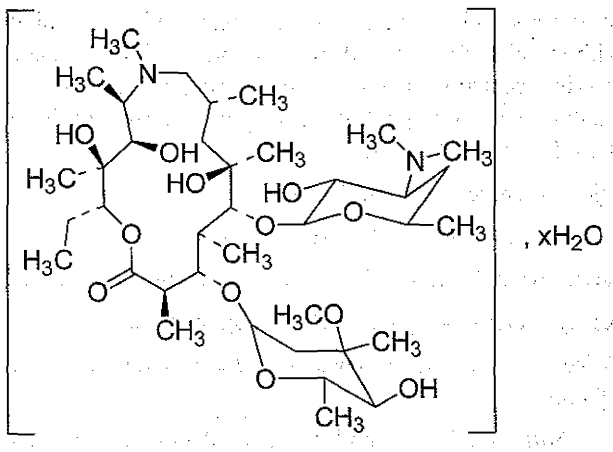
Inject reference solution (b) and the test solution.

Calculate the content of $C_{33}H_{34}N_4O_6$ in the tablets.

Storage. Store protected from light and moisture.



Azithromycin



$C_{38}H_{72}N_2O_{12}.xH_2O$ with x = 1 or 2 Mol. Wt. 749.0 (anhydrous)

Azithromycin is (2*R*,3*S*,4*R*,5*R*,8*R*,10*R*,11*R*,12*S*,13*S*,14*R*)-13-[2,6-dideoxy-3-*C*-methyl-3-*O*-methyl-α-L-*ribo*-hexopyranosyl)oxy]-2-ethyl-3,4,10-trihydroxy-3,5,6,8,10,12,14-heptamethyl-11-[[3,4,6-trideoxy-3-(dimethylamino)-β-D-*xylo*-hexopyranosyl]oxy]-1-oxa-6-azacyclopentadecan-15-one monohydrate or dihydrate.

Azithromycin contains not less than 96.0 per cent and not more than 102.0 per cent of $C_{38}H_{72}N_2O_{12}$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *azithromycin IPRS* or with the reference spectrum of azithromycin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Appearance of solution. Dissolve 0.5 g in *anhydrous ethanol* and dilute to 50.0 ml with the same solvent (solution A). Solution A is clear (2.4.1) and colourless (2.4.1).

pH (2.4.24). 9.0 to 11.0 determined in a solution prepared by dissolving 0.1 g in 25.0 ml of *methanol* and further diluting to 50.0 ml with *carbon dioxide-free water*.

Specific optical rotation (2.4.22). −49.0° to −45.0°, determined in solution A, at 20°.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. Prepare a 0.173 per cent w/v solution of *ammonium dihydrogen phosphate*, adjusted to pH 10.0 with *strong ammonia solution*. To 35 ml of the solution add 30 ml of *acetonitrile* and 35 ml of *methanol*. Mix well.

Test solution. Dissolve 0.2 g of the substance under examination in the solvent mixture and dilute to 25 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v of *azithromycin IPRS* and *6-demethyl-azithromycin IPRS (azithromycin impurity A)* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with end capped octadecylsilane amorphous organosilica polymer (5 µm),
- column temperature: 60°,
- mobile phase: A. a 0.18 per cent w/v solution of *anhydrous disodium hydrogen phosphate* with the pH adjusted to 8.9 with *dilute phosphoric acid* or with *dilute sodium hydroxide solution*,
  B. a mixture of 250 volumes of *methanol* and 750 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 50 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile Phase B (per cent v/v)

[1]azithromycin 3′- *N*-oxide,
[2]3′-(*N*,*N*-didemethyl)-3′-*N*-formylazithromycin,
[3]aminoazithromycin,
[4]3′-*N*-demethyl-3′-*N*- formylazithromycin,
[5]14-demethyl-14-(hydroxymethyl)azithromycin,
[6]13-*O*-decladinosylazithromycin,
[7]3′-*N*-demethylazithromycin,
[8]3″-*O*-demethylazithromycin,
[9]3′-de(dimethylamino)-3′-oxoazithromycin,
[10]3′-*N*-[[4-(acetylamino)phenyl]sulfonyl]-3′-*N*-demethylazithromycin
[11]6-demethylazithromycin,
[12]2-desethyl-2-propylazithromycin,
[13]3′-*N*-demethyl-3′-*N*-[(4-methylphenyl)sulfonyl]azithromycin,
[14]3-deoxyazithromycin.

Inject reference solution (b). The chromatogram obtained shows peaks corresponding to azithromycin and azithromycin impurity A. The test is not valid unless the resolution between these two peaks is at least 7.0.

Inject the test solution and reference solution (a). In the chromatogram obtained with the test solution, the area of any secondary peak eluting with relative retention time of about 1.3 due to 3-deoxyazithromycin (azithromycin impurity B) is not more than twice the area of principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent). The sum of the areas of all the other secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (3.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) ;ignore the peaks eluting before azithromycin impurity L and after azithromycin impurity B; ignore the peaks eluting before azithromycin impurity L and after azithromycin impurity B.

Heavy metals (2.3.13). 0.8 g complies with the limit test for heavy metals, Method B (25 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). 1.8 per cent to 6.5 per cent, determined on 0.2 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 40 volumes of *acetonitrile* and 60 volumes of *water*.

Test solution. Dissolve 0.1 g of the substance under examination in the solvent mixture and dilute to 100 ml with the solvent mixture.

Reference solution (a) . A 0.1 per cent w/v solution of *azithromycin IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v of *azithromycin IPRS* and *azithromycin impurity A IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with end capped polar embedded octadecylsilyl amorphous organosilica polymer (5 µm) (Such as Waters Xterra),
- column temperature: 70°,
- mobile phase: a mixture of 10 volumes of 3.484 per cent w/v solution of *dipotassium hydrogen phosphate* previously adjusted to pH 6.5 with *orthophosphoric acid*, 35 volumes of *acetonitrile* and 55 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 100 µl.

Inject reference solution (b). The chromatogram obtained shows peaks corresponding to azithromycin and azithromycin impurity A. The test is not valid unless the resolution between these two peaks is at least 7.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{38}H_{72}N_2O_{12}$.

Storage. Store protected from moisture.

Azithromycin Capsules

Azithromycin Capsules contain not less than 90.0 percent and not more than 110.0 percent of the stated amount of azithromycin, $C_{38}H_{72}N_2O_{12}$.

Usual strength. 500 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of a buffer solution prepared by adding to 6 litres of *0.1 M dibasic sodium phosphate* about 40 ml of

hydrochloric acid to adjusted to pH 6.0, adding 600 mg of *trypsin* and mixing.

Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14) as described under Assay using the following solutions.

Test solution. Use the filtrate, dilute if necessary, with the mobile phase.

Reference solution. A solution of *azithromycin IPRS* in the dissolution medium suitably diluted with the mobile phase to obtain a solution having the same concentration as that of the test solution.

Calculate the content of $C_{38}H_{72}N_2O_{12}$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{38}H_{72}N_2O_{12}$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. Prepare a 0.173 per cent w/v solution of *ammonium dihydrogen phosphate*, adjusted to pH 10.0 with *strong ammonia solution*. Transfer 35 ml of the solution, add 30 ml of *acetonitrile* and 35 ml of *methanol*. Mix well.

Test solution. Dissolve a suitable weighed quantity of the mixed contents of 20 capsules containing about 0.2 g of Azithromycin in the solvent mixture by shaking mechanically, dilute to 25.0 ml with the solvent mixture and filter.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v of *azithromycin IPRS* and *6-demethyl-azithromycin IPRS (azithromycin impurity A IPRS)* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with end-cappped octadecylsilyl amorphous organosilica polymer for mass spectrometry (5µm) (Such as Waters Xterra),
- column temperature: 60°,
- mobile phase: A. a solution of 0.18 per cent w/v solution of *anhydrous disodium hydrogen phosphate* with the pH adjusted to 8.9 with *dilute phosphoric acid* or with *dilute sodium hydroxide solution*,

  B. a mixture of 25 volumes of *methanol* and 75 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 50 µl.

[14]3-deoxyazithromycin.

Inject reference solution (b). The chromatogram obtained shows peaks corresponding to azithromycin and azithromycin impurity A. The test is not valid unless the resolution between these two peaks is at least 7.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak eluting with an relative retention time of about 1.3 due to 3-deoxyazithromycin (azithromycin impurity B) is not more than twice the area of principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent). The sum of the areas of all the other secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (3.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent); ignore the peaks eluting before azithromycin impurity L and after azithromycin impurity B.

Water (2.3.43). Not more than 5.0 per cent determined on 0.2 g of the contents of the capsules.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 40 volumes of *acetonitrile* and 60 volumes of *water*.

Test solution. Weigh a quantity of the mixed contents of 20 capsules containing about 0.1 g of Azithromycin, dissolve in about 75 ml of the solvent mixture by shaking mechanically, dilute to 100 ml with the solvent mixture and filter.

Reference solution(a). A 0.1 per cent w/v solution of *azithromycin IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v of *azithromycin IPRS* and *6-demethyl-azithromycin IPRS (azithromycin impurity A IPRS)* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with end capped polar embedded octadecylsilyl amorphous organosilica polymer (5 µm) (Such as Waters Xterra),
- column temperature: 70°,
- mobile phase: a mixture of 10 volumes of a 3.484 per cent w/v solution of *dipotassium hydrogen phosphate*, previously adjusted to pH 6.5 with *orthophosphoric acid*, 35 volumes of *acetonitrile* and 55 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 100 µl.

Inject reference solution (b). The chromatogram obtained shows peaks corresponding to azithromcyin and azithromycin impurity A. The test is not valid unless the resolution between these two peaks is at least 7.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{38}H_{72}N_2O_{12}$ in the capsules.

Storage. Store protected from moisture.

Azithromycin Eye Drops

Azithromycin Eye Drops is a sterile solution of Azithromycin in a suitable oily vehicle.

Azithromycin Eye Drops contain not less than 90.0 per cent and not more than 105.0 per cent of the stated amount of azithromycin, $C_{38}H_{72}N_2O_{12}$.

Usual strength. 1.0 per cent w/v.

Identification

A. Mix a quantity of the eye drops containing 100 mg of Azithromycin with 10 ml of *ethanol*. Allow to stand, retain the upper ethanolic layer and evaporate it to dryness under a stream of nitrogen. Wash the residue with 10 ml of *hexane* followed by a further 50 ml of *hexane* and allow to dry in air. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *azithromycin IPRS* treated in the same manner or with the reference spectrum of azithromycin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. 20 volumes of *dichloromethane* and 80 volumes of *methanol*.

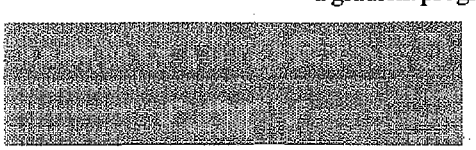
Test solution. Dilute a suitable volume of the eye drops with the solvent mixture to obtain a solution containing 0.8 per cent w/v of Azithromycin.

Reference solution (a). A 0.008 per cent w/v solution of *azithromycin IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v of *azithromycin IPRS* and *6-demethyl-azithromycin IPRS (azithromycin impurity A)* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with end-capped octadecylsilane amorphous organosilica polymer (5 µm) (Such as X-terra MS),
- column temperature: 60°,
- mobile phase: A. a 0.18 per cent w/v solution of *anhydrous disodium hydrogen phosphate*, adjusted to pH 8.9 with *dilute orthophosphoric acid* or with *dilute sodium hydroxide solution*,
  B. a mixture of 25 volumes of *methanol* and 75 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,



– flow rate: 1 ml per minute,
– spectrophotometer set at 210 nm,
– injection volume: 50 µl.

[13]3'-*N*-demethyl-3'-*N*-[(4-methylphenyl)sulfonyl]azithromycin,
[14]3-deoxyazithromycin.

Inject reference solution (b). The chromatogram obtained shows peaks corresponding to azithromycin and azithromycin impurity A. The test is not valid unless the resolution between these two peaks is at least 7.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak eluting with relative retention time of about 1.3 due to 3-deoxyazithromycin (azithromycin impurity B) is not more than twice the area of principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent) and the sum of the areas of all other secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (3.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). Ignore the peaks eluting before azithromycin impurity L and after azithromycin impurity B.

Other tests. Comply with the tests stated under Eye Drops.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 20 volumes of *dichloromethane* and 80 volumes of *methanol*.

Test solution. Dilute a volume of eye drops containing 0.05 g of Azithromycin to 100.0 ml with the solvent mixture.

Reference solution (a). A 0.05 per cent w/v solution of *azithromycin IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.05 per cent w/v, each of, *azithromycin IPRS* and *azithromycin impurity A IPRS* in the solvent mixture.

Chromatographic system
– a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane vinyl polymer (5µm) (Such as Asahipak ODP-50),
– column temperature: 40°,
– mobile phase: a mixture of 40 volumes of 0.67 per cent w/v solution of *dipotassium hydrogen orthophosphate*, adjusted to pH 11 with a 56 per cent w/v solution of *potassium hydroxide* and 60 volumes of *acetonitrile*,
– flow rate: 1 ml per minute,
– spectrophotometer set at 210 nm,
– injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to impurity A and azithromycin is not less than 1.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{38}H_{72}N_2O_{12}$ in the eye drops.

Azithromycin Oral Suspension

Azithromycin Oral Suspension is a dry mixture of Azithromycin with buffering agents and other excipients, or is a homogeneous suspension in a suitable vehicle.

The suspension is constituted by dispersing the contents of the sealed container in the specified volume of Water just before use.

Azithromycin Oral Suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of azithromycin, $C_{38}H_{72}N_2O_{12}$.

Usual strength. 40 mg per ml.

When stored at the temperature and for the period stated on the label during which the constituted suspension may be expected to be satisfactory for use, it contains not less than 80.0 per cent of the stated amount of azithromycin, $C_{38}H_{72}N_2O_{12}$.

The contents of the sealed container comply with the following test.

Water (2.3.43). Not more than 1.5 per cent, determined on 0.5 g.

Storage. Store protected from moisture.

The constituted suspension or the suspension complies with the tests stated under Oral liquids and with the following tests.

Identification

In the Assay, the retention time of the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 7.5 to 11.0.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. Prepare a 0.173 per cent w/v solution of *ammonium dihydrogen phosphate* with the pH adjusted to 10.0 with *strong ammonia solution*. Transfer 350 ml of the solution add 300 ml of *acetonitrile* and 350 ml of *methanol*. Mix well.

Test solution. Weigh a quantity of the oral suspension containing about 0.2 g of Azithromycin, dissolve in the solvent mixture, dilute to 50.0 ml with the solvent mixture and filter.

Reference solution (a). Dilute 1ml of the test solution to 100 ml with the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v of *azithromycin IPRS* and *6-demethyl-azithromycin IPRS (azithromycin impurity A IPRS)* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with end-cappped octadecylsilyl amorphous organosilica polymer for mass spectrometry (5µm) (Such as Waters Xterra),
- column temperature: 60°,
- mobile phase: A. a 0.18 per cent w/v solution of *anhydrous disodium hydrogen phosphate* with the pH adjusted to 8.9 with *dilute orthophosphoric acid* or with *dilute sodium hydroxide solution*,
  B. a mixture of 25 volumes of *methanol* and 75 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 100 µl.

Inject reference solution (b). The chromatogram obtained shows peaks corresponding to azithromcyin and azithromycin impurity A. The test is not valid unless the resolution between these two peaks is at least 7.0.

Inject reference solution (a) and the test solution.

Determine the weight per ml (2.4.29) of the suspension and calculate the content of $C_{38}H_{72}N_2O_{12}$, weight in volume.

Repeat the procedure using a portion of the constituted suspension that has been stored at the temperature and for the period stated on the label.

Azithromycin Tablets

Azithromycin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of azithromycin, $C_{38}H_{72}N_2O_{12}$.

Usual strengths. 250 mg; 500 mg.

Identification

In the Assay, the retention time of the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of a buffer solution prepared by adding to 6 litres of *0.1 M dibasic sodium phosphate* about 40 ml of *hydrochloric acid*, adjusted to pH 6.0, adding 600 mg of *trypsin*, and mixing.
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14) as described under Assay using the following solutions.

Test solution. Use the filtrate, dilute if necessary, with the mobile phase.

Reference solution. A solution of *azithromycin IPRS* in the dissolution medium suitably diluted with the mobile phase to obtain a solution having the same concentration as that of the test solution.

Inject the reference solution and the test solution.

Calculate the content of $C_{38}H_{72}N_2O_{12}$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{38}H_{72}N_2O_{12}$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. Prepare a 0.173 per cent w/v solution of *ammonium dihydrogen phosphate* with the pH adjusted to 10.0 with *strong ammonia solution*. Transfer 350 ml of the solution add 300 ml of *acetonitrile* and 350 ml of *methanol*. Mix well.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.2 g of Azithromycin, dissolve in the solvent mixture by shaking mechanically, dilute to 25.0 ml with the solvent mixture and filter.

Reference solution (a). A 0.008 per cent w/v solution of *azithromycin IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v of *azithromycin IPRS* and *azithromycin impurity A IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with end-cappped octadecylsilyl amorphous organosilica polymer for mass spectrometry (5 µm) (Such as Waters Xterra),
- column temperature: 60°,
- mobile phase: A. a 0.18 per cent w/v solution of *anhydrous disodium hydrogen phosphate*, adjusted to pH 8.9 with *dilute orthophosphoric acid* or with *dilute sodium hydroxide solution*,
  B. a mixture of 25 volumes of *methanol* and 75 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 50 µl.

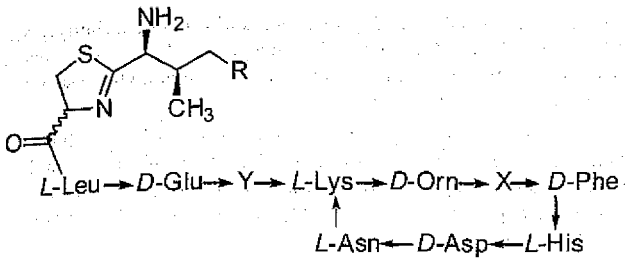
Inject reference solution (a) and the test solution.

Calculate the content of $C_{38}H_{72}N_2O_{12}$ in the tablets.

B

Bacitracin



Name	Mol. Formula	X	Y	R
Bacitracin A	$C_{66}H_{103}N_{17}O_{16}S$	*L*-Ile	*L*-Ile	CH_3
Bacitracin B1	$C_{65}H_{101}N_{17}O_{16}S$	*L*-Ile	*L*-Ile	H
Bacitracin B2	$C_{65}H_{101}N_{17}O_{16}S$	*L*-Val	*L*-Ile	CH_3
Bacitracin B3	$C_{65}H_{101}N_{17}O_{16}S$	*L*-Ile	*L*-Val	CH_3

Bacitracin is a mixture of polypeptides produced by the growth of certain strains of *Bacillus licheniformis* or *Bacillus subtilis*. Its main components are Bacitracin A, B1, B2 and B3.

Bacitracin has a potency of not less than 60 Units of bacitracin activity per mg, calculated on the dried basis.

Category. Antibacterial (for topical use).

Description. A white or almost white, hygroscopic powder.

Identification

Test A may be omitted if tests B and C are carried out. Test B may be omitted if tests A and C are carried out.

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 14 volumes of *glacial acetic acid*, 57 volumes of *butanol* and 29 volumes of *water*.

Test solution. Dissolve 10 mg of the substance under examination in 0.34 per cent w/v solution of *hydrochloric acid* and dilute to 1.0 ml with the same solution.

Reference solution. Dissolve 10 mg of *bacitracin zinc IPRS* in 0.34 per cent w/v solution of *hydrochloric acid* and dilute to 1.0 ml with the same solution.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise above half of the plate. Dry the plate at 105°, spray with *ninhydrin solution* and heat at 110° for 5 minutes. The principal spot obtained with the test solution corresponds to spot similar in position, size and colour that in the chromatogram obtained with reference solution.

B. In the test for Composition, the four principal peaks in the chromatogram obtained with the test solution correspond to the four peaks in the chromatogram obtained with reference solution (a).

C. Ignite 0.2 g an insignificant residue remains which is not yellow at high temperature. Allow to cool. Dissolve the residue in 0.1 ml of *dilute hydrochloric acid*, 5 ml of *water* and 0.2 ml of strong *sodium hydroxide solution*. No white precipitate is formed.

Tests

Appearance of solution. A 1.0 per cent w/v solution in *carbon dioxide-free water* (solution A) is clear (2.4.1).

pH (2.4.24). 6.0 to 7.0, determined in solution A.

Composition. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. Dissolve 4 g of *sodium edetate* in 100 ml of *water*, adjusted to pH 7.0 with *dilute sodium hydroxide solution*.

Test solution. Dissolve 0.1 g of the substance under examination in 50.0 ml of the mobile phase.

Reference solution (a). Dissolve 20 mg of *bacitracin for system suitability IPRS* in 10.0 ml of the solvent mixture.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 100.0 ml with the solvent mixture. Further dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution (c). Heat about 4 ml of reference solution (a) in a water-bath for 30 minutes. Cool to room temperature (to generate impurities E, F, G and H *in situ*).

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, end-capped, charged surface, ethylene-bridge octadecylsilane bonded to porous silica (3.5 µm),
- mobile phase: a mixture of 10 volumes of a buffer solution prepared by dissolving 27.2 g *potassium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 6.0 with 3.48 per cent w/v solution of *dipotassium hydrogen phosphate*, 4.3 volumes of *acetonitrile*, 30 volumes of *water* and 55.7 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 100 µl.

Name	Relative retention time

Inject reference solution (a). Identify the peaks due to impurity M, bacitracin A, bacitracin B1, bacitracin B2 and bacitracin B3.

Inject reference solution (a) and (b). The test is not valid unless the peak-to-valley ratio between the peaks due to bacitracin B1 and bacitracin B2 is not less than 1.2, where Hp is the height above the baseline of the peak due to bacitracin B2 and Hv is the height above the baseline of the lowest point of the curve separating this peak from the peak due to bacitracin B1 and between the peak due to impurity M and bacitracin B3 is not less than 1.1, where Hp is the height above the baseline of the peak due to impurity M and Hv is the height above the baseline of the lowest point of the curve separating from the peak due to bacitracin B3 in the chromatogram obtained with reference solution (a), the signal-to-noise ratio of the peak due to bacitracin A is not less than 50 in the chromatogram obtained with reference solution (b).

Inject the test solution. Run the chromatogram three times the retention time of the peak due to Bacitracin A. The area of the any peak corresponding to bacitracin A is not less than 45.0 per cent and the sum of the areas of the peaks due to bacitracin A, bacitracin B1, bacitracin B2 and bacitracin B3 is not less than 77 per cent. Ignore any peak with an area less than 0.25 per cent.

Related substances. Determine by liquid chromatography (2.4.14), as described under Composition with the following modifications.

Inject reference solution (a) and (c). Identify the peaks due to impurities A, B, C, L, M, N, O, P and Q in the chromatogram obtained with reference solution (a) and impurities E, F, G and H in the chromatogram obtained with reference solution (c).

Inject the test solution. The area of the any peak corresponding to impurity A is not more than 3.5 per cent, the area of the

peaks corresponding to impurities B and M, each of, is not more than 3.0 per cent, the area of any peak corresponding to impurity C is not more than 2.5 per cent, the area of any peak corresponding to impurity E is not more than 4.0 per cent, the sum of areas of the peaks corresponding to impurities O, P and Q is not more than 2.5 per cent, the sum of areas of the peaks corresponding to impurities F and G is not more than 2.0 per cent, the area of any peak corresponding to impurity H is not more than 1.0 per cent, the sum of areas of peaks corresponding to L and N is not more than 8.0 per cent and the area of any other secondary peak is not more than 2.0 per cent and the sum of areas of all the secondary peaks is not more than 23.0 per cent. Ignore any peak with an area less than 0.25 per cent.

Sulphated ash (2.3.18). Not more than 1.0 per cent.

Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 1.0 g by drying under vacuum over *phosphorus pentoxide* at 60° at a pressure not exceeding 0.1 kPa for 3 hours.

Assay. Determine by the microbiological assay of antibiotics, Method A (2.2.10). Use *bacitracin zinc IPRS* as the reference.

Bacitracin intended for use in the manufacture of Opthalmic Preparations without a further appropriate sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

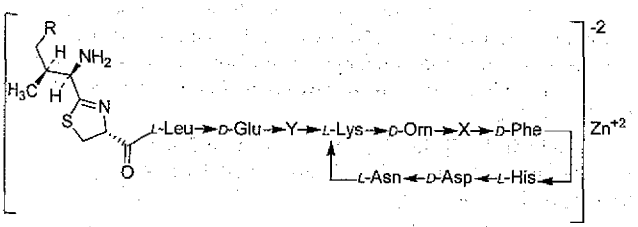
Bacitracin intended for use in the manufacture of Opthalmic Preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.8 Endotoxin Unit per mg of bacitracin.

Storage. Store protected from moisture, at a temperature between 2° to 8°. If the solution is sterile, the container is also sterile and temper-evident.

Labelling. The label states (1) the number of Units per mg; (2) whether or not the contents are intended for use in the manufacture of ophthalmic preparations.

Bacitracin Zinc



Name	Mol. Formula	X	Y	R
Bacitracin A	$C_{66}H_{103}N_{17}O_{16}S$	*L*-Ile	*L*-Ile	CH_3
Bacitracin B1	$C_{65}H_{101}N_{17}O_{16}S$	*L*-Ile	*L*-Ile	H
Bacitracin B2	$C_{65}H_{101}N_{17}O_{16}S$	*L*-Val	*L*-Ile	CH_3
Bacitracin B3	$C_{65}H_{101}N_{17}O_{16}S$	*L*-Ile	*L*-Val	CH_3

Bacitracin Zinc is zinc complex of bacitracin consists of a mixture of antimicrobial polypeptides produced by certain strains of *Bacillus licheniformis* or *Bacillus subtilis*. Its main components are Bacitracin A, B1, B2 and B3.

Bacitracin Zinc has a potency of not less than 60 Units of bacitracin activity per mg, calculated on the dried basis.

Category. Antibacterial (for topical use).

Description. A white or light yellowish-grey, hygroscopic powder.

Identification

Test A may be omitted if tests B and C are carried out. Test B may be omitted if tests A and C are carried out.

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 14 volumes of *glacial acetic acid*, 57 volumes of *butanol* and 29 volumes of *water*.

Test solution. Dissolve 10 mg of the substance under examination in 0.34 per cent w/v solution of *hydrochloric acid* and dilute to 1.0 ml with the same solution.

Reference solution. Dissolve 10 mg of *bacitracin zinc IPRS* in 0.34 per cent w/v solution of *hydrochloric acid* and dilute to 1.0 ml with the same solution.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise above half of the plate. Dry the plate at 105°, spray with *ninhydrin solution* and heat at 110° for 5 minutes. The principal spot obtained in the test solution corresponds to spot similar in position, size and colour that in the chromatogram obtained with the reference solution.

B. In the test for Composition, the four principal peaks in the chromatogram obtained with the test solution correspond to the four peaks in the chromatogram obtained with reference solution (a).

C. Ignite 0.15 g and allow to cool. Dissolve the residue in 1 ml of *dilute hydrochloric acid* and add 4 ml of *water*. The solution gives the reaction of zinc (2.3.1).

Tests

pH (2.4.24). 6.0 to 7.5, determined on the filtrate obtained by shaking 1.0 g for about 1 minutes with 10 ml of *carbon dioxide-free water* and filter.

Composition. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. Dissolve 4 g of *disodium edetate* in 100 ml of *water*, adjusted to pH 7.0 with *dilute sodium hydroxide solution*.

Test solution. Dissolve 0.1 g of the substance under examination in 50.0 ml of the solvent mixture.

Reference solution (a). Dissolve 20 mg of *bacitracin for system suitability IPRS* in 10.0 ml of the solvent mixture.

Reference solution (b). Dilute 5.0 ml of the reference solution (a) to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution (c). Heat about 4 ml of reference solution (a) on a water-bath for 30 minutes. Cool to room temperature (to generate impurities E, F, G and H *in situ*).

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with end-capped, charged surface, ethylene bridged octadecylsilane bonded to porous silica (3.5 µm),
- mobile phase: a mixture of 10 volumes of a buffer solution prepared by dissolving 27.2 g *potassium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 6.0 with 3.5 per cent w/v solution of *dipotassium hydrogen phosphate*, 4.3 volumes of *acetonitrile*, 30 volumes of *water* and 55.7 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 100 µl.

Inject reference solution (a). Identify the peaks due to impurity M, bacitracin A, bacitracin B1, bacitracin B2 and bacitracin B3.

Inject reference solution (a) and (b). The test is not valid unless the peak-to-valley ratio between the peaks due to bacitracin B1 and bacitracin B2 is not less than 1.2, where Hp is the height above the baseline of the peak due to bacitracin B2 and Hv is height above the baseline of the lowest point of the curve separating this peak from the peak due to bacitracin B1 and between the peaks due to impurity M and bacitracin B3 is not less than 1.1, where Hp is height above the baseline of the peak due to impurity M and Hv is height above the baseline of the lowest point of the curve separating this peak from the peak due to bacitracin B3 in the chromatogram obtained with reference solution (a). The signal-to-noise ratio of the peak due to bacitracin A is not less than 50 in the chromatogram obtained with reference solution (b).

Inject the test solution. Run the chromatogram three times the retention time of the peak due to Bacitracin A. The area of the any peak corresponding to Bacitracin A is not less than 45.0 per cent and the sum of area of the peaks due to bacitracin A, bacitracin B1, bacitracin B2 and bacitracin B3 is not less than 77 per cent. Ignore any peak with an area less than 0.25 per cent.

Related substances. Determine by liquid chromatography (2.4.14), as described under Composition with the following modifications.

Inject reference solution (a) and (c). Identify the peaks due to impurities A, B, C, L, M, N, O, P and Q in the chromatogram obtained with reference solution (a) and impurities E, F, G and H in the chromatogram obtained with reference solution (c).

Inject the test solution. The area of the any peak corresponding to impurity A is not more than 3.5 per cent, the area of the peaks corresponding to impurities B and M, each of, is not more than 3.0 per cent, the area of any peak corresponding to impurity C is not more than 2.5 per cent, the area of any peak corresponding to impurity E is not more than 4.0 per cent, the sum of areas of the peaks corresponding to impurities O, P and Q is not more than 2.5 per cent, the sum of areas of the peaks corresponding to impurities F and G is not more than 2.0 per cent, the area of any peak corresponding to impurity H is not more than 1.0 per cent, the sum of areas of peaks corresponding to L and N is not more than 8.0 per cent and the area of any other secondary peak is not more than 2.0 per cent and the sum of areas of all the secondary peaks is not more than 23.0 per cent. Ignore any peak with an area less than 0.25 per cent.

Zinc. 3.5 to 5.5 per cent, calculated on dried basis, determined on 0.2 g in a mixture of 2.5 ml of *dilute acetic acid* and 2.5 ml of *water*. Add 50 ml of *xylenol orange triturate* and sufficient *hexamethylenetetramine* to produce a red colour. Add 2 g of *hexamethylenetetramine* in excess. Titrate with *0.01 M disodium edetate* until a yellow colour is obtained.

1 ml of *0.01 M disodium edetate* is equivalent to 0.000654 g of Zn.

Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 1.0 g by drying in an vacuum over *phosphorus pentoxide* at 60° at a pressure not exceeding 0.1 kPa for 3 hours.

Assay. Weigh 50 mg, suspend in 5 ml of *water*, add 0.5 ml of *dilute hydrochloric acid* and dilute to 100.0 ml with *water*. Allow to stand at room temperature for 30 minutes. Determine by the microbiological assay of antibiotics, Method A (2.2.10), and express the results in Units per mg.

Pyrogens (2.2.8). If intended for administration by spraying into internal body cavities without a further appropriate procedure for the removal of pyrogens, it complies with the test for pyrogens. Inject per kilogram of the rabbit's mass 1 ml of the supernatant liquid obtained by centrifuging a suspension containing 11mg per millilitre in a 0.9 per cent w/v solution of *sodium chloride*.

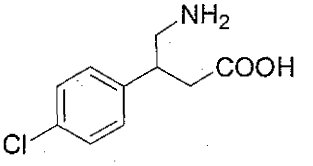
Bacitracin Zinc intended for administration as a spray in internal body cavities without a further appropriate sterilization procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from moisture at a temperature not exceeding 30°. If the solution is sterile, the container is also sterile and sealed so as to exclude micro-organisms.

Labelling. The label states (1) the number of Units per mg; (2) whether or not the contents are intended for administration as a spray in internal body cavities.

Baclofen



$C_{10}H_{12}ClNO_2$ Mol. Wt. 213.7

Baclofen is (*RS*)-4-amino-3-(4-chlorophenyl)butyric acid.

Baclofen contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{10}H_{12}ClNO_2$, calculated on the anhydrous basis.

Category. Muscle relaxant.

Description. A white or almost white powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *baclofen IPRS or* with the refernce spectrum of baclofen.

B. When examined in the range 220 nm to 320 nm (2.4.7), a 0.07 per cent w/v solution shows three absorption maxima, at 259 nm, 266 nm and 275 nm. The specific absorbances at these maxima are 9.8 to 10.8, 11.5 to 12.7 and 8.4 to 9.3, respectively.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 5 volumes of *anhydrous formic acid*, 5 volumes of *water*, 20 volumes of *methanol*, 30 volumes of *chloroform* and 40 volumes of *ethyl acetate*.

Test solution. Dissolve 10 mg of the substance under examination in the mobile phase and dilute to 10 ml with the mobile phase.

Reference solution. A 0.1 per cent w/v solution of *baclofen IPRS* in the mobile phase.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate and spray with *ninhydrin solution* until the plate is slightly wet. Place the plate in an oven maintained at 100° for 10 minutes. Examine in daylight. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Appearance of solution. Dissolve 0.5 g in *1 M sodium hydroxide* and dilute to 25 ml with the same solvent. The freshly prepared solution is not more intensely coloured than reference solution BY5 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 10 ml with the mobile phase.

Reference solution (a). A 0.25 per cent w/v solution of *(4RS)-4-(4-chlorophenyl)pyrrolidin-2-one IPRS* (baclofen impurity A) in the mobile phase.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with the mobile phase.

Reference solution (c). Dilute 2 ml of the test solution to 100 ml with the mobile phase.

Reference solution (d). Dilute 2 ml of the test solution and 2 ml of reference solution (a) to 100 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a solution of 1.822 g of *sodium hexanesulphonate* in 1000 ml of a mixture of 56 volumes of *water*, 44 volumes of *methanol* and 0.5 ml of *glacial acetic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 266 nm,
- injection volume: 20 µl.

Inject reference solution (d). The test is not valid unless the resolution between the peaks corresponding to baclofen and impurity A is at least 2.0.

Inject reference solution (b), (c) and the test solution. Continue the chromatography for 5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of the peak corresponding to baclofen impurity A is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of the areas of all such peaks is not greater than the area of the principal peak in the chromatogram obtained with reference solution (c) (2.0 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 1.0 g.

Assay. Weigh 0.15 g and dissolve in 50 ml of *anhydrous acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02137 g of $C_{10}H_{12}ClNO_2$.

Storage. Store protected from moisture.

Baclofen Oral Solution

Baclofen Oral Solution is a solution of Baclofen in a suitable aqueous vehicle.

Baclofen Oral Solution contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of baclofen, $C_{10}H_{12}ClNO_2$.

Usual strength. 1 mg per ml.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. 35 volumes of *acetonitrile* and 65 volumes of *water*.

Mobile phase. A mixture of 20 volumes of *glacial acetic acid*, 20 volumes of *water* and 80 volumes of *butan-1-ol*.

Test solution. Dilute a volume of the oral solution containing 5 mg of Baclofen to 100 ml with the solvent mixture.

Reference solution. A 0.005 per cent w/v solution of *baclofen IPRS* in the solvent mixture.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate in air. Place an evaporating dish containing a mixture of 4 ml of *water*, 1 ml of *7 M hydrochloric acid* and 0.5 g of *potassium permanganate* in a chromatography tank, close the tank and allow to stand for 2 minutes. Place the plate in the tank, close the tank and leave the plate in contact with the vapour for 1 minute. After removal of the plate, place it in a current of cold air until an area of coating below the line of application shows only a faint blue colour on the addition of 0.05 ml of *potassium iodide and starch solution*. Spray the plate with *potassium iodide and starch solution* and examine in daylight. The chromatogram obtained with the test solution exhibits a spot that corresponds to the spot in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Lactam. Determine by liquid chromatography (2.4.14) as described under Assay using the following solutions.

Test solution. Use the test solution prepared for the Assay.

Reference solution (a). A solution containing 0.0002 per cent w/v of *(4RS)-4-(4-chlorophenyl)pyrrolidin-2-one IPRS (baclofen impurity A)* in the mobile phase.

Reference solution (b). A solution containing 0.01 per cent w/v of *baclofen IPRS*, 0.0003 per cent w/v of *propyl 4-hydroxybenzoate*, 0.0003 per cent w/v of *methyl 4-hydroxybenzoate* and 0.0002 per cent w/v of *baclofen impurity A* in the mobile phase.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to methyl-4-hydroxybenzoate and baclofen impurity A and between the peaks due to baclofen impurity A and propyl-4-hydroxybenzoate is not less than 5.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution the area of any peak corresponding to baclofen impurity A (lactam) is not greater than the area of the peak in the chromatogram obtained with reference solution (a) (2.0 per cent).

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14):

Test solution. Dilute a weighed quantity of the oral solution containing about 5 mg of Baclofen to 50.0 ml with the mobile phase.

Reference solution (a). A 0.01 per cent w/v solution of *baclofen IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.01 per cent w/v of *baclofen IPRS*, 0.0003 per cent w/v of *propyl 4-hydroxybenzoate* and 0.0002 per cent w/v of *baclofen impurity A IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm) (Such as Nucleosil C18),
- mobile phase: a solution prepared by dissolving 5 g of *sodium dodecyl sulphate* in a mixture of 5 ml of *orthophosphoric acid* and 650 ml of *water* and diluting to 1000 ml with *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 218 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to baclofen impurity A and propyl-4-hydroxybenzoate is not less than 5.0 and the relative standard deviation for replicate injections for baclofen peak is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Determine the weight per ml (2.4.29) of the oral solution and calculate the content of $C_{10}H_{12}ClNO_2$, weight in volume.

Storage. Store protected from light, at a temperature not exceeding 30°. Do not freeze.

Baclofen Tablets

Baclofen tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of baclofen, $C_{10}H_{12}ClNO_2$.

Usual strengths. 10 mg; 20 mg.

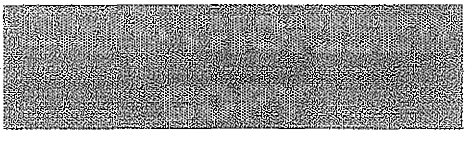
Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. 4 volumes of *ethanol* and 1 volume of *glacial acetic acid*.

Mobile phase. A mixture of 80 volumes of *butan-1-ol*, 20 volumes of *glacial acetic acid* and 20 volumes of *water*.

Test solution. Disperse a quantity of the powdered tablets containing 20 mg of Baclofen with 20 ml of the solvent mixture for 30 minutes and filter.



Reference solution. A 0.1 per cent w/v solution of *baclofen IPRS* in the solvent mixture.

Apply to the plate 5 µl of each solution. After development, dry the plate in air, spray with *ninhydrin solution* and heat at 100° for 10 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Lactam. Determine by liquid chromatography (2.4.14).

Test solution. Mix with the aid of ultrasound a quantity of the powdered tablets containing 0.1 g of Baclofen with 50 ml of the mobile phase for 30 minutes, shaking occasionally to disperse the sample, and filter through a glass-fibre filter (such as Whatman GF/C).

Reference solution (a). A solution containing 0.004 per cent w/v of *(4RS)-4-(4-chlorophenyl)pyrrolidin-2-one IPRS (baclofen impurity A)* in the mobile phase.

Reference solution (b). A solution containing 0.2 per cent w/v of *baclofen IPRS* and 0.004 per cent w/v of *(4RS)-4-(4-chlorophenyl)pyrrolidin-2-one IPRS* (baclofen impurity A) in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm) (Such as Spherisorb ODS 1),
- mobile phase: a mixture of 5 volumes of *glacial acetic acid*, 44 volumes of *methanol* and 50 volumes of water containing 1.822 g per litre of *sodium hexanesulphonate*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 266 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to baclofen and baclofen impurity A is at least 2.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of any peak corresponding to baclofen impurity A (lactam) is not greater than the area of the peak in the chromatogram obtained with reference solution (a) (2.0 per cent).

Dissolution (2.5.2)

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14) as described under Assay using the following solutions.

Test solution. Use the filtrate as given above.

Reference solution. A 0.001 per cent w/v solution of *baclofen IPRS* in the dissolution medium.

Calculate the content of $C_{10}H_{12}ClNO_2$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{10}H_{12}ClNO_2$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Add a quantity of whole tablets containing 0.1 g of Baclofen to 25 ml of a mixture of 100 volumes of *water* and 1 volume of *glacial acetic acid* and disperse with the aid of ultrasound. Dilute to 50.0 ml with *methanol*, filter and use the filtrate.

Reference solution. A 0.2 per cent w/v solution of *baclofen IPRS* in a mixture of 100 volumes of *methanol*, 100 volumes of *water* and 1 volume of *glacial acetic acid*.

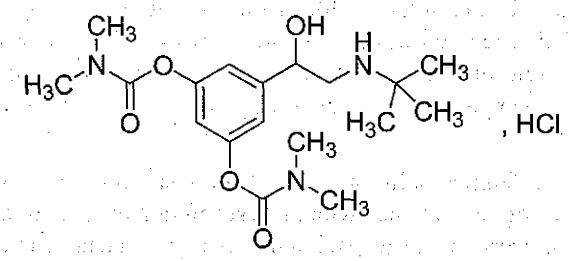
Chromatographic system
- a stainless steel column 20 cm × 4.6 mm, packed with octadecylsilyl silica gel (10 µm) (such as Nucleosil C18),
- mobile phase: *0.01 M sodium hexanesulphonate* in a mixture of 100 volumes of *methanol*, 100 volumes of *water* and 1 volume of *glacial acetic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{12}ClNO_2$, in the tablets.

Bambuterol Hydrochloride



$C_{18}H_{29}N_3O_5,HCl$ Mol Wt. 403.9

Bambuterol Hydrochloride is 5-[(1*RS*)-2-[(1, 1-dimethylethyl) amino]-1-hydroxyethyl]-1,3-phenylene bis(dimethyl-carbamate) hydrochloride.

Bambuterol Hydrochloride contains not less than 98.5 per cent and not more than 101.5 per cent of the $C_{18}H_{29}N_3O_5$,HCl calculated on the anhydrous basis.

Category. Bronchodilator.

Description. A white or almost white, crystalline powder .It shows polymorphism (2.5.11).

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *bambuterol hydrochloride IPRS* or with the reference spectrum of bambuterol hydrochloride. If the sample spectrum shows differences in the position of the absorption maximum as compared to reference spectrum, treat the sample and reference substance as follows. Dissolve the substance under examination in a mixture of 1 volume of *water* and 6 volumes of *acetone*, cool in ice to precipitate and dry precipitate in vacuum at 50°. On the residue, determine by infrared absorption spectrophotometry (2.4.6) and compare the spectra.

B. It gives reaction (A) of chlorides (2.3.1).

Tests

Acidity or alkalinity. To 10 ml of 20 per cent w/v solution in *carbon dioxide-free water*, add 0.2 ml of *methyl red solution* and 0.2 ml of *0.01 M hydrochloric acid*; the solution is red. Add 0.4 ml of *0.01 M sodium hydroxide*; the solution is yellow.

Optical rotation (2.4.22). – 0.10° to + 0.10°, determined on 2.0 per cent w/v solution in *carbon dioxide-free water*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 5 mg of the substance under examination in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a) A 0.01 per cent w/v solution of *formoterol fumarate dihydrate IPRS* in the mobile phase. Mix 0.8 ml of the solution with 0.4 ml of the test solution and dilute to 100.0 ml with the mobile phase.

Reference solution (b) Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 2.0 ml of the solution to 20.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with base-deactivated octadecylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 1.3 g of *sodium octanesulphonate* in 430 ml of a mixture of 25 volumes of *acetonitrile* and 75 volumes of *methanol* and 570 ml of a buffer solution prepared by dissolving 6.9 g of *sodium dihydrogen phosphate monohydrate* in *water* and dilute to 1000 ml with *water*, adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 214 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks corresponding to bambuterol and formoterol is not less than 5.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of areas of all the secondary peaks is not more than three times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.6 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 0.5 g.

Assay. Dissolve 0.32 g in 50 ml of *ethanol (95 per cent)*, add 5 ml of *0.01 M hydrochloric acid* and titrate with *0.1 M sodium hydroxide*, determining the end- point potentiometrically (2.4.25). Read the volume added between the two points of inflection.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.04039 g of $C_{18}H_{29}N_3O_5$,HCl.

Bambuterol Tablets

Bambuterol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of bambuterol hydrochloride, $C_{18}H_{29}N_3O_5$,HCl.

Usual strengths. 10 mg; 20 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a weighed quantity of *bambuterol hydrochloride IPRS* in the mobile phase and dilute with dissolution medium to obtain a solution having a known concentration similar to the test solution.

Use chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{29}N_3O_5$,HCl in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{18}H_{29}N_3O_5$,HCl.

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Disperse a quantity of powdered tablets containing 50 mg of Bambuterol Hydrochloride in 20 ml of the mobile phase, with the aid of ultrasound for 15 minutes and dilute to 100.0 ml with the mobile phase, filter. Dilute 5.0 ml of the solution to 10.0 ml with the mobile phase.

Inject the test solution. The area of any secondary peak is not more than 0.5 per cent and the sum of the areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalization method.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), using the chromatographic system as described under Assay.

Test solution. Disperse one tablet in 50 ml of the mobile phase with the aid of ultrasound for 10 minutes and dilute to 100.0 ml with the mobile phase.

Reference solution. Prepare a solution using *bambuterol hydrochloride IPRS* in the mobile phase to obtain the same concentration as expected in the test solution.

Calculate the content of $C_{18}H_{29}N_3O_5$.HCl in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powdered tablets containing 50 mg of Bambuterol Hydrochloride in 20 ml of the mobile phase, with the aid of ultrasound for 15 minutes and dilute to 100.0 ml with the mobile phase, filter. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.005 per cent w/v solution of *bambuterol hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 1.3 g of *sodium octane sulphonate* in 430 ml of a mixture of 25 volumes of *acetonitrile* with 75 volumes of *methanol* and 570 ml of *0.05 M phosphate buffer pH 3.0*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 214 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{29}N_3O_5$,HCl in the tablets.

Barium Sulphate

$BaSO_4$ Mol. Wt. 233.4

Category. Diagnostic aid (radio-opaque medium for gastrointestinal tract).

Description. A fine, heavy, white powder, free from gritty particles; odourless.

Identification

A. Boil 0.2 g with 5 ml of a 50 per cent w/v solution of *sodium carbonate* for 5 minutes, add 10 ml of *water* and filter. Reserve the residue for test B. Acidify the filtrate with *dilute hydrochloric acid*; the solution gives the reactions of sulphates (2.3.1).

B. Wash the residue obtained in test A three times with successive small quantities of *water*. To the residue add 5 ml of *dilute hydrochloric acid*, filter and add to the filtrate 0.3 ml of *dilute sulphuric acid*; a white precipitate is formed which is insoluble in *dilute sodium hydroxide solution*.

Tests

Acidity or alkalinity. Heat 5.0 g with 20 ml of *carbon dioxide-free water* on a water-bath for 5 minutes and filter. To 10 ml of the filtrate add 1 drop of *bromothymol blue solution*. Not more than 0.5 ml of *0.01 M hydrochloric acid* or *0.01 M sodium hydroxide* is required to change the colour of the solution.

Arsenic (2.3.10). Disperse 5.0 g in 50 ml of *water* and add 10 ml of *stannated hydrochloric acid AsT*. The resulting solution complies with the limit test for arsenic (2 ppm).

Heavy metals (2.3.13). Boil 4.0 g with a mixture of 2 ml of *glacial acetic acid* and 48 ml of *water* for 10 minutes. Add *water* to

make upto 50 ml, filter and reject the first 5 ml of the filtrate. 25 ml of the filtrate complies with the limit test for heavy metals, Method A (10 ppm).

Loss on ignition (2.4.20). Not more than 2.5 per cent, determined on 1.0 g at 600°.

Phosphate. Boil 1 g with a mixture of 3 ml of *nitric acid* and 5 ml of *water* for 5 minutes and add *water* to restore the original volume. Filter through a filter paper previously washed with *dilute nitric acid*. Add to the warm filtrate an equal volume of *ammonium molybdate solution*; no yellow precipitate is formed.

Sulphide. Boil 10 g with a mixture of 10 ml of *dilute hydrochloric acid* and 90 ml of *water* for 10 minutes. Expose a *lead acetate paper* to the vapours; the paper does not darken.

Acid-soluble substances. Cool the mixture obtained in the test for Sulphide, add *water* to restore the original volume and filter through a filter paper previously washed with a mixture of 10 ml of *dilute hydrochloric acid* and 90 ml of *water*, returning the first portions, if necessary, to obtain a clear filtrate. Evaporate 50 ml of the filtrate to dryness on a water-bath and add 2 drops of *hydrochloric acid* and 10 ml of hot *water*. Filter again through acid-washed paper, prepared as directed above, wash the filter paper with 10 ml of hot *water* and evaporate the combined filtrate and washings. Dry the residue at 105°, cool and weigh (0.3 per cent).

Soluble barium salts. Digest the residue obtained in the test for Acid-soluble substances with 10 ml of *water* and filter through a filter paper previously washed with a mixture of 10 ml of *dilute hydrochloric acid* and 90 ml of *water*. Add 0.5 ml of *dilute sulphuric acid* to the clear filtrate and set aside for 30 minutes; no turbidity is produced.

Barium Sulphate Oral Suspension

Barium Sulphate Oral Suspension is a suspension of Barium Sulphate in a suitable aqueous vehicle.

Barium Sulphate Oral Suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of barium sulphate, $BaSO_4$.

Description. A smooth, white or creamy white suspension.

Identification

Evaporate 1 ml to dryness and ignite to constant weight. The residue complies with the following tests.

A. To 0.2 g, add 5 ml of a 50 per cent w/v solution of *sodium carbonate* and boil for 5 minutes, add 10 ml of *water* and filter. Reserve the residue for test B. Acidify the filtrate with *2 M hydrochloric acid*. The solution gives the reactions of sulphates (2.3.1).

B. Wash the residue reserved in test A with *water*, add 5 ml of *2 M hydrochloric acid*, mix well and filter. Add 0.3 ml of *1 M sulphuric acid* to the filtrate. A white precipitate is produced which is insoluble in *2 M hydrochloric acid*.

Tests

pH (2.4.24). 3.5 to 8.5.

Microbial contamination (2.2.9). The total aerobic viable count is not more than 100 cfu per ml, the total combined molds and yeasts count is not more than 10 cfu per ml. 1 g is free from *staphylococcus aureus*, and *pseudomonas aeruginosa* and 10 g is free from *salmonella* species.

Other tests. Comply with the tests stated under Oral liquids.

Assay. Evaporate to dryness a quantity containing 0.6 g of Barium Sulphate in a platinum dish on a water-bath and add 5 g of *sodium carbonate* and 5 g of *potassium carbonate sesquihydrate* and mix. Heat to 100° and maintain at this temperature for 15 minutes. Allow to cool and suspend the residue in 150 ml of *water*. Wash the crucible with 2 ml of *6 M acetic acid* and add the washings to the suspension. Cool in ice and filter by decantation, transferring as little of the solid matter as possible to the filter. Wash the residue with successive quantities of a 2 per cent w/v solution of *sodium carbonate* until the washings are free from sulphate and discard the washings. Add 5 ml of *2M hydrochloric acid* to the filter and wash through into the vessel containing the bulk of the solid matter with *water*. Add 5 ml of *hydrochloric acid* and dilute to 100 ml with *water*. Add 10 ml of a 40 per cent w/v solution of *ammonium acetate*, 25 ml of a 10 per cent w/v solution of *potassium dichromate* and 10 g of *urea*. Cover, digest in an oven at 80° to 85° for 16 hours and filter whilst still hot through a sintered-glass filter (porosity No. 4), washing the precipitate initially with a 0.5 per cent w/v solution of *potassium dichromate* and finally with 2 ml of *water*. Dry to constant weight at 105°.

1 g of the residue is equivalent to 0.9213 g of $BaSO_4$.

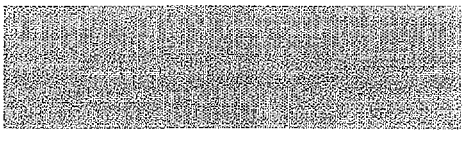
Determine the weight per ml of the oral suspension (2.4.29) and calculate the content of $BaSO_4$, weight in volume.

Barium Sulphate for Suspension

Barium Sulphate for Suspension is a dry mixture of Barium Sulphate with suitable dispersing agents and may contain suitable flavours and suitable antimicrobial preservatives.

Barium Sulphate for Suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of barium sulphate, $BaSO_4$.

Description. A fine, white or creamy white powder.



Identification

A. Ignite 1 g to constant weight. To 0.2 g of the residue, add 5 ml of a 50 per cent w/v solution of *sodium carbonate* and boil for 5 minutes, add 10 ml of *water* and filter. Reserve the residue for test B. Acidify the filtrate with *2 M hydrochloric acid*; the solution gives the reactions of sulphates (2.3.1).

B. Wash the residue obtained in test A with *water*, add 5 ml of *2 M hydrochloric acid*, filter. Add to the filtrate, 0.3 ml of *1 M sulphuric acid*; a white precipitate is produced which is insoluble in *2 M hydrochloric acid*.

Tests

pH (2.4.24). 3.5 to 8.5, determined in a suspension containing 60 per cent w/v Barium Sulphate in *water*.

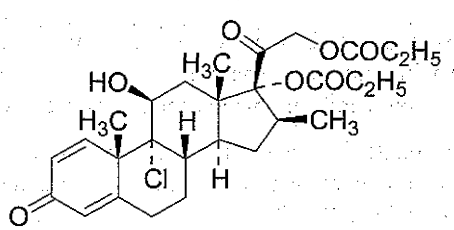
Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

Other tests. Comply with the tests stated under Oral Liquids.

Assay. To a quantity containing 0.6 g of Barium Sulphate in a platinum crucible, add 5 g of *sodium carbonate* and 5 g of *potassium carbonate sesquihydrate* and mix. Heat to 100° and maintain at this temperature for 15 minutes. Allow to cool and suspend the residue in 150 ml of *water*. Wash the crucible with 2 ml of *6 M acetic acid* and add the washings to the suspension. Cool in ice and filter by decantation, transferring as little of the solid matter as possible to the filter. Wash the residue with successive quantities of a 2 per cent w/v solution of *sodium carbonate* until the washings are free from sulphate and discard the washings. Add 5 ml of *2 M hydrochloric acid* to the filter and wash through into the vessel containing the bulk of the solid matter with *water*. Add 5 ml of *hydrochloric acid* and dilute to 100 ml with *water*. Add 10 ml of a 40 per cent w/v solution of *ammonium acetate*, 25 ml of a 10 per cent w/v solution of *potassium dichromate* and 10 g of *urea*. Cover, digest in an oven at 80° to 85° for 16 hours and filter whilst still hot through a sintered-glass filter (porosity No. 4), washing the precipitate initially with a 0.5 per cent w/v solution of *potassium dichromate* and finally with 2 ml of *water*. Dry to constant weight at 105°.

1 g of the residue is equivalent to 0.9213 g of $BaSO_4$.

Beclomethasone Dipropionate



$C_{28}H_{37}ClO_7$ Mol. Wt. 521.1

Beclomethasone Dipropionate is 9α-chloro-11β-hydroxy-16β-methyl-3,20-dioxopregna-1,4-diene-17,21-diyl dipropionate.

Beclomethasone Dipropionate is anhydrous or contains one molecule of water of hydration.

Beclomethasone Dipropionate contains not less than 96.0 per cent and not more than 103.0 per cent of $C_{28}H_{37}ClO_7$, calculated on the dried basis.

Category. Adrenocortical steroid.

Description. A white to creamy-white, crystalline powder; odourless.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *beclomethasone dipropionate IPRS* or with the reference spectrum of beclomethasone dipropionate.

B. Determine by the oxygen flask method (2.3.34), on 25 mg and use a mixture of 20 ml of *water* and 1 ml of *1 M sodium hydroxide* as the absorbing liquid. The liquid gives reaction (A) of chlorides (2.3.1).

C. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). + 88.0° to + 94.0°, determined in a 1.0 per cent w/v solution in *dioxan*.

Light absorption. Dissolve 50.0 mg in sufficient *ethanol (95 per cent)* to produce 100.0 ml and dilute 2.0 ml of the solution to 50.0 ml with the same solvent. Absorbance of the resulting solution at the maximum at about 238 nm, 0.57 to 0.60 (2.4.7).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent for anhydrous form; 2.8 per cent to 3.8 percent for monohydrate form, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh 70 mg of the substance under examination, dissolve in *methanol* and dilute to 50.0 ml with same solvent. To 4.0 ml of the solution add 4.0 ml of a 0.12 per cent w/v solution of *testosterone propionate IPRS* (internal standard) in *methanol*.

Reference solution. Dissolve a weighed quantity of *beclomethasone dipropionate IPRS* in *methanol* and dilute to obtain a solution having a known concentration of about 1.4 mg per ml. To 4.0 ml of the solution add 4.0 ml of a 0.12 per

cent w/v solution of *testosterone propionate IPRS* (internal standard) in *methanol*.

Chromatographic system
- a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica (3 to 10 µm),
- mobile phase: a mixture of 3 volumes of *acetonitrile* and 2 volumes of *water*, or such that the retention time of beclomethasone dipropionate is approximately 6 minutes and that of testsosterone propionate is approximately 10 minutes,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 3.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{28}H_{37}ClO_7$.

Storage. Store protected from light.

Beclomethasone Inhalation

Beclomethasone Dipropionate Inhalation;
Beclomethasone Inhalation Aerosol

Beclomethasone Inhalation is a suspension of Beclomethasone Dipropionate in a suitable liquid in a suitable pressurised container.

Beclomethasone Inhalation delivers not less than 80.0 per cent and not more than 120.0 per cent of the stated amount per inhalation of beclomethasone dipropionate, $C_{28}H_{37}ClO_7$, by actuation of the valve.

Identification

A. Discharge the container a sufficient number of times at low relative humidity into a mortar to obtain about 2 mg of anhydrous Beclomethasone Dipropionate. Heat at 110° for 2 hours at a pressure of 2kPa, cool, grind the residue thoroughly with 0.1 g of potassium bromide, add a further 0.2 g of potassium bromide and mix thoroughly.

On the resultant dispersion determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *beclomethasone dipropionate IPRS* or with the reference spectrum of beclomethasone dipropionate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to beclomethasone dipropionate in the reference solution.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 3 volumes of *methanol* and 97 volumes of *dichloroethane*.

Test solution. Discharge from the container into a small, dry flask a sufficient number of times to obtain 0.5 mg of Beclomethasone Dipropionate and dissolve the residue in 2 ml of *acetone*. Evaporate the solution to a volume such that the whole solution can be applied to the plate.

Reference solution (a). A 0.1 per cent w/v solution of *beclomethasone dipropionate IPRS* in *acetone*.

Reference solution (b). Dilute 5 ml of reference solution (a) to 10 ml with *acetone*.

Reference solution (c). Dilute 5 ml of reference solution (a) to 20 ml with *acetone*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air, spray with *alkaline tetrazolium blue solution* and heat at 50° for 5 minutes. Cool and spray again with *alkaline tetrazolium blue solution*. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a), not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) (1 per cent) and any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.5 per cent). Ignore any spot with an R_f value of more than 0.85.

Other tests. Comply with the tests stated under Inhalation Preparations (Pressurised metered-dose Preparations).

Follow the procedure described under Assay wherever the amount of active substance is to be determined in any test.

Assay. Carry out the test for Content of active ingredient delivered per actuation stated under Inhalation Preparations (Pressurised metered-dose Preparations).

Use 40 ml of *dehydrated methanol* as the solvent. Discharge the number of deliveries that constitute the minimum recommended dose, keep the solution on a water-bath for 5 minutes to expel the propellants. Transfer the solution and washings to a flask containing sufficient *testosterone propionate IPRS* (internal standard) in *methanol* that, on dilution to a suitable volume with appropriate amounts of *water* and *methanol*, the final solution contains 0.00015 per cent w/v each of testosterone propionate and beclomethasone dipropionate in the methanol-water mixture in the proportions 70:30 by volume.

Determine by liquid chromatography (2.4.14).

Test solution. The diluted solution obtained as given above.

Reference solution. A solution containing 0.00015 per cent w/v each of the internal standard and *beclomethasone dipropionate IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 50°
- mobile phase: a mixture of 70 volumes of *methanol* and 30 volumes of *water*, adjusted if necessary so that the resolution between the peaks due to beclomethasone dipropionate and the internal standard is not less than 2.0,
- flow rate: 2 ml per minute,
- spectrophotometer set at 239 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between the two principal peaks is not less than 2.0.

Inject the reference solution and the test solution.

Calculate the amount of $C_{28}H_{37}ClO_7$ delivered per actuation of the valve.

Determine the content of active ingredient for second and third time by repeating the procedure on the middle ten and on the last ten successive combined actuations of the valve. For each of the three determinations the average content of $C_{28}H_{37}ClO_7$ delivered per actuation of the valve meets the requirements.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Labelling. The label states the amount of active ingredient delivered per inhalation.

White Beeswax

White Beeswax is obtained by bleaching Yellow Beeswax.

Category. Pharmaceutical aid.

Description. Yellowish-white pieces or plates, translucent when thin, with a fine-grained, matt, non-crystalline fracture; becomes soft and pliable when warmed by hand.

Tests

Melting range (2.4.21). 61° to 65°, determined by Method IV.

Acid value (2.3.23). 5 to 15, determined by the following method. Weigh 5.0 g in a 250-ml conical flask fitted with a reflux condenser, add 40 ml of *xylene* and a few glass beads, heat until dissolved, add 20 ml of *ethanol (95 per cent)* and 0.5 ml of *phenolphthalein solution* and titrate the hot solution with *0.5 M ethanolic potassium hydroxide* until a red colour persists for at least 10 seconds (n_1 ml). Repeat the procedure omitting the substance under examination (n_2 ml). Calculate the Acid value from the expression $28.05(n_1 - n_2)/w$, where w is the weight, in g, of the substance taken.

Ester value (2.3.26). 75 to 95, determined by subtracting the Acid value from the Saponification value.

Ratio number. The Ester value divided by the Acid value is between 5 and 19.

Saponification value (2.3.37). 87 to 104, determined by the following method. Weigh 2.0 g, add 30 ml of a mixture of equal volumes of *xylene* and *ethanol (95 per cent)* and a few glass beads, heat until dissolved, add 25.0 ml of *0.5 M ethanolic potassium hydroxide* and heat under a reflux condenser for 3 hours. Titrate the hot solution immediately with *0.5 M hydrochloric acid* using 1 ml of *phenolphthalein solution* as indicator, bringing the solution back to boil several times during the titration (n_1 ml). Repeat the procedure omitting the substance under examination (n_2 ml). Calculate the Saponification value from the expression $28.05(n_2 - n_1)/w$, where w is the weight, in g, of the substance taken.

Fats, fatty acids, Japan wax and resin. Boil 5.0 g for 10 minutes with 80 ml of a 10 per cent w/v solution of *sodium hydroxide*, replace the water lost by evaporation, cool, filter the solution through a plug of glass wool and acidify with *hydrochloric acid*; no precipitate is produced.

Ceresin, paraffin and other waxes. To 3.0 g in a 100-ml round-bottomed flask add 30 ml of a 4 per cent w/v solution of *potassium hydroxide* in *aldehyde-free ethanol (95 per cent)* and boil gently under a reflux condenser for 2 hours. Remove the condenser and immediately insert a thermometer, place the flask in a water-bath at 80° and allow to cool with continuous swirling. The solution may be opalescent, but no precipitate is formed before the temperature reaches 65°.

Glycerin and other polyhydric alcohols. To 0.2 g add 10 ml of *ethanolic potassium hydroxide solution*, heat under a reflux condenser in a water-bath for 30 minutes, add 50 ml of *1 M sulphuric acid*, cool and filter. Rinse the flask and filter with *1 M sulphuric acid*, combine the filtrate and washings and dilute to 100 ml with *1 M sulphuric acid* (solution A). Into two matched test-tubes introduce, respectively, 1 ml of solution A and 1 ml of a 0.001 per cent w/v solution of *glycerin* in *1 M sulphuric acid* (solution B). Add 0.5 ml of a 1.07 per cent w/v solution of *sodium periodate* to each tube, mix, allow to stand for 5 minutes, add to each tube 1 ml of *decolorised fuchsin solution* and mix; any precipitate disappears. Place the tubes in a beaker containing water at 40° and observe for 10 to 15 minutes during cooling. Any bluish violet colour in the tube containing solution A is not more intense than that in the tube containing solution B (0.5 per cent w/w, calculated as glycerin).

Yellow Beeswax

Yellow beeswax is the wax obtained by melting the walls of the honeycomb of the bee, *Apis mellifera* Linn. with hot water and removing the foreign matter.

Category. Pharmaceutical aid.

Description. Yellow or light brown pieces or plates, with a fine-grained, matt, non-crystalline fracture; becomes soft and pliable when warmed by hand. It is tasteless and does not stick to the teeth.

Tests

Melting range (2.4.21). 61° to 65°, determined by Method IV.

Acid value (2.3.23). 5 to 15, determined by the following method. Weigh 5.0 g in a 250-ml conical flask fitted with a reflux condenser, add 40 ml of *xylene* and a few glass beads, heat until dissolved, add 20 ml of *ethanol (95 per cent)* and 0.5 ml of *phenolphthalein solution* and titrate the hot solution with *0.5 M ethanolic potassium hydroxide* until a red colour persists for at least 10 seconds (n_1 ml). Repeat the procedure omitting the substance under examination (n_2 ml). Calculate the Acid value from the expression:

$$= \frac{28.05(n_1 - n_2)}{w}$$

where w is the weight, in g, of the substance taken.

Ester value (2.3.26). 75 to 95, determined by subtracting the Acid value from the Saponification value.

Ratio number. The Ester value divided by the Acid value is between 5 and 19.

Saponification value (2.3.37). 87 to 104, determined by the following method. Weigh 2.0 g, add 30 ml of a mixture of equal volumes of *xylene* and *ethanol (95 per cent)* and a few glass beads, heat until dissolved, add 25.0 ml of *0.5 M ethanolic potassium hydroxide* and heat under a reflux condenser for 3 hours. Titrate the hot solution immediately with *0.5 M hydrochloric acid* using 1 ml of *phenolphthalein solution* as indicator, bringing the solution back to boil several times during the titration (n_1 ml). Repeat the procedure omitting the substance under examination (n_2 ml). Calculate the Saponification value from the expression:

$$= \frac{28.05(n_2 - n_1)}{w}$$

where w is the weight, in g, of the substance taken.

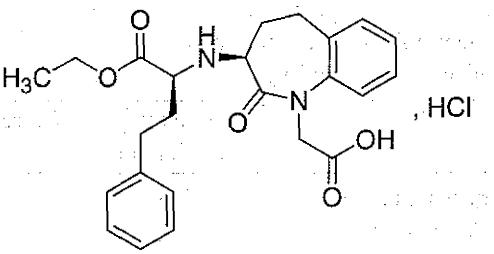
Fats, fatty acids, Japan wax and resin. Boil 5 g for 10 minutes with 80 ml of a 10 per cent w/v solution of *sodium hydroxide*, replace the water lost by evaporation, cool, filter the solution through a plug of glass wool and acidify with *hydrochloric acid*; no precipitate is produced.

Ceresin, paraffin and other waxes. To 3.0 g in a 100-ml round-bottomed flask add 30 ml of a 4 per cent w/v solution of *potassium hydroxide* in *aldehyde-free ethanol (95 per cent)* and boil gently under a reflux condenser for 2 hours. Remove the condenser and immediately insert a thermometer, place the flask in a water-bath at 80° and allow to cool with continuous swirling. The solution may be opalescent, but no precipitate is formed before the temperature reaches 65°.

Glycerin and other polyhydric alcohols. To 0.2 g add 10 ml of *ethanolic potassium hydroxide solution*, heat under a reflux condenser in a water-bath for 30 minutes, add 50 ml of *1 M sulphuric acid*, cool and filter. Rinse the flask and filter with *1 M sulphuric acid*, combine the filtrate and washings and dilute to 100 ml with *1 M sulphuric acid* (solution A). Into two matched test-tubes introduce, respectively, 1 ml of solution A and 1 ml of a 0.001 per cent w/v solution of *glycerin* in *1 M sulphuric acid* (solution B). Add 0.5 ml of a 1.07 per cent w/v solution of *sodium periodate* to each tube, mix, allow to stand for 5 minutes, add to each tube 1 ml of *decolorised fuchsin solution* and mix; any precipitate disappears. Place the tubes in a beaker containing water at 40° and observe for 10 to 15 minutes during cooling. Any bluish violet colour in the tube containing solution A is not more intense than that in the tube containing solution B (0.5 per cent w/w, calculated as glycerin).

Storage. Store in well-closed containers.

Benazepril Hydrochloride



$C_{24}H_{28}N_2O_5$, HCl Mol. Wt. 461.0

Benazepril Hydrochloride is {(3*S*)-3-[(1*S*)-1-Ethoxycarbonyl-3-phenylpropylamino]-2,3,4,5-tetrahydro-2-oxo-1*H*-1-benzazepin-1-yl}acetic acid hydrochloride.

Benazepril Hydrochloride contains not less than 97.5 per cent and not more than 102.0 per cent of $C_{24}H_{28}N_2O_5$, HCl, calculated on the dried basis.

Category. Antihypertensive.

Description. A white or almost white, crystalline powder, hygroscopic. It shows polymorphism (2.5.11).

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *benazepril hydrochloride IPRS* or with the reference spectrum of benazepril hydrochloride.

B. Specific optical rotation (2.4.22). – 141.0° to – 136.0°, determined in a 2.0 per cent w/v solution in *ethanol*.

C. It gives reaction (A) of chlorides (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution (a). Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Test solution (b). Dilute 10.0 ml of test solution (a) to 100.0 ml with the mobile phase.

Reference solution (a). A 0.01 per cent w/v solution of *benazepril hydrochloride IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a buffer solution prepared by adding 0.2 ml of *glacial acetic acid* and 0.81 g of *tetrabutylammonium bromide* to 1000 ml in a mixture of 360 volumes of *water* and 640 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 25 µl.

Name	Relative retention time	Correction factor
Benazepril impurity E[1]	0.3	0.5
Benazepril impurity F[2]	0.4	0.7
Benazepril impurity C[3]	0.5	---
Benazepril (Retention time: about 6 minutes)	1.0	---
Benazepril impurity B[4]	1.8	—
Benazepril impurity D[5]	2.0	—
Benazepril impurity G[6]	2.5	—

[1][(3*S*)-3-amino-2-oxo-2,3,4,5-tetrahydro-1*H*-1-benzazepin-1-yl]acetic acid,

[2]1,1-dimethylethyl [(3*S*)-3-amino-2-oxo-2,3,4,5-tetrahydro-1*H*-1-benzazepin-1-yl]acetate

[3](2*S*)-2-[[(3*S*)-1-(carboxymethyl)-2-oxo-2,3,4,5-tetrahydro-1*H*-1-benzazepin-3-yl]amino]-4-phenylbutanoic acid,

[4][(3*RS*)-3-[[(1*SR*)-1-(ethoxycarbonyl)-3-phenylpropyl]amino]-2-oxo-2,3,4,5- tetrahydro-1*H*-1-benzazepin-1-yl]acetic acid,

[5][(3*S*)-3-[[(1*S*)-3-cyclohexyl-1-(ethoxycarbonyl)propyl]amino]-2-oxo-2,3,4,5- tetrahydro-1*H*-1-benzazepin-1-yl]acetic acid,

[6]ethyl(2*S*)-2-[[(3*S*)-1-(2-ethoxy-2-oxoethyl)-2-oxo-2,3,4,5-tetrahydro-1*H*-1-benzazepin-3-yl]amino]-4-phenylbutanoate.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and tailing factor is not more than 2.0.

Inject reference solution (b) and test solution (a). Run the chromatogram three times the retention time of the principal peak. In the chromatogram obtained with test solution (a) the area of any peak corresponding to benazepril impurity B is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any peak corresponding to benazepril impurity C is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of any peaks corresponding to benazepril impurities D, E, F and G is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), area of any other peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The sum of areas of all the secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent). Ignore any peak with the area less than 0.25 times area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Enantiomeric purity. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 5 mg of *benazepril impurity A IPRS ([(3R)-3-[[(1R)-1-(ethoxycarbonyl)-3-phenylpropyl]amino]-2-oxo-2,3,4,5- tetrahydro-1H-1-benzazepin-1-yl]acetic acid IPRS)* in 50.0 ml of the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Reference solution (c). A 0.01 per cent w/v solution of *benazepril hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 10 cm x 4.0 mm packed with silica gel a-1 acid glycoprotein for chiral chromatography (5 µm),
- mobile phase: a mixture of 20 volumes of *methanol* and 80 volumes of a buffer solution pH 6.0 prepared by dissolving 3.58 g of *disodium hydrogen phosphate* and

9.66 g of *potassium dihydrogen phosphate* in 1000 ml of *water*,
- flow rate: 0.9 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 50 µl.

The relative retention time with respect to benazepril (retention time: about 6.0 minutes) for benazepril impurity A is about 1.9.

Inject reference solution (c). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. Run the chromatogram for 3.5 times the retention time of the principal peak. The area of any peak corresponding to benazepril impurity A is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.5 per cent, determined on 1.0 g by drying under vacuum at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances.

Inject reference solution (a) and test solution (b).

Calculate the content of $C_{24}H_{29}ClN_2O_5$.

Storage. Store protected from light and moisture.

Benazepril Hydrochloride Tablets

Benazepril Hydrochloride Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of benazepril hydrochloride, $C_{24}H_{28}N_2O_5$,HCl.

Usual strengths. 5 mg; 10 mg; 20 mg.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 80 volumes of *ethyl acetate*, 20 volumes of *methanol* and 15 volumes of *ammonium hydroxide*.

Test solution. Disperse a quantity of powdered tablets containing 50 mg of Benazepril Hydrochloride in 30 ml of *methanol* with the aid of ultrasound for 15 minutes and dilute to 50.0 ml with *methanol*. Centrifuge and use the supernatant liquid.

Reference solution. A 0.1 per cent w/v solution of *benazepril hydrochloride IPRS* in *methanol*.

Apply to the plate 20 µl of each solution. After development dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 500 ml of *water*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary with the dissolution medium.

Reference solution. Dissolve a weighted quantity of *benazepril hydrochloride IPRS* in *methanol* and dilute with dissolution medium to obtain a solution having a known concentration similar to the concentration of the test solution.

Use chromatographic system as described under Assay, using 60 µl injection volume:

Inject the reference solution and the test solution.

Calculate the content of $C_{24}H_{28}N_2O_5$,HCl in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{24}H_{28}N_2O_5$,HCl.

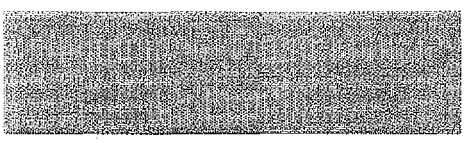
Related substances. Determine by liquid chromatography (2.4.14) as described under Assay with the following modification and using 80 µl injection volume:

Reference solution (a). A 0.0006 per cent w/v solution of *benazepril impurity C IPRS ((3-(1-carboxy-3-phenyl-1(S)-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1H -1-(3S)-benzazepine-1-acetic acid IPRS)* in the mobile phase.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to benazepril impurity C is not more than 3.0 per cent. The area of any other secondary peak is not more than 1.0 per cent. The sum of the areas of all other secondary peaks is not more than 2.0 per cent, calculated by area normalization.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14) as described under Assay using following test solution.



Test solution. Disperse 1 tablet in the mobile phase with the aid of ultrasound for 15 minutes and dilute to 50.0 ml with the mobile phase. Centrifuge and use the supernatant liquid.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg of Benazepril Hydrochloride in the 150 ml of the mobile phase with the aid of ultrasound for 15 minutes and dilute to 250.0 ml with the mobile phase. Centrifuge and use the supernatant liquid.

Reference solution (a). A 0.02 per cent w/v solution of *benazepril hydrochloride IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.04 per cent w/v each of *benazepril hydrochloride IPRS* and *benazepril impurity B IPRS* ((3*S*) 3-[[(1*R*)-1-(ethoxycarbonyl)-3-phenylpropyl]amino]-2,3,4,5-tetrahydro-2-oxo-1*H*-1-benzazepene-1-acetic acid monohydrate) in the mobile phase.

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 64 volumes of *methanol* and 36 volumes of *tetrabutylammonium bromide solution*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 25 µl.

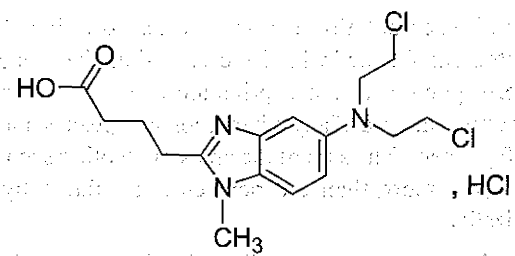
Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to benazepril hydrochloride and benazepril impurity B is not less than 1.7 and the relative standard deviation for replicate injection for each peak is not more than 2.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{24}H_{28}N_2O_5$,HCl in the tablets.

Storage. Store protected from moisture.

Bendamustine Hydrochloride



$C_{16}H_{21}Cl_2N_3O_2$, HCl, H_2O Mol Wt. 412.7

Bendamustine Hydrochloride is 4-[5-[bis(2-chloroethyl) amino]-1-methylbenzimidazol-2-yl]butanoic acid hydrochloride.

Bendamustine Hydrochloride contains not less than 98.5 per cent and not more than 102.0 per cent of $C_{16}H_{21}Cl_2N_3O_2$.HCl, calculated on the anhydrous basis.

Category. Antineoplastic.

Description. A white to almost white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *bendamustine hydrochloride IPRS* or with the reference spectrum of bendamustine hydrochloride.

B. It gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 0.5 per cent w/v solution (solution A) is clear (2.4.1) and not more intensely coloured than reference solution BS8 (2.4.1).B

pH (2.4.24). 2.5 to 3.5, determined in solution A.

Chloride content. Between 9.0 per cent and 9.5 per cent, calculated on anhydrous basis, dissolve 0.4 g in 5 ml of *carbon dioxide-free water*, add 5 ml of *anhydrous glacial acetic acid* and 50 ml of *methanol*, and titrate with *0.1N silver nitrate* using *eosin solution* as indicator. Carry out a blank titration.

1 ml of *0.1N silver nitrate* is equivalent to 0.003545 g of Chloride.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20.0 mg of the substance under examination in *methanol* and dilute to 10.0 ml with *methanol*.

Reference solution (a). A solution containing 0.02 per cent w/v of *bendamustine impurity A IPRS* in *methanol*.

Reference solution (b). A solution containing 0.02 per cent w/v of *bendamustine impurity B IPRS* in *methanol*.

Reference solution (c). A solution containing 0.02 per cent w/v of *bendamustine hydrochloride IPRS* in *methanol*.

Reference solution (d). Dilute 2.0 ml of reference solution (a), reference solution (b) and 1.0 ml of reference solution (c) to 100.0 ml with *methanol*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A, a 0.1 per cent v/v solution of *trifluroacetic acid* in *water*;
  B: *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
3	100	0
35	10	90
40	10	90
41	100	0
45	100	0

Name	Relative retention time
Impurity A[1]	0.75
Bendamustine	1.00
Impurity B[2]	1.13

[1]5-[Bis(2-hydroxyethyl)amino]-1-methyl-1H-bezimidazole-2-butanoic acid ethyl ester,

[2]5-[Bis (2-chloroethyl) amino]-1-methyl-1H-benzimidazole-2-butanoic acid ethyl ester.

Inject reference solution (d). The test is not valid unless the relative standard deviation for replicate injections of each peaks is not more than 5.0.

Inject reference solution (d) and test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to bendamustine Impurity A is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (d) (0.2 per cent),the area of any peak corresponding to bendamustine Impurity B is not more than 2.5 times the area of the corresponding peak in the chromatogram obtained with reference solution (d) (0.5 per cent), the area of any other secondary peak is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.5 per cent) and the sum of area of all the impurities is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (d) (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Bacterial endotoxins (2.2.3). Not more than 1.125 Endotoxin unit per mg of Bendamustine hydrochloride.

Sulphated ash (2.3.18). Not more than 0.1 per cent, determined on 0.5 g.

Water (2.3.43). Not more than 0.5 per cent for the anhydrous form and 4.5 to 6.5 per cent for the monohydrate form determined on 0.1 gm.

Assay. Determine by liquid chromatography (2.4.14). as described under Related substances with the following modification.

– injection volume: 10 µl.

Test solution. Dissolve 20 mg of the substance under examination in methanol and dilute to 100.0 ml with *methanol.* Dilute 5.0 ml of the solution to 10.0 ml with *methanol.*

Reference solution. Dissolve 20 mg of *bendamustine hydrochloride IPRS* in *methanol* and dilute to 100.0 ml with *methanol.* Dilute 5.0 ml of the solution to 10.0 ml with *methanol.*

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{21}Cl_2N_3O_2,HCl$.

Storage. Store in airtight containers, protected from light at a temperature between 2° to 8°.

Bendamustine Injection

Bendamustine Hydrochloride Injection

Bendamustine Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of bendamustine hydrochloride $C_{16}H_{21}Cl_2N_3O_2.HCl$.

The constituted solution complies with the requirements for the Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

NOTE— Bendamustine hydrochloride is cytotoxic; extra care required to prevent inhaling particles and exposing the skin to it.

Usual strength. 100 mg.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powder for Injections) and with the following requirements.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. It gives reaction (A) of chlorides (2.3.1).

Tests

pH (2.4.24). 2.5 to 3.5, determined in a 0.5 per cent w/v solution in *carbon dioxide-free water.*

Related substances. Determine by liquid chromatography (2.4.14)

Test solution. Dissolve a quantity of powder to obtain a solution containing 0.1 per cent w/v of bendamustine hydrochloride in mobile phase B. Dilute 5.0 ml of the solution to 20.0 ml with *acetonitrile.*

Reference solution. A solution containing 0.025 per cent w/v of *bendamustine hydrochloride IPRS* in mobile phase B, dilute 5.0 ml of the solution to 50 ml with *acetonitrile*. Further dilute 5.0 ml of the solution to 50.0 ml with *acetonitrile*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 90 volumes of a 0.1 per cent v/v solution of *trifluroacetic acid* in *water and* 10 volumes of *acetonitrile*,
  B. a mixture of 50 volumes of a 0.1 per cent v/v solution of *trifluroacetic acid* in *water and* 50 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl,

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
3	100	0
16	50	50
33	30	70
35	10	90
40	10	90
41	100	0
45	100	0

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent).

Bacterial endotoxins (2.2.3). Not more than 2.25 Endotoxin Units per mg of bendamustine hydrochloride.

Water (2.3.43). Not more than 3.0 per cent.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances with the following modifications.

Reference solution. A solution containing 0.1 per cent w/v of *bendamustine hydrochloride IPRS* in mobile phase B. Dilute 5.0 ml of the solution to 20.0 ml with *acetonitrile*.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

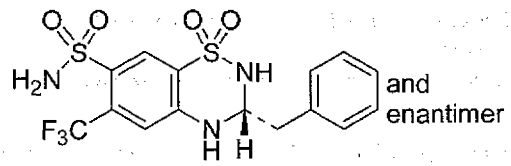
Calculate the content of $C_{16}H_{21}Cl_2N_3O_2.HCl$ in the injection.

Storage. Store protected from moisture at a temperature not exceeding 25°.

Labeling. The label states the strength in terms of the equivalent amount of Bendamustine hydrochloride.

Bendrofluazide

Bendroflumethiazide



$C_{15}H_{14}F_3N_3O_4S_2$ Mol. Wt. 421.4

Bendrofluazide is (3*RS*)-3-benzyl-6-(trifluoromethyl)-3,4-dihydro-2*H*-1,2,4-benzothiadiazine-7-sulfonamide 1,1-dioxide.

Bendrofluazide contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{15}H_{14}F_3N_3O_4S_2$, calculated on the dried basis.

Category. Diuretic.

Description. A white or almost white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *bendrofluazide IPRS* or with the reference spectrum of bendrofluazide.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Buffer solution. Dissolve 2 g of *citric acid monohydrate* in 1000 ml of *water*.

Solvent mixture. 40 volumes of *methanol* and 60 volumes of buffer solution.

Test solution. Dissolve 10 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). Dissolve 2 mg of *bendrofluazide impurity A IPRS (4-amino-6-(trifluoromethyl) benzene-1,3-*

disulfonamide) and 2.5 mg of *altizide IPRS* in the solvent mixture and dilute to 10.0 ml with the solvent mixture. Mix 1.0 ml of the solution with 1.0 ml of the test solution and dilute to 100.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm × 3.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 15 volumes of *tetrahydrofuran*, 25 volumes of *methanol* and 60 volumes of buffer solution,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 273 nm,
- injection volume: 20 µl.

Name	Relative retention time
Bendrofluazide impurity A	0.2
Altizide	0.5
Bendrofluazide (Retention time is about 8 minutes)	1.0

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to bendrofluazide and altizide is not less than 10.0.

Inject reference solution (b) and the test solution. Run the chromatogram at least twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to bendrofluazide impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g, by drying in an oven at 105°.

Assay. Dissolve 0.15 g in 50.0 ml of *dimethyl sulphoxide*. Titrate with *0.1 M tetrabutylammonium hydroxide* in *2-propanol*, determining the end point potentiometrically (2.4.25). Read the volumes added between the two points of inflection.

1.0 ml of *0.1 M tetrabutylammonium hydroxide* in *2-propanol* is equivalent to 0.02107 g of $C_{15}H_{14}F_3N_3O_4S_2$.

Bendrofluazide Tablets

Bendroflumethiazide Tablets

Bendrofluazide Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of bendrofluazide, $C_{15}H_{14}F_3N_3O_4S_2$.

Usual strength. 2.5 mg.

Identification

A. Determine by thin layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. Ethyl acetate.

Test solution. Disperse a quantity of the powdered tablets containing 10 mg of bendrofluazide with 10.0 ml of *acetone*, with the aid of ultrasound for 10 minutes and filter.

Reference solution. A 0.1 per cent w/v solution of *bendrofluazide IPRS* in *acetone*.

Apply to the plate 5 µl of each solution. After development, dry the plate in a current of warm air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. Ethyl acetate.

Test solution. Disperse a quantity of the powdered tablets containing 25 mg of bendrofluazide with 25 ml of *acetone*, with the aid of ultrasound for 10 minutes, filter, evaporate the filtrate to dryness and dissolve the residue in 2.5 ml of *acetone*.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with *acetone*.

Apply to the plate 10 µl of each solution. After development, dry the plate in a current of warm air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (1.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 15 mg of Bendrofluazide with 50 ml of *0.1M sodium hydroxide* with the aid of ultrasound for 10 minutes and add sufficient *0.1M sodium hydroxide* to produce 100.0 ml, filter. Dilute 10.0 ml of the filtrate to 100.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 275 nm (2.4.7).

Calculate the content of $C_{15}H_{14}F_3N_3O_4S_2$ taking 410 as the specific absorbance at 275 nm.

Bentonite

Bentonite is a natural, colloidal, hydrated aluminium silicate that has been processed to remove grit and non-swelling components of the ore.

Category. Pharmaceutical aid (suspending agent).

Description. A very fine, pale buff or cream-coloured to greyish-white powder, free or almost free from gritty particles.

Identification

Fuse 1 g with 2 g of *anhydrous sodium carbonate*, warm the residue with 10 ml of *water*, filter, wash the filter with 5 ml of *water* and reserve the combined filtrate and washings. Dissolve the residue in 10 ml of *dilute hydrochloric acid*; the solution gives the reactions of aluminium salts, (2.3.1). Add to the reserved filtrate and washings 3 ml of *hydrochloric acid*; a gelatinous precipitate is produced.

Tests

pH (2.4.24). 9.0 to 10.5, determined in a 2.0 per cent w/v suspension in *water*.

Sedimentation volume. In a mortar, mix 6.0 g with 0.3 g of *light magnesium oxide*, freshly calcined. Mix the powder progressively with 200 ml of *water*. Shake for 1 hour and place 100 ml of the suspension in a 100-ml graduated cylinder. After 24 hours the volume of the clear supernatant liquid is not greater than 2 ml.

Swelling power. Add 2.0 g in twenty portions at intervals of 2 minutes to 100 ml of a 1 per cent w/v solution of *sodium lauryl sulphate* in a 100-ml graduated cylinder about 3 cm in diameter. Allow each portion to settle before adding the next and let it stand for 2 hours. The apparent volume of the sediment at the bottom of the cylinder is not less than 24 ml.

Coarse particles. To 20 g add 1000 ml of *water* and mix for 15 minutes at not less than 5000 rpm. Transfer to a wet sieve of nominal aperture of 75 mm, previously dried at 100° to 105° and weighed, and wash with three quantities, each of 500 ml, of *water*, ensuring that any agglomerates are dispersed. Dry at 100° to 105° and weigh. The weight of the matter on the sieve is not more than 0.1 g (0.5 per cent).

Heavy metals (2.3.13). To 5.0 g add 7.5 ml of *2 M hydrochloric acid* and 27.5 ml of *water*, boil for 5 minutes, centrifuge and filter the supernatant liquid. Wash the residue with *water*, filter, combine the filtrates and dilute to 50 ml with *water*. To 5 ml of the solution add 5 ml of *water*, 10 ml of *hydrochloric acid* and 25 ml of *4-methyl-2-pentanone*, shake for 2 minutes, allow the layers to separate and evaporate the aqueous layer to dryness on a water-bath. Dissolve the residue in 1 ml of *5 M acetic acid*, dilute to 25 ml and filter. The resulting solution complies with the limit test for heavy metals, Method D (50 ppm). Prepare the standard using *lead standard solution (1 ppm Pb)*.

Microbial contamination (2.2.9). 1g is free from *Escherichia coli*.

Loss on drying (2.4.19). Not more than 15.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Benzalkonium Chloride

Benzalkonium Chloride is a mixture of alkylbenzyldimethylammonium chlorides, the alkyl groups having chain lengths of C_8 to C_{18}.

Benzalkonium Chloride contains not less than 95.0 per cent and not more than 104.0 per cent of alkylbenzyldimethylammonium chlorides, calculated as $C_{22}H_{40}ClN$ on the anhydrous basis.

Category. Antiseptic.

Description. A white or yellowish-white powder or gelatinous, yellowish-white fragments, hygroscopic, soapy to the touch.

Identification

A. Dilute 0.1 g with 10 ml of *water*. To 5 ml add 1.5 ml of *dilute nitric acid*; a white precipitate is produced which is soluble in *ethanol (95 per cent)*. To the remainder add 1.5 ml of *mercuric chloride solution*; a white precipitate is produced which is soluble in *ethanol (95 per cent)*.

B. Dissolve 0.25 g in 1 ml of *sulphuric acid*, add 0.1 g of *potassium nitrate*, heat on a water-bath for 5 minutes, cool, dilute with *water* to 10 ml, add 0.5 g of *zinc powder*, and heat on a water-bath for 5 minutes. To 2 ml of the clear supernatant liquid add 0.5 ml of *sodium nitrite solution*, cool in ice and add to 3 ml of *2-naphthol solution*; an orange red colour is produced.

C. To 25 mg add 1 ml of *2 M nitric acid*; a white precipitate is produced which dissolves on addition of 5 ml of *ethanol (95 per cent)*. The resulting solution gives reaction (A) of chlorides (2.3.1).

Tests

Acidity or alkalinity. Dissolve 0.5 g in 50 ml of *carbon dioxide-free water*, add 0.1 ml of *bromocresol purple solution* and titrate with *0.1 M hydrochloric acid* or with *0.1 M sodium hydroxide*. Not more than 0.1 ml is required to change the colour of the solution.

Ammonia compounds. Boil 0.1 g with 3 ml of *sodium hydroxide solution*; no odour of ammonia is produced.

Foreign amines. Dissolve 0.1 g in 5 ml of *water* and add 3 ml of *1 M sodium hydroxide*; no precipitate is formed. Heat to boiling; the odour of amines is not perceptible.

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 10 per cent, determined on 0.3 g.

Assay. Weigh 2.0 g, dissolve in sufficient *water* to produce 100.0 ml. Transfer 25.0 ml to a separating funnel, add 25 ml of *chloroform*, 10 ml of *0.1 M sodium hydroxide* and 10.0 ml of a freshly prepared 5 per cent w/v solution of *potassium iodide*. Shake well, allow to separate and discard the chloroform layer. Shake the aqueous solution with three further quantities, each of 10 ml, of *chloroform* and discard the chloroform layer. Add 40 ml of *hydrochloric acid*, cool and titrate with *0.05 M potassium iodate* until the solution becomes pale brown in colour. Add 2 ml of *chloroform* and continue the titration until the chloroform becomes colourless. Titrate a mixture of 20 ml of *water*, 10.0 ml of a freshly prepared 5 per cent w/v solution of potassium iodide and 40 ml of *hydrochloric acid* with *0.05 M potassium iodate* in a similar manner; the difference between the titrations represents the amount of *0.05 M potassium iodate* required.

1 ml of *0.05 M potassium iodate* is equivalent to 0.0354 g of $C_{22}H_{40}ClN$.

Storage. Avoid contact with metals.

Benzalkonium Chloride Solution

Benzalkonium Chloride Solution is a solution of a mixture of alkylbenzyldimethylammonium chlorides, the alkyl groups having chain lengths of C_8 to C_{18}. It may contain *ethanol (95 per cent)*. In making Benzalkonium Chloride Solution, the *ethanol (95 per cent)* may be replaced by Industrial Methylated Spirit, diluted so as to be of equivalent strength.

Benzalkonium Chloride Solution contains not less than 49.0 per cent w/v and not more than 51.0 per cent w/v of alkylbenzyldimethylammonium chlorides, calculated as $C_{22}H_{40}ClN$. It may contain not more than 16.0 per cent v/v of ethanol, C_2H_6O.

Category. Antiseptic detergent.

Description. A clear, colourless or slightly yellow, syrupy liquid.

Identification

A. Dilute 0.2 ml with 10 ml of *water*. To 5 ml add 1.5 ml of *dilute nitric acid*; a white precipitate is produced which is soluble in *ethanol (95 per cent)*. To the remainder add 1.5 ml of *mercuric chloride solution*; a white precipitate is produced which is soluble in *ethanol (95 per cent)*.

B. Evaporate 0.5 ml to dryness on a water-bath, dissolve the residue in 1 ml of *sulphuric acid*, add 0.1 g of *potassium nitrate*, heat on a water-bath for 5 minutes, cool, dilute with *water* to 10 ml, add 0.5 g of *zinc powder*, and heat on a water-bath for 5 minutes. To 2 ml of the clear supernatant liquid add 0.5 ml of *sodium nitrite solution*, cool in ice and add to 3 ml of *2-naphthol solution*; an orange red colour is produced.

C. To 0.05 ml add 1 ml of *2 M nitric acid*; a white precipitate is produced which dissolves on addition of 5 ml of *ethanol (95 per cent)*. The resulting solution gives reaction (A) of chlorides (2.3.1).

Tests

Acidity or alkalinity. Dissolve 1.0 g in 50 ml of *carbon dioxide-free water*, add 0.1 ml of *bromocresol purple solution* and titrate with *0.1 M hydrochloric acid* or with *0.1 M sodium hydroxide*. Not more than 0.1 ml is required to change the colour of the solution.

Ammonia compounds. Boil 0.2 ml with 3 ml of *sodium hydroxide solution*; no odour of ammonia is produced.

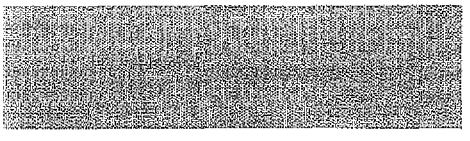
Foreign amines. To a volume containing 0.1 g of benzalkonium chloride add sufficient *water* to produce 5 ml and add 3 ml of *1 M sodium hydroxide*; no precipitate is formed. Heat to boiling; the odour of amines is not perceptible.

Ethanol *(if present)* (2.3.45). Not more than 16.0 per cent v/v, determined by Method I or II, as applicable.

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Assay. Weigh 4.0 g, dissolve in sufficient *water* to produce 100.0 ml. Transfer 25.0 ml to a separating funnel, add 25 ml of *chloroform*, 10 ml of *0.1 M sodium hydroxide* and 10.0 ml of a freshly prepared 5 per cent w/v solution of *potassium iodide*. Shake well, allow to separate and discard the chloroform layer. Shake the aqueous solution with three further quantities, each of 10 ml, of *chloroform* and discard the chloroform layer. Add 40 ml of *hydrochloric acid*, cool and titrate with *0.05 M potassium iodate* until the solution becomes pale brown in colour. Add 2 ml of *chloroform* and continue the titration until the chloroform becomes colourless. Titrate a mixture of 20 ml of *water*, 10.0 ml of a freshly prepared 5.0 per cent w/v solution of *potassium iodide* and 40 ml of *hydrochloric acid* with *0.05 M potassium iodate* in a similar manner; the difference between the titrations represents the amount of *0.05 M potassium iodate* required.

1 ml of *0.05 M potassium iodate* is equivalent to 0.0354 g of $C_{22}H_{40}ClN$. Determine the relative density (2.4.29), and calculate the amount of $C_{22}H_{40}ClN$, weight in volume.

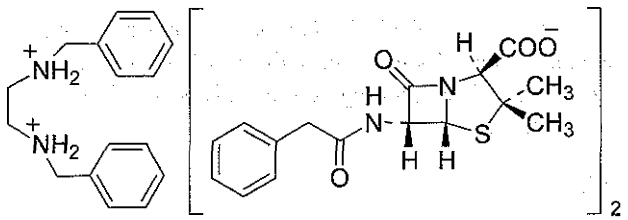


Storage. Avoid contact with metals.

Labelling. The label states, where appropriate, the content of *ethanol (95 per cent)* or Industrial Methylated Spirit.

Benzathine Penicillin

Benzathine Benzylpenicillin; Benzathine Penicillin G



$C_{16}H_{20}N_2,(C_{16}H_{18}N_2O_4S)_2$ Mol. Wt. 909.0

Benzathine Penicillin is *N,N'*-dibenzylethylenediammonium bis[(6*R*)-6-(2-phenylacetamido)penicillanate] containing a variable amount of water.

Benzathine Penicillin contains not less than 96.0 per cent and not more than 100.5 per cent of $C_{16}H_{20}N_2,(C_{16}H_{18}N_2O_4S)_2$ and not less than 24.0 per cent and not more than 27.0 per cent of $C_{16}H_{20}N_2$, both calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white, crystalline powder; almost odourless.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *benzathine penicillin IPRS*.

B. Shake 0.1 g with 1 ml of *1 M sodium hydroxide* for 2 minutes, add 2 ml of *ether*, shake for 1 minute and allow to separate. Evaporate 1 ml of the ether layer to dryness, dissolve the residue in 2 ml of *glacial acetic acid* and add 1 ml of *potassium dichromate solution*; a golden yellow precipitate is formed.

C. Shake 0.1 g with 2 ml of *1 M sodium hydroxide* for 2 minutes, extract the mixture with two quantities, each of 3 ml, of *ether*, evaporate the combined extracts and dissolve the residue in 1 ml of *ethanol (50 per cent)*. Add 5 ml of *picric acid solution*, heat at 90° for 5 minutes and allow to cool slowly; the precipitate, after recrystallisation from *ethanol (25 per cent)* containing a small quantity of *picric acid*, melts at about 214° (2.4.21).

D. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.24). 5.0 to 7.5, determined in a saturated solution.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use. Avoid any overheating during the preparation of the solutions.

Test solution. Dissolve a weighed quantity of about 70 mg of the substance under examination in 25 ml of *methanol* with the aid of ultrasound (for about 2 minutes). Dilute to 50.0 ml with a solution containing 6.8 g per litre of *potassium dihydrogen phosphate* and 1.02 g per litre of *disodium hydrogen phosphate*.

Reference solution (a). Dissolve a weighed quantity of about 70 mg of *benzathine penicillin IPRS* in 25 ml of *methanol* with the aid of ultrasound (for about 2 minutes). Dilute to 50.0 ml with a solution containing 6.8 g per litre of *potassium dihydrogen phosphate* and 1.02 g per litre of *disodium hydrogen phosphate*.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with mobile phase A.

Chromatographic system

- a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. a mixture of 10 volumes of a 34 g per litre solution of *potassium dihydrogen phosphate* adjusted to pH 3.5 with *orthophosphoric acid*, 30 volumes of *methanol* and 60 volumes of *water*,
  B. a mixture of 10 volumes of a 34 g per litre solution of *potassium dihydrogen phosphate* adjusted to pH 3.5 with *orthophosphoric acid*, 30 volumes of *water* and 60 volumes of *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	75	25
10	75	25
20	0	100
55	0	100
70	75	25

Inject reference solution (a). The relative retention time with reference to benzylpenicillin for benzathine is about 0.3 to 0.4;

for benzylpenicilloic acids benzathide is about 2.4. If necessary, adjust the concentration of *methanol* in the mobile phase.

Inject reference solution (b) and the test solution. The area of any secondary peak obtained with the test solution corresponding to benzylpenicilloic acid benzathide is not more than twice the sum of the areas of the two principal peaks in the chromatogram obtained with reference solution (b) (2 per cent).The area any other secondary peak obtained with the test solution is not more than the sum of the areas of the two principal peaks in the chromatogram obtained with reference solution (b) (1 per cent). Disregard any peak with an area 0.05 times the sum of the areas of the two principal peaks in the chromatogram obtained with reference solution (b) (0.05 per cent).

Water (2.3.43). 5.0 to 8.0 per cent, determined on 0.3 g.

Assay. Determine by liquid chromatography, (2.4.14) as given under the test for Related substances using the following mobile phase.

Mobile phase. a mixture of 10 volumes of *phosphate buffer solution pH 3.5,* 35 volumes of *methanol,* and 55 volumes of *water.*

Inject reference solution (a) and the test solution.

Calculate the contents of $C_{16}H_{20}N_2$ and of $C_{16}H_{20}N_2$, $(C_{16}H_{18}N_2O_4S)_2$. Calculate the content of $C_{16}H_{20}N_2$, $(C_{16}H_{18}N_2O_4S)_2$ by multiplying the percentage content of benzylpenicillin by 1.36.

Benzathine Penicillin intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.13 Endotoxin Unit per ml of a solution prepared by suspending 20 mg of the substance under examination in 20 ml of *0.1 M sodium hydroxide* diluted 1 ml to 100 ml and using the supernatant.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from moisture at a temperature not exceeding 30°. If the material is intended for use in the manufacture of parenteral preparations the container should be sterile and sealed so as to exclude micro-organisms.

Labelling The label states whether or not the contents are intended for use in the manufacture of parenteral preparations.

Benzathine Penicillin Injection

Benzathine Benzylpenicillin Injection; Benzathine Penicillin G Injection

Benzathine Penicillin Injection is a sterile material consisting of Benzathine Penicillin with or without suspending agents, buffering agents and other excipients. It is filled in a sealed container.

The injection is constituted by suspending the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

Usual strength. 450 mg (600,000 Units) (Each mg of Benzathine Penicillin is approximately equivalent to 1,330 Units of penicillin).

Storage. The constituted suspension should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Benzathine Penicillin Injection contains not less than 95.0 per cent and not more than 110.0 per cent of the stated amount of benzathine penicillin, $C_{16}H_{20}N_2$, $(C_{16}H_{18}N_2O_4S)_2$.

Description. A white crystalline powder, almost odourless.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

A. Shake 0.1 g with 1 ml of *1 M sodium hydroxide* for 2 minutes, add 2 ml of *ether*, shake for 1 minute and allow to separate. Evaporate 1 ml of the ether layer to dryness, dissolve the residue in 2 ml of *glacial acetic acid* and add 1 ml of *potassium dichromate solution*; a golden yellow precipitate is formed.

B. Shake 0.1 g with 2 ml of *1 M sodium hydroxide* for 2 minutes, extract the mixture with two quantities, each of 3 ml, of *ether,* evaporate the combined extracts and dissolve the residue in 1 ml of *ethanol (50 per cent)*. Add 5 ml of *picric acid solution*, heat at 90° for 5 minutes and allow to cool slowly; the precipitate, after recrystallisation from *ethanol (25 per cent)* containing a small quantity of *picric acid*, melts at about 214° (2.4.21).

C. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.24). 5.0 to 7.5, determined in a suspension obtained by reconstituting as directed on the label.

Consistency. To a quantity containing 60,000 Units add 2 ml of *water* and shake thoroughly. The resulting suspension passes through a 23G hypodermic needle.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use. Avoid any overheating during the preparation of the solutions.

Test solution. Dissolve a weighed quantity containing about 70 mg of Benzathine Penicillin in 25 ml of *methanol* with the aid of ultrasound (for about 2 minutes). Dilute to 50.0 ml with a solution containing 6.8 g per litre of *potassium dihydrogen phosphate* and 1.02 g per litre of *disodium hydrogen phosphate*.

Reference solution (a). Dissolve a weighed quantity of about 70 mg of *benzathine penicillin IPRS* in 25 ml of *methanol* with the aid of ultrasound (for about 2 minutes). Dilute to 50.0 ml with a solution containing 6.8 g per litre of *potassium dihydrogen phosphate* and 1.02 g per litre of *disodium hydrogen phosphate*.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with mobile phase A.

Chromatographic system

- a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. a mixture of 10 volumes of a 34 g per litre solution of *potassium dihydrogen phosphate* adjusted to pH 3.5 with *orthophosphoric acid*, 30 volumes of *methanol* and 60 volumes of *water*,
  B. a mixture of 10 volumes of a 34 g per litre solution of *potassium dihydrogen phosphate* adjusted to pH 3.5 with *orthophosphoric acid*, 30 volumes of *water* and 60 volumes of *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	75	25
10	75	25
20	0	100
55	0	100
70	75	25

Inject reference solution (a). The relative retention time with reference to benzylpenicillin for benzathine is about 0.3 to 0.4; for benzylpenicilloic acids benzathide is about 2.4.

Inject reference solution (b) and the test solution. The area of any secondary peak obtained with the test solution corresponding to benzylpenicilloic acids benzathide is not more than twice the sum of the areas of the two principal peaks in the chromatogram obtained with reference solution (b) (2.0 per cent). The area of any other secondary peak obtained with the test solution is not more than the sum of the areas of the two principal peaks in the chromatogram obtained with reference solution (b) (1 per cent). Disregard any peak with an area 0.05 times the sum of the areas of the two principal peaks in the chromatogram obtained with reference solution (b) (0.05 per cent).

Bacterial endotoxin (2.2.3). Not more than 0.13 Endotoxin Unit per ml of a solution prepared by suspending 20 mg of the substance under examination in 20 ml of *0.1 M sodium hydroxide* diluted 1 ml to 100 ml and using the supernatant.

Water (2.3.43). 5.0 to 8.0 per cent, determined on 0.3 g.

Assay. Determine by liquid chromatography, (2.4.14) as given under the test for Related substances using the following mobile phase.

Mobile phase. a mixture of 10 volumes of *phosphate buffer solution pH 3.5*, 35 volumes of *methanol*, and 55 volumes of *water*.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{16}H_{20}N_2S(C_{16}H_{18}N_2O_4S)_2$ by multiplying the percentage content of benzylpenicillin by 1.36.

Labelling. The label states (1) the directions for constituting the suspension; (2) the names of any added buffering agents or other pharmaceutical aids; (3) that the preparation is meant for intramuscular injection only.

Fortified Benzathine Penicillin Injection

Fortified Benzathine Benzylpenicillin Injection; Fortified Benzathine Penicillin G Injection

Benzathine Penicillin Injection is a sterile material consisting of Benzathine Penicillin and Procaine Penicillin with or without suspending agents, buffering agents and other excipients. It is filled in a sealed container.

The injection is constituted by suspending the contents of the sealed container in the requisite amount of sterile Water for Injections containing Benzylpenicillin Sodium immediately before use.

Storage. The constituted suspension should be used immediately after preparation but, in any case, within the period and under the conditions recommended by the manufacturer.

Fortified Benzathine Penicillin Injection contains not less than 90.0 per cent and not more than 125.0 per cent of the stated amount of benzathine penicillin, not less than 95.0 per cent and not more than 125.0 per cent of the stated amount of procaine penicillin, not less than 90.0 per cent and not more than 130.0 per cent of the stated amount of benzylpenicillin sodium, all in terms of Units of penicillin.

Category. Antibacterial.

Usual strength. Benzathine Penicillin, 450 mg (600,000 Units), Procaine Penicillin, 300 mg (300,000 Units) and Benzylpenicillin, 180 mg (300,000 Units).

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

A. It gives the reaction for penicillins (2.3.1).

B. It gives reaction (B) of penicillins and cephalosporins (2.3.1).

C. Shake 0.1 g with 1 ml of *1 M sodium hydroxide* for 2 minutes, add 2 ml of *ether*, shake for 1 minute and allow to separate. Evaporate 1 ml of the ether layer to dryness, dissolve the residue in 2 ml of *glacial acetic acid* and add 1 ml of *potassium dichromate solution*; a golden yellow precipitate is formed.

D. It give the reactions of sodium salts (2.3.1).

Tests

Stability. Using an aseptic technique prepare the suspension as directed on the label in an individual unopened container and determine the concentration of benzylpenicillin sodium by the method described below using a measured quantity of the suspension, withdrawn aseptically from the container. Store the remainder of the suspension in the closed container at 4° for 7 days and then repeat the determination of benzylpenicillin sodium.

The concentration of benzylpenicillin sodium in the stored injection is not less than 80 per cent of the concentration found in the freshly prepared suspension.

Consistency. To a quantity containing 600,000 Units of Benzathine Penicillin, 300,000 Units each of Procaine Penicillin and Benzylpenicillin add 2 ml of *water* and shake thoroughly. The resulting suspension passes readily through a 22G hypodermic needle.

Bacterial endotoxin (2.2.3). Not more than 0.13 Endotoxin Unit per ml of a solution prepared by suspending 20 mg of the substance under examination in 20 ml of *0.1 M sodium hydroxide* diluted 1 ml to 100 ml and using the supernatant.

Water (2.3.43). Not more than 7.5 per cent, determined on 0.3 g.

Assay. *For benzathine penicillin* — Disperse a quantity of the mixed contents of 10 containers containing 1 g of Benzathine Penicillin with 30 ml of a saturated solution of *sodium chloride* and 10 ml of *5 M sodium hydroxide* and extract with four successive quantities, each of 50 ml of *ether*. Wash the combined ether extracts with three successive quantities, each of 5 ml, of *water*, extracting each aqueous washing with the same 25 ml of *ether*. Combine the ether extracts, evaporate to a low bulk, add 2 ml of *ethanol* and evaporate to dryness. Dissolve the residue in 50 ml of *glacial acetic acid* and titrate with *0.1 M perchloric acid* using 1 ml of *1-naphtholbenzein solution* as indicator.

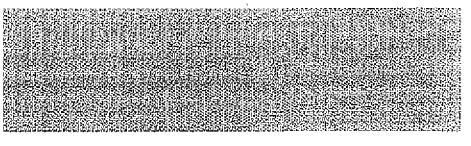
1 ml of *0.1 M perchloric acid* is equivalent to 0.04545 g of $C_{18}H_{50}N_6O_8S_2$. Calculate the apparent content of Benzathine Penicillin.

Calculate the content of procaine penicillin, as determined by the method given below in the weight of the sample used in this assay, multiply this content by a factor of 1.544 and deduct the figure from the apparent content of benzathine penicillin; the result is the content of benzathine penicillin. (1 mg of benzathine penicillin is approximately equivalent to 1330 Units of penicillin).

For procaine penicillin — To a quantity of the mixed contents of 10 containers containing 0.25 g of Procaine Penicillin add 100 ml of *water*, shake well, dilute to 200.0 ml with *water*, mix and filter. Dilute 5.0 ml of the filtrate to 250.0 ml with *buffer solution pH 7.0* and measure the absorbance of the resulting solution at the maximum at about 290 nm, using *buffer solution pH 7.0* as the blank (2.4.7). Calculate the content of procaine penicillin taking 310 as the specific absorbance at 290 nm. (1 mg of procaine penicillin is equivalent to 1009 Units of penicillin).

For benzylpenicillin sodium — Disperse a quantity of the mixed contents of 10 containers containing 0.15 g of Benzylpenicillin Sodium with water until dissolved and dilute to 500.0 ml with *water*. Dilute 25.0 ml of the resulting solution to 100.0 ml with *phosphate buffer pH 6.8*. Place two quantities, each of 2.0 ml, of the resulting solution in separate stoppered tubes. To one tube add 10.0 ml of *imidazole-mercury reagent*, mix, stopper the tube and immerse in a water-bath at 60° for 35 minutes, swirling occasionally. Remove from the water-bath and cool rapidly to 20° (solution A). Add 10.0 ml of *imidazole solution* to the second tube, mix, stopper the tube and allow to stand at 20° for 35 minutes, swirling occasionally (solution B). Without delay measure the absorbance of solutions A and B at about 325 nm (2.4.7), using as the blank a mixture of 2.0 ml of *water* and 10.0 ml of *imidazole-mercury reagent* for solution A and a mixture of 2.0 ml of *water* and 10.0 ml of *imidazole solution* for solution B. Calculate the content of total penicillins as $C_{16}H_{17}N_2NaO_4S$ from the difference between the absorbances of solutions A and B, from the difference obtained by repeating the procedure using 0.15 g of *benzylpenicillin sodium IPRS* in place of the contents of the sealed containers. Calculate the content of benzylpenicillin sodium by subtracting the contents of benzathine penicillin and procaine penicillin, both expressed as benzylpenicillin sodium, $C_{16}H_{17}N_2NaO_4S$.

Labelling. The label on the sealed container states (1) the quantity of Benzathine Penicillin, Benzylpenicillin Sodium and Procaine Penicillin contained in it; (2) the directions for



reconstituting the suspension; (3) the names of the added suspending agent, buffering agent and any other pharmaceutical aid; (4) that the preparation is intended for intramuscular injection only.

Benzathine Penicillin Tablets

Benzathine Benzylpenicillin Tablets; Benzathine Penicillin G Tablets

Benzathine Penicillin Tablets contain Benzathine Penicillin equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated number of Units of penicillin.

Usual strength. 200,000 Units of penicillin.

Identification

A. Shake 0.1 g with 1 ml of *1 M sodium hydroxide* for 2 minutes, add 2 ml of *ether*, shake for 1 minute and allow to separate. Evaporate 1 ml of the ether layer to dryness, dissolve the residue in 2 ml of *glacial acetic acid* and add 1 ml of *potassium dichromate solution*; a golden yellow precipitate is formed.

B. Shake 0.1 g with 2 ml of *1 M sodium hydroxide* for 2 minutes, extract the mixture with two quantities, each of 3 ml, of *ether*, evaporate the combined extracts and dissolve the residue in 1 ml of *ethanol (50 per cent)*. Add 5 ml of *picric acid solution*, heat at 90° for 5 minutes and allow to cool slowly; the precipitate, after recrystallisation from *ethanol (25 per cent)* containing a small quantity of *picric acid*, melts at about 214° (2.4.21).

C. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use. Avoid any overheating during the preparation of the solutions.

Test solution. Weigh and powder 20 tablets. Dissolve a weighed quantity containing about 70 mg of Benzathine Penicillin in 25 ml of *methanol* with the aid of ultrasound for 2 minutes and allow to stand for 15 minutes. Dilute to 50.0 ml with a solution containing 6.8 g per litre of *potassium dihydrogen phosphate* and 1.02 g per litre of *disodium hydrogen phosphate* mix and filter.

Reference solution (a). Dissolve a weighed quantity of about 70 mg of *benzathine penicillin IPRS* in 25 ml of *methanol* with the aid of ultrasound (for about 2 minutes). Dilute to 50.0 ml with a solution containing 6.8 g per litre of *potassium dihydrogen phosphate* and 1.02 g per litre of *disodium hydrogen phosphate*.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with mobile phase A.

Chromatographic system

- a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. a mixture of 10 volumes of a 34 g per litre solution of *potassium dihydrogen phosphate* adjusted to pH 3.5 with *orthophosphoric acid*, 30 volumes of methanol and 60 volumes of *water*,
  B. a mixture of 10 volumes of a 34 g per litre solution of *potassium dihydrogen phosphate* adjusted to pH 3.5 with *orthophosphoric acid*, 30 volumes of *water* and 60 volumes of *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	75	25
10	75	25
20	0	100
55	0	100
70	75	25

Inject reference solution (a). The relative retention time with reference to benzylpenicillin for benzathine is about 0.3 to 0.4; for benzylpenicilloic acids benzathide is about 2.4. If necessary, adjust the concentration of *methanol* in the mobile phase.

Inject reference solution (b) and the test solution. The area of any secondary peak obtained with the test solution corresponding to benzylpenicilloic acids benzathide is not more than twice the sum of the areas of the two principal peaks in the chromatogram obtained with reference solution (b) (2.0 per cent). The area of any other secondary peak obtained with the test solution is not more than the sum of the areas of the two principal peaks in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area 0.05 times the sum of the areas of the two principal peaks in the chromatogram obtained with reference solution (b) (0.05 per cent).

Water (2.3.43). Not more than 8.0 per cent, determined on the powdered tablets.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography, (2.4.14) as given under the test for Related substances using the following mobile phase.

Mobile phase. a mixture of 10 volumes of *phosphate buffer pH 3.5*, 35 volumes of *methanol*, and 55 volumes of *water*.

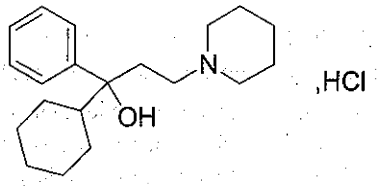
Inject reference solution (a) and the test solution.

Calculate the content of $C_{16}H_{20}N_2,(C_{16}H_{18}N_2O_4S)_2$ by multiplying the content of benzylpenicillin by 1.36.

Storage. Store at a temperature not exceeding 30°.

Benzhexol Hydrochloride

Trihexyphenidyl Hydrochloride



$C_{20}H_{31}NO,HCl$ Mol. Wt. 337.9

Benzhexol Hydrochloride is (*RS*)-1-cyclohexyl-1-phenyl-3-piperidinopropan-1-ol hydrochloride.

Benzhexol Hydrochloride contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{20}H_{31}NO,HCl$, calculated on the dried basis.

Category. Antiparkinsonian.

Description. A white or creamy-white, crystalline powder; odourless or almost odourless.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *benzhexol hydrochloride IPRS* or with the reference spectrum of benzhexol hydrochloride.

B. Dissolve 0.5 g in 5 ml of warm *methanol* and make just alkaline to *litmus paper* with *5 M sodium hydroxide*; a precipitate is produced, which, after recrystallisation from *methanol* melts at about 114° (2.4.21).

C. It gives the reactions of chlorides (2.3.1).

Tests

pH (2.4.24). 5.2 to 6.2, determined in a solution prepared by dissolving 1.0 g in 50 ml of *carbon dioxide-free water* with the aid of heat, cooling and diluting to 100.0 ml with the same solvent.

Optical rotation (2.4.22). – 0.10° to + 0.10°, determine in a 5.0 per cent w/v solution in a mixture of 20 volumes of *methanol* and 80 volumes of *dichloromethane*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in 10.0 ml of the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 10 mg of *1-phenyl-3-(piperidin-1-yl)propan-1-one IPRS (trihexyphenidyl impurity A IPRS)* in 10.0 ml of the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 100.0 ml with the mobile phase.

Reference solution (d). Add 1.0 ml of the test solution to 1.0 ml of the reference solution (b) and dilute to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 200 volumes of *water*, 0.2 volume of *triethylamine*, adjusted to pH 4.0 with *orthophosphoric acid* and 800 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject reference solution (d). The test is not valid unless the resolution between the peaks due to trihexyphenidyl and trihexyphenidyl impurity A not less than 3.0.

Inject reference solution (a), (c) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of secondary peak corresponding to trihexyphenidyl impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (a) (0.1 per cent) and the sum of the areas of all secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.7 g in 50 ml of *anhydrous glacial acetic acid* previously neutralised using *1-naphtholbenzein solution* as indicator, warming and cooling, if necessary. Add 15 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*

to the full colour change of the indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03379 g of $C_{20}H_{31}NO,HCl$.

Benzhexol Tablets

Benzhexol HydrochlorideTablets; Trihexyphenidyl Hydrochloride Tablets

Benzhexol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of benzhexol hydrochloride, $C_{20}H_{31}NO,HCl$.

Usual strengths. 2 mg; 5 mg.

Identification

A. Disperse a quantity of the powdered tablets containing 20 mg of benzhexol hydrochloride with 20 ml of *water* and filter. The filtrate yields a yellow precipitate with *trinitrophenol solution* and a white precipitate with *5 M sodium hydroxide*.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 90 volumes of *chloroform* and 10 volumes of *methanol*.

Test solution. Disperse a quantity of the powdered tablets with sufficient *chloroform* to produce a solution containing 0.2 per cent w/v of Benzhexol Hydrochloride and filter.

Reference solution. A 0.2 per cent w/v solution of *benzhexol hydrochloride IPRS* in *chloroform*.

Apply to the plate 10 µl of each solution. After development remove the plate, allow it to dry in air and spray with *dilute potassium iodobismuthate solution*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14).

Test solution. Disperse one tablet in few ml of *water* with the aid of ultrasound and dilute with the mobile phase to obtain a solution containing 0.008 per cent w/v of benzhexol hydrochloride.

Reference solution. A solution containing 0.008 per cent w/v of *benzhexol hydrochloride IPRS* and 0.004 per cent w/v of *3-piperidylpropiophenone hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: 800 volumes of *acetonitrile*, 200 volumes of *water* and 0.2 volume of *triethylamine*, adjusted to pH 4.0 with *orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between the two principal peaks is not less than 4.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{31}NO,HCl$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 5 mg of Benzhexol Hydrochloride with a few ml of *water*, add 10 ml of the mobile phase, shake for 15 minutes, dilute to 25.0 ml with the mobile phase, mix and filter.

Reference solution. A solution containing 0.02 per cent w/v of *benzhexol hydrochloride IPRS* and 0.01 per cent w/v of *3-piperidylpropiophenone hydrochloride IPRS* in the mobile phase.

Chromatographic system

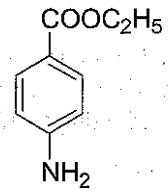
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: 450 volumes of *acetonitrile*, 550 volumes of *water* and 5.0 volume of *triethylamine*, adjusted to pH 4.0 with *orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between the two principal peaks is not less than 4.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{31}NO,HCl$ in the tablets.

Benzocaine



$C_9H_{11}NO_2$ Mol. Wt. 165.2

Benzocaine is ethyl 4-aminobenzoate.

Benzocaine contains not less than 99.0 per cent and not more than 101.0 per cent of $C_9H_{11}NO_2$, calculated on the dried basis.

Category. Local anaesthetic.

Description. Colourless crystals or a white, crystalline powder; odourless.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *benzocaine IPRS* or with the reference spectrum of benzocaine.

B. Dissolve 10 mg in 1 ml of *water* with the aid of one drop of *dilute hydrochloric acid* and add 2 drops of a 10 per cent w/v solution of *sodium nitrite* and 2 drops of a solution of 10 mg of *2-naphthol* in 5 ml of *sodium hydroxide solution*; a deep red colour is produced. On setting aside the solution for some time, a scarlet precipitate is produced.

C. Dissolve 0.2 g in 10 ml of *water* with the aid of *dilute hydrochloric acid* (solution A) and divide into 2 parts. To one part of solution A add *iodine solution*; a precipitate is obtained (distinction from orthocaine).

D. To the other part of solution A add *potassium mercuri-iodide solution*; no precipitate is obtained (distinction from procaine).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *ethanol (95 per cent)* is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. Dissolve 0.5 g in 5 ml of *ethanol (95 per cent)*, add 10 ml of *water* and one drop of *phenolphthalein solution*; no pink colour is produced. Add 0.5 ml of *0.01 M sodium hydroxide*; the solution develops a pink colour.

Chlorides. Dissolve 0.2 g in 5 ml of *ethanol (95 per cent)* previously acidified with a few drops of *dilute nitric acid* and add few drops of *silver nitrate solution*; no turbidity is produced immediately.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

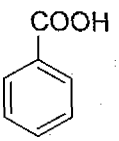
Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* at a pressure of 1.5 to 2.5 kPa.

Assay. Weigh 0.4 g and dissolve in a mixture of 25 ml of *hydrochloric acid* and 50 ml of *water*, add 3g of *potassium bromide*. Cool to 10°. Determine by the nitrite titration (2.3.31). 1 ml of *0.1 M sodium nitrite* is equivalent to 0.01652 g of $C_9H_{11}NO_2$.

Storage. Store protected from light.

Benzoic Acid



$C_7H_6O_2$ Mol. Wt. 122.1

Benzoic Acid contains not less than 99.5 per cent and not more than 100.5 per cent of $C_7H_6O_2$, calculated on the anhydrous basis.

Category. Antifungal agent; pharmaceutical aid (anti- microbial preservative).

Description. Colourless, light crystals, scales or needles.

Identification

A. Melting point (2.4.21). 121° to 124°.

B. A 5.0 per cent w/v solution in *ethanol (95 per cent)*, gives reaction (a) of benzoates (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *ethanol (95 per cent)* is clear (2.4.1), and colourless (2.4.1).

Arsenic (2.3.10). Mix 5.0 g with 3 g of *anhydrous sodium carbonate*, add 10 ml of *bromine solution* and mix thoroughly. Evaporate to dryness on a water-bath, gently ignite and dissolve the cooled residue in 16 ml of *brominated hydrochloric acid* and 45 ml of *water*. Remove the excess of bromine with 2 ml of *stannous chloride AsT*. The resulting solution complies with the limit test for arsenic (2 ppm).

Readily oxidisable substances. Add 1 ml of *sulphuric acid* to 100 ml of *water*, heat to boiling and add dropwise *0.1 M potassium permanganate* until the pink colour persists for 30 seconds. Dissolve exactly 1 g in the hot solution and titrate with *0.1 M potassium permanganate* to a pink colour that persists for 15 seconds; not more than 0.5 ml of *0.1 M potassium permanganate* is required.

Readily carbonisable substances. Dissolve 0.5 g in 5 ml of *sulphuric acid* and allow to stand for 5 minutes. The colour of the solution is not more intense than that of reference solution YS5 (2.4.1).

Cinnamic acid. Warm 0.1 g with 0.1 g of *potassium permanganate* and 5 ml of *dilute sulphuric acid*; no odour of benzaldehyde is developed.

Chlorinated compounds. Dissolve 0.33 g in 5 ml of *0.5 M sodium carbonate*, evaporate to dryness and heat the residue until completely charred, keeping the temperature below 400°. Extract the residue with a mixture of 10 ml of *water* and 12 ml of *dilute nitric acid* and filter; the filtrate complies with the limit test for chlorides (2.3.12).

Heavy metals. Not more than 10 ppm, determined by the following method. Dissolve 2.0 g in 25 ml of *acetone* and add 2 ml of *water* and 10 ml of *hydrogen sulphide solution*; any colour produced is not more intense than that of a solution prepared with 25 ml of *acetone*, 2.0 ml of *lead standard solution (10 ppm Pb)* and 10 ml of *hydrogen sulphide solution*.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.7 per cent, determined on 0.25 g and using a mixture of 1 volume of *methanol* and 2 volumes of *pyridine* as the solvent.

Assay. Dissolve 1.0 g in 15 ml of warm *ethanol (95 per cent)* previously neutralised to *phenolphthalein solution*. Add 20 ml of *water* and titrate with *0.5 M sodium hydroxide* using *phenolphthalein solution* as indicator.

1 ml of *0.5 M sodium hydroxide* is equivalent to 0.06106 g of $C_7H_6O_2$.

Compound Benzoic Acid Ointment

Benzoic and Salicylic Acids Ointment; Whitfield's Ointment

Compound Benzoic Acid Ointment is an ointment containing 6.0 per cent w/w of Benzoic Acid and 3.0 per cent w/w of Salicylic Acid in a suitable ointment base. Other strengths may also be prepared with Benzoic Acid and Salicylic Acid being in the ratio of about 2 to 1.

Compound Benzoic Acid Ointment contains not less than 5.7 per cent and not more than 6.3 per cent w/w of benzoic acid, $C_7H_6O_2$, and not less than 2.85 per cent and not more than 3.15 per cent w/w of salicylic acid, $C_7H_6O_3$.

Category. Antifungal (topical).

Identification

Carry out the method for thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 80 volumes of *toluene* and 20 volumes of *glacial acetic acid*.

Test solution. Warm 1 g of the ointment with 10 ml of *chloroform*, cool and filter.

Reference solution. A solution containing 0.6 per cent w/v of *benzoic acid* and 0.3 per cent w/v of *salicylic acid* in *chloroform*.

Apply to the plate 2 µl of each solution. After development, dry the plate in a current of air and examine under ultraviolet light at 254 nm. The two principal spots in the chromatogram obtained with the test solution correspond to those in the chromatogram obtained with the reference solution. Examine the plate under ultraviolet light at 365 nm. A blue fluorescent spot in the chromatogram obtained with the test solution corresponds in colour and position to the one in the chromatogram obtained with the reference solution. Spray the plate with *ferric chloride test-solution*. The chromatogram obtained with the test solution shows a purple spot corresponding in position to the blue fluorescent spot observed in ultraviolet light at 365 nm and corresponding in colour and position to the spot in the chromatogram obtained with the reference solution.

Tests

Other tests. Comply with the tests stated under Ointments.

Assay. *For benzoic acid* — Dissolve 2 g, in 150 ml of *water*, with the aid of gentle heat and titrate with *0.1M sodium hydroxide* using *phenolphthalein solution* as indicator. Reserve the solution for the Assay for salicylic acid.

1 ml of *0.1 M sodium hydroxide*, after deducting 1 ml for each 0.01381 g of $C_7H_6O_3$ found in the Assay for salicylic acid is equivalent to 0.01221 g of $C_7H_6O_2$.

For salicylic acid — Cool the titrated solution obtained in the Assay for benzoic acid, dilute to 250.0 ml with *water* and filter. To 5.0 ml of the filtrate add sufficient *iron(III) nitrate solution* to produce 50.0 ml. Filter, if necessary, to remove haze and measure the absorbance of the resulting solution at the maximum at about 530 nm (2.4.7) using *iron(III) nitrate solution* in the reference cell. Calculate the content of $C_7H_6O_3$ from the absorbance obtained by repeating the operation using 5 ml of a 0.024 per cent w/v solution of *salicylic acid* and beginning at the words 'add sufficient *iron(III) nitrate solution* .....'.

Storage. Store at a temperature not exceeding 30°.

Benzoic Acid Solution

Benzoic Acid Solution contains 50 g of benzoic acid, 750 ml of propylene glycol, diluted to 1000 ml with purified water.

Benzoic Acid Solution contains not less than 4.75 per cent w/v and not more than 5.25 per cent w/v of benzoic acid, $C_7H_6O_2$.

Category. Antifungal.

Identification

To 5 ml, add 30 ml of *1 M sulphuric acid* and extract the precipitated acid with three 25 ml quantities of *light petroleum ether (boiling range, 40° to 60°)*. Wash the combined extracts with three 25 ml quantities of *water*, filter through absorbent cotton and evaporate to dryness. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *benzoic acid IPRS* or with the reference spectrum of benzoic acid.

B. Melting point (2.4.21). 121° ± 1°.

Tests

Weight per ml (2.4.29). 1.045 to 1.055 g.

Assay. To 10 ml, add 20 ml of *ethanol (95 per cent)* previously neutralised to *phenolphthalein solution* and titrate with *0.1 M sodium hydroxide* using *phenolphthalein solution* as indicator.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01221 g of $C_7H_6O_2$

Labelling. The label states (1) the date after which the solution is not intended to be used; (2) the conditions under which it should be stored.

Benzoin

Benzoin is the balsamic resin obtained from *Styrax benzoin* Dryander or *Styrax parallelloneurus* Perkins, known in commerce as Sumatra Benzoin or from *Styrax tonkinensis* (Pierre) Craib ex Hartwich, or other species of the Section *Anthostyrax* of the genus *Styrax*, known in commerce as Siam Benzoin (Fam. Styraceae).

Benzoin contains not less than 25.0 per cent of total balsamic acids, calculated as cinnamic acid, $C_9H_8O_2$, in Sumatra Benzoin and as benzoic acid, $C_7H_6O_2$, in Siam Benzoin, calculated on the dried basis.

Category. Topical protectant; expectorant and comforting by steam inhalation in acute laryngitis.

Description. *Unground Sumatra Benzoin* — Blocks or lumps of varying size, made up of tears compacted together, with a reddish-brown, reddish-grey or greyish-brown resinous mass, known in commerce as block benzoin. It also occurs in the form of tears with cream-coloured to yellowish surfaces; when fractured they exhibit milky-white surfaces.

Unground Siam Benzoin — Pebble-like tears of variable size and shape, compressed, yellowish-brown to rusty-brown externally, milky white on fracture, hard and brittle at ordinary temperatures but softened by heat.

Identification

A. To a solution in *ethanol (95 per cent)* add *water*; the solution becomes milky, and the mixture is acid to *litmus paper*.

B. Heat 0.5 g in a dry test-tube; it melts and evolves white fumes, which form a white needle-shaped crystalline sublimate.

C. Heat 0.5 g in a test-tube with 5 ml of *potassium permanganate solution*; a strong odour of benzaldehyde is obtained with Sumatra Benzoin.

D. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 93 volumes of *toluene* and 7 volumes of *ethyl acetate*.

Test solution. Dissolve 2.0 g of the substance under examination in 100 ml of *ethanol (95 per cent)*.

Reference solution (a). A 0.05 per cent w/v solution of *benzoic acid IPRS* in *chloroform*.

Reference solution (b). A 0.05 per cent w/v solution of *cinnamic acid IPRS* in *chloroform*.

Reference solution (c). A 0.05 per cent w/v solution of *coniferyl benzoate IPRS* in *chloroform*.

Reference solution (d). A 0.05 per cent w/v solution of *cinnamoyl cinnamate IPRS* in *chloroform*.

Reference solution (e). A 0.05 per cent w/v solution of *propyl cinnamate IPRS* in *chloroform*.

Reference solution (f). A 0.05 per cent w/v solution of *cinnamoyl benzoate IPRS* in *chloroform*.

After development, dry the plate in air until the odour of the solvent is no longer detectable and spray with *anisaldehyde-sulphuric acid reagent*. Heat the plate at 110° for 5 minutes and examine under ultraviolet light at 254 nm. In the case of Sumatra Benzoin, the chromatogram obtained with the test solution exhibits four intense spots corresponding to spots in the chromatograms obtained with reference solution (b), (c), (d) and (e). In the case of Siam Benzoin, it exhibits intense spots corresponding to spots in the chromatograms obtained with reference solution (a), (c), (d) and (f).

Tests

Dammar gum. Determine by thin-layer chromatography (2.4.17), coating the plate with *aluminium oxide G*.

Mobile phase. A mixture of 60 volumes of *ether* and 40 volumes of *light petroleum* (80° to 100°).

Test solution. Dissolve by warming 0.2 g of the substance under examination in 10 ml of *ethanol (90 per cent)* and centrifuge.

Apply to the plate 5 µl of the test solution. Allow the mobile phase to rise 10 cm. Dry the plate in air, spray with *anisaldehyde-sulphuric acid reagent* and heat at 100° to 105° for 5 minutes. The chromatogram does not show any prominent spot with an R_f value between 0.4 and 1.0.

Foreign organic matter (2.6.1). Not more than 1.0 per cent.

Ethanol-soluble extractive. Not less than 75.0 per cent in Sumatra Benzoin and not less than 90.0 per cent in Siam Benzoin, determined by the following method. Weigh 2 g, in coarse powder, in a tared extraction thimble and insert the thimble in a Soxhlet or other suitable continuous extraction apparatus. Place 0.1 g of *sodium hydroxide* in the receiving flask of the apparatus, extract with *ethanol (95 per cent)* until extraction is complete (about 5 hours), dry the thimble to constant weight at 105° and calculate the ethanol-soluble extractive from the increase in weight of the thimble.

Acid-insoluble ash (2.3.19). Not more than 1.0 per cent in Sumatra Benzoin and not more than 0.5 per cent in Siam Benzoin, determined on 2.0 g.

Loss on drying (2.4.19). Not more than 10.0 per cent, determined on 2.0 g, in coarse powder, by drying over *phosphorus pentoxide* at a pressure not exceeding 2.7 kPa for 4 hours.

Assay. Weigh 1.25 g and boil with 25 ml of *dilute ethanolic potassium hydroxide solution* under a reflux condenser for 1 hour. Remove the ethanol and digest the residue with 50 ml of hot *water* until diffused. Cool the liquid, add 150 ml of *water* and 1.5 g of *magnesium sulphate* dissolved in 50 ml of *water*. Mix thoroughly and set aside for 10 minutes. Filter, wash the residue on the filter with 20 ml of water, acidify the combined filtrate and washings with *hydrochloric acid* and extract with successive quantities of 50, 40, 30, 30 and 30 ml of *ether*. Combine the ether extracts and discard the aqueous portion. Extract with successive quantities of 20, 20, 10, 10 and 10 ml of *sodium bicarbonate solution*, washing each aqueous extract with the same 20 ml of *ether*. Discard the ether layers, acidify the combined aqueous extracts with *hydrochloric acid* and extract with successive quantities of 30, 20, 20 and 10 ml of *chloroform*, filtering each chloroform extract through a plug of cotton wool on which a layer of *anhydrous sodium sulphate* is placed. Evaporate the chloroform on a water-bath until about 10 ml remains and remove the remainder in a current of air stopping immediately when the last trace of solvent is removed. Dissolve the residue by warming with 10 ml of *ethanol (95 per cent)*, previously neutralised to *phenol red solution*, cool and titrate with *0.1 M sodium hydroxide* using *phenol red solution* as indicator.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01482 g of total balsamic acids, calculated as cinnamic acid, $C_9H_8O_2$, in Sumatra Benzoin and 0.01221 g of total balsamic acids, calculated as benzoic acid, $C_7H_6O_2$, in Siam Benzoin.

Storage. Store protected from light at a temperature not exceeding 30°.

Labelling. The label states whether the material is Sumatra Benzoin or Siam Benzoin.

Compound Benzoin Tincture

Friars' Balsam

Benzoin, in *moderately coarse powder*	100 g
Prepared Storax	75 g
Tolu Balsam	25 g
Aloes, in *moderately coarse powder*	20 g
Ethanol (90 per cent) sufficient to produce	1000 ml

Macerate the Benzoin, Prepared Storax, Tolu Balsam and Aloes with 800 ml of Ethanol (90 per cent) in a closed vessel for not less than 2 days with occasional shaking. Filter and pass sufficient Ethanol (90 per cent) through the filter to produce the required volume.

Compound Benzoin Tincture contains not less than 4.5 per cent w/v of total balsamic acids, calculated as cinnamic acid, $C_9H_8O_2$.

Category. Topical protectant; expectorant and comforting by steam inhalation in acute laryngitis.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 93 volumes of *toluene* and 7 volumes of *ethyl acetate*.

Test solution. Dilute 1 ml of the tincture with 4 ml of *ethanol (95 per cent)*. (The chromatographic profile may vary depending on the variety of Benzoin used).

Reference solution (a). A 0.05 per cent w/v solution of *benzoic acid IPRS* in *chloroform*.

Reference solution (b). A 0.05 per cent w/v solution of *cinnamic acid IPRS* in *chloroform*.

Reference solution (c). A 0,05 per cent w/v solution of *coniferyl benzoate IPRS* in *chloroform*.

Reference solution (d). A 0.05 per cent w/v solution of *cinnamoyl cinnamate IPRS* in *chloroform*.

Reference solution (e). A 0.05 per cent w/v solution of *propyl cinnamate IPRS* in *chloroform*.

Reference solution (f). A 0.05 per cent w/v solution of *cinnamoyl benzoate IPRS* in *chloroform*.

Apply to the plate 20 µl of each solution. After development, dry the plate in air until the odour of the solvent is no longer detectable and spray with *anisaldehyde-sulphuric acid reagent*. Heat the plate at 110° for 5 minutes and examine under ultraviolet light at 254 nm. In the case of Sumatra Benzoin, the chromatogram obtained with the test solution exhibits four intense spots corresponding to spots in the chromatograms obtained with reference solution (b), (c), (d) and (e). In the case of Siam Benzoin, it exhibits intense spots corresponding to spots in the chromatograms obtained with reference solution (a), (c), (d) and (f).

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 93 volumes of *toluene* and 7 volumes of *ethyl acetate*.

Test solution. Dilute 1 ml of the *tincture* with 4 ml of *ethanol (95 per cent)*.

Reference solution. A 0.05 per cent w/v solution of *styrene IPRS* in *chloroform*.

Apply to the plate 20 µl of each solution. After development, dry the plate in air until the odour of the solvent is no longer detectable and spray with *anisaldehyde-sulphuric acid reagent*. Heat the plate at 110° for 5 minutes and examine under ultraviolet light at 254 nm. The chromatogram obtained with the test solution exhibits an intense spot corresponding to the spot in the chromatogram obtained with the reference solution (Prepared Storax).

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 93 volumes of *toluene* and 7 volumes of *ethyl acetate*.

Test solution. Dilute 1 ml of the *tincture* with 4 ml of *ethanol (95 per cent)*.

Reference solution (a). A 0.05 per cent w/v solution of *benzoyl benzoate IPRS* in *chloroform*.

Reference solution (b). A 0.05 per cent w/v solution of *benzoyl cinnamate IPRS* in *chloroform*.

Reference solution (c). A 0.05 per cent w/v solution of *eugenol IPRS* in *chloroform*.

Reference solution (d). A 0.05 per cent w/v solution of *vanillin IPRS* in *chloroform*.

Apply to the plate 20 µl of each solution. After development, dry the plate in air until the odour of the solvent is no longer detectable and spray with *anisaldehyde-sulphuric acid reagent*. Heat the plate at 110° for 5 minutes and examine in ultraviolet light at 254 nm. The chromatogram obtained with the test solution exhibits spots corresponding to the spots in the chromatogram obtained with reference solutions, (a), (b), (c) and (d) (Tolu Balsam).

D. Carry out the method for thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 100 volumes of *ethyl acetate*, 13.5 volumes of *methanol* and 10 volumes of *water*.

Test solution. Dilute 1 ml of the *tincture* with 4 ml of *ethanol (95 per cent)*.

Reference solution. A 0.5 per cent w/v solution of *barbaloin IPRS* in *methanol*.

Apply to the plate 50 µl of each solution as bands 20 mm long and not more than 3 mm wide. Allow the mobile phase to rise 10 cm. Dry the plate in air until the odour of the solvent is no longer detectable, spray with a 10 per cent w/v solution of *potassium hydroxide* in *methanol* and examine in ultraviolet light at 365 nm. The chromatogram obtained with the test solution exhibits a yellow fluorescent band corresponding to the band obtained in the chromatogram obtained with the reference solution and a light blue fluorescent band with a lower R_f value due to aloesine. Heat the plate at 110° for 5 minutes; a violet fluorescent band just below the band corresponding to barbaloin may also be seen in the chromatogram obtained with the test solution (Aloes).

Tests

Weight per ml (2.4.29). 0.870 g to 0.885 g.

Ethanol content. 70.0 to 77.0 per cent v/v, determined by Method II (2.3.45).

Total solids. Not less than 13.5 per cent w/v, determined on 1 ml by drying in an oven at 105° for 4 hours.

Assay. Evaporate 10 ml to a thick consistency on a water-bath. Boil the residue with 25 ml of *ethanolic potassium hydroxide solution* under a reflux condenser for 1 hour. Remove the ethanol and digest the residue with 50 ml of hot *water* until diffused. Cool the liquid, add 150 ml of *water* and 1.5 g of *magnesium sulphate* dissolved in 50 ml of *water*. Mix thoroughly and set aside for 10 minutes. Filter, wash the residue on the filter with 20 ml of water, acidify the combined filtrate and washings with *hydrochloric acid* and extract with successive quantities of 50, 40, 30, 30 and 30 ml of *ether*. Combine the ether extracts and discard the aqueous portion. Extract with successive quantities of 20, 20, 10, 10 and 10 ml of *sodium bicarbonate solution*, washing each aqueous extract with the same 20 ml of *ether*. Discard the ether layers, acidify the combined aqueous extracts with *hydrochloric acid* and extract with successive quantities of 30, 20, 20 and 10 ml of *chloroform*, filtering each chloroform extract through a plug of cotton wool on which a layer of *anhydrous sodium sulphate* is placed. Evaporate the chloroform on a water-bath until about

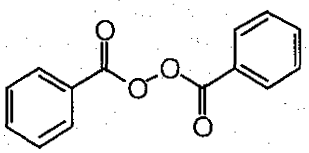
10 ml remains and remove the remainder in a current of air stopping immediately when the last trace of solvent is removed. Dissolve the residue by warming with 10 ml of *ethanol (95 per cent)*, previously neutralised to *phenol red solution*, cool and titrate with *0.1 M sodium hydroxide* using *phenol red solution* as indicator.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01482 g of total balsamic acids, calculated as cinnamic acid, $C_9H_8O_2$.

Storage. Store protected from light in tightly-closed containers and avoid exposure to direct sunlight and to excessive heat.

Labelling. The label states that it is flammable.

Hydrous Benzoyl Peroxide



$C_{14}H_{10}O_4$ Mol. Wt. 242.2

Hydrous Benzoyl Peroxide is dibenzoyl peroxide.

Hydrous Benzoyl Peroxide contains not less than 70.0 per cent and not more than 77.0 per cent of $C_{14}H_{10}O_4$.

Category. Antiacne.

Description. A white or almost white, granular or amorphous powder.

Identification

NOTE — It loses water rapidly on exposure to air with a risk of explosion. Mix the entire sample thoroughly before carrying out the following tests.

Test A, C and D may be omitted if B is carried out.

A. When examined in the range of 250 nm to 300 nm (2.4.7), a 0.008 per cent w/v solution in *ethanol (95 per cent)* shows an absorption maxima at about 274 nm and shoulder at about 282 nm and when examined in the range of 220 nm to 250 nm (2.4.7), a 0.0008 per cent w/v solution in *ethanol (95 per cent)* shows an absorption maxima at about 235 nm.

B. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *benzoyl peroxide IPRS* or with the reference spectrum of benzoyl peroxide.

C. Weigh 25 mg, dissolve in 2 ml of *acetone*, add 1 ml of 1.0 per cent solution of *diethylphenylenediamine sulphate* and mix; a red colour develops which quickly darkens and becomes dark violet within 5 minutes. On heating, a gas is evolved and the solution becomes red.

D. To 1 g add 5 ml of *ethanol (96 per cent)*, 5 ml of *dilute sodium hydroxide solution* and 10 ml of *water*. Boil the mixture under reflux for 20 minutes and cool. The solution gives reaction (C) of benzoates (2.3.1).

Tests

Acidity. Dissolve a quantity of the substance under examination containing 1 g benzoyl peroxide in 25 ml of *acetone*, add 75 ml of *water* and filter. Wash the residue with two quantities, each of 10 ml of *water*. Combine the filtrate and the washings and add 0.25 ml of *phenolphthalein solution* as indicator. Titrate with *0.1 M sodium hydroxide* to a pink colour; not more than 1.25 ml of *0.1 M sodium hydroxide* is required for neutralisation. Carry out a blank test.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Dissolve a quantity of the substance under examination containing 0.1 g benzoyl peroxide in *acetonitrile* and dilute to 50.0 ml with *acetonitrile*.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *acetonitrile*. Further dilute 1.0 ml of the solution to 10.0 ml with *acetonitrile*.

Reference solution (b). A 0.003 per cent w/v solution of *benzoic acid* in the mobile phase.

Reference solution (c). A 0.0005 per cent w/v solution of *ethyl benzoate* in the mobile phase.

Reference solution (d). A 0.0005 per cent w/v solution of *benzaldehyde* in the mobile phase.

Reference solution (e). Dissolve 30 mg each of *benzoic acid* and *benzaldehyde* in the mobile phase and dilute to 100.0 ml with the mobile phase. Further dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 0.1 ml of *glacial acetic acid*, 50 volumes of *water* and 50 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 20 µl.

Name	Relative retention time
Benzoic acid	0.15
Benzaldehyde	0.2
Ethyl benzoate	0.4
Benzoyl peroxide (Retention time: about 28.4 minutes)	1.0

Inject reference solution (e). The test is not valid unless the resolution between the peaks corresponding to benzoic acid and benzaldehyde is not less than 6.0.

Inject reference solution (a), (b), (c), (d) and the test solution. Run the chromatogram twice the retention time of the principal peak for test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to benzaldehyde is not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.25 per cent), the area of peak corresponding to benzoic acid is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent), the area of peak corresponding to ethyl benzoate is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.25 per cent) and the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). Ignore any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

Chlorides (2.3.12). Dissolve a quantity of the substance under examination containing 0.5 g of benzoyl peroxide in 15 ml of *acetone,* add, while stirring, 50 ml of *0.05 M nitric acid.* Allow to stand for 10 minutes and filter. Wash the residue with 2 quantities, each of 10 ml, of *0.05 M nitric acid.* Combine the filtrate and the washings and dilute to 100 ml with *0.05 M nitric acid.* Dilute 12.5 ml of the solution to 15.0 ml with *water.* The solution complies with the limit test for chlorides (0.4 per cent).

Water (2.3.43). Not less than 20.0 per cent, determined on 5.0 ml of 2.5 percent w/v solution of sample in *dimethylformamide* and using a mixture of 20.0 ml of *anhydrous methanol* and 3.0 ml of 10.0 per cent w/v solution of *potassium iodide* in *dimethylformamide* in titration vessel instead of *methanol.*

Assay. Dissolve 2.5 g of substance under examination immediately before use in 75 ml of *dimethylformamide* and dilute to 100.0 ml with the *dimethylformamide.*

To 5.0 ml of the solution, add 20 ml of *acetone* and 3 ml of *potassium iodide solution* prepared by dissolving 500 g of *potassium iodide* in 1000 ml of *water.* Mix and allow to stand for 1 minute. Titrate with *0.1 M sodium thiosulphate*, using 1 ml of *starch solution* added towards the end of the titration as indicator.

1 ml of *0.1 M sodium thiosulphate* is equivalent to 0.01211 g of $C_{14}H_{10}O_4$.

Storage. Store protected from light in a container that has been treated to reduce static discharge and that has a device for release of excess pressure, at a temperature between 2° to 8°.

Benzoyl Peroxide Cream

Benzoyl Peroxide Cream contains Hydrous Benzoyl Peroxide in a suitable basis.

Benzoyl Peroxide Cream contains not less than 90.0 per cent and not more than 110.0 per cent of anhydrous benzoyl peroxide, $C_{14}H_{10}O_4$.

Usual strength. 10 per cent w/w.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica GF254.*

Mobile phase. A mixture of 1 volume of *glacial acetic acid,* 2 volumes of *dichloromethane* and 50 volumes of *toluene.*

Test solution. Disperse a quantity of the cream containing 50 mg of anhydrous Benzoyl Peroxide with 10 ml of *chloroform* and filter.

Reference solution. A 0.5 per cent w/v solution of *benzoyl peroxide* in *chloroform.*

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the cream containing 0.1 g of anhydrous Benzoyl Peroxide in 25 ml of *acetonitrile* and dilute to 50.0 ml with *water,* filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). A 0.02 per cent w/v solution of *benzoic acid* in the mobile phase.

Reference solution (c). A 0.002 per cent w/v solution of *ethyl benzoate* in the mobile phase.

Reference solution (d). A 0.002 per cent w/v solution of *benzaldehyde* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 1 volume of *glacial acetic acid,* 500 volumes of *acetonitrile* and 500 volumes of *water,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 20 µl.

Inject reference solution (a), (b), (c), (d) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to benzoic acid is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (10.0 per cent), the area of any peak corresponding to ethyl benzoate is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent), the area of any peak corresponding to benzaldehyde is not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (1.0 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent).

Other tests. Comply with the tests stated under Creams.

Assay. Disperse a quantity of the cream containing 0.25 g of anhydrous Benzoyl Peroxide with 50 ml of *acetone* and dilute to 100.0 ml with *acetone*. To 10 ml, add 25 ml of a 20 per cent w/v solution of *potassium iodide*, mix, stopper the flask and allow to stand for 15 minutes protected from light. Add 25 ml of *acetone* and titrate with *0.01 M sodium thiosulphate* using *starch mucilage* as indicator added towards the end of the titration. Repeat the operation without the cream. The difference between the titrations represents the amount of *sodium thiosulphate* required.

1 ml of *0.01 M sodium thiosulphate* is equivalent to 0.001211 g of $C_{14}H_{10}O_4$.

Labelling. The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous benzoyl peroxide.

Benzoyl Peroxide Gel

Benzoyl Peroxide Gel is a solution of Hydrous Benzoyl Peroxide in a suitable water- soluble basis.

Benzoyl Peroxide Gel contains not less than 90.0 per cent and not more than 110.0 per cent of anhydrous benzoyl peroxide, $C_{14}H_{10}O_4$.

Usual strengths. 2.5 per cent w/v; 5 per cent w/v; 10 per cent w/v.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 1 volume of *glacial acetic acid*, 2 volumes of *dichloromethane* and 50 volumes of *toluene*.

Test solution. Disperse a quantity of the gel containing 50 mg of anhydrous Benzoyl Peroxide with 10 ml of *chloroform* and filter.

Reference solution. A 0.5 per cent w/v solution of *benzoyl peroxide* in *chloroform*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the gel containing 0.1 g of anhydrous Benzoyl Peroxide in 25 ml of *acetonitrile* and dilute to 50.0 ml with *water*, filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). A 0.02 per cent w/v solution of *benzoic acid* in the mobile phase.

Reference solution (c). A 0.002 per cent w/v solution of *ethyl benzoate* in the mobile phase.

Reference solution (d). A 0.002 per cent w/v solution of *benzaldehyde* in the mobile phase.

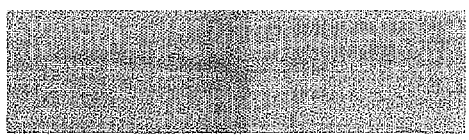
Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 0.1 ml of *glacial acetic acid*, 50 volumes of *acetonitrile* and 50 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 20 µl.

Inject reference solution (a), (b), (c), (d) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to benzoic acid is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (10.0 per cent), the area of any peak corresponding to ethyl benzoate is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent), the area of any peak corresponding to benzaldehyde is not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (1.0 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent).

Other tests. Comply with the tests stated under Gels.

Assay. Disperse a quantity of the gel containing 0.25 g of anhydrous Benzoyl Peroxide with 50 ml of *acetone* and dilute to 100.0 ml with *acetone*. To 10 ml, add 25 ml of a 20 per cent w/v solution of *potassium iodide*, mix, stopper the flask and allow to stand for 15 minutes protected from light. Add 25 ml

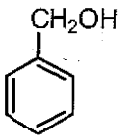


of *acetone* and titrate with *0.01 M sodium thiosulphate* using *starch mucilage* as indicator added towards the end of titration. Repeat the operation without gel. The difference between the titrations represents the amount of sodium thiosulphate required.

1 ml of *0.01 M sodium thiosulphate* is equivalent to 0.001211 g of $C_{14}H_{10}O_4$.

Labelling. The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous benzoyl peroxide.

Benzyl Alcohol



C_7H_8O Mol. Wt. 108.1

Benzyl Alcohol contains not less than 98.0 per cent and not more than 100.5 per cent of C_7H_8O.

Category. Local anaesthetic; disinfectant.

Description. Clear, colourless, oily liquid.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *benzyl alcohol IPRS* or with the reference spectrum of benzyl alcohol.

Tests

Appearance of solution. A 1.0 per cent v/v solution is clear (2.4.1), colourless and oily liquid (2.4.1).

Peroxide value (2.3.35). Not more than 5.0.

Wt. per ml (2.4.29). 1.04 g to 1.05 g.

Refractive index (2.4.27). 1.536 to 1.542.

Acid Value (2.3.23). Not more than 0.5.

Related substances. Determine by gas chromatography (2.4.13).

Test solution. The substance under examination.

Reference solution (a). Dissolve 0.1 g of *ethylbenzene* in 10.0 ml of the test solution. Dilute 2.0 ml of the solution to 20.0 ml with the test solution.

Reference solution (b). Dissolve 2.0 g of *dicyclohexyl* in 10.0 ml of the test solution. Dilute 2.0 ml of the solution to 20.0 ml with the test solution.

Reference solution (c). Dissolve 0.75 g of *benzyl alcohol impurity A (benzaldehyde)* and 0.5 g of *benzyl alcohol impurity B (cyclohexyl-methanol)* in 25.0 ml of the test solution. Add 1.0 ml of the solution to a mixture of 2.0 ml of reference solution (a) and 3.0 ml of reference solution (b) and dilute to 20.0 ml with the test solution.

Reference solution (d). Dissolve 0.25 g of *benzaldehyde* and 0.5 g of *cyclohexylmethanol* in 25.0 ml of the test solution. Add 1.0 ml of the solution to a mixture of 2.0 ml of reference solution (a) and 2.0 ml of reference solution (b) and dilute to 20.0 ml with the test solution.

Chromatographic system

- a capillary column 30 m x 0.32 mm, packed with fused silica coated with macrogol 20000 (film thickness 0.5 µm),
- temperature:

column	time (min.)	temperature (°)
	0-34	50-220
	34-69	220

- inlet port: 200° and detector. 310°,
- flame ionization detector,
- linear velocity: 25 cm/second, using nitrogen as the carrier gas,

NOTE — Benzyl alcohol not intended for parenteral use.

Inject 0.1 µl reference solution (c). The relative retention time with reference to benzyl alcohol for ethyl benzene is about 0.28, for dicyclohexyl is about 0.59, for benzyl alcohol impurity A is about 0.68 and for benzyl alcohol impurity B is about 0.71. The test is not valid unless the resolution between the peaks due to benzyl alcohol impurity A and benzyl alcohol impurity B is not less than 3.0.

If any peaks in the chromatogram obtained with the test solution have the same retention time as the peaks due to ethyl benzene or dicyclohexyl, subtract the areas of any such peaks from the peak areas at these retention times in the chromatograms obtained with reference solution (c) or (d) (corrected peak areas of ethyl benzene and dicyclohexyl). Any such peaks in the chromatogram obtained with the test solution are to be included in the assessments for the sum of other peaks.

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution, the area of secondary peak corresponding to benzyl alcohol impurity A is not more than the area of the peak due to benzyl alcohol impurity A in the chromatogram obtained with reference solution (c) (0.15 per cent). The area of secondary peak corresponding to benzyl alcohol impurity B is not more than the area of the peak due to benzyl alcohol impurity B in the chromatogram obtained with reference solution (c) (0.1 per

cent). The sum of the areas of all other secondary peaks with relative retention time less than benzyl alcohol is not more than 4 times the area of the peak due to ethylbenzene in the chromatogram obtained with reference solution (c) (0.04 per cent). The sum of the areas of all other secondary peaks with relative retention time more than benzyl alcohol is not more than the area of the peak due to dicyclohexyl in the chromatogram obtained with reference solution (c) (0.3 per cent). Ignore any peak with an area less than 0.01 times the area of the peak due to ethylbenzene in the chromatogram obtained with reference solution (c) (0.0001 per cent).

NOTE — Benzyl alcohol intended for parenteral use.

Inject 0.1 µl reference solution (d). The relative retention time with reference to benzyl alcohol for ethyl benzene is about 0.28, for dicyclohexyl is about 0.59, for benzyl alcohol impurity A is about 0.68 and for benzyl alcohol impurity B is about 0.71. The test is not valid unless the resolution between the peaks due to benzyl alcohol impurity A and benzyl alcohol impurity B is not less than 3.0.

Inject reference solution (d) and the test solution. In the chromatogram obtained with the test solution, the area of secondary peak corresponding to benzyl alcohol impurity A is not more than the area of the peak due to benzyl alcohol impurity A in the chromatogram obtained with reference solution (d) (0.05 per cent). The area of secondary peak corresponding to benzyl alcohol impurity B is not more than the area of the peak due to benzyl alcohol impurity B in the chromatogram obtained with reference solution (d) (0.1 per cent). The sum of the areas of all other secondary peaks with relative retention time less than benzyl alcohol is not more than twice the area of the peak due to ethylbenzene in the chromatogram obtained with reference solution (d) (0.02 per cent). The sum of the areas of all other secondary peaks with relative retention time more than benzyl alcohol is not more than the area of the peak due to dicyclohexyl in the chromatogram obtained with reference solution (d) (0.2 per cent). Ignore any peak with an area less than 0.01 times the area of the peak due to ethylbenzene in the chromatogram obtained with reference solution (d) (0.0001 per cent).

Residue on evaporation. Not more than 0.05 per cent.

After ensuring that the substance under examination complies with the test for peroxide value, evaporate 10.0 g of Benzyl Alcohol, on a hot plate at a temperature not exceeding 200°. Ensure that the substance under examination does not boil during examination and dry the residue at 200° for 1 hour. Cool in a desiccator and weigh.

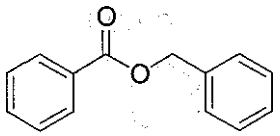
Assay. To 1.5 g add *25* ml of a mixture of 1 volume of *acetic anhydride* and 7 volumes of *pyridine* and heat on a water-bath for thirty minutes. Cool, add 25 ml of *water*, and titrate with *1 M sodium hydroxide*, using *phenolphthalein solution* as indicator. Repeat the operation without the substance under examination; the difference between the titrations represents the amount of alkali required by the benzyl alcohol.

1 ml of *1 M sodium hydroxide* is equivalent to 0.1081 g of C_7H_8O.

Storage. Store protected from light and moisture.

Labelling. The label states, where appropriate, the contents are intended for use in the manufacture of parenteral preparations.

Benzyl Benzoate



$C_{14}H_{12}O_2$ Mol. Wt. 212.2

Benzyl Benzoate is the benzyl ester of benzoic acid.

Benzyl Benzoate contains not less than 99.0 per cent and not more than 100.5 per cent w/w of $C_{14}H_{12}O_2$.

Category. Anti-parasitic (for topical treatment of scabies).

Description. Colourless crystals or a clear, colourless, oily liquid.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *benzyl benzoate IPRS* or with the reference spectrum of benzyl benzoate.

Tests

Congealing temperature (2.4.10). Not below 17.0°.

Relative density (2.4.29). 1.113 to 1.118.

Refractive index (2.4.27). 1.568 to 1.570.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Boil a convenient quantity of *ethanol (95 per cent)* thoroughly to expel carbon dioxide and neutralise to *phenolphthalein solution*. Weigh 2 g of the substance under examination, dissolve in 5 ml of the neutralised ethanol contained in a hard-glass flask and neutralise the free acid in the solution with *0.5 M ethanolic potassium hydroxide* using 0.2 ml of *phenolphthalein solution* as indicator. Add 40 ml of *0.5 M ethanolic potassium hydroxide* and boil under a reflux condenser on a water-bath for 1 hour. Add 20 ml of *water* and titrate the excess of alkali with *0.5 M hydrochloric*

acid using a further 0.2 ml of *phenolphthalein solution* as indicator. Repeat the operation without the substance under examination. The difference between the titrations represents the alkali required to saponify the benzyl benzoate.

1 ml of *0.5 M ethanolic potassium hydroxide* is equivalent to 0.1061 g of $C_{14}H_{12}O_2$.

Storage. Store protected from light and air in well-filled containers.

Benzyl Benzoate Application

Benzyl Benzoate Application contains 25 per cent w/w of Benzyl Benzoate in a suitable oil-in-water emulsified base.

Benzyl Benzoate Application contains not less than 22.5 per cent and not more than 27.5 per cent w/w of benzyl benzoate, $C_{14}H_{12}O_2$.

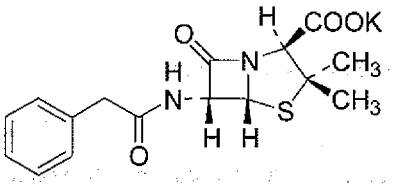
Assay. Dissolve 8.0 g in 10 ml of *ethanol (95 per cent)* previously neutralised with *0.1 M sodium hydroxide* contained in a hard-glass flask and neutralise the free acid in the solution with *0.5 M ethanolic potassium hydroxide* using 0.2 ml of *phenolphthalein solution* as indicator. Add 40 ml of *0.5 M ethanolic potassium hydroxide* and boil under a reflux condenser on a water-bath for 1 hour. Add 20 ml of *water* and titrate the excess of alkali with *0.5 M hydrochloric acid* using a further 0.2 ml of *phenolphthalein solution* as indicator. Repeat the operation without the substance under examination. The difference between the titrations represents the alkali required to saponify the benzyl benzoate.

1 ml of *0.5 M ethanolic potassium hydroxide* is equivalent to 0.1061 g of $C_{14}H_{12}O_2$.

Labelling. The label states that the contents should be shaken before use.

Benzylpenicillin Potassium

Penicillin G Potassium



$C_{16}H_{17}KN_2O_4S$ Mol. Wt. 372.5

Benzylpenicillin Potassium is potassium (6*R*)-6-(2- phenylacetamido)penicillanate, produced by the growth of certain strains of *Penicillium notatum* or related organisms, or obtained by any other means.

Benzylpenicillin Potassium contains not less than 96.0 per cent and not more than 100.5 per cent of penicillins, calculated as $C_{16}H_{17}KN_2O_4S$ on the dried basis.

Category. Antibacterial.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *benzylpenicillin potassium IPRS* or with the reference spectrum of benzylpenicillin potassium.

B. It gives reaction (A) of potassium salts (2.3.1).

Tests

pH (2.4.24). 5.5 to 7.5, determined in a 10.0 per cent w/v solution.

Specific optical rotation (2.4.22). + 270.0° to + 300.0°, determined in a 2.0 per cent w/v solution in *carbon dioxide-free water.*

Light absorption (2.4.7). Dissolve 94 mg in sufficient *water* to produce 50.0 ml. Measure the absorbance of the solution at about 325 nm, at about 280 nm and at the maximum at about 264 nm, diluting the solution, if necessary, for the measurement at the maximum at about 264 nm. Absorbances at about 325 nm and 280 nm, not more than 0.10 and that at the maximum at about 264 nm, calculated on the basis of the undiluted solution (0.188 per cent w/v), 0.80 to 0.88.

Related substances. Determine by liquid chromatography (2.4.14) as described under Assay.

Inject reference solution (d) and elute isocratically using the chosen mobile phase. Inject test solution (b) and start the elution isocratically. Immediately after elution of the benzylpenicillin peak start the following gradient:

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	70	30
20	0	100
35	0	100
50	70	30

Inject water and use the same elution pattern to obtain a blank. In the chromatogram obtained with test solution (b) the area of any peak, other than the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (d) (1.0 per cent).

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use.

Test solution (a). Dissolve 50 mg of the substance under examination in *water* and dilute to 50.0 ml with the same solvent.

Test solution (b). Dissolve 80 mg of the substance under examination in *water* and dilute to 20.0 ml with the same solvent.

Reference solution (a). Dissolve 50 mg of *benzylpenicillin potassium IPRS* in *water* and dilute to 50.0 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *benzylpenicillin potassium IPRS* and 10 mg of *phenylacetic acid IPRS* in *water* and dilute to 50.0 ml with the same solvent.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 20.0 ml with *water*. Dilute 1.0 ml of the solution to 50.0 ml with the same solvent.

Reference solution (d). Dilute 4.0 ml of reference solution (a) to 100.0 ml with *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 10 volumes of a 68 g per litre solution of *potassium dihydrogen phosphate* adjusted to pH 3.5 with a 500 g per litre solution of *dilute orthophosphoric acid*, 30 volumes of *methanol* and 60 volumes of *water*,

  B. a mixture of 10 volumes of a 68 g per litre solution of *potassium dihydrogen phosphate* adjusted to pH 3.5 with a 500 g per litre solution of *dilute orthophosphoric acid*, 40 volumes of *water* and 50 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

Equilibrate the column with a mobile phase ratio A:B of 70:30.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is at least 6.0 (if necessary, adjust the ratio A:B of the mobile phase) and the capacity factor for the second peak (benzylpenicillin) is 4.0 to 6.0.

Inject reference solution (c). Adjust the system to obtain a peak with a signal-to-noise ratio of at least 3.

Inject test solution (a) and reference solution (a).

Calculate the content of benzylpenicillin potassium.

Benzylpenicillin Potassium intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.16 Endotoxin Unit per mg.

Benzylpenicillin Potassium intended for use in the manufacture of parenteral preparations without a further appropriate sterilisation procedure complies with the following additional requirement.

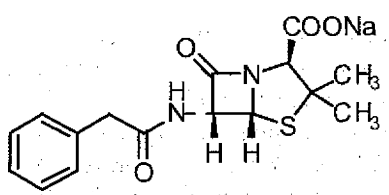
Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from moisture at a temperature not exceeding 30°. If it is intended for use in the manufacture of parenteral preparations, the container should be sterile and sealed so as to exclude micro-organisms.

Labelling. The label states whether or not the contents are intended for use in the manufacture of parenteral preparations.

Benzylpenicillin Sodium

Penicillin G Sodium



$C_{16}H_{17}N_2NaO_4S$ Mol. Wt. 356.4

Benzylpenicillin Sodium is sodium (6*R*)-6-(2-phenylacetamido) penicillanate, produced by the growth of certain strains of *Penicillium notatum* or related organisms, or obtained by any other means.

Benzylpenicillin Sodium contains not less than 96.0 per cent and not more than 100.5 per cent of penicillins, calculated as $C_{16}H_{17}N_2NaO_4S$ on the dried basis.

Category. Antibacterial.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *benzylpenicillin sodium IPRS* or with the reference spectrum of benzylpenicillin sodium.

B. It gives reaction (A) of sodium salts (2.3.1).

Tests

pH (2.4.24). 5.5 to 7.5, determined in a 10.0 per cent w/v solution.

Specific optical rotation (2.4.22). +285° to +310°, determined in a 2.0 per cent w/v solution in *carbon dioxide-free water*.

Light absorption (2.4.7). Dissolve 90 mg in sufficient *water* to produce 50.0 ml. Measure the absorbance of the solution at about 325 nm, at about 280 nm and at the maximum at about

264 nm, diluting the solution, if necessary, for the measurement at about 264 nm. Absorbances at about 325 nm and 280 nm, not more than 0.10 and that at the maximum at about 264 nm, calculated on the basis of the undiluted solution (0.18 per cent w/v), 0.80 to 0.88.

Related substances. Determine by liquid chromatography (2.4.14) as described under Assay.

Inject reference solution (d) and elute isocratically using the chosen mobile phase. Inject test solution (b) and start the elution isocratically. Immediately after elution of the benzylpenicillin peak start the following gradient:

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	70	30
20	0	100
35	0	100
50	70	30

Inject water and use the same elution pattern to obtain a blank. In the chromatogram obtained with test solution (b) the area of any peak, other than the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (d) (1.0 per cent).

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography, (2.4.14).

NOTE—Prepare the solutions immediately before use.

Test solution (a). Dissolve 50.0 mg of the substance under examination in *water* and dilute to 50.0 ml with *water*.

Test solution (b). Dissolve 80.0 mg of the substance under examination in *water* and dilute to 20.0 ml with *water*.

Reference solution (a). Dissolve 50.0 mg of *benzylpenicillin sodium IPRS* in *water* and dilute to 50.0 ml with *water*.

Reference solution (b). Dissolve 10 mg of *benzylpenicillin sodium IPRS* and 10 mg of *phenylacetic acid IPRS* in *water* and dilute to 50.0 ml with *water*.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 20.0 ml with *water*. Dilute 1.0 ml of the solution to 50.0 ml with *water*.

Reference solution (d). Dilute 4.0 ml of reference solution (a) to 100.0 ml with *water*.

Chromatographic system

- a stainless steel a column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 10 volumes of a 68 g per litre solution of *potassium dihydrogen phosphate* adjusted to pH 3.5 with a 500 g per litre solution of *dilute orthophosphoric acid*, 30 volumes of *methanol* and 60 volumes of *water*,

  B. a mixture of 10 volumes of a 68 g per litre solution of *potassium dihydrogen* phosphate adjusted to pH 3.5 with a 500 g per litre solution of *dilute orthophosphoric acid*, 40 volumes of *water* and 50 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

Equilibrate the column with a mobile phase ratio A:B of 70:30.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is at least 6.0 (if necessary, adjust the ratio A:B of the mobile phase) and the capacity factor for the second peak (benzylpenicillin) is 4.0 to 6.0.

Inject reference solution (c). Adjust the system to obtain a peak with a signal-to-noise ratio of at least 3.

Inject reference solution (a) and test solution (a).

Calculate the content of $C_{16}H_{17}N_2NaO_4S$.

Benzylpenicillin Sodium intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.16 Endotoxin Unit per mg.

Benzylpenicillin Sodium intended for use in the manufacture of parenteral preparations without a further appropriate sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from moisture at a temperature not exceeding 30°. If it is intended for use in the manufacture of parenteral preparations, the container should be sterile and sealed so as to exclude micro-organisms.

Labelling. The label states whether or not the contents are intended for use in the manufacture of parenteral preparations.

Benzylpenicillin Injection

Penicillin G Injection

Benzylpenicillin Injection is a sterile material consisting of Benzylpenicillin Potassium or Benzylpenicillin Sodium with or without buffering agents and other excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Usual strengths. The equivalent of 150 mg (250,000 Units), 300 mg (500,000 Units) and 600 mg (1,000,000 Units) of Benzylpenicillin.

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Benzylpenicillin Injection contains not less than 95.0 per cent and not more than 110.0 per cent of the stated amount of penicillins, calculated as $C_{16}H_{18}N_2O_4S$.

Description. A white or almost white crystalline powder.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *benzylpenicillin potassium IPRS* or with the reference spectrum of benzylpenicillin potassium.

or

Compare the spectrum with that obtained with *benzylpenicillin sodium IPRS* or with the reference spectrum of benzylpenicillin sodium.

B. It gives reaction (A) of potassium salts or sodium salts (2.3.1).

Tests

pH (2.4.24). 5.5 to 7.5, determined in a 10.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14) as described under Assay.

Inject reference solution (d) and elute isocratically using the chosen mobile phase. Inject test solution (b) and start the elution isocratically. Immediately after elution of the benzylpenicillin peak start the following gradient:

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	70	30
20	0	100
35	0	100
50	70	30

Inject reference solution (d) and test solution (b). In the chromatogram obtained with test solution (b), the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (1.0 per cent).

Bacterial endotoxins (2.2.3). Not more than 0.16 Endotoxin Unit per mg.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography, (2.4.14).

NOTE—Prepare the solutions immediately before use.

Determine the weight of the contents of 10 containers.

Test solution (a). Dissolve 50 mg of the mixed contents of the 10 containers in *water* and dilute to 50.0 ml with *water*.

Test solution (b). Dissolve 80 mg of the substance under examination in *water* and dilute to 20.0 ml with *water*.

Reference solution (a). Dissolve 50 mg of *benzylpenicillin sodium IPRS* in *water* and dilute to 50.0 ml with *water*.

Reference solution (b). Dissolve 10 mg of *benzylpenicillin sodium IPRS* and 10 mg of *phenylacetic acid IPRS* in *water* and dilute to 50.0 ml with *water*.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 20.0 ml with *water*. Dilute 1.0 ml of the solution to 50.0 ml with *water*.

Reference solution (d). Dilute 4.0 ml of reference solution (a) to 100.0 ml with *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 10 volumes of a 68 g per litre solution of *potassium dihydrogen phosphate* adjusted to pH 3.5 with a 500 g per litre solution of *dilute orthophosphoric acid*, 30 volumes of *methanol* and 60 volumes of *water*,

  B. a mixture of 10 volumes of a 68 g per litre solution of *potassium dihydrogen phosphate* adjusted to pH 3.5 with a 500 g per litre solution of *dilute orthophosphoric acid*, 40 volumes of *water* and 50 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

Equilibrate the column with a mobile phase ratio A:B of 70:30.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is at least 6.0 (if necessary, adjust the ratio A:B of the mobile phase) and the capacity factor for the second peak (benzylpenicillin) is 4.0 to 6.0.

Inject reference solution (c). Adjust the system to obtain a peak with a signal-to-noise ratio of at least 3.

Inject reference solution (a) and test solution (a).

Calculate the content of benzylpenicillin sodium in the injection.

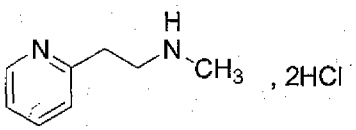
1 mg of $C_{16}H_{17}N_2NaO_4S$ is equivalent to 0.9383 mg of $C_{16}H_{18}N_2O_4S$.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Labelling. The label states (1) whether the contents are Benzylpenicillin Potassium or Benzylpenicillin Sodium; (2) the name of any added buffering agents.

Betahistine Hydrochloride

Betahistine Dihydrochloride



$C_8H_{12}N_2, 2HCl$ Mol. Wt. 209.1

Betahistine Hydrochloride is *N*-methyl-2-(2-pyridyl) ethylamine dihydrochloride.

Betahistine Hydrochloride contains not less than 98.5 per cent and not more than 102.0 per cent of $C_8H_{12}N_2, 2HCl$, calculated on the dried basis.

Category. Antihistaminic.

Description. A white to off-white, crystalline powder; sometimes clumped, odourless or almost odourless, very hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *betahistine hydrochloride IPRS* or with the reference spectrum of betahistine hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. It gives the reaction (A) of chlorides (2.3.12).

Tests

Appearance of solution. A 10 per cent w/v solution in *water* is clear (2.4.1) and not more intensely coloured than reference solution BS8 (2.4.1).

pH (2.4.24). 2.0 to 3.0, determined in a 10 per cent w/v solution in *water*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dissolve 10 mg of *betahistine dihydrochloride IPRS* and 10 mg of *2-vinylpyridine* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 2.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 2.0 ml of reference solution (b) to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 3.0 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 2 g of *sodium lauryl sulphate* in a mixture of 15 ml of a 10.0 per cent v/v solution of *sulphuric acid*, 35 ml of a 1.7 per cent w/v solution of *tetrabutylammonium hydrogen sulphate* and 650 ml of *water*; adjusted to pH 3.3 using *dilute sodium hydroxide solution* and mix with 300 ml of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Betahistine impurity B[1]	0.2	0.4
Betahistine impurity A[2]	0.3	—
Betahistine (Retention time: about 7 minutes)	1.0	—
Betahistine impurity C[3]	3.0	—

[1]2-(pyridin-2-yl)ethanol,

[2]2-vinylpyridine,

[3]*N*-methyl-2-(pyridin-2-yl)-*N*-[2-(pyridin-2-yl)ethyl]ethanamine.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to 2-vinylpyridine and betahistine is not less than 3.5.

Inject reference solution (b), (c) and the test solution. Run the chromatogram 4 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to betahistine impurity A, betahistine impurity B and betahistine impurity C is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent). The area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Heavy metals (2.3.13). 1 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 2.0 per cent, determined on 1 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 40 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution. A 0.04 per cent w/v solution of *betahistine dihydrochloride IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 3.0 mm packed with octadecylsilane chemically bonded to porous silica (5 µm),
- mobile phase: dissolve 0.45 g *ammonium acetate* and 0.4 ml *glacial acetic acid* in 650 ml of *water*, add 350 ml of *acetonitrile* and add 2.88 g of *sodium laurylsulphate* and mix,
- flow rate: 0.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{12}N_2$, 2HCl.

Storage. Store protected from light.

Betahistine Tablets

Betahistine Hydrochloride Tablets

Betahistine Tablets contain Betahistine Dihydrochloride.

Betahistine Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of betahistine dihydrochloride, $C_8H_{12}N_2$,2HCl.

Usual strengths. 8 mg; 16 mg.

Identification

Dissolve the powdered tablet containing about 0.1 g of Betahistine Hydrochloride in 5 ml of *water*, add 0.5 ml of *5 M sodium hydroxide*, extract with 5 ml of *dichloromethane*, filter the dichloromethane layer through *anhydrous sodium sulphate* with 2 ml of *dichloromethane* and evaporate the solution to dryness. The residue complies with the following test.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *betahistine hydrochloride IPRS* treated in the same manner or with the reference spectrum of betahistine.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),

Medium. 900 ml of buffer solution prepared by dissolving 21.9 g of *anhydrous disodium hydrogen orthophosphate* and 4.83 g of *citric acid* in 1000 ml of *water*, adjusted to pH 6.8 with *1 M sodium hydroxide*,

Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the medium if necessary, at the maximum at about 256 nm (2.4.7). Calculate the content of $C_8H_{12}N_2$, 2HCl in the medium from the absorbance obtained from a solution of known concentration of *betahistine hydrochloride IPRS* in the same medium.

Q. Not less than 80 per cent of the stated amount of $C_8H_{12}N_2$,2HCl.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 32 mg of Betahistine Dihydrochloride in 50 ml of mobile phase and dilute to 100.0 ml with mobile phase, centrifuge and use the supernatant liquid.

Reference solution (a). Dilute 1.0 ml of the test solution to 500.0 ml with the mobile phase.

Reference solution (b). A 0.00064 per cent w/v solution of *betahistine impurity C IPRS (N-methyl-2-(pyridin-2-yl)-N-[2-(pyridine-2- yl)ethyl]ethanamine trihydrochloride)* in the mobile phase.

Reference solution (c). A 0.000032 per cent w/v solution of *betahistine impurity A IPRS(2-vinylpyridine)* in *acetonitrile*.

Reference solution (d). A solution containing 0.00064 per cent w/v each of *betahistine impurity C IPRS* and *betahistine dihydrochloride IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Zorbax XDB Eclipse),
- mobile phase: dissolve 0.4 g of *hexylamine* in 600 ml of a solution containing 0.46 per cent w/v solution of *sodium dihydrogen orthophosphate monohydrate* and

0.27 per cent w/v of *sodium lauryl sulphate*, add 400 ml of *acetonitrile*, mix and adjusted to pH 3.5 using *orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (d). The test is not valid unless the resolution between the peaks due to N-methyl-2-(pyridin-2-yl)-N-[2-(pyridine-2- yl)ethyl]ethanamine trihydrochloride and betahistine dihydrochloride is not less than 3.0.

Inject reference solution (a), (b), (c) and the test solution. Run the chromatogram 4 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to betahistine impurity C is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent) and the area of any peak corresponding to betahistine impurity A is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Uniformity of content. Complies with the tests stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay.

Test solution. Disperse one tablet to a 25-ml volumetric flask with about 15 ml of mobile phase, mix with the aid of ultrasound and dilute to 25.0 ml with the mobile phase, filter. Dilute with mobile phase to achieve concentration of 0.032 per cent w/v of betashistine hydrochloride.

Calculate the content of $C_8H_{12}N_2$,2HCl in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powdered tablet containing 32 mg of Betahistine Dihydrochloride, disperse in 50 ml of mobile phase and dilute to 100.0 ml with mobile phase and filter.

Reference solution. A 0.032 per cent w/v solution of *betahistine hydrochloride IPRS* in mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 50°,
- mobile phase: dissolve 2.76 g of *sodium dihydrogen phosphate monohydrate* and 1.6 g of *sodium dodecyl-sulphate* in 600 ml of *water*, add 0.4 g of *hexylamine* and 400 ml of *acetonitrile*, adjusted to pH 3.5 with *orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency in not less than 2000 theoretical plates. The relative standard deviation for replicate injections is not more than 2.0 per cent.

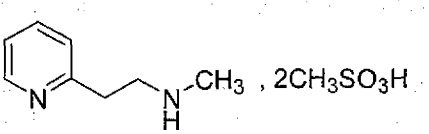
Inject the reference solution and the test solution.

Calculate the content of $C_8H_{12}N_2$, 2HCl in the tablet.

Storage. Store protected from light.

Betahistine Mesylate

Betahistine Mesilate



$C_8H_{12}N_2$,2CH_3SO_3H Mol Wt. 328.4

Betahistine Mesilate is 2-[(2-Methylamino)ethyl]pyridine bis(methanesulphonate).

Betahistine Mesylate contains not less than 98.0 per cent and not more than 101.0 per cent of $C_8H_{12}N_2$, 2CH_3SO_3H, calculated on anhydrous basis.

Category. Antivertigo.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *betahistine mesylate IPRS* or with the reference spectrum of betahistine mesylate.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 0.75 volume of *ammonia*, 15 volumes of *ethyl acetate* and 30 volumes of *methanol*.

Test solution. Dissolve 10 mg of the substance under examination in *ethanol (95 per cent)* and dilute to 2.0 ml with *ethanol (95 per cent)*.

Reference solution. A 0.5 per cent w/v solution of *betahistine mesylate IPRS* in *ethanol (95 per cent)*.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 8 cm. Dry the plate in air and heat at 110° for 10 minutes, allow to cool and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

C. To 0.1 g, add 5 ml of *dilute hydrochloric acid* and shake for about 5 minutes. Add 1 ml of *barium chloride solution*. The solution remains clear. To a further 0.1 g, add 0.5 g of *anhydrous sodium carbonate*, mix and ignite until a white residue is obtained. Allow to cool and dissolve the residue in 7 ml of *water*. It gives reaction (A) of sulphates (2.3.1).

Tests

Appearance of solution. A 10 per cent w/v solution in *carbon dioxide-free water* (Solution A) is clear (2.4.1) and colourless (2.4.1).

pH (2.4.24). 2.0 to 3.0, determined in solution A.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). A solution containing 0.0008 per cent w/v each of *betahistine mesylate IPRS* and *2- vinylpyridine* (betahistine mesylate impurity A) in the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 2.0 ml of reference solution (b) to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 2.0 g of *sodium dodecyl sulphate* in a mixture of 15 volumes of 10 per cent v/v solution of *sulphuric acid*, 35 volumes of 1.7 per cent w/v solution of *tetrabutylammonium hydrogen sulphate* and 650 volumes of *water*, adjusted to pH 3.3 with *sodium hydroxide solution* and 300 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks corresponding to betahistine mesylate impurity A and betahistine mesylate is not less than 3.5.

Inject reference solution (b), (c) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. The area any secondary peak corresponding to betahistine mesylate impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent). The area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

2-Propanol (5.4). Not more than 0.5 per cent.

Chlorides (2.3.12). Add 1 ml of *water* to 14 ml of solution A. The solution complies with the limit test of chlorides (35 ppm) using 2 ml of *chloride standard solution (25 ppm)*.

Sulphates (2.3.17). Dilute 6 ml of solution A in *water* to 15 ml with *water*. The solution complies with the limit test of sulphates (250 ppm).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

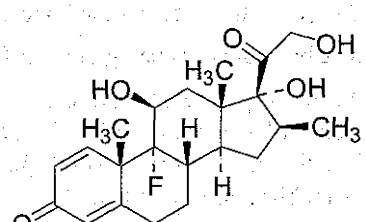
Water (2.3.43). Not more than 2.0 per cent, determined on 0.5 g.

Assay. Dissolve 0.14 g in 50 ml of a mixture of 1 volume of *anhydrous acetic acid* and 7 volumes of *acetic anhydride* and titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01642 g of $C_{10}H_{20}N_2O_6S_2$.

Storage. Store protected from moisture.

Betamethasone



$C_{22}H_{29}FO_5$ Mol. Wt. 392.5

Betamethasone is 9α-fluoro-11β,17α,21-trihydroxy-16β-methylpregna-1,4-diene-3,20-dione.

Betamethasone contains not less than 96.0 per cent and not more than 104.0 per cent of $C_{22}H_{29}FO_5$, calculated on the dried basis.

Category. Adrenocortical steroid.

Description. A white to creamy-white powder; odourless.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests C and D may be omitted if tests A and B are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *betamethasone IPRS* or with the reference spectrum of betamethasone.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with a suitable silica gel containing a fluorescent indicator with an optimal intensity at 254 nm (such as Merck silica gel 60 F254).

Mobile phase. A mixture of 85 volumes of *ether*, 10 volumes of *toluene* and 5 volumes of *1-butanol* saturated with *water*.

Test solution. Dissolve 25 mg of the substance under examination in 10 ml of a mixture of 90 volumes of *chloroform* and 10 volume of *methanol*.

Reference solution (a). A 0.25 per cent w/v solution of *betamethasone IPRS* in a mixture of 90 volumes of *chloroform* and 10 volumes of *methanol*.

Reference solution (b). A 0.125 per cent w/v solution of each of the substance under examination and *betamethasone IPRS* in the same solvent mixture.

Reference solution (c). A 0.125 per cent w/v solution of each of the substance under examination and *dexamethasone IPRS* in the same solvent mixture.

Apply to the plate 2 µl of each solution. After development, dry the plate in air and spray with *ethanolic sulphuric acid (20 per cent)*. Heat at 120° for 10 minutes or until spots are produced, allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution is similar in colour in daylight, in fluorescence in ultraviolet light at 365 nm, position and size to the principal spot in the chromatogram obtained with reference solution (a) and the chromatogram obtained with reference solution (b) shows only one spot. The test is not valid unless the chromatogram obtained with reference solution (c) shows two principal spots that are close to one another but separated.

C. Heat 0.5 ml of *chromic-sulphuric acid* in a test-tube (5 cm × about 6 mm) in a naked flame until white fumes are evolved; the solution wets the sides of the tube readily and there is no greasiness. Add 2 or 3 mg of the substance under examination and again heat in a naked flame until white fumes appear; the solution does not wet the sides of the tube and does not pour easily from the tube.

D. Place 2 ml of a 0.01 per cent w/v solution in *ethanol* in a stoppered tube, add 10 ml of *phenylhydrazine solution*, mix, warm in a water-bath at 60° for 20 minutes and cool immediately; absorbance of the resulting solution at about 450 nm (2.4.7), not more than 0.25.

Tests

Specific optical rotation (2.4.22). + 114.0° to + 122.0°, determined in a 0.5 per cent w/v solution in *dioxan*.

Light absorption (2.4.7). Absorbance of a 0.001 per cent w/v solution in *ethanol (95 per cent)* at the maximum at about 240 nm, 0.37 to 0.40.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25.0 mg of the substance under examination in a mixture of equal volumes of *acetonitrile* and *methanol* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 2 mg of *betamethasone IPRS* and 2 mg of *methylprednisolone IPRS* in mobile phase A and dilute to 100.0 ml with the same mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: A. a 25 per cent v/v of *acetonitrile*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 2.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
15	100	0
40	0	100
41	100	0
46	100	0

The retention times of methylprednisolone is about 11.5 minutes and of betamethasone is about 12.5 minutes.

Inject reference solution (a). The test is not valid unless the resolution between the peaks corresponding to methylprednisolone and betamethasone is not less than 1.5.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any

secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and not more than one such peak has an area more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). The sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.1 g in *ethanol (95 per cent)* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of the solution to 100.0 ml with *ethanol (95 per cent)*. Measure the absorbance of the resulting solution at the maximum at about 238.5 nm (2.4.7).

Calculate the content of $C_{22}H_{29}FO_5$ taking 395 as the specific absorbance at 238.5 nm.

Storage. Store protected from light.

Betamethasone Tablets

Betamethasone Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of betamethasone, $C_{22}H_{29}FO_5$.

Usual strengths. 0.5 mg; 1.0 mg.

Identification

Powder a few tablets and extract with *chloroform*. Evaporate the extract to dryness. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *betamethasone IPRS* or with the reference spectrum of betamethasone.

B. Place 2 ml of a 0.01 per cent w/v solution in *ethanol* in a stoppered tube, add 10 ml of *phenylhydrazine solution*, mix, warm in a water-bath at 60° for 20 minutes and cool immediately; absorbance of the resulting solution at about 450 nm (2.4.7), not more than 0.25.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. A mixture of 90 volumes of *acetone* and 10 volumes of *formamide*.

Mobile phase. *Chloroform*.

Test solution. Dissolve 25 mg of the residue in 10 ml of the solvent mixture.

Reference solution (a). Dissolve 25 mg of *betamethasone IPRS* in 10 ml of the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Reference solution (c). Mix equal volumes of the test solution and a 0.25 per cent w/v solution of *dexamethasone IPRS* in the solvent mixture.

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot. The chromatogram obtained with reference solution (c) shows two closely running spots.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *water* and 1 ml of 0.05 per cent w/v solution of *testosterone IPRS* (internal standard) in *methanol*,

Speed and time. 50 rpm and 45 minutes.

Use one tablet in the vessel for each test.

Withdraw a suitable volume of the medium and filter.

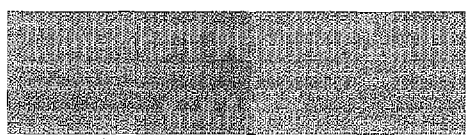
Determine by liquid chromatography (2.4.14).

Test solution. The filtrate obtained as given above.

Reference solution. Dilute a mixture of 1.0 ml each of a 0.05 per cent w/v solution of *betamethasone IPRS* in *methanol* and 1 ml of a 0.05 per cent w/v solution of *testosterone IPRS* in *methanol* to 900 ml with *water*. Make suitable changes in concentration of *betamethasone IPRS* as per test concentration.

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of *methanol* and 40 volumes of *water*,



- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 100 µl.

Q. Not less than 75 per cent of the stated amount of $C_{22}H_{29}FO_5$.

Related substances. Transfer a quantity of the powdered tablets containing about 2 mg of Betamethasone to a glass-stoppered 50-ml centrifuge tube. Pipette 20 ml of *ethanol (95 per cent)* into the tube, shake for 2 minutes and allow to stand for 20 minutes with occasional shaking. Centrifuge the mixture for 5 minutes. Pipette 10 ml of the clear supernatant liquid into a glass-stoppered tube and evaporate the *ethanol* on a water-bath with the aid of a current of air to about 0.5 ml, then evaporate without heat to dryness. Pipette 1 ml of a mixture of 9 volumes of *chloroform* and 1 volume of *methanol*, insert the stopper and mix. Centrifuge, if necessary, to remove any insoluble material. Use the solution as the test solution.

Determine by thin-layer chromatography (2.4.17), coating the plate with a suitable silica gel containing a fluorescent indicator with an optimal intensity at 254 nm (such as Merck silica gel 60 F254).

Mobile phase. A mixture of 77 volumes of *dichloromethane*, 15 volumes of *ether*, 8 volumes of *methanol* and 1.2 volumes of *water*.

Reference solution (a). A 0.002 per cent w/v solution of *betamethasone IPRS* in a mixture of 90 volumes of *chloroform* and 10 volumes of *methanol*.

Reference solution (b). A 0.001 per cent w/v solution of *betamethasone IPRS* in the same solvent mixture.

Reference solution (c). A 0.1 per cent w/v solution of each of *betamethasone IPRS* and *dexamethasone IPRS* in the same solvent mixture.

Apply to the plate 5 µl of each solution. After development, dry the plate in air until the odour of solvents is no longer detectable and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated principal spots.

Uniformity of content. Complies with the test stated under Tablets. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light.

Test solution. Finely crush one tablet, add 20.0 ml of a 0.002 per cent w/v solution of *hydrocortisone* (internal standard) in *methanol (50 per cent)*, shake for 10 minutes and filter through a glass-fibre filter paper.

Reference solution. A solution containing 0.0025 per cent w/v of *betamethasone IPRS* and 0.002 per cent w/v of *hydrocortisone*.

Chromatographic system

- a stainless steel column 20 cm x 5 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 53 volumes of *water* and 47 volumes of *methanol*,
- flow rate: 1.4 ml per minute,
- spectrophotometer set at 238 nm,
- injection volume: 20 µl.

Calculate the content of $C_{22}H_{29}FO_5$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 2.5 mg of Betamethasone, add 20.0 ml of *methanol (50 per cent)*, shake for 10 minutes and filter through a glass-fibre paper.

Reference solution (a). A solution containing 0.0125 per cent w/v of *betamethasone IPRS* and 0.01 per cent w/v of *hydrocortisone* (internal standard) in *methanol* (50 per cent).

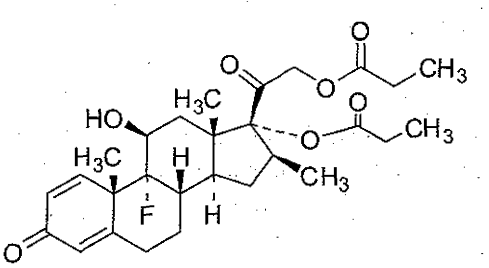
Reference solution (b). Prepare in the same manner as the test solution but use 20.0 ml of a 0.01 per cent w/v solution of *hydrocortisone* in *methanol (50 per cent)* in place of 20.0 ml of *methanol (50 per cent)*.

Use chromatographic system as described under Uniformity of content.

Calculate the content of $C_{22}H_{29}FO_5$ in the tablets.

Storage. Store protected from light.

Betamethasone Dipropionate



$C_{28}H_{37}FO_7$ Mol. Wt. 504.6

Betamethasone Dipropionate is 9α-fluoro-11β,17α,21-trihydroxy-16β-methylpregna-1,4-diene-3,20-dione 17α,21-dipropionate.

Betamethasone Dipropionate contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{28}H_{37}FO_7$, calculated on the dried basis.

Category. Topical Steroid.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *betamethasone dipropionate IPRS* or with the reference spectrum of betamethasone dipropionate.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Solvent mixture. 10 volumes of *methanol* and 90 volumes of *dichloromethane.*

Mobile phase. Add 1.2 volumes of *water* and 8 volumes of *methanol* in a mixture of 15 volumes of *ether* and 77 volumes of *dichloromethane.*

Test solution. Dissolve 10 mg of the substance under examination in 10.0 ml of the solvent mixture.

Reference solution (a). A 0.1 per cent w/v solution of *betamethasone dipropionate IPRS* in the solvent mixture.

Reference solution (b). A 0.1 per cent w/v solution of *betamethasone acetate IPRS* in the solvent mixture. Dilute 5.0 ml of the solution to 10 ml with reference solution (a).

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with reference solution (a). Spray with *ethanolic sulphuric acid.* Heat at 120° for 10 minutes or until the spots appear, allow to cool. Examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with reference solution (a). Reference solution (b) gives two clearly separated spots.

Tests

Specific optical rotation (2.4.22). + 63° to + 70°, determined on a 1.0 per cent w/v solution of *dioxan.*

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 62.5 mg of the substance under examination in 25.0 ml of the mobile phase.

Reference solution (a). Dissolve 2.5 mg of *betamethasone dipropionate RS* and 2.5 mg of *anhydrous beclomethasone dipropionate IPRS* in 50.0 ml of the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of *water* and 60 volumes of *acetonitrile,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to betamethasone dipropionate and beclomethasone dipropionate is not less than 2.5.

Inject reference solution (b) and the test solution. Run the chromatogram 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.75 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent) and not more than one such peak has an area more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). The sum of all the secondary peaks is not more than 1.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.5 per cent). Ignore any peak with an area less than 0.025 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 0.5 g by drying in an oven at 105°.

Assay. Dissolve 50 mg in 100.0 ml of *ethanol (95 per cent).* Dilute 2.0 ml of the solution to 50.0 ml with *ethanol (95 per cent)* and measure the absorbance of the resulting solution at the maximum at about 240 nm (2.4.7). Calculate the content of $C_{28}H_{37}FO_7$ taking 305 as the specific absorbance at 240 nm.

Storage. Store protected from light.

Betamethasone Cream

Betamethasone Dipropionate Cream

Betamethasone Cream contains an amount of betamethasone dipropionate, $C_{28}H_{37}FO_7$ equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of betamethasone, $C_{22}H_{29}FO_5$ in a suitable cream base.

Usual strength. 0.05 per cent w/w.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 70 volumes of *chloroform* and 10 volumes of *acetone.*

Test solution. Transfer about 1.5 g of Cream to a glass-stoppered, 50-ml centrifuge tube. Add 15 ml of a *methanolic hydrochloric acid solution* prepared by mixing 1 volume of *dilute hydrochloric acid* (1 in 120) with 4 volumes of *methanol.* Shake to obtain a homogeneous mixture. Add 30 ml of *hexane,* mix for 10 minutes, and centrifuge. Using a suitable syringe, transfer the lower aqueous phase to a second centrifuge tube, add about 20 ml of *water* and mix. Extract this aqueous mixture with chloroform by shaking, centrifuging, and removing the lower, chloroform phase with a syringe. Evaporate the chloroform on a steam bath with the aid of a stream of nitrogen to dryness, cool, and dissolve the residue in chloroform to obtain a solution containing about 150 µg of betamethasone dipropionate per ml.

Reference solution. A 0.015 per cent w/v solution of *betamethasone dipropionate IPRS* in *chloroform.*

Apply to the plate 40 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with the reference solution.

Tests

Other tests. Comply with the tests stated under Cream.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. A 0.1 per cent v/v solution of *acetic acid* in *methanol.*

Internal standard solution. A 0.045 per cent w/v solution of *beclomethasone dipropionate IPRS* in the solvent mixture.

Test solution. Weigh and transfer the cream containing 2.0 mg of of Betamethasone Dipropionate into a capped 50.0 ml centrifuge tube, add 10.0 ml of solvent mixture followed by 5.0 ml of internal standard solution and mix. Heat in a water bath maintained at 60°, shaking intermittently, until the cream melts. Remove from the bath, and shake vigorously until the specimen has solidified. Repeat the heating and shaking. Freeze in an ice-methanol bath for about 15 minutes, and centrifuge to obtain a clear supernatant liquid.

Reference solution. Add 5.0 ml of internal standard solution to 10.0 ml of a 0.02 percent w/v solution of *betamethasone dipropionate IPRS* in solvent mixture and mix.

Chromatographic system

- a stainless steel column 30 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of *acetonitrile* and 50 volumes of *water,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 25 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of betamethasone, $C_{22}H_{29}FO_5$ in the cream by using the peak area ratio of the betamethasone dipropionate peak and the internal standard peak obtained from the reference solution and the test solution.

Storage. Preserve in collapsible tubes or tight containers and at a temperature of 30°, excursions permitted between 15° and 30°. Protect from freezing.

Betamethasone Lotion

Betamethasone Dipropionate Lotion

Betamethasone Lotion contains an amount of betamethasone dipropionate, $C_{28}H_{37}FO_7$ equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of betamethasone, $C_{22}H_{29}FO_5$ in a suitable lotion base.

Usual strength. 0.05 per cent w/w.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 70 volumes of *chloroform* and 10 volumes of *acetone.*

Test solution. Disperse a quantity of Lotion containing about 0.6 mg of Betamethasone Dipropionate with 10 ml of *0.1 M hydrochloric acid* and 4 ml of *chloroform* for 10 minutes. Centrifuge at 2000 rpm for about 5 minutes. Transfer the chloroform layer to a suitable vial.

Reference solution. A 0.015 per cent w/v solution of *betamethasone dipropionate IPRS* in *chloroform.*

Apply to the plate 40 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with the reference solution.

Tests

Other tests. Comply with the tests stated under Lotions.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. A 0.1 per cent v/v solution of *acetic acid* in *methanol.*

Internal standard solution. A 0.09 per cent w/v solution of *beclomethasone dipropionate IPRS* in *chloroform.*

Test solution. Disperse a quantity of Lotion containing about 1.2 mg of Betamethasone Dipropionate with 10.0 ml of *0.1 M hydrochloric acid* in a capped 50-ml centrifuge tube. Add 2.0 ml of internal standard solution and 2.0 ml of *chloroform.* Cap and shake vigorously for about 2 minutes, or disperse on a vortex mixer for about 1 minute. Centrifuge at 2500 rpm for about 3 minutes. Transfer the chloroform phase to a suitable vial. Evaporate the chloroform under a stream of nitrogen at a slightly elevated temperature to dryness. Cool the vial to room temperature, add 4.0 ml of *methanol,* and swirl to dissolve the residue.

Reference solution. A 0.06 per cent w/v solution of *betamethasone dipropionate IPRS* in *chloroform.* Transfer 5.0 ml of the solution to a suitable vial, and add 5.0 ml of internal standard solution to obtain a solution having known concentrations of about 0.3 mg of Betamethasone Dipropionate and about 0.45 mg of Beclomethasone Dipropionate per ml. To 10.0 ml of *0.1 M hydrochloric acid* in a capped 5-ml centrifuge tube add 4.0 ml of the prepared solution. Cap and shake vigorously for about 2 minutes, or disperse on a vortex mixer for about 1 minute. Centrifuge at 2500 rpm for about 3 minutes. Transfer the chloroform phase to a suitable vial. Evaporate the chloroform under a stream of nitrogen at a slightly elevated temperature to dryness. Cool the vial to room temperature, add 4.0 ml of *methanol,* and swirl to dissolve the residue.

Chromatographic system
- a stainless steel column 30 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of *acetonitrile* and 50 volumes of *water,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 25 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of betamethasone, $C_{22}H_{29}FO_5$ in the Lotion.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Labelling. The label states (1) the concentrations of Betamethasone in the preparation; (2) that the preparation is intended for external use only; (3) that the contents should be shaken before use; the conditions under which the preparation should be stored.

Betamethasone Ointment

Betamethasone Dipropionate Ointment

Betamethasone Ointment contains an amount of betamethasone dipropionate, $C_{28}H_{37}FO_7$ equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of betamethasone, $C_{22}H_{29}FO_5$, in a suitable ointment base.

Usual strength. 0.05 per cent w/w.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 70 volumes of *chloroform* and 10 volumes of *acetone.*

Test solution. Shake about 1.5 g of Ointment with 15 ml of *methanolic hydrochloric acid solution* prepared by mixing 1 volume of *dilute hydrochloric acid* (1 in 120) with 4 volumes of *methanol.* Add 30 ml of *hexane,* mix for 10 minutes, and centrifuge. Using a suitable syringe, transfer the lower aqueous phase to a second centrifuge tube, add about 20 ml of *water,* and mix. Extract this aqueous mixture with *chloroform* by shaking, centrifuge and removing the lower, chloroform phase with a syringe. Evaporate the chloroform on a steam bath with the aid of a stream of nitrogen to dryness, cool, and dissolve the residue in chloroform to obtain a solution containing about 150 µg of betamethasone dipropionate per ml.

Reference solution. A 0.015 per cent w/v solution of *betamethasone dipropionate IPRS* in *chloroform.*

Apply to the plate 40 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with the reference solution.

Tests

Other tests. Comply with the tests stated under Ointment.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. A 0.1 per cent v/v solution of *acetic acid* in *methanol.*

Internal standard solution. A 0.09 per cent w/v solution of *beclomethasone dipropionate IPRS* in *chloroform.*

Test solution. Disperse a quantity of Ointment containing about 2 mg of Betamethasone Dipropionate with 5.0 ml of internal standard solution and 10.0 ml of the solvent mixture. Heat in a water-bath at 70°, shaking intermittently until the ointment melts. Remove from the bath, and shake vigorously until the ointment has solidified. Repeat the heating and shaking operation. Freeze in an ice-methanol bath for about

15 minutes, and centrifuge at 2500 rpm for about 5 minutes. Transfer a portion of the supernatant to a suitable vial.

Reference solution. A 0.06 per cent w/v solution of *betamethasone dipropionate IPRS* in *chloroform*. Transfer 5.0 ml of the solution to a suitable vial, and add 5.0 ml of internal standard solution to obtain a solution having known concentrations of about 0.3 mg of Betamethasone Dipropionate and about 0.45 mg of Beclomethasone Dipropionate per ml. To 10.0 ml of *0.1 M hydrochloric acid* in a capped 5-ml centrifuge tube add 4.0 ml of the prepared solution. Cap, and shake vigorously for about 2 minutes, or disperse on a vortex mixer for about 1 minute. Centrifuge at 2500 rpm for about 3 minutes. Transfer the chloroform phase to a suitable vial. Evaporate the chloroform under a stream of nitrogen at a slightly elevated temperature to dryness. Cool the vial to room temperature, add 4.0 ml of *methanol*, and swirl to dissolve the residue.

Chromatographic system
- a stainless steel column 30 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of *acetonitrile* and 50 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 25 µl.

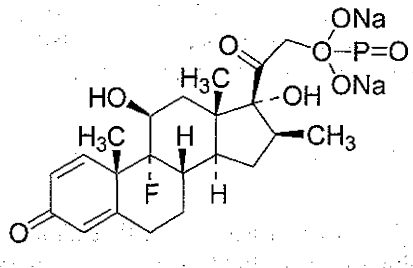
Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{29}FO_5$ in the Ointment.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Betamethasone Sodium Phosphate



$C_{22}H_{28}FNa_2O_8P$ Mol. Wt. 516.4

Betamethasone Sodium Phosphate is 9α-fluoro-11β,17α,21-trihydroxy-16β-methylpregna-1,4-diene-3,20-dione disodium phosphate.

Betamethasone Sodium Phosphate contains not less than 96.0 per cent and not more than 103.0 per cent of $C_{22}H_{28}FNa_2O_8P$, calculated on the anhydrous basis.

Category. Adrenocortical steroid.

Description. A white or almost white powder; odourless; very hygroscopic.

Identification

A. To 2 ml of a 0.013 per cent w/v solution in *ethanol (95 per cent)* in a stoppered tube add 10 ml of *phenylhydrazine-sulphuric acid solution*, mix, warm in a water-bath at 60° for 20 minutes and cool immediately. Absorbance of the resulting solution at the maximum at about 450 nm, not more than 0.13 (2.4.7).

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A freshly prepared mixture of 30 volumes of *isopropyl alcohol*, 10 volumes of *acetic acid* and 10 volumes of *water*.

Test solution. Dissolve 0.25 g of the substance under examination in 100 ml of *water*.

Reference solution (a). A 0.25 per cent w/v solution of *betamethasone sodium phosphate IPRS* in *water*.

Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

Reference solution (c). A mixture of equal volumes of the test solution and a 0.25 per cent w/v solution of *prednisolone sodium phosphate IPRS*.

Apply to the plate 2 µl of each solution. After development, dry the plate in air until the odour of solvents is no longer detectable, spray with *ethanolic sulphuric acid (20 per cent)*, heat at 120° for 10 minutes, allow to cool, and examine in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot and the chromatogram obtained with reference solution (c) shows two closely running spots.

C. Heat 0.5 ml of *chromic-sulphuric acid* in a test-tube (5 cm x 6 mm) in a naked flame until white fumes are evolved; the solution wets the sides of the tube readily and there is no greasiness. Add 2 or 3 mg of the substance under examination and again heat in a naked flame until white fumes appear; the solution does not wet the sides of the tube and does not pour easily from the tube.

D. Dissolve 2 mg in 2 ml of *sulphuric acid* and allow to stand for 5 minutes; no red colour or yellowish-green fluorescence

is produced (distinction from prednisolone sodium phosphate and hydrocortisone sodium phosphate).

E. Heat gently 40 mg with 2 ml of *sulphuric acid* until white fumes are evolved, add *nitric acid* dropwise until oxidation is complete and cool. Add 2 ml of *water*, heat until white fumes are again evolved, cool, add 10 ml of *water* and neutralise to *litmus paper* with *dilute ammonia solution*. The solution gives the reactions of sodium salts and of phosphates (2.3.1).

Tests

Appearance of solution. A 2.0 per cent w/v solution is clear (2.4.1) and colourless (2.4.1).

pH (2.4.24). 7.5 to 9.0, determined in a 0.5 per cent w/v solution.

Specific optical rotation (2.4.22). +98.0° to +104.0°, determined in a 1.0 per cent w/v solution.

Light absorption (2.4.7). Ratio of the absorbance of the solution prepared as directed under Assay at the maximum at about 241 nm to that at about 263 nm, 1.70 to 1.90.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 62.5 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). A solution containing 0.004 per cent w/v each of *betamethasone sodium phosphate IPRS* and *dexamethasone sodium phosphate IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 1.36 g of *potassium dihydrogen phosphate* and 0.6 g of *hexylamine* in 185 ml of *water* and add 65 ml of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

The retention time of betamethasone sodium phosphate peak is about 14 minutes and of dexamethasone sodium phosphate peak is about 15.5 minutes.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to betamethasone sodium phosphate and dexamethasone sodium phosphate is not less than 2.0.

Inject reference solution (b) and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent) and not more than one such peak has an area more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent). Ignore any peak with an area less than 0.025 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Inorganic phosphate. Not more than 0.5 per cent, calculated as PO_4, determined by the following method. Weigh 25 mg, dissolve in 10 ml of *water*, add 4 ml of *dilute sulphuric acid*, 1 ml of *ammonium molybdate solution* and 2 ml of *methylaminophenol with sulphite solution* and allow to stand for 15 minutes. Add sufficient *water* to produce 25.0 ml, allow to stand for further 15 minutes and measure the absorbance of the resulting solution at the maximum at about 730 nm (2.4.7). Calculate the content of phosphate from a calibration curve prepared by treating suitable aliquots of a 0.00143 per cent w/v solution of *potassium dihydrogen phosphate* in a similar manner.

Free betamethasone and other derivatives. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. *Methanol*.

Test solution. Dissolve 1.0 g of the substance under examination in 100 ml of *methanol*.

Reference solution (a). A 1.0 per cent w/v solution of *betamethasone sodium phosphate IPRS* in *methanol*.

Reference solution (b). A 0.02 per cent w/v solution of *betamethasone IPRS* in *methanol*.

Apply to the plate 2 µl of each solution. After development, dry the plate in air for 5 minutes and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution other than that corresponding to *betamethasone sodium phosphate IPRS* is not more intense than the spot in the chromatogram obtained with reference solution (b).

Water (2.3.43). Not more than 8.0 per cent, determined on 0.5 g.

Assay. Weigh 0.2 g and dissolve in sufficient *water* to produce 200.0 ml. Dilute 5.0 ml to 250.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 241 nm (2.4.7). Calculate the content of $C_{22}H_{28}FNa_2O_8P$, taking 297 as the specific absorbance at 241 nm.

Storage. Store protected from light and moisture.

Betamethasone Eye Drops

Betamethasone Eye Drops are a sterile solution of Betamethasone Sodium Phosphate in Purified Water.

Betamethasone Eye Drops contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of betamethasone sodium phosphate, $C_{22}H_{28}FNa_2O_8P$.

Usual strength. 0.1 per cent w/v.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 60 volumes of *butanol*, 20 volumes of *acetic anhydride* and 20 volumes of *water*.

Test solution. Dilute the eye drops suitably with *water* to get a solution containing 0.1 per cent w/v of Betamethasone Sodium Phosphate.

Reference solution (a). A 0.1 per cent w/v solution of *betamethasone sodium phosphate IPRS* in *water*.

Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

Reference solution (c). A mixture of equal volumes of reference solution (a) and 0.1 per cent w/v of *prednisolone sodium phosphate IPRS* in *water*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate in air, heat at 110° for 10 minutes and examine under ultraviolet light at 254 nm. The chromatograms obtained with the test solution, reference solution (a) and reference solution (b) show single principal spots with similar R_f values. The chromatogram obtained with reference solution (c) shows two principal spots with almost identical R_f values.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. To a volume containing 0.2 mg of Betamethasone Sodium Phosphate, add slowly 1 ml of *sulphuric acid* and allow to stand for 2 minutes. A brownish yellow colour but no red colour or yellowish green fluorescence is produced.

Tests

pH (2.4.24). 7.0 to 8.5.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute the eye drops if necessary to obtain a solution containing 0.1 per cent w/v of Betamethasone Sodium Phosphate.

Reference solution (a). Dilute 1 volume of the test solution to 50 volumes with *water*.

Reference solution (b). A solution containing 0.006 per cent w/v each of *betamethasone sodium phosphate IPRS* and *betamethasone IPRS*.

Chromatographic system

- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm) (Such as Spherisorb ODS 1),
- column temperature: 60°,
- mobile phase: a mixture of 60 volumes of *citro-phosphate buffer pH 5.0* and 40 volumes of *methanol*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 241 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to betamethasone sodium phosphate and betamethasone is at least 3.5.

Inject reference solution (a) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any peak corresponding to betamethasone is not more than 1.3 times the area of the principal peak in the chromatogram obtained with reference solution (a), the area of any other secondary peak is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) and the sum of the areas of all the secondary peaks is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a). Ignore any peak the area of which is less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a).

Other tests. Comply with the tests stated under Eye Drops.

Assay. Determine by liquid chromatography (2.4.14).

Test solution (a). Mix a quantity of the eye drops containing 5 mg of Betamethasone Sodium Phosphate with 10 ml of *methanol* and dilute to 25.0 ml with *water*.

Test solution (b). Mix a quantity of the eye drops containing 5 mg of Betamethasone Sodium Phosphate with 10 ml of a 0.06 per cent w/v solution of *hydrocortisone* (internal standard) in *methanol* and dilute to 25.0 ml with *water*.

Reference solution. Mix 5.0 ml of a 0.1 per cent w/v solution of *betamethasone sodium phosphate IPRS* in *water* (solution A) and 10 ml of the internal standard solution and dilute to 25.0 ml with *water*.

Chromatographic system

- a stainless steel column 20 cm x 5 mm, packed with octadecylsilane bonded to porous silica (10 µm) (Such as Spherisorb ODS 1),

- mobile phase: a mixture of 55 volumes of *citrophosphate buffer pH 5.0* and 45 volumes of *methanol*,
- flow rate: 2 ml per minute.
- spectrophotometer set at 241 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution, test solution (a) and (b).

Calculate the content of $C_{22}H_{28}FNa_2O_8P$ in the eye drops.

Storage. Store protected from light.

Betamethasone Injection

Betamethasone Sodium Phosphate Injection

Betamethasone Injection is a sterile solution of Betamethasone Sodium Phosphate in Water for Injections.

Betamethasone Injection contains not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of betamethasone, $C_{22}H_{29}FO_5$.

Usual strength. The equivalent of 4 mg of betamethasone per ml. (5.2 mg of Betamethasone Sodium Phosphate is approximately equivalent to 4 mg of betamethasone).

Description. A clear, colourless solution.

Identification

A. To a volume of injection containing 4 mg of betamethasone, add 1 ml of *water* and sufficient *ethanol* to produce 40 ml. To 2 ml of the solution in a stopper tube, add 10 ml of *phenyl hydrazine solution*, mix, warm in a water-bath at 60° for 20 minutes and cool immediately; absorbance of the resulting solution at the maximum at 450 nm (2.4.7), not more than 0.1.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 60 volumes of *1-butanol*, 20 volumes of *acetic anhydride* and 20 volumes of *water*.

Test solution. Dilute a volume of the injection with *water* to obtain a solution containing 0.2 per cent w/v of Betamethasone.

Reference solution (a). A 0.25 per cent w/v solution of *betamethasone sodium phosphate IPRS* in *water*.

Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

Reference solution (c). A mixture of equal volumes of the test solution and a 0.25 per cent w/v solution of *prednisolone sodium phosphate IPRS* in *water*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air, heat at 110° for 10 minutes and examine under ultraviolet light at 254 nm. The chromatogram obtained with the test solution, reference solution (a) and reference solution (b) shows single principal spot with identical Rf values. The chromatogram obtained with reference solution (c) shows two principal spots with almost identical Rf values.

C. Evaporate a volume containing the equivalent of 2 mg betamethasone to dryness on a water-bath, dissolve the residue in 2 ml of *sulphuric acid* and allow to stand for 2 minutes, No red colour is produced.

Tests

pH (2.4.24). 8.0 to 9.0.

Appearance of solution. A 0.2 per cent w/v solution of betamethasone is not more intensely coloured than reference solution BYS4 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light.

Test solution. Dilute a volume of the injection with the mobile phase to obtain a solution containing 0.1 per cent w/v of Betamethasone.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.006 per cent w/v, each of, *betamethasone sodium phosphate IPRS* and *betamethasone IPRS* in the mobile phase

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm), (Such as Spherisorb ODS 1),
- column temperature: 60°,
- mobile phase: a mixture of 60 volumes of *citrophosphate buffer pH 5.0* and 40 volumes of *methanol*,
- flow rate: 2 ml per minute,
- spectrophotometer set 241 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to betamethasone sodium phosphate and betamethasone is not less than 3.5.

Inject reference solution (a) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. The area of any peak corresponding to betamethasone is not more than 1.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (2.6 per cent), the area of any other secondary peak is not more than 1.5 times the area of the principal peak in the chromatogram

obtained with reference solution (a) (3.0 per cent) and the sum of areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (5.0 per cent). Ignore any peak with an area less than 0.05 times of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light.

Test solution. Dilute a volume of the injection containing 8 mg of betamethasone to 50.0 ml with *methanol* (50 per cent).

Reference solution. A 0.045 per cent w/v solution of *betamethasone sodium phosphate IPRS* in *water*. Dilute 5.0 ml of the solution to 10.0 ml with *methanol*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm), (Such as Spherisorb ODS 1),
- column temperature: 60°,
- mobile phase: a mixture of 55 volumes of *citro-phosphate pH 5.0* and 45 volumes of *methanol*,
- flow rate: 2 ml per minute,
- spectrophotometer set 241nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{29}FO_5$ in the injection.

Storage. Store protected from light, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of betamethasone.

Betamethasone Sodium Phosphate Tablets

Betamethasone Sodium Phosphate Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of betamethasone, $C_{22}H_{29}FO_5$.

Usual strength. The equivalent of 0.5 mg of betamethasone (0.65 mg of Betamethasone Sodium Phosphate is approximately equivalent to 0.5 mg of betamethasone).

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A freshly prepared mixture of 30 volumes of *1-butanol*, 10 volumes of *acetic anhydride* and 10 volumes of *water*.

Test solution. Dissolve a quantity of the powdered tablets containing 2 mg of betamethasone in 25 ml of *water*, add 2.5 g of *sodium chloride* and 1 ml of *hydrochloric acid*, extract with 25 ml of *chloroform* and discard the chloroform layer. Extract with 2.5 ml of *tributyl phosphate* and discard the aqueous layer.

Reference solution (a). Prepare in the same manner as the test solution but using 2.5 mg of *betamethasone sodium phosphate IPRS* instead of the substance under examination.

Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

Reference solution (c). A mixture of equal volumes of the test solution and a solution prepared in the same manner as the test solution but using 2.5 mg of *prednisolone sodium phosphate IPRS* instead of the substance under examination.

Apply to the plate 2 µl of each solution. After development, dry the plate in air until the odour of solvents is no longer detectable, spray with *ethanolic sulphuric acid (20 per cent)*, heat at 120° for 10 minutes, allow to cool, and examine in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot and the chromatogram obtained with reference solution (c) shows two closely running spots. Secondary spots due to excipients may also be seen in the chromatograms obtained with the test solution and reference solution (b) and (c).

B. Disperse a quantity of intact tablets containing 1 mg of betamethasone in 1 ml of *sulphuric acid* and allow to stand for 5 minutes, a pale yellow colour is produced.

Tests

Disintegration (2.5.1). Not more than 5 minutes.

Uniformity of content. Complies with the test stated under Tablets. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve one tablet as completely as possible in 5 ml of *water*, add 5 ml of *methanol* and filter. Dilute with *methanol* (50 per cent v/v) to produce a solution containing 0.0032 per cent w/v of Betamethasone Sodium Phosphate.

Reference solution. A 0.0065 per cent w/v solution of *betamethasone sodium phosphate IPRS* in *water*. Dilute 5.0 ml of the solution to 10.0 ml with *methanol*.

Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm) (Such as Spherisorb ODS),
- column temperature: 60°,
- mobile phase: a mixture of 55 volumes of *citro-phosphate buffer pH 5.0* and 45 volumes of *methanol*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 241 nm,
- injection volume: 20 µl.

Calculate the content of $C_{22}H_{29}FO_5$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14)

Test solution. Disperse a quantity of the intact tablets containing 5 mg of Betamethasone in 50 ml of *water* with the aid of ultrasound for 20 minutes, dilute to 100.0 ml with *methanol*, mix and filter.

Reference solution. Dilute 5.0 ml of a 0.014 per cent w/v solution of *betamethasone sodium phosphate IPRS* in *water* to 10.0 ml with *methanol*.

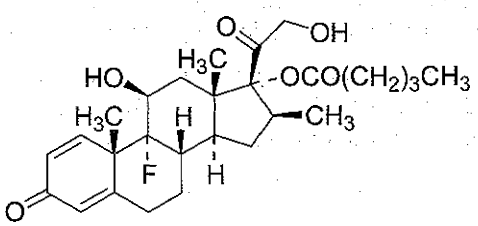
Use chromatographic system as described under Uniformity of content.

Calculate the content of $C_{22}H_{29}FO_5$ in the tablets.

Storage. Store protected from light.

Labelling. The label states the strength in terms of the equivalent amount of betamethasone.

Betamethasone Valerate



$C_{27}H_{37}FO_6$ Mol. Wt. 476.6

Betamethasone Valerate is a 9α–fluoro-11β,17α,21-trihydroxy-16β-methylpregna-1,4-diene-3,20-dione-17-valerate.

Betamethasone Valerate contains not less than 96.0 per cent and not more than 102.0 per cent of $C_{27}H_{37}FO_6$, calculated on the dried basis.

Category. Adrenocortical steroid.

Description. A white to creamy-white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *betamethasone valerate IPRS* or with the reference spectrum of betamethasone valerate.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. A mixture of 90 volumes of *chloroform* and 10 volumes of *methanol*.

Mobile phase. A mixture of 95 volumes of *1,2-dichloroethane*, 5 volumes of *methanol* and 0.2 volume of *water*.

Test solution. Dissolve 25 mg of the substance under examination in 10 ml of the solvent mixture.

Reference solution (a). Dissolve 25 mg of *betamethasone valerate IPRS* in 10 ml of the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

C. In the Assay, the retention time of the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to *betamethasone valerate IPRS* in the chromatogram obtained with the reference solution.

D. Heat 50 mg with 2 ml of *0.5 M ethanolic potassium hydroxide* in a water-bath for 5 minutes. Cool, add 2 ml of *sulphuric acid* (50 per cent v/v) and boil gently for 1 minute; the odour of ethyl valerate is perceptible.

Tests

Specific optical rotation (2.4.22). +75.0° to +82.0°, determined in a 1.0 per cent w/v solution in *dioxan*.

Light absorption (2.4.7). Absorbance of a 0.002 per cent w/v solution in *ethanol* at the maximum at about 240 nm, 0.63 to 0.67.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh 4 mg of the substance under examination add 10 ml of the mobile phase and shake well to dissolve.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (3 to 10 µm),
- mobile phase: a mixture of 55 volumes of *acetonitrile*, 45 volumes of *water* and 0.1 volume of *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject the test solution. The resolution between betamethasone valerate and any impurity is not less than 1.5 and the column efficiency is not less than 9000 theoretical plates.

Inject the test solution. Calculate the content of each impurity as a percentage of the sum of all the peak responses (1.0 per cent). Not more than 2.0 per cent of total impurities is found.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh 60 mg of the substance under examination, dissolve in a 0.1 percent v/v solution of *glacial acetic acid* in *methanol* and dilute to 100.0 ml with the same solvent. To 5.0 ml of the solution add 10.0 ml of reference solution (b) and mix.

Reference solution (a). Weigh a suitable quantity of *betamethasone valerate IPRS* and dissolve in a 0.1 per cent v/v solution of *glacial acetic acid* in *methanol* to obtain a solution containing a known concentration of about 0.6 mg per ml. To 5.0 ml of the solution add 10.0 ml of reference solution (b) and mix.

Reference solution (b). A 0.04 per cent w/v solution of *beclomethasone dipropionate IPRS* in a 0.1 per cent v/v solution of *glacial acetic acid* in *methanol*.

Chromatographic system
- a stainless steel column 30 cm × 4.0 mm, packed with octadecylsilane bonded to porous silica (3 to 10 µm),
- mobile phase: a mixture of 30 volumes of *acetonitrile* and 20 volumes of *water*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

The relative retention times are about 1.7 for beclomethasone dipropionate and 1.0 for betamethasone valerate

Inject reference solution (a). The resolution between betamethasone valerate and beclomethasone dipropionate is not less than 4.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{27}H_{37}FO_6$.

Storage. Store protected from light.

Betamethasone Valerate Cream

Betamethasone Valerate Cream contains Betamethasone Valerate in a suitable cream base.

Betamethasone Valerate Cream contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of betamethasone, $C_{22}H_{29}FO_5$.

Ususal strengths. 0.1 per cent; 0.12 per cent.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 5 volumes of *ethanol*, 10 volumes of *acetone* and 100 volumes of *chloroform*.

Test solution. Disperse a quantity of the cream containing 0.5 mg of Betamethasone in 20 ml of *methanol (80 per cent)* by heating on a water-bath until the methanol begins to boil. Shake vigorously, cool in ice for 30 minutes and centrifuge. Mix 10 ml of the supernatant liquid with 3 ml of *water* and 5 ml of *chloroform*, shake vigorously, allow the layers to separate and evaporate the chloroform layer to dryness in a current of nitrogen with gentle heating. Dissolve the residue in 1 ml of *chloroform*.

Reference solution (a). A 0.03 per cent w/v solution of *betamethasone valerate IPRS* in *chloroform*.

Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air until the solvent has evaporated, heat at 105° for 5 minutes and spray while hot with *alkaline tetrazolium blue solution*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The spot in the chromatogram obtained with reference solution (b) appears as a single compact spot.

B. In the Assay, the principal peak in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with the reference solution.

Tests

Other tests. Comply with the tests stated under Creams.

Assay. Determine by liquid chromatography (2.4.14).

Test solution (a). Disperse a quantity of the cream containing 2 mg of betamethasone with 100 ml of hot *hexane* for 2 minutes, cool, extract the mixture with 20 ml of *ethanol (75 per cent)*

and filter the lower, ethanolic layer through absorbent cotton previously washed with *ethanol (75 per cent)*. Repeat the extraction of the hexane mixture with two 10-ml quantities of *ethanol (75 per cent)*, filtering each extract in turn through the absorbent cotton. Combine the filtrates, add 5 ml of a 0.072 per cent w/v solution of *beclometasone dipropionate IPRS* (internal standard) and dilute to 50.0 ml with *ethanol (75 per cent)*.

Test solution (b). Disperse a quantity of the cream containing 2 mg of betamethasone with 100 ml of hot *hexane* for 2 minutes, cool, extract the mixture with 20 ml of *ethanol (95 per cent)* and filter the lower, ethanolic layer through absorbent cotton previously washed with *ethanol (75 per cent)*. Repeat the extraction of the hexane mixture with two 10-ml quantities of *ethanol (75 per cent)*, filtering each extract in turn through the absorbent cotton and dilute the combined filtrates to 50.0 ml with *ethanol (75 per cent)*.

Reference solution. Mix 10 ml of a solution containing 0.024 per cent w/v of *betamethasone valerate IPRS* and 0.0012 per cent w/v of *betamethasone 21-valerate IPRS* in *ethanol (80 per cent)* with 5 ml of a 0.072 per cent w/v solution of *beclometasone dipropionate IPRS* (internal standard) in *ethanol (80 per cent)* and dilute to 50.0 ml with the same solvent.

Chromatographic system

- a stainless steel column 10 cm x 5 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 60°,
- mobile phase: a mixture of 42 volumes of *ethanol* and 58 volumes of *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 238 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to betamethasone valerate (retention time: about 5 minutes) and betamethasone 21-valerate (retention time: about 7 minutes) is not less than 1.0.

Inject the reference solution and test solution (b).

Calculate the content of $C_{22}H_{29}FO_5$ in the cream.

Storage. Store protected from light.

Labelling. The quantity of active ingredient is stated in terms of the equivalent amount of betamethasone.

Betamethasone Valerate Ointment

Betamethasone Valerate Ointment contains Betamethasone Valerate in a suitable ointment base.

Betamethasone Valerate Ointment contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of betamethasone, $C_{22}H_{29}FO_5$.

Usual strengths. The equivalent of 0.025 per cent w/w and 0.1 per cent w/w of betamethasone (120 mg of Betamethasone Valerate is approximately equivalent to 100 mg of betamethasone).

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 20 volumes of *chloroform*, 2 volumes of *acetone* and 1 volume of *ethanol*.

Test solution. Heat a quantity of the ointment containing 1 mg of betamethasone with 10 ml of *methanol* on a water-bath until it boils, shake vigorously, cool in ice for 30 minutes, filter, evaporate the filtrate to dryness in a current of nitrogen with gentle heating and dissolve the residue in 0.5 ml of *chloroform*.

Reference solution. A 0.24 per cent w/v solution of *betamethasone valerate IPRS* in *chloroform*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air, heat at 105° for 5 minutes and spray while hot with *alkaline tetrazolium blue solution*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to *betamethasone valerate IPRS* in the chromatogram obtained with the reference solution.

Tests

Microbial contamination (2.2.9). 1.0 g is free from *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

Other tests. Comply with the tests stated under Ointments.

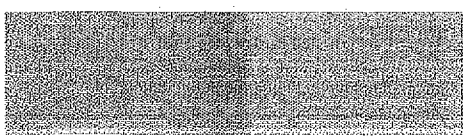
Assay. Determine by liquid chromatography (2.4.14).

Test solution. Heat a quantity of the weighed ointment containing 2.5 mg of betamethasone with 10.0 ml of 0.04 per cent w/v solution of *beclomethasone dipropionate IPRS* (internal standard) in *methanol* containing 0.1 per cent v/v of *glacial acetic acid* and 5.0 ml of *methanol* containing 0.1 per cent v/v of *glacial acetic acid* on a water-bath until it boils, shake vigorously, cool in ice for 30 minutes, centrifuge and decant the supernatant solution into a stoppered flask.

Reference solution. Mix 5 ml of a 0.06 per cent w/v solution of *betamethasone valerate IPRS* in *methanol* containing 0.1 per cent v/v of *glacial acetic acid* and 10.0 ml of a 0.04 per cent w/v solution of *beclomethasone dipropionate IPRS* in *methanol* containing 0.1 per cent v/v of *glacial acetic acid*.

Chromatographic system

- a stainless steel column 30 cm × 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),



- mobile phase: a mixture of 60 volumes of *acetonitrile* and 40 volumes of *water*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

The relative retention time with reference to betamethasone valerate for beclomethasone dipropionate is about 1.7.

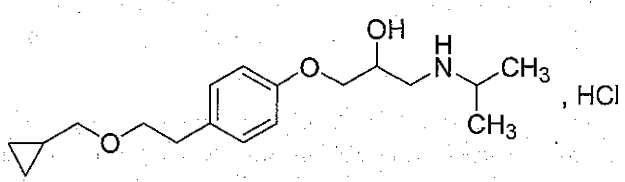
Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{29}FO_5$ in the ointment.

Storage. Store protected from light. Avoid exposure to excessive heat.

Labelling. The label states the strength in terms of the equivalent amount of betamethasone.

Betaxolol Hydrochloride



$C_{18}H_{29}NO_3$, HCl Mol Wt. 343.9

Betaxolol Hydrochloride is (*RS*)-1-[4-[2-(Cyclopropyl methoxy)ethyl]phenoxy]-3-[(1-methylethyl)amino]propan-2-ol hydrochloride.

Betaxolol Hydrochloride contains not less than 98.5 per cent and not more than 101.5 per cent of the $C_{18}H_{29}NO_3$, HCl, calculated on the dried basis.

Category. Antihypertensive.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Test B may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *betaxolol hydrochloride IPRS* or with the reference spectrum of betaxolol hydrochloride.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *octadecylsilane silica gel F254*.

Mobile phase. A mixture of 0.5 volume of *perchloric acid*, 50 volumes *methanol* and 50 volumes of *water*.

Test solution. Dissolve 10 mg of the substance under examination in 1 ml of *methanol*.

Reference solution (a). A 1.0 per cent w/v solution of *betaxolol hydrochloride IPRS* in *methanol*.

Reference solution (b). A 1.0 per cent w/v solution of *oxprenolol hydrochloride IPRS* in reference solution (a).

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 8 cm. Dry the plate in air and examine under ultraviolet light at 254 nm and spray with 5 per cent w/v solution of *vanillin* in a mixture of 5 volumes of *sulphuric acid*, 10 volumes of *glacial acetic acid* and 85 volumes of *methanol*, heat at 105° and examine in day light. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

C. It gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 2.0 per cent w/v solution in *water* is clear (2.4.1) and colourless (2.4.1).

Acidity or alkalinity. Dissolve 0.2 g in 20 ml of *carbon dioxide-free water*, add 0.2 ml of *methyl red solution* and 0.2 ml of *0.01 M hydrochloric acid*. The solution is red. Add 0.4 ml of *0.01 M sodium hydroxide*. The solution is yellow.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE— Prepare the reference solutions immediately before use.

Test solution. Dissolve 10 mg of the substance under examination in the mobile phase and dilute to 5.0 ml with the mobile phase.

Reference solution (a). A solution containing 0.04 per cent w/v of the substance under examination and 0.02 per cent w/v of *betaxolol impurity A IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 175 volumes of *acetonitrile*, 175 volumes of *methanol* and 650 volumes of 0.34 per cent w/v solution of *potassium dihydrogen phosphate* in *water*, previously adjusted to pH 3.0 with *ortho-phosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 273 nm,
- injection volume: 20 µl.

Name	Relative retention time
Betaxolol impurity B[1]	0.3
Betaxolol impurity A[2]	0.8
Betaxolol (Retention time: about 8 minutes)	1.0
Betaxolol impurity D[3]	1.5
Betaxolol impurity E[4]	2.2
Betaxolol impurity C[5]	4.1

[1](2*RS*)-1-[4-(2-hydroxyethyl)phenoxy]-3-[(1-methylethyl)amino]propan-2-ol,

[2] (2*RS*)-1-(4-ethylphenoxy)-3-[(1-methylethyl)amino]propan-2-ol,

[3] 4-[2-(cyclopropylmethoxy)ethyl]phenol,

[4](2*RS*)-1-[4-(2-butoxyethyl)phenoxy]-3-[(1-methylethyl)amino]propan-2-ol,

[5](2*RS*)-2-[[4-[2-(cyclopropylmethoxy)ethyl]phenoxy]methyl]oxirane.

Inject reference solution (a). The test is not valid unless the resolution between the peaks corresponding to betaxolol hydrochloride impurity A and betaxolol is not less than 2.0.

Inject reference solution (b) and the test solution. Run the chromatogram for 4.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area any peak corresponding to betaxolol impurities A, B, C, D and E is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent). The area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.3 g in 10 ml of *0.01 M hydrochloric acid* and add 50 ml of *ethanol (95 per cent)*. Titrate with *0.1 M sodium hydroxide*, determining the end- point potentiometrically (2.4.25). Carry out a blank titration. Read the volume added between the 2 points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.03439 g of $C_{18}H_{30}ClNO_3$.

Storage. Store protected from light.

Betaxolol Eye Drops

Betaxolol Eye Drops are a sterile solution of Betaxolol Hydrochloride in Purified Water.

Betaxolol Eye Drops contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of betaxolol, $C_{18}H_{29}NO_3$.

Usual strengths. 0.25 per cent w/v; 0.5 per cent w/v.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 30 volumes of a solution prepared by diluting 1 volume of *13.5 M ammonia* to 50 volumes with *propan-2-ol* immediately before use and 70 volumes of *chloroform*.

Test solution. Dilute the eye drops with *water* to obtain a solution containing 0.1 per cent w/v of betaxolol. Shake 1 ml of the solution with 4 ml of *water*, 0.1 ml of *13.5M ammonia* and 2 ml of *chloroform*, centrifuge and use the chloroform layer.

Reference solution (a). A 0.1 per cent w/v solution of *betaxolol hydrochloride IPRS* in *water*. Shake 1 ml of solution with 4 ml of *water*, 0.1 ml of *13.5 M ammonia* and 2 ml of *chloroform*, centrifuge and use the chloroform layer.

Reference solution (b). A mixture of equal volumes of test solution and reference solution (a).

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and spray with a solution prepared by dissolving 5 g of *iodine* and 10 g of *potassium iodide* in sufficient *water* to produce 100 ml and mixing 20 ml of the resulting solution with 30 ml of *water* and 50 ml of *2 M acetic acid*. Examine the plate immediately; spots due to betaxolol is brown colour. The principal spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows a single, compact spot

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.24). 6.0 to 7.8.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of the eye drops to obtain a solution containing the equivalent of 0.02 per cent w/v of betaxolol in the mobile phase.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: dissolve 3 g of *sodium dodecyl sulphate* in 450 ml of the solution containing 45 volumes of a buffer solution prepared by diluting 5 ml of *orthophosphoric acid* to 990 ml of *water*, adjusted the pH to 3.0 with *2 M ammonia* and diluted to 1000 ml with *water* and 55 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 8000 theoretical plates and the tailing factor is not more than 2.5.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent), the area of not more than one secondary peak is more than 0.3 times the area of the principal peak in the chromatogram obtained with the reference solution (0.3 per cent).

Other tests. Comply with the tests stated under Eye Drops.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute the eye drops to obtain a solution containing 0.01 per cent w/v of betaxolol in the mobile phase.

Reference solution (a). A 0.012 per cent w/v solution of *betaxolol hydrochloride IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.012 per cent w/v of *betaxolol hydrochloride IPRS* and 0.006 per cent w/v solution of *pilocarpine nitrate IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica,
- mobile phase: a mixture of 45 volumes of *acetonitrile* and 55 volumes of *water* containing 0.71 per cent w/v of *anhydrous disodium hydrogen orthophosphate* and 0.91 per cent w/v solution of *dimethylamine hydrochloride*, adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

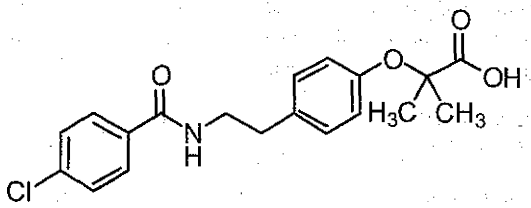
Injection reference solution (b). The test is not valid unless the resolution between the peaks coressponding to betaxolol and pilocarpine is not less than 1.5.

Calculate the content of $C_{18}H_{29}NO_3$ in the eye drops.

Storage. Store protected from light.

Labelling. The quantity of active ingredient is stated in terms of the equivalent amount of betaxolol.

Bezafibrate



$C_{19}H_{20}ClNO_4$ Mol. Wt. 361.8

Bezafibrate is 2-[4-[2-(4-Chlorobenzamido)ethyl]phenoxy]-2-methylpropanoic acid.

Bezafibrate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{19}H_{20}ClNO_4$, calcuated on the dried basis.

Category. Hypolipidaemic.

Description. A white or almost white, crystalline powder. It shows polymorphism (2.5.11).

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *bezafibrate IPRS* or with the reference spectrum of bezafibrate.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 2.7 volumes of *glacial acetic acid*, 30 volumes of *methyl ethyl ketone* and 60 volumes of *xylene*.

Test solution. Dissolve 10 mg of the substance under examination in *methanol* and dilute to 5 ml with *methanol*.

Reference solution. A 0.2 per cent w/v solution of *bezafibrate IPRS* in *methanol*.

Apply to the plate 5 µl of each solution. After development dry the plate in air and heat at 120° for 15 minutes, allow to cool and examine under ultraviolet light at 254 nm. The principal

spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Appearance of solution. A 5.0 per cent w/v solution in *dimethylformamide* (Solution A) is clear (2.4.1) and not more intensely coloured than reference solution BYS4 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). Dilute 10.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 50.0 ml with the mobile phase.

Reference solution (c). To 1.0 ml of the test solution, add 1 ml of *0.1 M hydrochloric acid* and evaporate to dryness on a hot plate. Dissolve the residue in 20.0 ml of the mobile phase.

Chromatographic system
- a stainless steel column 12.5 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of *methanol* and 40 volumes of a buffer solution prepared by dissolving 2.72 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 2.3 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 228 nm,
- injection volume: 20 µl,

Name	Relative retention time
Bezafibrate impurity A[1]	0.5
Bezafibrate impurity B[2]	0.6
Bezafibrate (Retention time: about 6 minutes)	1.0
Bezafibrate impurity C[3]	1.5
Bezafibrate impurity D[4]	2.3
Bezafibrate impurity E[5]	6.2

[1]chlorobenzoyltyramine,

[2]4-chlorobenzoic acid,

[3]methyl 2-[4-[2-[(4-chlorobenzoyl)amino]ethyl]phenoxy]-2-methylpropanoate,

[4]ethyl 2-[4-[2-[(4-chlorobenzoyl)amino]ethyl]phenoxy]-2-methylpropanoate,

[5]butyl 2-[4-[2-[(4-chlorobenzoyl)amino]ethyl]phenoxy]-2-methylpropanoate.

Inject reference solution (b) and (c). The test is not valid unless the resolution between the two principal peaks in the chromatogram obtained with reference solution (c) is not less than 5.0. The signal to noise ratio for the principal peak in the chromatogram obtained with the reference solution (b) is not less than 5.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak corresponding to each of the bezafibrate impurities A, B, C, D and E is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). The area of any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).The sum of areas of all the secondary peaks is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.75 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Chlorides (2.3.12). Boil 0.83 g with 30 ml of *water* for 5 minutes, cool and filter. The filtrate complies with the limit test for chlorides (300 ppm).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g drying in an oven at 105°.

Assay. Dissolve 0.3 g in a 50 ml mixture of 25 volumes of *water* and 75 volumes of *ethanol (95 per cent)*. Titrate with *0.1 M sodium hydroxide* until a pink colour is obtained, using 0.1 ml of *phenolphthalein solution* as an indicator. Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.03618 g of $C_{19}H_{20}ClNO_4$.

Bezafibrate Tablets

Bezafibrate Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of bezafibrate, $C_{19}H_{20}ClNO_4$.

Usual strengths. 200 mg; 400 mg.

Identification

Disperse a quantity of the powdered tablets containing 0.2 g of Bezafibrate with two 10 ml quantities of *acetone* for 10 minutes, combine and filter the extracts and evaporate the filtrate to dryness. On the residue, determine by infrared

absorption spectrophotometry (2.4.6). Compare the spectrum obtained with *bezafibrate IPRS* or with the reference spectrum of bezafibrate.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of buffer solution pH 6.5 prepared by dissolving 0.608 g of *sodium hydroxide* and 6.805 g of *potassium dihydrogen orthophosphate* in sufficient *water* to produce 1000 ml and adjusted to pH 6.5 with *sodium hydroxide solution* or *orthophosphoric acid*,

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium, filter and dilute with the dissolution medium, if necessary. Measure the absorbance of the solution, at the maximum at about 229 nm (2.4.7). Calculate the content of $C_{19}H_{20}ClNO_4$ in the medium from the absorbance of a 0.0011 per cent w/v solution of *bezafibrate IPRS* in the dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_{19}H_{20}ClNO_4$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 0.1 g of Bezafibrate in 15 ml of *methanol* with the aid of ultrasound for 2 minutes, shake for a further 10 minutes, and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the mobile phase.

Reference solution (c). A solution containing 0.0002 per cent w/v each of *bezafibrate IPRS* and *chlorobenzoyltyramine IPRS* prepared by dissolving in minimum quantity of *methanol* and dilute with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (4 µm),
- mobile phase: a mixture of 3.9 volumes of 40 per cent w/v of *tetrabutylammonium hydroxide*, 400 volumes of *acetonitrile* and 600 volumes of *water* and adjusted to pH 4.0 with 10 per cent v/v *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 239 nm,
- injection volume: 20 µl.

The retention time of bezafibrate is about 5 minutes.

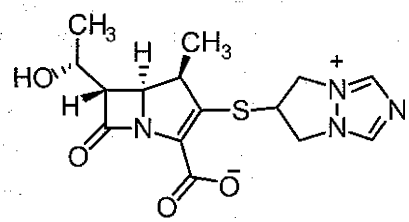
Inject reference solution (c). The test is not valid unless, the resolution between the peaks corresponding to bezafibrate and chlorobenzoyltyramine is not less than 7.0.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 4 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). The sum of areas of all the secondary peaks is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.75 per cent). Ignore any peak with an area less than that of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 100 mg of Bezafibrate in 70 ml of *methanol* with the aid of ultrasound for 2 minutes, shake for a further 10 minutes and dilute 100 ml with *methanol* and filter. Dilute 1.0 ml of the solution to 100.0 ml with *methanol* and measure the absorbance of the solution at the maximum at about 229 nm (2.4.7). Calculate the content of $C_{19}H_{20}ClNO_4$ from the absorbance of 0.001 per cent w/v solution of *bezafibrate IPRS* in *methanol*.

Biapenem



$C_{15}H_{18}N_4O_4S$ Mol Wt. 350.4

Biapenem is (4*R*,5*S*,6*S*)-3-(6,7-dihydro-5*H*-pyrazolo[1,2-a][1,2,4] triazol-8-ium-6-yl sulfanyl-6-(1-hydroxyethyl)-4, 7-oxo-1-azabicyclo [3.2.0] hept-2-ene-2 carboxylate.

Biapenem contains not less than 95.0 per cent and not more than 101.0 per cent of of $C_{15}H_{18}N_4O_4S$, calculated on the anhydrous basis.

Category. Antibiotic.

Description. A white to pale yellow powder.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 4.0 to 6.0, determined on 1.0 per cent w/v solution in *water*.

Specific optical rotation (2.4.22). −35° to −25°, determined on 1.0 per cent w/v solution in *phosphate buffer pH 7.0*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 75 mg of the substance under examination in *water* and dilute to 25.0 ml with *water*.

Reference solution (a). A 0.003 per cent w/v solution of *biapenem IPRS* in *water*.

Reference solution (b). Dissolve 30 mg of *biapenem IPRS* in 1.0 ml of *sodium hydroxide solution* and dilute to 10.0 ml with *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a 0.284 per cent w/v solution of *disodium hydrogen orthophosphate* in *water*, adjusted to pH 7.0 with *orthophosphoric acid* ,
  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	97	3
7	97	3
25	80	20
30	70	30
34	70	30
35	97	3
45	97	3

The relative retention time with reference to biapenem for base degraded impurity is about 0.38.

Inject reference solution (b). The test is not valid unless the resolution between base degraded impurity and biapenem is not less than 6.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (a) (1.0 per cent) and the sum of areas of all the peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with the reference solution (a) (3.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Bacterial endotoxins (2.2.3). Not more than 1.17 Endotoxin units per mg of biapenem.

Sterility (2.2.11). Complies with the test for sterility.

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 0.2 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *biapenem IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 98 volumes of buffer solution prepared by dissolving 1.54 g *ammonium acetate* in 1000 ml of *water* and 2 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 295 nm,
- injection volume: 20 µl.

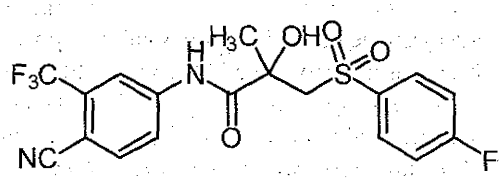
Inject the reference solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates, tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{18}N_4O_4S$.

Storage. Store protected from moisture.

Bicalutamide



$C_{18}H_{14}F_4N_2O_4S$ Mol. Wt. 430.4

Bicalutamide is (*RS*)-*N*-[4-Cyano-3-(trifluoromethyl)phenyl]-3-[(4-fluorophenyl)sulfonyl]-2-hydroxy-2-methylpropanamide.

Bicalutamide contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{18}H_{14}F_4N_2O_4S$, calculated on the dried basis.

Category. Antineoplastic.

Description. A white to pale yellow powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *bicalutamide IPRS* or with the reference spectrum of bicalutamide.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). −0.5 to +0.5, determined on 1.0 per cent w/v solution in *ethyl acetate* at 25°.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 1 volume of mobile phase A and 2 volumes of mobile phase B.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). A 0.0001 per cent w/v solution of *bicalutamide IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.0005 per cent w/v of *bicalutamide related compound A IPRS* and 0.005 per cent w/v of *bicalutamide IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 10 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: A. a 0.01 per cent v/v of *trifluoroacetic acid* in *water*,
  B. a 0.01 per cent v/v of *trifluoroacetic acid* in *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	67	33
16.5	67	33
26.5	40	60
32.5	5	95
32.6	67	33
35	67	33

Name	Relative retention time	Correction factor
Bicalutamide aminobenzonitrile[1]	0.30	0.71
Bicalutamide impurity A isomer A[2]	0.64	—
Bicalutamide impurity A isomer B[2]	0.67	—
Desfluoro bicalutamide[3]	0.83	0.91
2-Fluoro bicalutamide[4]	0.94	—
Bicalutamide	1.00	—
Deoxybicalutamide[5]	1.33	—
Bicalutamide sulphide[6]	1.56	—

[1]4-Amino-2-(trifluoromethyl)benzonitrile,

[2]*N*-[4-Cyano-3-(trifluoromethyl)phenyl]-3-[(4-fluorophenyl)sulfinyl]-2-hydroxy-2-methylpropanamide,

[3] *N*-[4-Cyano-3-(trifluoromethyl)phenyl]-2-hydroxy-2-methyl-3-(phenylsulfonyl)propanamide,

[4]*N*-[4-Cyano-3-(trifluoromethyl)phenyl]-3-(2-fluorophenylsulfonyl)-2-hydroxy-2-methylpropanamide,.

[5]*N*-[4-Cyano-3-(trifluoromethyl)phenyl]-3-(4-fluorophenylsulfonyl)-2-methylpropanamide,

[6]*N*-[4-Cyano-3-(trifluoromethyl)phenyl]-3-(4-fluorophenylthio)-2-hydroxy-2-methylpropanamide.

Inject reference solution (b). The test is not valid unless the resolution between the peak due to bicalutamide related compound A isomer A and isomer B is not less than 0.8 and between the peaks due to bicalutamide related compound A isomer B and bicalutamide is not less than 8.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to bicalutamide aminobenzonitrile, bicalutamide related compound A isomer A, isomer B and bicalutamide sulphide, each of, is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent), the area of any peak corresponding to desfluoro bicalutamide, 2-fluoro bicalutamideand deoxybicalutamide, each of, is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphates (2.3.17). 0.3 g complies with the test for sulphates (500 ppm).

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *bicalutamide IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{14}F_4N_2O_4S$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Bicalutamide Tablets

Bicalutamide Tablets contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of bicalutamide $C_{18}H_{14}F_4N_2O_4S$.

Usual strengths. 50 mg; 150 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 1000 ml of 1.0 per cent w/v *sodium lauryl sulphate* in *water*,
Speed and time. 50 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the medium if necessary, at the maximum at about 272 nm (2.4.7). Calculate the content of $C_{18}H_{14}F_4N_2O_4S$ in the medium from the absorbance obtained from a solution of known concentration of *bicalutamide IPRS*.

Q. Not less than 70 per cent of the stated amount of $C_{18}H_{14}F_4N_2O_4S$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing 50 mg of Bicalutamide with 30 ml of mobile phase with the aid of ultrasound for about 10 minutes and dilute to 50.0 ml with mobile phase.

Reference solution. A 0.001 per cent w/v solution of *bicalutamide IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of buffer solution prepared by dissolving 7.1 g of *anhydrous disodium hydrogen orthophosphate* and 1.0 g of *hexane sodium sulphonate* in 1000 ml *water*, adjusted the pH to 7.3 with *orthophosphoric acid* and 50 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. Run the chromatogram 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent).

Water (2.3.43). Not more than 6.0 per cent, determined on 0.5 g.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg of Bicalutamide with 30 ml of *methanol* with the aid of ultrasound for 10 minutes and dilute to 50.0 ml with *methanol*. Further dilute 5.0 ml of the solution to 50.0 ml with *methanol*.

Reference solution. A 0.01 per cent w/v solution of *bicalutamide IPRS* in *methanol*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of buffer solution prepared by dissolving 7.1 g of *anhydrous disodium hydrogen orthophosphate* and 1.0 g of *hexane sodium*

sulphonate in 1000 ml *water*, adjusted to pH 7.3 with *orthophosphoric acid* and 50 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

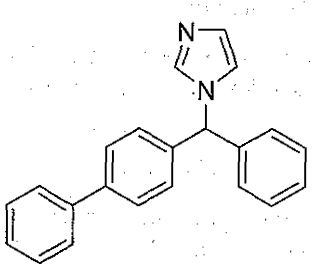
Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{14}F_4N_2O_4S$ in the tablets.

Storage. Store at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the amount of bicalutamide.

Bifonazole



$C_{22}H_{18}N_2$ Mol. Wt. 310.4

Bifonazole is 1-[(*RS*)-(biphenyl-4-yl)phenylmethyl]-1*H*-imidazole

Bifonazole contains not less than 98.0 per cent and not more than 100.5 per cent of $C_{22}H_{18}N_2$, calculated on the dried basis.

Category. Antifungal.

Description. A white or almost white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *bifonazole IPRS* or with the reference spectrum of bifonazole.

Tests

Optical rotation (2.4.22). – 0.1° to + 0.1°, determined in a 1.0 per cent w/v solution in *methanol*.

Related substances. Determined by liquid chromatography (2.4.14).

Buffer solution pH 3.2. Mix 2.0 ml of *orthophosphoric acid* with *water* and dilute to 1000.0 ml with the same solvent. Adjusted to pH 3.2 with *triethylamine*.

Test solution. Dissolve 50 mg of the substance under examination in 25 ml of *acetonitrile* and dilute to 50.0 ml with buffer solution pH 3.2.

Reference solution. Dilute 0.25 ml of the test solution to 50.0 ml with buffer solution pH 3.2.

Chromatographic system
- a stainless steel column 12.5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. a mixture of 20 volumes of *acetonitrile* and 80 volumes of *buffer solution pH 3.2*,
  B. a mixture of 20 volumes of *buffer solution pH 3.2* and 80 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 50 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	60	40
8	60	40
12	10	90
30	10	90
32	60	40

Inject the reference solution and the test solution. Run the chromatogram 1.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 3 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent). Sum of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent). Ignore the peaks having area less than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.25 g in 80 ml of *anhydrous acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03104 g of $C_{22}H_{18}N_2$.

Bifonazole Cream

Bifonazole Cream contains Bifonazole in a suitable cream base.

Bifonazole Cream contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of bifonazole, $C_{22}H_{18}N_2$.

Usual strength. 1.0 per cent w/w.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Other tests. Comply with the tests stated under Creams.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the cream containing about 10 mg of Bifonazole with 40 ml of *methanol* in a 50-ml volumetric flask for 30 minutes and heat on a water-bath until the sample dissolves, allow to cool and dilute to volume with *methanol*. Freeze out the fatty phase under swirling 2 minutes in an ice-bath and filter through a membrane filter.

Reference solution. A 0.02 per cent w/v solution of *bifonazole IPRS* in *methanol.*

Chromatographic system

- a stainless steel column 12.5 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5µm) (Such as LiChrospher 60 RP Select – B),
- column temperature: 40°,
- mobile phase: a mixture of 47 volumes of *acetonitrile*, 53 volumes of *0.02 M orthophosphoric acid*, adjusted to pH 5.0 with *ammonia solution*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 258 nm,
- injection volume: 10 µl.

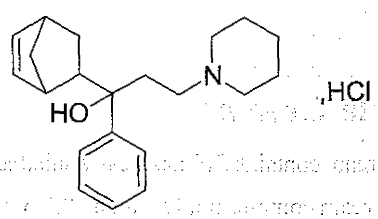
Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{18}N_2$ in the cream.

Storage. Store at a temperature not exceeding 30°.

Biperiden Hydrochloride



$C_{21}H_{29}NO,HCl$ Mol. wt. 347.9

Biperiden Hydrochloride is (*RS*)-1-[(*IPRS*,2*RS*,4*RS*)-bicyclo-[2.2.1] hept-5-en-2-yl]-1-phenyl-3-(piperidin-1-yl)propan-1-ol hydrochloride.

Biperiden Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{21}H_{29}NO,HCl$, calculated on the dried basis.

Category. Anticholinergic.

Description. A white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *biperiden hydrochloride IPRS* or with the reference spectrum of biperiden hydrochloride.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 100 volumes of *toluene*, 5 volumes of *diethylamine* and 5 volumes of *methanol.*

Test solution. Dissolve 0.5 g of the substance under examination in 100.0 ml of *methanol.*

Reference solution (a). A 0.5 per cent w/v solution of *biperiden hydrochloride IPRS* in *methanol.*

Reference solution (b). Dissolve 5 mg of (*SR*)-1-[(1*RS*, 2*RS*, 4*RS*)-bicyclo [2.2.1] hept-5-en-2-yl]-1-phenyl-3-(piperidin-1-yl]-propan-1-ol (*endo* form) in reference solution (a) and dilute to 2 ml with the same solution.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). Spray with *dilute iodobismuthate solution* and examine under daylight. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

C. To about 20 mg add 5 ml of *phosphoric acid*; a green colour develops.

D. It gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 0.2 per cent solution in *carbon dioxide-free water* is not more opalescent than opalescence standard OS2 (2.4.1), and is colourless (2.4.1).

pH (2.4.24). 5.0 to 6.5, determined in a 0.2 per cent w/v solution.

Related substances. Determine by gas chromatography (2.4.13).

Test solution. Dissolve 1.0 g of the substance under examination in 100.0 ml of *methanol*.

Reference solution (a). Dilute 1.0 ml of the test solution to 100 ml with *methanol* and mix. Dilute 10 ml of the resulting solution to 100 ml with *methanol*.

Reference solution (b). To 1.0 ml of the test solution add 10 ml of *methanol* and 10 mg of (*SR*)-1-[(1*RS*, 2*RS*, 4*RS*)-bicyclo [2.2.1]hept-5-en-2-yl]-1-phenyl-3-(piperidin-1-yl) propan-1-ol (*endo* form) and sufficient *methanol* to produce 100 ml.

Chromatographic system
- a fused-silica capillary column, 50 m x 0.25 mm coated with poly (vinyl-phenylmethyl siloxane with thickness of 0.25 µm,
- flame ionisation detector,
- temperature:
- column. 200° for 5 minutes, then raised at the rate of 2° per minute to 270°,
- inlet port at 250° and detector at 300°,
- flow rate: 0.4 ml per minute using nitrogen as the carrier gas and a split ratio of 1:250.

Inject 2 µl of each solution. The test is not valid unless, in the chromatogram obtained with reference solution (b), the resolution between the first peak due to biperiden and the second peak due to (*SR*)-1-[(1*RS*, 2*RS*,4*RS*)]-bicyclo [2.2.1] hept-5-en-2-yl]-phenyl-3- (piperidin-1-yl)propane-1-ol (*endo* form) is at least 2.5; the principal peak in the chromatogram obtained with reference solution (a) has a signal-to-noise ratio of at least 6. For peaks with a retention time of 0.95 to 1.05 relative to biperiden, the area of any peak, other than the principal peak, is not more than 0.5 per cent of the area of the principal peak and the sum of the areas of any such peaks is not more than 1.0 per cent of the area of the principal peak. For peaks with relative retention times outside the above-mentioned range, the area of any peak is not more than 0.1 per cent of the area of the principal peak and the sum of the areas of such peaks is not more than 0.5 per cent of the area of the principal peak. Ignore any peak with an area less than 0.05 per cent of the area of the principal peak in the chromatogram obtained with the test solution.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

Assay. Weigh 0.5 g, dissolve in 80 ml of *anhydrous glacial acetic acid*, warming slightly, if necessary to effect solution and cool. Add 10 ml of *mercuric acetate solution* and titrate with *0.1 M perchloric acid*, using 0.1ml of *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03479 g of $C_{21}H_{29}NO$, HCl.

Storage. Store protected from light.

Biperiden Tablets

Biperiden Hydrochloride Tablets

Biperiden Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of biperiden hydrochloride, $C_{21}H_{29}NO$, HCl.

Usual strength. 2 mg.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 100 volumes of *methanol* and 1.5 volumes of *strong ammonia solution*.

Test solution. Disperse a quantity of the powdered tablets containing about 10 mg of Biperiden Hydrochloride with 5 ml of *water* and disperse the powder with the aid of ultra sound for a few minutes. Add 5 ml of *methanol* and mix again for 15 minutes. Filter the solution into a separator, add 2 ml of *1 M sodium hydroxide* and 10 ml of *chloroform* and shake for 3 minutes. Filter the chloroform layer into a stoppered flask and use the filtrate.

Reference solution. Prepare in a similar manner using 10 mg of *biperiden hydrochloride IPRS* in place of the substance under examination.

Apply to the plate 20 µl of each solution. After development, dry the plate in air and expose it to iodine vapours till spots appear. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 500 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw 75 ml of the solution and filter through a membrane filter disc with an average pore diameter not greater than

1.0 µm, rejecting the first few ml of the filtrate. Transfer 50.0 ml of the clear filtrate into a suitable container, adjusted to pH 5.3 with *0.1 M sodium hydroxide*. Transfer the solution to a 100-ml volumetric flask and dilute with *water* to volume and mix.

Prepare a reference solution by weighing 80 mg of *biperiden hydrochloride IPRS* in sufficient *methanol* to produce 100.0 ml. Dilute 5.0 ml of the solution to 500.0 ml with *0.1 M hydrochloric acid* and mix. Transfer 25.0 ml of the resulting solution into a suitable container and adjusted to pH 5.3 with *0.1 M sodium hydroxide* and dilute to 100.0 ml with *water* (2 µg per ml).

Prepare a blank solution by treating 50 ml of *water* in place of the clear filtrate in the same manner as described for the test solution beginning at the words "adjusted to pH 5.3.....

Transfer 20.0 ml of the solutions into individual separators, each containing 10.0 ml of *phosphate-buffered bromocresol purple solution*. Add 40.0 ml of *chloroform* to each and shake for 10 minutes. After the layers have separated, filter each chloroform extract through a filter paper into separate, glass-stoppered flasks, discarding the first 10 ml of each filtrate.

Measure the absorbances of the solutions at the maximum at about 408 nm (2.4.7) against the blank solution. Calculate the content of $C_{21}H_{29}NO$,HCl in the medium from the absorbance obtained from the reference solution.

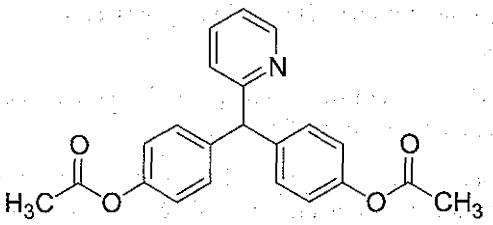
Q. Not less than 75 per cent of the stated amount of $C_{21}H_{29}NO$, HCl.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 2 mg of Biperiden Hydrochloride and transfer to a 50-ml volumetric flask, add 12.5 ml of *water* and heat on a steam-bath for 15 minutes. Cool, dilute with *methanol* to volume and mix. Transfer 5.0 ml of the resulting solution to a separator, add 10.0 ml of *phosphate-buffered bromocresol purple solution*, extract with two quantities, each of 20 ml, of *chloroform* and allow to separate. Filter the chloroform extracts into a 50-ml volumetric flask through filter paper and make to volume. Measure the absorbance of the resulting solution at the maximum at about 408 nm (2.4.7), using a reagent blank of a mixture of 3 volumes of *methanol* and 1 volume of *water* and preparing the solution in a similar manner as that of the test solution omitting the substance under examination. Calculate the content of $C_{21}H_{29}NO$, HCl from the absorbance obtained by repeating the operation using a solution prepared by adding 5.0 ml of a 0.08 per cent w/v solution of *biperiden hydrochloride IPRS* in *methanol* to 25 ml of *water*, diluting to 100.0 ml with *methanol* and treating in the same manner as the test solution.

Storage. Store protected from light.

Bisacodyl



$C_{22}H_{19}NO_4$ Mol. Wt. 361.4

Bisacodyl is bis(4-acetoxyphenyl)-2-pyridylmethane.

Bisacodyl contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{22}H_{19}NO_4$, calculated on the dried basis.

Category. Laxative.

Description. A white or almost white, crystalline powder; odourless.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *bisacodyl IPRS* or with the reference spectrum of bisacodyl.

B. When examined in the range 230 nm to 360 nm, a 0.001 per cent w/v solution in *0.1 M potassium hydroxide* in *methanol* shows an absorption maximum only at about 248 nm, about 0.65 (2.4.7).

Tests

Acidity or alkalinity. Shake 1.0 g with 20 ml of *carbon dioxide-free water*, boil, cool and filter. Add 0.2 ml of *0.01 M sodium hydroxide* and 0.1 ml of *methyl red solution*. The resulting solution is yellow and not more than 0.4 ml of *0.01 M hydrochloric acid* is required to change the colour of the solution to red.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of 4 volumes of *glacial acetic acid*, 30 volumes of *acetonitrile* and 66 volumes of *water*.

Test solution. Dissolve 50 mg of substance under examination in 25 ml of *acetonitrile* and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution (b). Dissolve 2 mg of *bisacodyl for system suitability IPRS* (containing bisacodyl impurity A, B, C, D and E) in 1.0 ml of *acetonitrile* and dilute to 2.0 ml with the solvent mixture.

Reference solution (c). Dissolve 5 mg of *bisacodyl for peak identification IPRS* (containing bisacodyl impurity F) in 2.5 ml of *acetonitrile* and dilute to 5.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 45 volumes of *acetonitrile* and 55 volumes of 0.16 per cent w/v solution of *ammonium formate*, adjusted to pH 5.0 with *anhydrous formic acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 20 µl.

Inject reference solution (a). The relative retention time with reference to bisacodyl for 4,4'- (pyridine-2-ylmethylene) diphenol (bisacodyl impurity A) is about 0.2, for 2-((*RS*)-(4-hydroxyphenyl)(pyridine-2-yl)methyl)phenol (bisacodyl impurity B) is about 0.4, for 4-((*RS*)-(4-hydroxyphenyl) (pyridine-2-yl)methyl)phenyl acetate (bisacodyl impurity C) is about 0.45, for bisacodyl impurity D is about 0.8, for 2-((*RS*)-(4-acetyloxy)phenyl)(pyridine-2-yl)methyl)phenyl acetate (bisacodyl impurity E) is about 0.9, and for bisacodyl impurity F is about 2.6.

Inject reference solution (b). The test is not valid unless the peak-to-valley ratio between the peaks due to bisacodyl impurity E and bisacodyl is not less than 1.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of secondary peaks corresponding to bisacodyl impurity A, multiplied by correction factor of 0.7 and impurity B, each of, is not more than the area of corresponding peak in the chromatogram obtained with reference solution (a) (0.1 per cent), the area of secondary peak corresponding to bisacodyl impurity C and E is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent), the area of secondary peak corresponding to bisacodyl impurity D is not more than twice the area of corresponding peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of secondary peak corresponding to bisacodyl impurity F is not more than 3 times the area of corresponding peak in the chromatogram obtained with reference solution (a) (0.3 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and sum of areas of all secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 0.5 g by drying in an oven at 105°.

Assay. Weigh 0.3 g and dissolve in 50 ml of *anhydrous glacial acetic acid.* Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03614 g of $C_{22}H_{19}NO_4$.

Storage. Store protected from light.

Bisacodyl Suppositories

Bisacodyl Suppositories contain Bisacodyl in a suitable suppository base.

Bisacodyl Suppositories contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of bisacodyl, $C_{22}H_{19}NO_4$.

Usual strengths. 5 mg; 10 mg.

Identification

A. Dissolve a quantity of the suppositories containing 0.15 g of Bisacodyl as completely as possible in 150 ml of *light petroleum (40° to 60°)*, filter, wash the residue with *light petroleum (40° to 60°)* until free from fatty material and dry at about 100°. Wash with a very small quantity of warm *chloroform* and dissolve the residue in 10 ml of a 1 per cent w/v solution of *sulphuric acid* (solution A). To 2 ml of the solution add one drop of *potassium mercuri-iodide solution*; a white precipitate is produced.

B. To 2 ml of the solution A add *sulphuric acid*; a reddish violet colour is produced.

C. Boil 2 ml of the solution A with a few drops of *nitric acid*; a yellow colour is produced. Cool and add *5 M sodium hydroxide*; the colour becomes yellowish brown.

Tests

Related substances. Determine by thin–layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of equal volumes of *butan–2–one* and *xylene.*

Test solution. Disperse a quantity of the suppositories containing about 20 mg of Bisacodyl with 20 ml of *petroleum spirit (boiling range,40° to 60°)*, filter, wash the residue with *petroleum spirit (boiling range, 40° to 60°)* until free from fat and dissolve in 2 ml of *acetone.*

Reference solution. Dilute 3.0 volumes of the test solution to 100.0 volumes with *acetone.*

Apply to the plate 10 µl of each solution. After development, dry the plate in air and spray with a mixture of equal volumes of *0.05 M iodine* and *dilute sulphuric acid* and examine the plate in day light. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Other tests. Comply with the tests stated under Suppositories.

Assay. Weigh a quantity of the suppositories containing about 50 mg of Bisacodyl, add 80 ml of *anhydrous glacial acetic acid* previously neutralised with *0.02 M perchloric acid* to *1-naphtholbenzein solution* and warm gently until solution is complete. Immediately titrate with *0.02 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.02 M perchloric acid* is equivalent to 0.007228 g of $C_{22}H_{19}NO_4$.

Storage. Store protected from light at a temperature not exceeding 30°.

Bisacodyl Gastro-resistant Tablets

Bisacodyl Tablets

Bisacodyl Gastro-resistant Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of bisacodyl, $C_{22}H_{19}NO_4$. The tablets are rendered gastro-resistant by enteric coating or by other means.

Usual strength. 5 mg.

Identification

A. Extract a quantity of the powdered tablets containing 50 mg of Bisacodyl with *chloroform*, filter, evaporate the filtrate to dryness and dissolve the residue in 10 ml of a 1 per cent w/v solution of *sulphuric acid* (solution A). To 2 ml of the solution add one drop of *potassium mercuri-iodide solution*; a white precipitate is produced.

B. To 2 ml of solution A add *sulphuric acid*; a reddish-violet colour is produced.

C. Boil 2 ml of solution A with a few drops of *nitric acid*; a yellow colour is produced. Cool and add *5 M sodium hydroxide*; the colour becomes yellowish-brown.

Tests

Dissolution (2.5.2).

A. Apparatus No. 1 (Basket),
Medium. 500 ml of *0.1 M hydrochloric acid*,
Speed and time. 100 rpm and 120 minutes.

Withdraw a suitable volume of medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary with the dissolution medium.

Reference solution. Dissolve about 50 mg of *bisacodyl IPRS* in 50 ml of *methanol*, add a drop of *orthophosphoric acid* and dilute with *0.1 M hydrochloric acid* to obtain 0.0005 per cent w/v solution of bisacodyl.

Chromatographic system
- a stainless steel column 10 cm × 4.0 mm, packed with end-capped octadecylsilane bonded to porous silica (5 µm) (Such as Nucleosil C18),
- column temperature: 40°,
- mobile phase: a mixture of 35 volumes of 0.1 per cent w/v solution of *ammonium acetate*, adjusted to pH 8.0 with *dilute ammonia solution* and 65 volumes of *acetonitrile*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{19}NO_4$.

Complies with the acceptance criteria given under acid stage.

After completion of A, remove the basket from the vessel and dip once into a 100 ml beaker containing 80 ml of *water*. After the *water* has drained from the basket, transfer the tablets to Apparatus No. 2 (Paddle) and carry out the procedure described under B.

B. Apparatus No. 2 (Paddle),

Medium. 900 ml of a buffer solution prepared by dissolving 8.9 g of *disodium hydrogen orthophosphate* and 10 g of *sodium lauryl sulphate* in 800 ml of *water*, adjusted the pH to 7.5 with *0.1 M hydrochloric acid* and diluted to 1000 ml with *water*.
Speed and time. 100 rpm and 60 minutes.

Withdraw a suitable volume of medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary with the dissolution medium.

Reference solution. Dissolve about 50 mg of *bisacodyl IPRS* in 50 ml of *methanol* add a drop of *orthophosphoric acid* and dilute with dissolution medium to obtain a 0.00056 per cent w/v solution of bisacodyl.

Use chromatographic system as described under A.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{19}NO_4$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{22}H_{19}NO_4$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 4 volumes of *glacial acetic acid,* 30 volumes of *acetonitrile* and 66 volumes of *water.*

Test solution. Disperse a quantity of the powdered tablets containing about 25 mg of Bisacodyl with 40 ml of the solvent mixture and dilute to 50.0 ml with the same solvent, filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with base deactivated octadecylsilane bonded to porous silica (5µm),
- mobile phase: a mixture of 45 volumes of *acetonitrile* and 55 volumes of *0.025 M ammonium formate,* previously adjusted to pH 5.0 with *anhydrous formic acid,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 50 µl.

Name	Relative retention time	Correction factor
Bisacodyl impurity A[1]	0.2	0.7
Bisacodyl impurity B[2]	0.4	---
Bisacodyl impurity C[3]	0.45	---
Bisacodyl impurity D[4]	0.8	---
Bisacodyl impurity E[5]	0.9	---
Bisacodyl (Retention time: about 13 minutes)	1.0	---
Bisacodyl impurity F[6]	2.6	---

[1]4,4′-(pyridin-2-ylmethylene)diphenol,

[2]2-[(RS)-(4-hydroxyphenyl)(pyridin-2-yl)methyl]phenol,

[3]4-[(RS)-(4-hydroxyphenyl)(pyridin-2-yl)methyl]phenyl acetate,

[4,6]unknown structure,

[5]2-[(RS)-[4-(acetyloxy) phenyl](pyridin-2-yl)methyl]phenyl acetate.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 3.5 times of the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak corresponding to bisacodyl impurity C is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent), the area of any secondary peak corresponding to bisacodyl impurity A is not more than 0.8 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.8 per cent), the area of any secondary peak corresponding to bisacodyl impurity E is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent), the area of any secondary peak corresponding to bisacodyl impurity F is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent), the area of any secondary peak corresponding to bisacodyl impurity D is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks excluding bisacodyl impurity A and C is not more than 5 times of the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay using following test solution.

Test solution. Crush one tablet and disperse in 50 ml of the solvent mixture. Dilute 25.0 ml of the solution to 50.0 ml with the solvent mixture.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 4 volumes of *glacial acetic acid,* 30 volumes of *acetonitrile* and 66 volumes of *water.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 10 mg of Bisacodyl with 50 ml of the solvent mixture. Dilute 25.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution. A 0.005 per cent w/v solution of *bisacodyl IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with base deactivated octadecylsilane bonded to porous silica (5 µm) (such as Symmetry C18),
- mobile phase: a mixture of 45 volumes of *acetonitrile* and 55 volumes of *0.025 M ammonium formate,* adjusted to pH 5.0 with *anhydrous formic acid,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{19}NO_4$ in the tablets.

Bismuth Subcarbonate

Bismuth Carbonate

$Bi_2(CO_3)O_2$ Mol. Wt. 510.0

Bismuth Subcarbonate contains not less than 80.0 per cent and not more than 82.5 per cent of Bi, calculated on the dried basis.

Category. Antacid.

Description. A white or almost white powder; odourless.

Identification

A. It gives the reactions of bismuth salts (2.3.1).

B. It gives reaction (A) of carbonates (2.3.1).

Tests

Appearance of solution. Disperse 5.0 g with 10 ml of *water*, add 20 ml of *nitric acid*. Heat to dissolve, cool and dilute to 100 ml with *water* (solution A). Solution A is not more opalescent than opalescence standard OS2 (2.4.1), and is colourless (2.4.1).

Alkalis and alkaline-earth metals. Not more than 1.0 per cent, determined by the following method. To 1.0 g add 10 ml of *water* and 10 ml of *5 M acetic acid*, boil for 2 minutes, cool, filter and wash the residue with 20 ml of *water*. To the combined filtrate and washings add 2 ml of *2 M hydrochloric acid* and 20 ml of *water*. Boil, pass hydrogen sulphide through the boiling solution until no further precipitate is produced, filter and wash the residue with *water*. Evaporate the combined filtrate and washings to dryness on a water-bath and add 0.5 ml of *sulphuric acid*, ignite gently and allow to cool.

Arsenic (2.3.10). To 0.5 g in a distillation flask add 5 ml of *water* and 7 ml of *sulphuric acid*, cool and add 5 g of *hydrazine reducing mixture* and 10 ml of *hydrochloric acid*. Connect the flask to an air-condenser, heat gradually to boiling during 15 to 30 minutes and continue heating at such a rate that the distillation proceeds steadily and until the volume in the flask is reduced by half, or until 5 minutes after the condenser has become full of steam. Discontinue distillation before fumes of sulphur trioxide are evolved. Collect the distillate in a tube containing 15 ml of *water* cooled in ice. Wash the condenser with *water* and dilute the combined distillate and washings to 25 ml with *water*. The resulting solution complies with the limit test for arsenic (5 ppm). Use 2.5 ml of *arsenic standard solution (1 ppm As)* diluted to 25 ml with *water* to prepare the standard.

Copper. To 5 ml of solution A add 2 ml of *10 M ammonia*, dilute to 50 ml with *water* and filter. To 10 ml of the filtrate add 1 ml of a 0.1 per cent w/v solution of *sodium diethyldithiocarbamate*. Any colour produced is not more intense than that produced by treating at the same time and in the same manner a solution containing 0.25 ml of *copper standard solution (10 ppm Cu)* diluted to 10 ml with *water* (50 ppm).

Lead. To 10 ml of solution A add 10 ml of *1 M sulphuric acid*; the solution does not become cloudy.

Silver. To 2.0 g add 1 ml of *water* and 4 ml of *nitric acid*. Heat gently to dissolve and dilute to 11 ml with *water*. Cool, add 2 ml of *1 M hydrochloric acid* and allow to stand for 5 minutes protected from light. Any opalescence produced is not more intense than that obtained by treating at the same time and in the same manner a mixture of 10 ml of *silver standard solution (5 ppm Ag)*, 2 ml of *1 M hydrochloric acid* and 1 ml of *nitric acid* (25 ppm).

Chlorides (2.3.12). To 10 ml of solution A add 4 ml of *nitric acid* and 20 ml of *water*; the resulting solution complies with the limit test for chlorides (500 ppm).

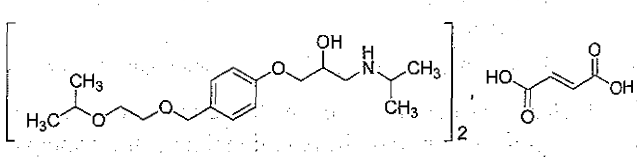
Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.5 g, dissolve in 3 ml of *nitric acid* and dilute to 250 ml with *water*. Add *strong ammonia solution* until cloudiness is first observed, add 0.5 ml of *nitric acid* and heat to 70°, maintaining the solution at this temperature until the solution becomes completely clear. Add about 50 mg of *xylenol orange mixture* and titrate with *0.1 M disodium edetate* until the colour changes from pinkish-violet to lemon yellow.

1 ml of *0.1 M disodium edetate* is equivalent to 0.02090 g of Bi.

Storage. Store protected from light.

Bisoprolol Fumarate



$(C_{18}H_{31}NO_4)_2.C_4H_4O_4$ Mol.Wt. 767.0

Bisoprolol Fumarate is 2-propanol,1-[4-[[2-(1-methylethoxy) ethoxy]methyl]phenoxy]-3-[(1-methylethyl)amino]-,(±)-,(*E*)-2-butenedioate.

Bisoprolol Fumarate contains not less than 97.5 per cent and not more than 102.0 per cent of $(C_{18}H_{31}NO_4)_2,C_4H_4O_4$, calculated on the anhydrous basis.

Category. Beta-adrenoceptor antagonist.

Description. A white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *bisoprolol fumarate IPRS* or with the reference spectrum of bisoprolol fumarate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Optical rotation (2.4.22). – 2.0° to + 2.0°, determined in a 1.0 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay using the following modifications.

Inject the test solution. The sum of areas of all the secondary peaks, other than the peak due to fumaric acid is not more than 0.5 per cent, calculated by area normalization.

Fumaric acid. 14.8.per cent to 15.4 per cent.

Weigh 0.5 g and dissolve in 70 ml of *ethanol*, add 8.0 ml of *0.1M tetrabutylammonium hydroxide*, stir for 2 minutes. Continue to titrate with *0.1 M tetrabutylammonium hydroxide*, determining the end point potentiometrically (2.4.25), using glass-calomel electrode. Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.005804 g of fumaric acid.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Water (2.3.43). Not more than 0.5 per cent.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 65 volumes of *water* and 35 volumes of *acetonitrile*.

Test solution. Dissolve 50 mg of the substance under examination in 50.0 ml of the solvent mixture.

Reference solution (a). A 0.1 per cent w/v solution of *bisoprolol fumarate IPRS* in the solvent.

Reference solution (b). A solution containing 0.05 per cent w/v of *propranolol hydrochloride IPRS* and 0.1 per cent w/v of *bisoprolol fumarate IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 12.5 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: To 1000 ml of solvent mixture, add 5 ml of *heptafluorobutyric acid*, 5 ml of *diethylamine* and 2.5 ml of *formic acid*. Mix and filter, make necessary adjustment if necessary to obtain desired resolution.
- flow rate: 1 ml per minute,
- spectrophotometer set at 273 nm,
- injection volume: 10 µl.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to bisoprolol and propranalol is not less than 7 in the chromatogram obtained with reference solution (b), the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent for bisoprolol peak in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $(C_{18}H_{31}NO_4)_2,C_4H_4O_4$ using the area of the 2 major peaks.

Storage. Store protected from light and moisture at a temperature below 30°.

Bisoprolol Fumarate and Hydrochlorothiazide Tablets

Bisoprolol Fumarate and Hydrochlorothiazide Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of bisoprolol fumarate, $(C_{18}H_{31}NO_4)_2$, $C_4H_4O_4$ and hydrochlorothiazide, $C_7H_8ClN_3O_4S_2$.

Usual strengths. Bisoprolol Fumarate, 2.5 mg, Hydrochlorothiazide, 6.25 mg; Bisoprolol Fumarate, 5 mg, Hydrochlorothiazide, 6.25 mg; Bisoprolol Fumarate 10 mg, Hydrochlorothiazide 6.25 mg.

Identification

A. Determine by thin layer chromatography (2.4.17), coating the plate with *silica gel GF 254*.

Mobile phase. A mixture of 43 volumes of *dichloromethane*, 20 volumes of *methanol* and 8 volumes of *strong ammonia solution*.

Test solution. Disperse 1 tablet in 5-ml volumetric flask. Dilute with *methanol* to volume, sonicate for 5 minutes and centrifuge and use the clear supernatant liquid.

Reference solution (a). A 0.1 per cent w/v solution of *bisoprolol fumarate IPRS* in *methanol*.

Reference solution (b). A 0.1 per cent w/v solution of *hydrochlorothiazide IPRS* in *methanol*.

Apply to the plate 25 µl of each solution. After development, dry the plate in current of air and examine under ultraviolet light at 254 nm as well as by exposure to iodine vapour. The two principal spots in the chromatogram obtained with test solution corresponds to those in the chromatogram obtained with reference solution (a) and (b).

B. In the Assay, the principal peaks in the chromatogram obtained with test solution (a) corresponds to the peak in the chromatogram obtained with reference solution (b).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.1 M hydrochloric acid*,

Speed and time. 75 rpm and 20 minutes for bisoprolol fumarate and 30 minutes for hydrochlorothiazide.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary with the dissolution medium.

Reference solution (a). A 0.05 per cent w/v solution of *bisoprolol fumarate IPRS* in dissolution medium.

Reference solution (b). Weigh 30 mg of *hydrochlorothiazide IPRS* in 50-ml volumetric flask, dissolve in 5 ml of *methanol* and dilute to volume with dissolution medium.

Reference solution (c). Dilute a volume of reference solution (a) and reference solution (b) with dissolution medium to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with phenyl groups bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of *triethylamine solution* prepared by mixing 2 ml of *triethylamine* in 1000 ml of *water*, adjusted to pH 3.0 with *ortho-phosphoric acid* and 10 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 227 nm for bisoprolol fumarate and 272 nm for hydrochlorothiazide,
- injection volume: 20 µl.

Inject reference solution (c) and the test solution.

Q. Not less than 80 per cent of the stated amount of $(C_{18}H_{31}NO_4)_2,C_4H_4O_4$ and $C_7H_8ClN_3O_4S_2$.

Related substances. Determine by liquid chromatography (2.4.14) as described under Assay with the following modifications.

Test solution (a). Weigh and powder 10 tablets and transfer in to 100-ml volumetric flask. Add 50 ml of solvent mixture, sonicate for 10 minutes, and cool. Dilute with solvent mixture up to volume, stir by mechanical means for 1 hour, and centrifuge.

Test solution (b). Dilute a suitable volume of test solution (a) with the solvent mixture to obtain a solution containing 0.01 per cent w/v of bisoprolol fumarate.

Reference solution. A solution containing 0.0002 per cent w/v of *hydrochlorothiazide IPRS* in solvent mixture.

Chromatographic system

- spectrophotometer set at 260 nm,

The correction factor 0.83 for the peak with a relative retention time of 0.69 and 0.71 for the peak with a relative retention time 1.2 with reference to hydrochlorothiazide.

Inject the reference solution and test solution (b). In the chromatogram obtained with test solution (b) the area of any peak at relative retention time of 1.2 is not more than the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent). The area of any other secondary peak at relative retention time of 0.69 is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Calculate the percentage of each impurity using following expression:

$$100 \times C \times \frac{Lb}{Lh} \times \frac{Cs}{Cb} \times \frac{Rt}{Rs}$$

where, C = Correction factor for the peak with relative retention time of 0.69 and 1.2,

Lb = Labelled quantity of bisoprolol fumarate in mg,

Lh = Labelled quantity of hydrochlorothiazide in mg,

Cs = Concentration of *hydrochlorothiazide IPRS* in reference solution (mg per ml),

Cb = Concentration of bisoprolol fumarate in test solution (b) (mg per ml),

Rt = Peak area of each of the two impurity obtained from test solution (b),

Rs = Peak area of hydrochlorothiazide peak obtained from reference solution.

Uniformity of content. Complies with the test stated under tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Transfer one tablet in 25-ml volumetric flask. Add 12.5 ml of solvent mixture, sonicate for 10 minutes, and cool. Dilute with solvent mixture to volume, stir by mechanical means for 1 hour, and centrifuge. Dilute further if necessary, with the solvent mixture.

Inject reference solution (b) and the test solution.

Calculate the content of $(C_{18}H_{31}NO_4)_2,C_4H_4O_4$ and $C_7H_8ClN_3O_4S_2$ in the tablets.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Dilute 10 ml of *1 M dibutylammonium phosphate* with 1000 ml of a mixture prepared by mixing 50 volumes of *water* and 50 volumes of *acetonitrile.*

Test solution (a). Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 25 mg of Bisoprolol Fumarate in 100-ml volumetric flask and dilute to volume with the solvent mixture.

Test solution (b). Dilute a suitable volume of test solution (a) with the solvent mixture to obtain a solution containing 0.01 per cent w/v of bisoprolol fumarate.

Test solution (c). Dilute a suitable volume of test solution (a) with solvent mixture to obtain a solution containing 0.00625 per cent w/v of hydrochlorothiazide.

Reference solution (a). A solution containing 0.004 per cent w/v each of *chlorothiazide IPRS and hydrochlorothiazide IPRS in solvent mixture.*

Reference solution (b). A solution containing 0.01 per cent w/v of *bisoprolol fumarate IPRS* and 0.00625 per cent w/v of *hydrochlorothiazide IPRS* in solvent mixture.

Chromatographic system

- a stainless steel column 10 cm x 8.0 mm, packed with phenyl groups bonded to porous silica (5 µm),
- mobile phase: A. dilute 10 ml of *1 M dibutylammonium phosphate* with 1000 ml of *water,*
  B. a mixture of 30 volumes of *acetonitrile* and 20 volumes of *water,* add 0.5 volume of *1 M dibutyl ammonium phosphate* and stir vigorously for 2 minutes, filter.
- a gradient programme using the conditions given below,
- flow rate: 3 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
9	40	60
9.1	100	0
12	100	0

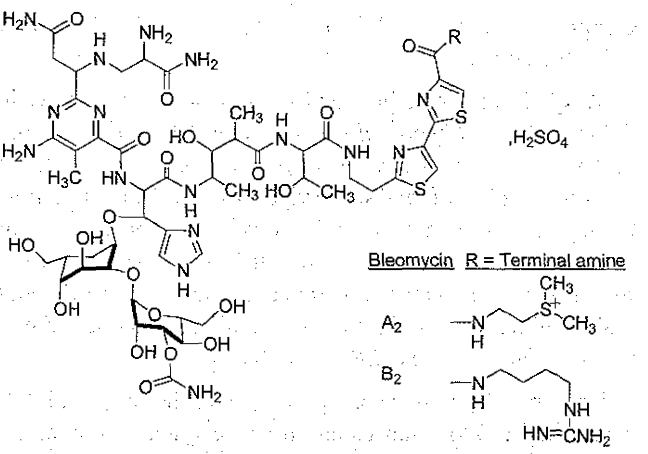
Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to chlorothiazide and hydrochlorothiazide is not less than 1.5 obtained with reference solution (a), the tailing factor due to hydrochlorothiazide is not more than 1.3 obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (b) and test solution (b), (c).

Calculate the content of $(C_{18}H_{31}NO_4)_2,C_4H_4O_4$ and $C_7H_8ClN_3O_4S_2$ in the tablets.

Storage. Store protected from light and moisture.

Bleomycin Sulphate



$C_{55}H_{84}N_{17}O_{21}S_3,H_2SO_4$ Mol. Wt. 1513.6
(Bleomycin A_2 Sulphate)

$C_{55}H_{84}N_{20}O_{21}S_2,H_2SO_4$ Mol. Wt. 1523.6
(Bleomycin B_2 Sulphate)

Bleomycin Sulphate is the sulphate salt of bleomycin, a mixture of basic cytotoxic glycopeptides produced by the growth of *Streptomyces verticillus* or produced by other means. Its main components are bleomycin A_2 and bleomycin B_2. Bleomycin A_2 sulphate is N^1-[3 (dimethylsulphonio)propyl]bleomycina-mide hydrogen sulphate and Bleomycin B_2 is N^1-(guanidinobutyl) bleomycinamide sulphate.

Bleomycin Sulphate contains not less than 1.5 and not more than 2.0 Units of bleomycin per mg and the content of bleomycins is: bleomycin A_2, between 55 per cent and 70 per cent;bleomycin B_2, between 25 per cent and 32 per cent; sum of bleomycin A_2 and bleomycin B_2, not less than 85 per cent; demethylbleomycin A_2, not more than 5.5 per cent; other related substances, not more than 9.5 per cent.

Category. Anticancer.

Description. A white or cream-coloured, amorphous powder.

CAUTION — Bleomycin Sulphate must be handled with care, avoiding contact with the skin and inhalation of airborne particles.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *bleomycin sulphate IPRS* or with the reference spectrum of bleomycin sulphate.

B. It gives the reactions of sulphates (2.3.1).

Tests

pH (2.4.24). 4.5 to 6.0, determined in a solution containing 10 Units per ml.

Copper. Not more than 0.02 per cent determined by Method A or by Method B.

A. Weigh 50 mg, transfer to a 60-ml separator and dissolve in 10.0 ml of *0.1 M hydrochloric acid*. Add 10 ml of a 0.01 per cent w/v solution of *zinc bis (diphenyl dithiocarbamate)* in *carbon tetrachloride* and shake vigorously for 1 minute. Allow the layers to separate, filter the lower layer through 1 g of *anhydrous sodium sulphate*. Treat similarly 1.0 ml of *copper standard solution (10 ppm Cu)* and measure the absorbances (2.4.7) of the two solutions at the maximum at about 435 nm, using *carbon tetrachloride* as the blank.

B. Determine by atomic absorption spectrophotometry (2.4.2) measuring at 324.7 nm using an air-acetylene flame and a solution prepared by dissolving 50 mg of the substance under examination in *water* and dilute to 10.0 ml with *water*. Use *copper solution AAS* suitably diluted with *water*, for preparing the reference solutions.

Content of bleomycins. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve the substance under examination in freshly boiled and cooled *water* so as to give a solution containing about 2.5 Units per ml. (*The solution should be stored at 2° to 8° just before use*).

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Nucleosil C18),
- mobile phase: Transfer 0.96 g of *sodium 1-pentanesulphonate* to a 1000-ml volumetric flask, add 5.0 ml of *glacial acetic acid* and 900 volumes of *water*. Mix and adjusted to pH 4.3 with *strong ammonia solution* (1.86 g of *disodium edetate* may be included if needed for satisfactory chromatography). Adjust the volume with *water*, mix well, filter and degas before use. Use a linear gradient of 10 per cent to 40 per cent *methanol*, which also is filtered and degassed before use, mixed with the solution,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

After the final conditions are reached (about 60 minutes) allow the chromatography to proceed with the final gradient mixture for an additional 20 minutes or until demethylbleomycin A_2 is eluted.

Inject the test solution and proceed with gradient elution, pumping the mobile phase mixture under the conditions mentioned above for about 80 minutes or until the demethylbleomycin A_2 is eluted. The usual order of elution is bleomycinic acid, bleomycin A_2 (first principal peak), bleomycin A_5, bleomycin B_2 (second principal peak), bleomycin B_4 and demethylbleomycin A_2 (retention time relative to bleomycin A_2, between 1.5 and 2.5).

Measure the peak responses of all peaks. Calculate the contents of each bleomycin component by comparing the ratios of the individual areas of the peaks with that of the total area of all bleomycins.

Loss on drying (2.4.19). Not more than 3.0 per cent, determined on 50 mg by drying in an oven over *phosphorous pentoxide* at 60° at a pressure not exceeding 0.25 kPa for 3 hours.

Assay. Determine by the microbiological assay of antibiotics, Method A or B (2.2.10), and express the result in Units per mg.

Bleomycin Sulphate intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 10.0 Endotoxin Units per unit of bleomycin.

Bleomycin Sulphate intended for use in the manufacture of parenteral preparations without a further appropriate sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. If the material is sterile, it should be stored in sterile, tamper-evident containers and sealed so as to exclude micro-organisms.

Labelling. The label states (1) the strength with respect to Bleomycin Sulphate as the number of bleomycin Units per mg; (2) whether or not the contents are intended for use in the manufacture of parenteral preparations.

Bleomycin Injection

Bleomycin Sulphate Injection

Bleomycin Injection is a sterile freeze dried material consisting of Bleomycin Sulphate with or without excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of the liquid stated on the label before use.

The constituted solution complies with the tests for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Bleomycin injection contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of bleomycin and the content of bleomycins is: bleomycin A_2, between 55 per cent and 70 per cent;bleomycin B_2, between 25 and 32 per cent; sum of bleomycin A_2 and bleomycin B_2, not less than 85 per cent; demethylbleomycin A_2, not more than 5.5 per cent; other related substances, not more than 9.5 per cent.

The contents of the sealed container comply with the tests stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Usual strengths. 15 units per vial; 30 units per vial.

Identification

A. Determine by infra-red absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *bleomycin sulphate IPRS* or with the reference spectrum of bleomycin sulphate.

B. It gives the reactions of sulphates (2.3.1).

Tests

pH (2.4.24). 4.5 to 6.0, determined in a solution containing 10 Units per ml.

Copper. Not more than 0.02 per cent, determined by Method A or Method B

A. Weigh a quantity containing about 50 mg of bleomycin, transfer to a 60-ml separator and dissolve in 10.0 ml of *0.1 M hydrochloric acid*. Add 10 ml of a 0.01 per cent w/v solution of *zinc bis(diphenyl dithiocarbamate)* in *carbon tetrachloride* and shake vigorously for 1 minute. Allow the layers to separate, filter the lower layer through 1 g of *anhydrous sodium sulphate*. Treat similarly 1.0 ml of *copper standard solution (10 ppm Cu)* and measure the absorbances (2.4.7) of the two solutions at the maximum at about 435 nm, using *carbon tetrachloride* as the blank.

B. Determine by atomic absorption spectrophotometry (2.4.2) measuring at 324.7 nm using an air-acetylene flame and a solution prepared in the following manner: Weigh a quantity containing about 75 mg of bleomycin, dissolve in *water* and dilute to 10 .0 ml with the same solvent. Use *copper solution AAS* suitably diluted with *water*, for preparing the reference solutions.

Content of bleomycin. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a suitable quantity dissolve in freshly boiled and cooled *water* and dilute to obtain a solution containing about 2.5 Units per ml. (*The solution should be stored at 2° to 8° just before use*).

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Nucleosil C18),
- mobile phase: Transfer 0.96 g of *sodium 1-pentanesulphonate* to a 1000-ml volumetric flask, add 5.0 ml of *glacial acetic acid* and 900 volumes of *water*. Mix and adjusted to pH 4.3 with *strong ammonia solution* (1.86 g of *disodium edetate* may be included if needed for satisfactory chromatography). Adjust the volume with *water*, mix well, filter and degas before use. Use a linear gradient of 10 per cent to 40 per cent *methanol*, which also is filtered and degassed before use, mixed with the solution,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

After the final conditions are reached (about 60 minutes) allow the chromatography to proceed with the final gradient mixture for an additional 20 minutes or until demethylbleomycin A_2 is eluted.

Inject the test solution and proceed with gradient elution, pumping the mobile phase mixture under the conditions mentioned above for about 80 minutes or until the demethylbleomycin A_2 is eluted. The usual order of elution is bleomycinic acid, bleomycin A_2 (first principal peak), bleomycin A_5, bleomycin B_2 (second principal peak), bleomycin B_4 and demethylbleomycin A_2 (retention time relative to bleomycin A_2, between 1.5 and 2.5).

Measure the peak responses of all the peaks. Calculate the contents of each bleomycin component by comparing the ratios of the individual areas of the peaks with that of the total area of all bleomycins.

Bacterial endotoxins (2.2.3). Not more than 10.0 Endotoxin Units per unit of bleomycin.

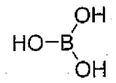
Loss on drying (2.4.19). Not more than 6.0 per cent, determined by drying the combined contents of two containers in an oven at 60° at a pressure not exceeding 0.7 kPa for 3 hours.

Assay. Determine the weight of the contents of 10 containers. Mix the contents of the containers and determine by the microbiological assay of antibiotics, Method A or B (2.2.10) and express the results in Units per vial.

Storage. The sealed container should be protected from light.

Labelling. The label states the total number of units contained in the sealed container.

Boric Acid



H_3BO_3 Mol. Wt. 61.8

Boric Acid contains not less than 99.5 per cent and not more than 100.5 per cent of H_3BO_3, calculated on the dried basis.

Category. Local anti-infective.

Description. A white, crystalline powder or colourless shiny plates unctuous to the touch or white crystals; odourless.

Identification

A. Dissolve 0.1 g by gently warming with 5 ml of *methanol* to which a few drops of *sulphuric acid* have been added. Ignite the solution; the flame has a green border.

B. Dissolve 3.0 g in 90 ml of boiling *distilled water*, cool; the solution is slightly acid (2.4.46).

Tests

Appearance of solution. A 3.5 per cent w/v solution in boiling *water* is clear (2.4.1), and colourless (2.4.1).

pH (2.4.24). 3.8 to 4.8, determined in the solution obtained in Identification test B.

Solubility in ethanol. Dissolve 1.0 g in 10 ml of boiling *ethanol (95 per cent)*; the solution is not more opalescent than opalescence standard OS2 (2.4.1), and colourless (2.4.1).

Arsenic (2.3.10). Dissolve 1.0 g in 50 ml of *water* containing 2 g of *citric acid* and add 0.1 ml of *stannous chloride solution AsT* and 10 ml of *hydrochloric acid*. The resulting solution complies with the limit test for arsenic (10 ppm).

Heavy metals (2.3.13). A solution produced by dissolving 1.0 g in 2 ml of *dilute acetic acid* and diluting with sufficient *water* to produce 25 ml complies with the limit test for heavy metals, Method A (20 ppm).

Sulphates (2.3.17). Dissolve 0.33 g in 10 ml of boiling *water* and dilute to 15 ml with *water*. The solution complies with the limit test for sulphates (450 ppm).

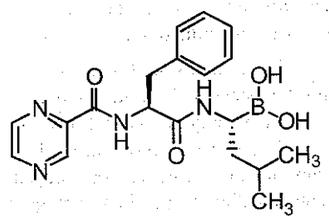
Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying over *silica gel* for 5 hours.

Assay. Weigh 2.0 g, dissolve in a mixture of 50 ml of *water* and 100 ml of *glycerin*, previously neutralised to *phenolphthalein solution*. Titrate with *1 M sodium hydroxide* using *phenolphthalein solution* as indicator.

1 ml of *1 M sodium hydroxide* is equivalent to 0.06183 g of H_3BO_3.

Labelling. The label states that it is not meant for internal use.

Bortezomib



$C_{19}H_{25}BN_4O_4$ Mol. Wt. 384.2

Bortezomib is [(1*R*)-3-methyl-1-[[(2*S*)-1-oxo-3-phenyl-2-[(pyrazinylcarbonyl)-amino]propyl]amino]butyl]boronic acid.

Bortezomib contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{19}H_{25}BN_4O_4$, calculated on the dried basis.

Category. Anticancer.

Description. A white to off-white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *bortezomib IPRS* or with the reference spectrum of bortezomib.

Tests

Specific Optical Rotation (2.4.22). −55.0° to −45.0°, calculated on dried basis and determined in a 1.0 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 5.0 ml of mobile phase B and dilute to 50.0 ml with mobile phase A.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- sample temperature: 5°,
- mobile phase: A. a mixture of 30 volumes of *acetonitrile*, 70 volumes of *water* and 0.1 volume of *formic acid*,
  B. a mixture of 80 volumes of *acetonitrile*, 20 volumes of *water* and 0.1 volume of *formic acid*,
- a gradient programme using the conditions given below,

- flow rate: 1 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
15	100	0
30	0	100
45	0	100
47	100	0
55	100	0

Inject the test solution. The area of any secondary peak is not more than 0.5 per cent and the sum of areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalization.

Chiral purity. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modifications.

The retention time of bortezomib peak is about 8.5 minutes and of S, S enantiomer is about 10.5 minutes.

Inject the test solution. The area of the peak corresponding to S, S enantiomer is not more than 0.5 per cent, calculated by area normalization.

Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 0.5 g by drying over *phosphorus pentoxide* at room temperature, under vacuum at a pressure of 1.5kPa to 2.5kPa for 3 hours.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances with the following modifications.

Test solution. Dissolve 25 mg of the substance under examination in 5 ml of mobile phase B and dilute to 50.0 ml with mobile phase A.

Reference solution. Dissolve 25 mg of *bortezomib IPRS* in 5 ml of mobile phase B and dilute to 50.0 ml with mobile phase A.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{25}BN_4O_4$.

Bortezomib Injection

Bortezomib Injection is a sterile freeze dried material consisting of Bortezomib with or without excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of *0.9 per cent w/v sodium chloride injection* immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Bortezomib injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of bortezomib $C_{19}H_{25}BN_4O_4$.

Usual strengths. 2 mg per vial; 3.5 mg per vial

Description. A white or almost white powder.

The contents of the sealed container comply with the requirements stated under Parenteral preparations (Powders for injection) and with the following requirements.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH. (2.4.24). 4.0 to 7.0, when constituted as 1 mg per ml with 0.9 per cent w/v *sodium chloride injection*.

Appearance of solution. A constituted solution containing 1 mg of bortezomib per ml with 0.9 per cent w/v *sodium chloride injection* is clear (2.4.1) and colourless (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 30 volumes of 0.9 per cent w/v of *sodium chloride* and 70 volumes of *acetonitrile*.

Test solution. Determine the weight of the content of 10 containers. Disperse a quantity of the mixed contents of the 10 containers containing 10 mg of Bortezomib, dissolve in the solvent mixture and dilute to 20.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm)
- mobile phase: A. a mixture of 1000 volumes of *water* and 1 volume of *formic acid*,
  B. *acetonitrile*
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	70	30
15	70	30
30	40	60
60	40	60
65	70	30
70	70	30

Inject the test solution. The area of any secondary peak is not more than 1.0 per cent and the sum of the areas of all the secondary peaks is not more than 2.0 per cent, calculated by area normalisation.

Tertiary Butanol (*If present*). Not more than 5000 ppm.

Determine by gas chromatography (2.4.13).

Test solution. Transfer mixed contents of the containers containing 0.025 g of bortezomib to a 20 ml vial, add 1.0 ml of *dimethylformamide*.

Reference solution (a). A 0.025 per cent w/v solution of *tertiary butanol* in *dimethylformamide*.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 10.0 ml with *dimethylformamide*. Transfer 1.0 ml of the solution to a 20.0 ml vial.

Chromatographic system

- a capillary column 30 m x 0.53 mm, packed with bonded and crosslinked siloxane (3 µm),
- temperature:

column	time (in min.)	temperature (°)
	0 – 8	40
	8 – 10	80
	10 – 14.5	90

- inlet port at 200° and detector at 250°,
- flame ionization detector,
- flow rate: 4 ml per minute, helium as the carrier gas.

Inject 1 µl of vapour phase from the reference solution (b) and the test solution.

Calculate the content of tertiary butanol from the peak responses of tertiary butanol in the test solution and the reference solution (b).

Bacterial endotoxins (2.2.3). Not more than 75 Endotoxin Units per mg of bortezomib.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 35 volumes of *acetonitrile*, 65 volumes of *water* and 0.1 volume of *formic acid*.

Test solution: Determine the weight of the content of 10 containers. Weigh a quantity of the mixed contents of the 10 containers containing 20 mg of Bortezomib, dissolve in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution. A 0.04 per cent w/v solution of *bortezomib IPRS* in the solvent mixture.

Chromatographic system:

- a stainless steel column 15 cm x 4.6 mm packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 30 volumes of *acetonitrile*, 70 volumes of *water* and 0.1 volume of *formic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 20 µl

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

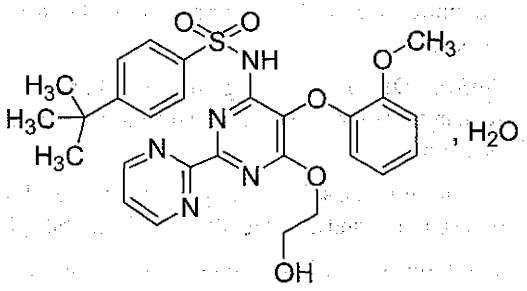
Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{25}BN_4O_4$ in the injection.

Storage. Store protected from light and moisture.

Labeling. The label states the quantity of bortezomib contained in the sealed container.

Bosentan Monohydrate



$C_{27}H_{29}N_5O_6S,H_2O$ Mol. Wt. 569.6

Bosentan Monohydrate is 4-(1, 1- Dimethylethyl)-*N*-[6-(2-hydroxyethoxy)-5-(2- methoxyphenoxy)[2,2-bipyrimidin]-4-yl] benzenesulfonamide monohydrate.

Bosentan Monohydrate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{27}H_{29}N_5O_6S$, calculated on the anhydrous basis.

Category. Antihypertensive.

Description. A white to yellowish powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *bosentan monohydrate IPRS* or with the reference spectrum of bosentan monohydrate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture A. a mixture of 90 volumes of *acetonitrile* and 10 volumes of *water*.

Solvent mixture B. a mixture of equal volumes of mobile phase A and mobile phase B.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture B and dilute to 50.0 ml with the solvent mixture B.

Reference solution. A 0.01 per cent w/v solution of *bosentan monohydrate IPRS* in the solvent mixture A. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture B.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with phenyl silica gel bonded to porous silica (5 µm), (Such as Zorbax SB-Phenyl),
- sample temperature: 8°,
- column temperature: 35°,
- mobile phase: A. a mixture of 40 volumes of *methanol* and 60 volumes of a buffer solution prepared by diluting 1.0 ml of *triethylamine* in 1000 ml of *water*, adjusted to pH 2.5 with *orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	70	30
5	70	30
25	40	60
30	40	60
35	70	30
40	70	30

Name	Relative retention time	Correction factor
Bosentan related compound E[1]	0.39	1.15
Bosentan related compound D[2]	0.57	1.38
Bosentan related compound B[3]	0.96	0.99
Bosentan	1.0	---
Bosentan related compound A[4]	1.34	1.16
Bosentan related compound C[5]	2.15	1.12

[1]4-(tert-butyl) benzensulfonamide,

[2]4,6-Dichloro-5-(2-methoxyphenoxy)-2,2'-bipyrimidine,

[3]4-(tert-butyl)-N-[6-hydroxy-5-(2-methoxyphenoxy)-2,2'-bipyrimidin-4-yl] benzensulfonamide,

[4]4-(tert-butyl)-N-[6-chloro-5-(2-methoxyphenoxy)-2,2'-bipyrimidin-4-yl benzensulfonamide,

[5]1,2-Bis({6-[4-(tert-butyl)phenylsulfonamido]-5-(2-methoxyphenoxy)-[2,2'-bipyrimidine]-4-yl}oxy) ethane.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with test solution, the area of any peak due to bosentan related compounds A, B, C, D and E is not more than 1.5 times the area of principal peak in the chromatogram obtained with the reference solution (0.15 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not less than 2.0 per cent and not more than 4.0 per cent, determined on 0.1g dissolved in a mixture of equal volumes of *methanol* and *dimethylformamide*.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *bosentan monohydrate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with phenyl silica gel bonded to porous silica (5 µm), (Such as Zorbax SB-Phenyl),

- sample temperature: 8°,
- column temperature: 35°,
- mobile phase: a mixture of 45 volumes of *acetonitrile* and 55 volumes of a buffer solution prepared by diluting 1.0 ml of *triethylamine* in 1000 ml of *water*, adjusted to pH 2.5 with *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{27}H_{29}N_5O_6S$.

Storage. Store in tight container and at a temperature not exceeding 25°.

Bosentan Tablets

Bosentan Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of bosentan, $C_{27}H_{29}N_5O_6S$.

Usual strengths. 62.5 mg; 125 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of a buffer solution prepared by dissolving 6.8 g *sodium dihydrogen orthophosphate* in 1000 ml of *water* and mix. Adjusted to pH 6.8 with 10 per cent w/v solution of *sodium hydroxide*. To the solution add 5 g of *sodium lauryl sulphate*,

Speed and time. 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, Dilute if necessary, with the mobile phase.

Reference solution. Dissolve a quantity of *bosentan monohydrate IPRS* in *methanol* and dilute with the mobile phase to obtain a solution of known concentration similar to the expected concentration of the test solution.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Zorbax SB- C18),
- column temperature: 40°,
- mobile phase: a mixture of 30 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen phosphate* in 1000 ml of *water* and 70 volumes of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 10 µl.

Inject the reference solution and the test solution.

Q. Not less than 75 per cent of the stated amount of $C_{27}H_{29}N_5O_6S$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. a mixture of equal volumes of *acetonitrile* and a buffer solution prepared by diluting 1.0 ml of *triethylamine* in 1000 ml of *water*, adjusted pH 3.0 with *orthophosphoric acid.*

Test solution. Disperse an accurately weighed quantity of the tablet powder containing 50 mg of bosentan in 30 ml of the solvent mixture with the aid of ultrasound for 10 minutes and dilute to 50.0 ml with the solvent mixture, mix well and filter.

Reference solution . A 0.001 per cent w/v solution of *bosentan monohydrate IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS 3V),
- column temperature: 40°,
- mobile phase: a mixture of 55 volumes of a buffer solution prepared by diluting 1.0 ml of *triethylamine* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and 45 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with test solution, the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution

(2.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse an accurately weighed quantity of the powder containing 125 mg of bosentan in 140 ml of the *methanol* with the aid of ultrasound for 10 minutes and dilute to 200.0 ml with the *methanol*, mix well and filter. Dilute 5.0 ml of the solution to 25.0 ml with the *methanol*.

Reference solution. A 0.0125 per cent w/v solution of *bosentan monohydrate IPRS* in *methanol*.

Use chromatographic system as described under Dissolution.

Inject 20 µl of the reference solution and the test solution.

Inject the reference solution. The test is not valid unless the column efficiency in not less than 800 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

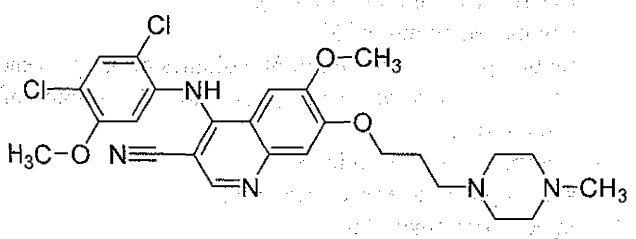
Inject the reference solution and the test solution.

Calculate the content of $C_{27}H_{29}N_5O_6S$ in the tablets.

Storage. Store in a cool and dry place.

Labelling. The label states the strength in terms of the equivalent amount of bosentan.

Bosutinib



$C_{26}H_{29}Cl_2N_5O_3$ Mol. Wt. 530.5 (anhydrous form)

Bosutinib is 3-Quinolinecarbonitrile,4-[(2,4-dichloro-5-methoxyphenyl)amino]-6-methoxy-7-[3-(4-methyl-1-piperazinyl) propoxy].

Bosutinib contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{26}H_{29}Cl_2N_5O_3$, calculated on anhydrous basis.

CAUTION — Bosutinib is cytotoxic, extra care required to prevent inhaling particles and exposing the skin to it.

Category. Anticancer

Description. A white to yellowish-tan powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *bosutinib IPRS* or with the reference spectrum of bosutinib.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 70 volumes of *acetonitrile* and 30 volumes of *water*.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). A 0.01 per cent w/v solution of *bosutinib IPRS* in the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 25.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm) (Such as YMC Triart),
- mobile phase: A. a buffer solution prepared by dissolving 1.74 g of *dipotassium hydrogen ortho-phosphate* in 1000 ml of *water*, adjusted to pH 10.0 with 1per cent w/v solution of *potassium hydroxide*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate:1 ml per minute,
- spectrophotometer set at 268 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	75	25
10	35	65
35	35	65
37	75	25
45	75	25

Inject reference solution (a) and (b). The test is not valid unless the column efficiency is not less than 22000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard

deviation for replicate injections is not more than 10.0 per cent in the chromatogram obtained with reference solution (a) and the signal-to-noise ratio is not less than 10 in the chromatogram obtained with reference solution (b).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent), the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 5.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

*Solvent mixture.*70 volumes of *acetonitrile* and 30 volumes of *water.*

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution. A 0.005 per cent w/v solution of *bosutinib IPRS* in the solvent mixture.

Chromatographicsystem
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5µm) (Such as X-Bridge C18),
- column temperature: 40°,
- sample temperature:10°,
- mobile phase: a mixture of 50 volumes of 0.1 per cent v/v of *triethylamine* in *water* and 50 volumes of *acetonitrile,*
- flow rate:1 ml per minute,
- spectrophotometer set at 269 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution. Calculate the content of $C_{26}H_{29}Cl_2N_5O_3$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Bosutinib Tablets

Bosutinib Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of bosutinib, $C_{26}H_{29}Cl_2N_5O_3$.

Usual strengths. 100 mg; 400 mg; 500 mg.

CAUTION — Bosutinib is cytotoxic, extra care required to prevent inhaling particles and exposing the skin to it.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1M hydrochloric acid,*
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *bosutinib IPRS* in the dissolution medium and dilute with the dissolution medium to obtain a solution containing 0.011 per cent w/v of bosutinib.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Kromasil Eternity XT C-18),
- column temperature: 35°,
- mobile phase: a mixture of 58 volumes of 0.1 per cent v/v of *triethylamine* in *water* and 42 volumes of acetonitrile,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 269 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{26}H_{29}Cl_2N_5O_3$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{26}H_{29}Cl_2N_5O_3$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and *water.*

Test solution. Disperse a quantity of the powdered tablets containing 100 mg of Bosutinib in the solvent mixture, with the aid of mechanical shaker for 30 minutes, dilute to 200.0 ml with the solvent mixture, mix and filter.

Reference solution (a). A 0.0005 per cent w/v solution of *bosutinib IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 20.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as YMC Triart),
- column temperature: 45°,
- sample temperature: 5°,
- mobile phase: A. a mixture of 95 volumes of a buffer solution prepared by dissolving 3.08 g of *ammonium acetate* in 1000 ml of *water*, adjusted to pH 6.8 with *ammonia solution* and 5 volumes of *acetonitrile*,
  B. a mixture of 90 volumes of *acetonitrile* and 10 volumes of *water*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 5 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	65	35
25	45	55
33	35	65
40	20	80
45	20	80
45.5	65	35
52	65	35

Inject reference solution (a) and (b). The test is not valid unless the column efficiency is not less than 12000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (a) and the signal-to-noise ratio is not less than 10 in the chromatogram obtained with reference solution (b).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent). Ignore any peak with an area 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 70 volumes of *acetonitrile* and 30 volumes of *water.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 250 mg of Bosutinib in the solvent mixture, with the aid of mechanical shaker for 30 minutes and dilute to 250.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 20.0 ml with the solvent mixture.

Reference solution. A 0.005 per cent w/v solution of *bosutinib IPRS* in the solvent mixture.

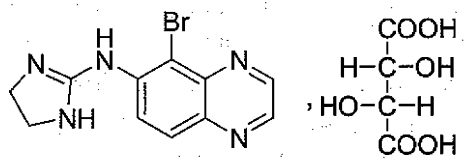
Use chromatographic system as described under dissolution.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution. Calculate the content of $C_{26}H_{29}Cl_2N_5O_3$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Brimonidine Tartrate



$C_{11}H_{10}BrN_5, C_4H_6O_6$ Mol. Wt. 442.2

Brimonidine Tartrate is 5-bromo-6-(2-imidazolidinylidene-amino) quinoxaline *L*-tartrate.

Brimonidine Tartrate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{11}H_{10}BrN_5, C_4H_6O_6$, calculated on dried basis

Category. Antiglaucoma.

Description. A white to slightly yellowish powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *brimonidine tartrate IPRS* or with the reference spectrum of brimonidine tartrate.

Tests

pH (2.4.24). 3.0 to 4.5, determined in a 1.0 per cent w/v solution.

Specific optical rotation (2.4.22). +9.0° to + 10.5°, determined in a 1.0 per cent w/v solution in *water*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution. A 0.00005 per cent w/v solution of *brimonidine tartrate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 10 volumes of *acetonitrile* and 90 volumes of *0.01M triethylamine*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 248 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution. Run the chromatogram 5 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.25 g in 40 ml of *glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of 0.1 M perchloric acid is equivalent to 0.04422 g of $C_{11}H_{10}BrN_5, C_4H_6O_6$.

Storage. Store protected from light and moisture.

Brimonidine Tartrate Eye Drops

Brimonidine Tartrate Eye Drops is a sterile solution of Brimonidine tartrate in Purified Water.

Brimonidine Tartrate Eye Drops contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of brimonidine tartrate, $C_{11}H_{10}BrN_5, C_4H_6O_6$.

Usual strengths. 0.15 per cent w/v; 0.2 per cent w/v.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 5.7 to 8.0.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a suitable volume of the eye drops containing 10 mg of Brimonidine Tartrate to 20.0 ml with the mobile phase.

Reference solution. A 0.0005 per cent w/v solution of *brimonidine tartrate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 mm),
- mobile phase: a mixture of 10 volumes of *acetonitrile* and 90 volumes of buffer solution prepared by diluting 1.4 ml of *triethylamine* in 1000 ml *water*, adjusted to pH 7.2 with *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 248 nm,
- injection volume: 10 µl.

The relative retention time with reference to brimonidine tartrate for debromobrimonidine impurity is about 0.6 and correction factor for debromobrimonidine impurity is 2.77.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. Run the chromatogram 5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak due to debromobrimonidine impurity is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent). The area of any other secondary peak is not more than 0.3 times the area of the principal peak in the chromatogram obtained with the reference solution (0.3 per cent). The sum of the areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent).

Other tests. Comply with the tests stated under Eye Drops.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a suitable volume of the eye drops containing 20 mg of Brimonidine Tartrate to 250.0 ml with the mobile phase.

Reference solution. A 0.008 per cent w/v solution of *brimonidine tartrate IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 10 volumes of *acetonitrile* and 90 volumes of buffer solution prepared by diluting 1.4 ml of *triethylamine* in 1000 ml of *water*, adjusted to pH to 7.2 with *glacial acetic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 248 nm,
- injection volume: 10 µl.

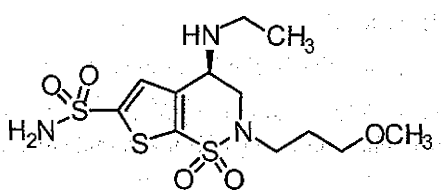
Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{11}H_{10}BrN_5$, $C_4H_6O_6$ in the Eye Drops.

Storage. Store protected from light.

Brinzolamide



$C_{12}H_{21}N_3O_5S_3$ Mol Wt. 383.5

Brinzolamide is(*R*)-4-(ethylamino)-3,4-dihydro-2-(3-methoxypropyl)-2*H*-thieno[3,2-e]-1,2-thiazine-6-sulphonamide1,1-dioxide.

Brinzolamide contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{12}H_{21}N_3O_5S_3$, calculated on the dried basis.

Category. Antiglaucoma agent.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *brinzolamide IPRS* or with the reference spectrum of brinzolamide.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Limit of Brinzolamide Related Compound A

Test solution. Dissolve about 25 mg of the substance under examination in *ethanol* and dilute to 50.0 ml with *ethanol.*

Reference solution. A solution containing 0.04 per cent w/v of *brinzolamide IPRS* and 0.002 per cent w/v of *brinzolamide impurity A IPRS (S-(-)-4-ethylamino-2, 3-dihydro-2-(-3-methoxypropyl)-4H-thieno-[3,2,e]-thiazine-6-sulphonamide-1,1-dioxide)* in *ethanol.*

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, such as chiral Pack ADH (5 µm),
- mobile phase: a mixture of 55 volumes of *ethanol,* 40 volumes of *hexane,* 5 volumes of *methanol* and 0.2 volume of *diethylamine,*
- flow rate: 0.75 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 5 µl.

The relative retention time with reference to brinzolamide for brinzolamide impurity A is about 1.2.

Inject the reference solution. The test is not valid unless the resolution between brinzolamide and brinzolamide impurity A is not less than 1.8, the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 1.8 for the brinzolamide peak.

Inject the test solution. The area of any peak due to brinzolamide impurity A is not more than 0.5 per cent, calculated by area normalization.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in mobile phase A and dilute to 50.0 ml with mobile phase A.

Reference solution. A solution containing 0.01 per cent w/v each of *brinzolamide IPRS* and *brinzolamide impurity B IPRS ((R)-4-Amino-2-(3-methoxypropyl)-3,4-dihydro-2H-thieno[3,2-e][1,2]thiazine-6-sulphonamide 1,1-dioxide oxalate* in mobile phase A.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 75 volumes of a buffer solution prepared by dissolving 4.0 ml of *triethylamine* in 1000 ml of *water* adjusted to pH 3.0 with *ortho-phosphoric acid* and 25 volumes of *acetonitrile,*

B. a mixture of 65 volumes of a buffer solution prepared by dissolving 4.0 ml of *triethylamine* in 1000 ml of *water* adjusted to pH 3.0 with *orthophosphoric acid* and 35 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

The relative retention time with reference to brinzolamide for brinzolamide impurity B is about 0.8 using mobile phase A.

Inject the reference solution. The test is not valid unless the resolution between brinzolamide and brinzolamide impurity B is not less than 2.0, the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0 for the brinzolamide peak.

Analysis 1

Inject the test solution using mobile phase A. Run the chromatogram for about 20 minutes. The area of any secondary peak is not more than 0.3 per cent, calculated by area normalization.

Analysis 2

Inject the test solution using mobile phase B. Run the chromatogram for about 20 minutes and measure the areas for brinzolamide and all the peaks having a relative retention not less than 6.

The area of any secondary peak is not more than 0.3 per cent and the sum of areas of all secondary peaks is not more than 1.0 per cent, calculated by area normalization from analysis1 and analysis 2.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *brinzolamide IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of buffer solution prepared by dissolving 4.0 ml of *triethylamine* in 1000 ml of *water* adjusted to pH 3.0 with *orthophosphoric acid* and 35 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the the column efficiency is not less than 1200 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{12}H_{21}N_3O_5S_3$.

Brinzolamide Ophthalmic Suspension

Brinzolamide Ophthalmic Suspension is a sterile, aqueous suspension of Brinzolamide containing a suitable antimicrobial preservative.

Brinzolamide Ophthalmic Suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of brinzolamide, $C_{12}H_{21}N_3O_5S_3$.

Usual strength. 1 per cent w/v.

Identification

In the Assay the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 6.5 to 8.5.

Impurity A. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a suitable volume of the ophthalmic suspension containing 10 mg of brinzolamide to 25.0 ml with *ethanol*.

Reference solution. A solution containing 0.04 per cent w/v of *brinzolamide IPRS* and 0.002 per cent w/v solution of *brinzolamide impurity A IPRS (brinzolamide-(S)-isomer IPRS)* in *ethanol*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with amylase tris-3,5-dimethylphenylcarbamate coated to porous silica (5 µm) (Such as chiral Pack ADH),
- mobile phase: a mixture of 55 volumes of *ethanol*, 40 volumes of *hexane*, 5 volumes of *methanol* and 0.2 volume of *diethylamine*,
- flow rate: 0.75 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 5 µl.

The relative retention time with reference to brinzolamide for brinzolamide impurity A is about 1.2.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to brinzolamide and brinzolamide impurity A is not less than 1.8, the column efficiency is not less than 2000 theoretical plates and the tailing factor for the brinzolamide peak is not more than 1.8.

Inject the test solution. The area of any peak due to brinzolamide impurity A is not more than 1.5 per cent, calculated by area normalisation method.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a suitable volume of the ophthalmic suspension containing 10 mg of brinzolamide to 50.0 ml with the mobile phase.

Reference solution (a). A 0.02 per cent w/v solution of *brinzolamide IPRS* in the mobile phase.

Reference solution (b). A 0.006 per cent w/v solution of (*R*-4-Amino)-2,3-dihydro-2-(3-methoxypropyl)-4*H* -thieno[3,2,-e]-thiazine-6-sulphonamide-1,1-dioxide ethandioate 1:1 *(brinzolamide impurity B IPRS)* in reference solution (a).

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of buffer solution prepared by dissolving 11.75 g of *ammonium acetate* in 1000 ml of *water*, adjusted to pH 5.2 with *acetic acid* and 35 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

The relative retention time with reference to brinzolamide for brinzolamide impurity B is between 0.48 and 0.61.

Inject reference solution (b). The test is not valid unless the resolution between brinzolamide and brinzolamide impurity B is not less than 4.5, the column efficiency is not less than 2500 theoretical plates and the tailing factor is not more than 2.0 for principal peak.

Inject the test solution. The area of any secondary peak is not more than 0.5 per cent and the sum of the areas of all the secondary peaks is not more than 2.0 per cent, calculated by area normalization method.

Other tests. Comply with the tests stated under Eye Drops.

Assay. Determine by liquid chromatography (2.4.14)

Test solution. Dilute a volume of ophthalmic suspension containing 10 mg of brinzolamide to 50.0 ml with the mobile phase.

Reference solution (a). A 0.02 per cent w/v solution of *brinzolamide IPRS* in the mobile phase.

Reference solution (b). A 0.006 per cent w/v solution of *brinzolamide impurity B IPRS* in reference solution (a).

Use chromatographic system as described under Related substances.

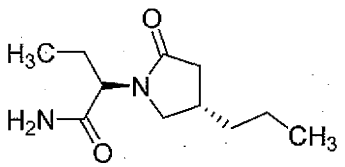
The relative retention time with reference to brinzolamide for brinzolamide impurity B is between 0.48 and 0.61.

Inject reference solution (a) and (b). The test is not valid unless the resolution between brinzolamide and brinzolamide impurity B is not less than 4.5, the column efficiency is not less than 2500 theoretical plates, the tailing factor is not more than 2.0 for principal peak obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 2.0 per cent for reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_{12}H_{21}N_3O_5S_3$ in the suspension.

Brivaracetam



$C_{11}H_{20}N_2O_2$ Mol. Wt. 212.3

Brivaracetam is (2S)-2-[(4R)-2-oxo-4-propylpyrrolidin-1-yl]butanamide.

Brivaracetam contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{11}H_{20}N_2O_2$, calculated on the dried basis.

Category. Anticonvulsant.

Description. A white to off white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *brivaracetam IPRS* or with the reference spectrum of brivaracetam.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). −65.0° to −55.0°, determined in 1.0 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 100 mg of the substance under examination in mobile phase A and dilute to 100.0 ml with mobile phase A.

Reference solution (a). A 0.0003 per cent w/v solution of *brivaracetam IPRS* in mobile phase A.

Reference solution (b). Dilute 3.0 ml of reference solution (a) to 10.0 ml with mobile phase A.

Reference solution (c). A solution containing 0.0003 per cent w/v of *(2R,4R)-diastereomer* (*RR*-isomer of brivaracetam) *IPRS* or *(2S,4S)-diastereomer* (*SS*-isomer of brivaracetam) *IPRS* in mobile phase A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane with extra selectivity of penta fluoro phenyl phase bonded to porous silica (5 µm) (Such as ACE C18-PFP),
- column temperature: 35°,
- sample temperature: 10°,
- mobile phase: A. a 0.1 per cent v/v solution of *ortho-phosphoric acid* in *water*,
  B. a mixture of 40 volumes mobile phase A, 30 volumes of *methanol* and 30 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 15 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
5	100	0
20	50	50
50	50	50
50.1	100	0
60	100	0

The relative retention time with reference to brivaracetam for *RR* isomer or *SS* isomer of brivaracetam is about 1.02.

Inject reference solution (a) and (b). The test is not valid unless the tailing factor is not more than 1.5, the relative standard deviation for replicate injections is not more than 10.0 per cent in the chromatogram obtained with reference solution (a). The signal-to-noise ratio is not less than 10 in the chromatogram obtained with reference solution (b).

Inject reference solution (c) to identify the peak due to RR isomer or SS isomer of brivaracetam.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent). Ignore any peak corresponding to *RR* isomer and *SS* isomer of brivaracetam.

The sum of all the impurities including RR isomer of brivaracetam and SS isomer of brivaracetam (determined under chiral purity test) is not more than 1.0 per cent.

Chiral purity. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 100 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). A 0.001 per cent w/v solution of *brivaracetam IPRS* in the mobile phase.

Reference solution (b). Dilute 2.0 ml of reference solution (a) to 20.0 ml with the mobile phase.

Reference solution (c). A solution containing 0.006 per cent w/v, each of, *enantiomer of brivaracetam IPRS* and *(2R,4R)-diastereomer* (*RR* isomer of brivaracetam) *IPRS* and *(2S,4S)-diastereomer* (*SS* isomer of brivaracetam) *IPRS* in the mobile phase.

Reference solution (d). Dissolve 20 mg of *brivaracetam IPRS* in the mobile phase, add 1.0 ml of reference solution (c) and dilute to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with amylose tris-(3,5-dimethylphenylcarbamate) coated with porous silica (5 µm) (Such as chiralpack AD-H),
- column temperature: 15 °,
- sample temperature: 10°,
- mobile phase: a mixture of 85 volumes of *n-hexane* and 15 volumes of *ethanol*.
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Name	Relative retention time
Enantiomer of brivaracetam[1]	0.39
RR-isomer of brivaracetam[2]	0.43
SS-isomer of brivaracetam[3]	0.65
Brivaracetam (Retention time is about 36 minutes)	1.0

[1](2*R*)-2-[(4*S*)-2-oxo-4-propylpyrrolidin-1-yl]butanamide,

[2](2*R*)-2-[(4*R*)-2-oxo-4-propylpyrrolidin-1-yl]butanamide,

[3](2*S*)-2-[(4*S*)-2-oxo-4-propylpyrrolidin-1-yl]butanamide.

Inject reference solution (a), (b) and (d). The test is not valid unless the resolution between the peaks due to enantiomer of brivaracetam and (2*R*,4*R*)-diastereomer is not less than 1.8 in the chromatogram obtained with reference solution (d), the

tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 10.0 per cent in the chromatogram obtained with reference solution (a). The signal-to-noise ratio of the principal peak is not less than 10 in the chromatogram obtained with reference solution (b).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to enantiomer, *RR*-isomer and *SS*-isomer of brivaracetam, each of, is not more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g in vacuum oven at 60° for 3 hours, at a pressure not exceeding 0.7 kPa.

Assay. Determine by liquid chromatography (2.4.14).

Solution A. A 0.1 per cent v/v solution of *orthophosphoric acid* in *water*.

Test solution. Dissolve 100 mg of the substance under examination in solution A and dilute to 100.0 ml with solution A. Dilute 2.0 ml of the solution to 10.0 ml with solution A.

Reference solution (a). A 0.02 per cent w/v solution of *brivaracetam IPRS* in solution A.

Reference solution (b). A solution containing 0.02 per cent w/v of *brivaracetam IPRS* and 0.00006 per cent w/v of *(2R,4R)-diastereomer* or *(2S ,4S)-diastereomer IPRS* in solution A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane with extra selectivity of a penta fluoro phenyl bonded to porous silica (5 µm) (Such as ACE-C18-PFP),
- mobile phase: a mixture of 64 volumes of solution A, 18 volumes of *acetronitrile* and 18 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 15 µl.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to brivaracetam and (2*R*,4*R*)-diastereomer or (2*S*,4*S*)- diastereomer is not less than 1.8 in the chromatogram obtained with reference solution (b), the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 1.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_{11}H_{20}N_2O_2$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Brivaracetam Tablets

Brivaracetam Tablets contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of brivaracetam, $C_{11}H_{20}N_2O_2$.

Usual strengths. 25 mg; 50 mg; 75 mg; 100 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* and 0.5 g of *sodium hydroxide* in 1000 ml of *water*, adjusted to pH 6.4 with *1 M sodium hydroxide*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and centrifuge at 4000 rpm for 10 minutes.

Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of 0.1 per cent v/v solution of *orthophosphoric acid* in *water*, 10 volumes of *methanol* and 10 volumes of *acetonitrile*.

Test solution. Use the clear supernatant liquid, dilute if necessary with the dissolution medium.

Reference solution. A 0.1 per cent w/v solution of *brivaracetam IPRS* in the solvent mixture. Diluted 3.0 ml of the solution to 100.0 ml with the dissolution medium.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as X Bridge C18),
- column temperature: 35°,
- mobile phase: a mixture of 80 volumes of 0.1 per cent v/v solution of *orthophosphoric acid* in *water* and 20 volumes of a mixture of 90 volumes of *acetonitrile* and 10 volumes of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{11}H_{20}N_2O_2$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{11}H_{20}N_2O_2$.

Related substances. Determine by liquid chromatography (2.4.14), as described under Dissolution with the following modifications.

Test solution. Disperse sufficient quantity of intact tablets containing 0.3 g of Brivaracetam in the solvent mixture, with the aid of ultrasound with intermediate shaking and dilute to 200.0 ml with the solvent mixture. Centrifuge at 4000 rpm for 15 minutes. Dilute 4.0 ml of supernatant liquid to 25.0 ml with the solvent mixture.

Reference solution. A 0.024 per cent w/v solution of *brivaracetam IPRS* in the solvent mixture.

Inject the reference solution .The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injection is not more than 2.0 per cent.

Inject the test solution. The area of any secondary peak is not more than 0.5 per cent and the sum of area of all the secondary peaks is not more than 2.0 per cent, calculated by area normalization.

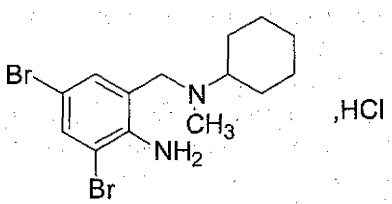
Assay. Determine by liquid chromatography (2.4.14), as described under Related substances.

Inject the reference solution and the test solution.

Calculate the content of $C_{11}H_{20}N_2O_2$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Bromhexine Hydrochloride



$C_{14}H_{20}Br_2N_2,HCl$ Mol. Wt. 412.6

Bromhexine Hydrochloride is 2,4-Dibromo-6-[[cyclohexyl (methyl)amino]methyl]aniline hydrochloride.

Bromhexine Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{14}H_{20}Br_2N_2,HCl$, calculated on the dried basis.

Category. Expectorant.

Description. A white or almost white, crystalline powder. It shows polymorphism (2.5.11).

Identification

Test A may be omitted if tests B and C are carried out. Test B may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *bromhexine hydrochloride IPRS* or with the reference spectrum of bromhexine hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with test solution (b) corresponds to the peak in the chromatogram obtained with reference solution (c).

C. Dissolve about 20 mg in 1 ml of *methanol* and add 1 ml of *water*. The solution gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 3.0 per cent w/v solution in *methanol* is clear (2.4.1) and not more intensely coloured than reference solution YS6 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14)

Solvent mixture. Equal volumes of *acetonitrile* and *water.*

Test solution (a). Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Test solution (b). Dilute 1.0 ml of test solution (a) to 50.0 ml with the solvent mixture.

Reference solution (a). Dissolve 10 mg of *bromhexine for system suitability IPRS* (containing impurities C and D) in the solvent mixture and dilute to 2.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of test solution (a) to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution (c). A 0.01 per cent w/v solution of *bromhexine hydrochloride IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 2.1 mm, packed with end-capped octadecylsilane bonded to porous silica (2.6 µm),
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolving 1.26 g of *ammonium formate* in 950 ml of *water,* adjusted to pH 4.4 with *anhydrous formic acid,* dilute to 1000 ml with *water* and 40 volumes of *acetonitrile,*
- flow rate: 0.2 ml per minute,
- spectrophotometer set 248 nm,
- injection volume: 3 µl.

Name	Relative retention time
Bromhexine impurity C[1]	0.2
Bromhexine impurity D[2]	0.3
Bromhexine (Retention time: about 10 minutes)	1.0

[1]2-[[cyclohexyl(methyl)amino]methyl]aniline,

[2]4-bromo-2-[[cyclohexyl(methyl)amino]methyl]aniline.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to bromhexine impurity C and bromhexine impurity D is not less than 2.0.

Inject reference solution (b) and test solution (a). Run the chromatogram twice the retention time of the principal peak, the area of any peak corresponding to impurity C, multiplied with correction factor of 1.6, is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent)

Sulphated ash (2.3.18).Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modifications.

Inject reference solution (c) and test solution (b).

Calculate the content of $C_{14}H_{20}Br_2N_2,HCl$.

Storage. Store protected from light.

Bromhexine Tablets

Bromhexine Hydrochloride Tablets

Bromhexine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of bromhexine hydrochloride, $C_{14}H_{20}Br_2N_2$, HCl.

Usual strengths. 4 mg; 8 mg.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with test solution (b) corresponds to the peak in the chromatogram obtained with reference solution (c).

B. Suspend a quantity of the powdered tablets containing 0.1 g of Bromhexine Hydrochloride in 5 ml of *dilute ammonia solution* and extract with two quantities, each of 20 ml, of *chloroform*. Wash the combined extracts with 5 ml of *water*, filter through anhydrous *sodium sulphate* and evaporate the filtrate to dryness using a rotary evaporator. If necessary, scratch the inside of the flask with a glass rod to induce crystallisation. Mix the residue with 1 g of *sodium carbonate*, heat at a dull red heat for 10 minutes, allow to cool, extract with water and filter. The filtrate, after acidification with *2 M nitric acid*, yields reaction A of bromides (2.3.1).

C. Disperse a quantity of the powdered tablets containing 20 mg of Bromhexine Hydrochloride with 10 ml *methanol* and filter. The filtrate gives reaction (A) of chlorides (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14)

Solvent mixture. Equal volumes of *acetonitrile* and *water*.

Test solution (a). Disperse a quantity of the powdered tablets containing 50 mg of Bromhexine Hydrochloride in 10 ml of solvent mixturewith the aid of ultrasound and filter.

Test solution (b). Dilute 1.0 ml of test solution (a) to 50.0 ml with the solvent mixture.

Reference solution (a). Dissolve 10 mg of *bromhexine for system suitability IPRS* (containing impurities C and D) in the solvent mixture and dilute to 2.0 ml with the solvent mixture.

Reference solution (b). A 0.0005 per cent w/v solution of *bromhexine hydrochloride IPRS* in the solvent mixture.

Reference solution (c). A 0.01 per cent w/v solution of *bromhexine hydrochloride IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 2.1 mm, packed with end-capped octadecylsilane bonded to porous silica (2.6 µm),
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolving 1.26 g of *ammonium formate in* 950 ml of *water*, adjusted to pH 4.4 with *anhydrous formic acid*, dilute to 1000 ml with *water* and 40 volumes of *acetonitrile*,
- flow rate: 0.2 ml per minute,
- spectrophotometer set 248 nm,
- injection volume: 3 µl.

Name	Relative retention time
Bromhexine impurity C[1]	0.2
Bromhexine impurity D[2]	0.3
Bromhexine (Retention time: about 10 minutes)	1.0

[1]2-[[cyclohexyl(methyl)amino]methyl]aniline,

[4-bromo-2-[[cyclohexyl(methyl)amino]methyl]aniline.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to bromhexine impurity C and D is not less than 2.0.

Inject reference solution (b) and test solution (a). Run the chromatogram twice the retention time of the principal peak, the area of any peak corresponding to impurity C, multiplied with correction factor of 1.6, is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent)

Other tests. Comply with the tests stated under Tablets.

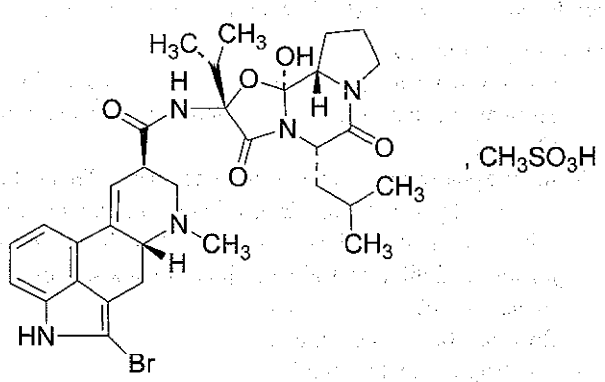
Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modifications.

Inject reference solution (c) and test solution (b).

Calculate the content of $C_{14}H_{20}Br_2N_2,HCl$ in the tablets.

Storage. Store protected from light.

Bromocriptine Mesylate



$C_{32}H_{40}BrN_5O_5,CH_4O_3S$ Mol. Wt. 750.7

Bromocriptine Mesylate is (5'*S*)-2-bromo-12'-hydroxy-2'-(1-methylethyl)-5'-(2-methylpropyl)ergotaman-3',6',18-trione methanesulphonate

Bromocriptine Mesylate contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{32}H_{40}BrN_5O_5,CH_4O_3S$, calculated on the dried basis.

Category. Antiparkinson.

Description. A white or slightly coloured, fine crystalline powder; very sensitive to light.

NOTE — Carry out the tests as rapidly as possible without exposure to daylight and with minimum exposure to artificial light.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry in a mineral oil dispersion (2.4.6). Compare the spectrum with that obtained with *bromocriptine mesylate IPRS* or with the reference spectrum of bromocriptine mesylate.

B. Dissolve 5 mg in 5 ml of *methanol* and dilute to 100 ml with *0.01 M hydrochloric acid*. The resulting solution, when examined in the range 230 nm to 360 nm (2.4.7) shows an absorption maximum at about 305 nm and a minimum at about 270 nm; absorbance at about 305 nm, 0.60 to 0.68.

C. To about 0.1 g add 5 ml of *2 M hydrochloric acid*, shake for 5 minutes, filter and add 1 ml of a 6 per cent w/v solution of *barium chloride* to the filtrate; it remains clear. Mix another 0.1 g with 0.5 g of *anhydrous sodium carbonate* and ignite until a white residue is obtained. After cooling, dissolve the residue in 5 ml of *water* (solution A); solution A gives the reactions of sulphates (2.3.1).

D. Solution A gives reaction (A) of bromides (2.3.1).

Tests

Appearance of solution. A 1.0 per cent w/v solution in *methanol* is clear (2.4.1), and not more intensely coloured than reference solution BS5, YS5 or BYS5 (2.4.1).

pH (2.4.24). 3.1 to 3.8, determined in a 1.0 per cent w/v solution in a mixture of 2 volumes of *methanol* and 8 volumes of *water*.

Specific optical rotation (2.4.22). +95° to +105°, determined in a 1.0 per cent w/v solution in a mixture of equal volumes of *methanol* and *dichloromethane*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of 50 volumes of *chloride buffer pH 2.0* and 50 volumes of *methanol*.

Test solution. Dissolve 0.5 g of the substance under examination in 5.0 ml of *methanol* and dilute to 10.0 ml with *chloride buffer pH 2.0*.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the reference solution (a) to 10.0 ml with the solvent mixture.

Reference solution (c). Dissolve the contents of a vial of *bromocriptine mesylate for system suitability IPRS* (containing bromocriptine impurities A and B) in 1.0 ml of the solvent mixture.

Chromatographic system

- a stainless steel column 12 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5µm),
- mobile phase: A. a 0.079 per cent w/v solution of *ammonium carbonate,*
  B. *acetonitrile,*
- a gradient programme using the conditions given below,
- flow rate: 2 ml per minute,
- spectrophotometer set at 300 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
30	40	60
45	40	60
47	90	10

Use the chromatogram supplied with bromocriptine mesylate for system suitability RS and the chromatogram obtained with reference solution (c) to identify the peaks due to bromocriptine impurities A and B. The relative retention time with reference to bromocriptine for bromocriptine impurity C is about 1.2.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to 2-bromodehydro-α-ergocriptine (bromocriptine impurity A) and α-ergocriptine (bromocriptine impurity B) is not less than 1.1.

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak corresponding to bromocriptine impurity A is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.02 per cent), the area of secondary peak corresponding to bromocriptine impurity C is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent), the area of any other secondary peak is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent). The sum of areas of all the secondary peaks is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent) (except the peak due to bromocriptine impurity A).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 3.0 per cent, determined on 0.5 g by drying in an oven over *phosphorus pentoxide* at 80° at a pressure of 1.5 to 2.5 kPa for 5 hours.

Assay. Weigh 0.5 g, dissolve in 80 ml of a mixture of 10 volumes of *anhydrous glacial acetic acid* and 70 volumes of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25) Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.07507 g of $C_{32}H_{40}BrN_5O_5,CH_4O_3S$.

Storage. Store protected from light in a deep freezer (temperature not exceeding –15°).

Bromocriptine Capsules

Bromocriptine Mesylate Capsules

Bromocriptine Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of bromocriptine, $C_{32}H_{40}BrN_5O_5$.

Usual strengths. 5 mg; 10 mg.

NOTE — Carry out the tests as rapidly as possible without exposure to daylight and with minimum exposure to artificial light.

Identification

A. Disperse a quantity of the contents of the capsules containing 10 mg of bromocriptine with 50 ml of *methanol* for 30 minutes, centrifuge and dilute 5 ml of the supernatant liquid to 20 ml with *methanol*. When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows an absorption maximum at about 305 nm and a minimum at about 270 nm.

B. In the test for Related substances, the principal band in the chromatogram obtained with test solution corresponds to that in the chromatogram obtained with reference solution (e).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium.500 ml of *0.1 M hydrochloric acid,*
Speed and time. 50 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a suitable quantity of *bromocriptine mesylate IPRS* in minimum amount of *methanol* and dilute with the dissolution medium to obtain a solution having the same concentration as that of the test solution.

Chromatographic system
- a stainless steel column 30 cm × 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of *acetonitrile* and 35 volumes of *0.01M ammonium carbonate*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 300 nm,
- injection volume: 100 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{32}H_{40}BrN_5O_5$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{32}H_{40}BrN_5O_5$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G.*

NOTE — Carry out the tests as rapidly as possible without exposure to daylight and with minimum exposure to artificial light.

Mobile phase. A mixture of 0.1 volume of *13.5M ammonia*, 1.5 volumes of *water*, 3 volumes of *propan-2-ol*, 88 volumes of *dichloromethane* and 100 volumes of *ether.*

Test solution. Disperse a quantity of the contents of the capsules containing about 20 mg of bromocriptine with 10 ml of *methanol* for 20 minutes and centrifuge.

Reference solution (a). Dilute 1 ml of the test solution to 10 ml with *methanol.*

Reference solution (b). Dilute 3 ml of the test solution to 100 ml with *methanol.*

Reference solution (c). Dilute 1 ml of the test solution to 100 ml with *methanol*

Reference solution (d). Dilute 1 ml of the test solution to 200 ml with *methanol.*

Reference solution (e). A 0.23 per cent w/v solution of *bromocriptine mesilate IPRS* in *methanol.*

Apply to the plate 50 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in a current of cold air, spray with *ammonium molybdate solution* and heat at 100° until bands appear (about 10 minutes). Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b) (3.0 per cent), not more than one such secondary spot is more intense than the chromatogram obtained with reference solution (c) (1.0 per cent) and not more than two such secondary spots are more intense than the chromatogram obtained with reference solution (d) (0.5 per cent). Ignore the spot within 20 mm of the line of application.

Uniformity of content. Complies with the test stated under Capsules.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Disperse the content of one capsule in the solvent mixture and dilute with the solvent mixture to obtain a solution containing 0.011 per cent w/v of Bromocriptine.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{32}H_{40}BrN_5O_5$ in the capsule.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *methanol* and *water.*

NOTE — Prepare the solutions under subdued light.

Test solution. Weigh a quantity of the mixed content of 20 capsules containing 10 mg of bromocriptine, disperse in 70 ml of the solvent mixture, with the aid of ultrasound for 5 minutes and dilute to 100.0 ml with the solvent mixture and filter.

Reference solution (a). A 0.011 per cent w/v solution of *bromocriptine mesylate IPRS* in the solvent mixture.

Reference solution (b). A 0.011 per cent w/v solution of *bromocriptine mesylate IPRS* in a mixture of 1 volume of *1M acetic acid* and 9 volumes of *methanol*, heat at 60° for 90 minutes and cool to room temperature.

Chromatographic system
- a stainless steel column 10 cm x 4 mm, packed with octadecylsilane bonded to silica (5µm) (Such as Spherisorb ODS 1),
- mobile phase: a mixture of 45 volumes of a 0.08 per cent w/v solution of *ammonium carbonate* and 55 volumes of *acetonitrile,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 300 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the two peaks is not less than 3.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{32}H_{40}BrN_5O_5$ in the capsules.

1 mg of bromocriptine mesylate, $C_{32}H_{40}BrH_5O_5,CH_4SO_3$ is equivalent to 0.87 mg of bromocriptine, $C_{32}H_{40}BrH_5O_5$

Storage. Store protected from light.

Labelling. The label states the strength in terms of the equivalent amount of bromocriptine.

Bromocriptine Tablets

Bromocriptine Mesylate Tablets

Bromocriptine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of bromocriptine, $C_{32}H_{40}BrN_5O_5$.

Usual strengths. 1 mg; 2.5 mg.

NOTE — Carry out the tests as rapidly as possible without exposure to daylight and with minimum exposure to artificial light.

Identification

A. Disperse a quantity of powdered tablets containing about 20 mg of bromocriptine with 20 ml of *methanol*, filter, evaporate the filtrate to dryness on a water-bath and dry at 105° for 1 hour.The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *bromocriptine mesylate IPRS* or with the reference spectrum of bromocriptine mesylate.

B. Disperse a quantity of the powdered tablets containing about 10 mg of bromocriptine with 50 ml of *methanol* for 30 minutes, centrifuge and dilute 5 ml of the supernatant liquid to 20 ml with *methanol*. When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows an absorption maximum at about 305 nm and a minimum at about 270 nm.

C. In the test for Related substances, the principal band in the chromatogram obtained with test solution corresponds to that in the chromatogram obtained with reference solution (e).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 500 ml of *0.1 M hydrochloric acid,*
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a suitable quantity of *bromocriptine mesylate IPRS* in minimum amount of *methanol* and dilute with the dissolution medium to obtain a solution having the same concentration as that of the test solution.

Chromatographic system
- a stainless steel column 30 cm × 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of *acetonitrile* and 35 volumes of *0.01M ammonium carbonate*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 300 nm,
- injection volume: 100 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{32}H_{40}BrN_5O_5$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{32}H_{40}BrN_5O_5$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G.*

Solvent mixture. Equal volumes of *chloroform* and *methanol.*

Mobile phase. A mixture of 0.1 volume of *13.5M ammonia*, 1.5 volumes of *water*, 3 volumes of *propan-2-ol*, 88 volumes of *dichloromethane* and 100 volumes of *ether.*

Test solution. Disperse a quantity of the powdered tablets containing about 10 mg of bromocriptine with 25 ml of the solvent mixture for 30 minutes, filter and wash the residue with two 5 ml quantities of the solvent mixture. Evaporate the filtrate and washings to dryness at 25° at a pressure of 2 kPa, dissolve the residue in 2 ml of the solvent mixture and centrifuge.

Reference solution (a). Dilute 1 ml of the test solution to 10 ml with the solvent mixture.

Reference solution (b). Dilute 3 ml of reference solution (a) to 10 ml with the solvent mixture

Reference solution (c). Dilute 1 ml of reference solution (a) to 10 ml with the solvent mixture.

Reference solution (d). Dilute 1 ml of reference solution (a) to 20 ml with the solvent mixture.

Reference solution (e). A 0.55 per cent w/v solution of *bromocriptine mesilate IPRS* in the solvent mixture.

Apply to the plate 20 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air, spray with *ammonium molybdate solution* and heat at 100° until spots appear (about 10 minutes). Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b) (3.0 per cent), not more than one such secondary spot is more intense than the spot in the chromatogram obtained with reference solution (c) (1.0 per cent) and not more than two secondary

spots are more intense than the spot in the chromatogram obtained with reference solution (d) (0.5 per cent). Ignore the spot within 20 mm of the line of application.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Disperse one tablet in the solvent mixture and dilute with the solvent mixture to obtain a solution containing 0.011 per cent w/v of Bromocriptine.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{32}H_{40}BrN_5O_5$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *methanol* and *water*.

NOTE — Preparethe solutions under subdued light.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 10 mg of bromocriptine, disperse in 70 ml of the solvent mixture, with the aid of ultrasound for 5 minutes and dilute to 100.0 ml with the solvent mixture and filter.

Reference solution (a). A 0.011 per cent w/v solution of *bromocriptine mesylate IPRS* in the solvent mixture.

Reference solution (b). A 0.011 per cent w/v solution of *bromocriptine mesylate IPRS* in a mixture of 1 volume of *1M acetic acid* and 9 volumes of *methanol*, heat at 60° for 90 minutes and cool to room temperature.

Chromatographic system

- a stainless steel column 10 cm x 4 mm, packed with octadecylsilane bonded to silica (5µm) (Such as Spherisorb ODS 1),
- mobile phase: a mixture of 45 volumes of a 0.08 per cent w/v solution of *ammonium carbonate* and 55 volumes of *acetonitrile,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 300 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the two peaks is not less than 3.0.

Inject reference solution (a) and the test solution.

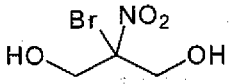
Calculate the content of $C_{32}H_{40}BrN_5O_5$ in the tablets.

1 mg of bromocriptine mesylate, $C_{32}H_{40}BrH_5O_5,CH_4SO_3$ is equivalent to 0.87 mg of bromocriptine, $C_{32}H_{40}BrH_5O_5$

Storage. Store protected from light.

Labelling. The label states the strength in terms of the equivalent amount of bromocriptine.

Bronopol



$C_3H_6BrNO_4$ Mol. Wt. 200.0

Bronopol is 2-bromo-2-nitropropane-1,3-diol.

Bronopol contains not less than 99.0 per cent and not more than 101.0 per cent of $C_3H_6BrNO_4$, calculated on the anhydrous basis.

Category. Antiseptic; local anaesthetic.

Description. White or almost white crystals or crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *bronopol IPRS* or with the reference spectrum of bronopol.

B. Dissolve 0.1 g in 10 ml of *water*, add 10 ml of *7.5 M sodium hydroxide* and carefully with constant stirring and cooling, 0.5 g of *nickel-aluminium alloy*. Allow the reaction to subside, filter and carefully neutralise with *nitric acid*. The resulting solution gives reaction (A) of bromides (2.3.1).

Tests

pH (2.4.24). 5.0 to 7.0, determined on 1.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.2 g of the substance under examination in 100 ml of mobile phase.

Reference solution (a). Dilute 5 ml of the test solution to 50 ml with the mobile phase. Further, dilute 1 ml of the solution to 100 ml with the mobile phase.

Reference solution (b). A solution containing 0.001 per cent w/v each of *2-methyl-2-nitropropan-1,3-diol* and *tris (hydroxymethyl)nitromethane* in the mobile phase.

Reference solution (c). A solution containing 0.0002 per cent w/v each of *2-methyl-2-nitropropane-1,3-diol, 2-nitroethanol, sodium bromide* and *tris(hydroxymethyl)-nitromethan* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: a mixture of 189 volumes of *water*, 10 volumes of *acetonitrile* and 1 volume of a 10 per cent v/v solution of *orthophosphoric acid*, adjusted to pH 3.0 using *2 M sodium hydroxide*,
- flow rate: 1 ml per minute,

- spectrophotometer set at 214 nm,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless the resolution between the peaks corresponding to sodium bromide and tris (hydroxymethyl) nitromethane is at least 1.0 and the resolution between the peaks corresponding to tris(hydroxymethyl)nitromethane and 2-nitroethanol is at least 1.5.

Inject reference solution (a), (b) the test solution. Continue the chromatography for 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any peaks corresponding to 2-methyl-2-nitropropane-1,3-diol and tris (hydroxymethyl) nitromethane are not more than the area of the corresponding peaks in the chromatogram obtained with reference solution (b) (0.5 per cent each) and the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 2.0 g.

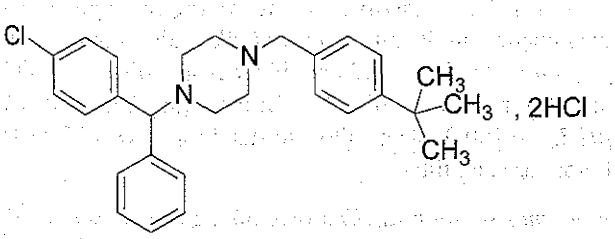
Assay. In a flask fitted with a reflux condenser dissolve 0.4 g in 15 ml of *water* and add 15 ml of *7.5 M sodium hydroxide*. Slowly, with caution, add 2 g of *nickel-aluminium alloy* through the reflux condenser, agitating the flask whilst cooling under running *water*. Allow the mixture to stand for 10 minutes and boil for 1 hour. Cool and filter under reduced pressure, washing the condenser, flask and residue with 150 ml of *water*. Combine the filtrate and washings, add 25 ml of *nitric acid* and 40 ml of *0.1 M silver nitrate*, shake vigorously and titrate with *0.1 M ammonium thiocyanate* using *ammonium iron(III) sulphate solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.020 g of $C_3H_6BrNO_4$.

Storage. Store protected from light.

Buclizine Hydrochloride

Buclizine Dihydrochloride



$C_{28}H_{33}ClN_2,2HCl$ Mol. Wt. 506.0

Buclizine Hydrochloride is (*RS*)-1-(4-*tert*-butylbenzyl)-4-(4-chlorobenzhydryl)piperazine dihydrochloride

Buclizine Hydrochloride contains not less than 99.0 per cent and not more than 100.5 per cent of $C_{28}H_{33}ClN_2,2HCl$, calculated on the dried basis.

Category. Antihistaminic; antiemetic.

Description. A white or slightly yellowish, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *buclizine dihydrochloride IPRS* or with the reference spectrum of buclizine dihydrochloride.

B. A 0.25 per cent w/v solution in *ethanol (50 per cent)* gives reaction (A) of chlorides (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution (a). Dissolve 0.5 g of the substance under examination in 100 ml of the initial mobile phase.

Test solution (b). Dissolve 10 mg of the substance under examination in 100 ml of the initial mobile phase and mix. Dilute 10 ml of the solution to 100 ml with the same mobile phase.

Reference solution (a). A 0.1 per cent w/v solution of *buclizine dihydrochloride IPRS* in the initial mobile phase.

Reference solution (b). A 0.001 per cent w/v solution of *buclizine impurity A IPRS* (*1,4-bis(4-chlorobenzylhydryl) piperazine IPRS*) in the initial mobile phase.

Chromatographic system

- a stainless steel column 20 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (10 µm) (Such as Nucleosil C 18),
- mobile phase, initial: *0.01 M sodium heptanesulphonate* in a mixture of 55 volumes of *water* and 45 volumes of *acetonitrile*, adjusted to pH 4.0 with *1 M orthophosphoric acid*, final: *0.01 M sodium heptanesulphonate* in a mixture of 20 volumes of *water* and 80 volumes of *acetonitrile*, adjusted to pH 4.0 with *1 M ortho-phosphoric acid*, a linear gradient elution programme for 30 minutes with the initial mobile phase and 10 minutes with the final mobile phase,
- flow rate: 2 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the relative standard deviation is not more than 2.0 per cent.

Inject reference solution (b), test solution (a) and (b). In the chromatogram obtained with test solution(a), the area of any peak corresponding to impurity A is not more than the area of

the peak obtained in the chromatogram obtained with reference solution (b) and the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with test solution (b).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

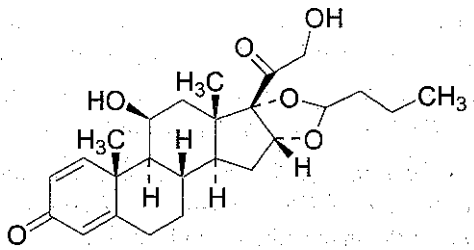
Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.4 g in 50 ml of *anhydrous acetic acid*, add 10 ml of mercuric acetate solution. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.0253 g of $C_{28}H_{33}ClN_2,2HCl$.

Storage. Store protected from light and moisture.

Budesonide



$C_{25}H_{34}O_6$ Mol. Wt. 430.5

Budesonide is a mixture of the C-22*S* (epimer A) and the C-22*R* (epimer B) epimers of 16α,17-[(1*RS*)-butylidenebis(oxy)]-11β,21-dihydroxypregna-1,4-diene-3,20-dione.

Budesonide contains not less than 98.0 per cent and not more than 102.0 per cent of a mixture of epimers A and B, $C_{25}H_{34}O_6$, calculated on the dried basis.

Category. Glucocorticoid.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *budesonide IPRS* or with the reference spectrum of budesonide.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. Add a mixture of 1.2 volumes of *water* and 8 volumes of *methanol* to a mixture of 15 volumes of *ether* and 77 volumes of *dichloromethane*.

Solvent mixture. 1 volume of *methanol* and 9 volumes of *methylene chloride*.

Test solution. Dissolve 25 mg of the substance under examination in 10 ml of the solvent mixture.

Reference solution (a). A 0.25 per cent w/v solution of *budesonide IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.25 per cent w/v of *triamcinolone acetonide IPRS* and 0.25 per cent w/v of *budesonide IPRS* in the solvent mixture.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

C. Dissolve about 2 mg in 2 ml of *sulphuric acid*. A yellow colour appears in 5 minutes and the colour changes to brown or reddish-brown in 30 minutes. Add cautiously the solution to 10 ml of *water* and mix. The colour fades and a clear solution remains.

D. Dissolve about 1 mg in 2 ml of a solution containing 2 g of *phosphomolybdic acid* in a mixture of 10 ml of *dilute sodium hydroxide solution*, 15 ml of *water* and 25 ml of *glacial acetic acid*. Heat for 5 minutes on a water-bath. Cool in iced water for 10 minutes and add 3 ml of *dilute sodium hydroxide solution*. The solution turns blue.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 30 ml of *acetonitrile*. Add about 60 ml of *phosphate buffer pH 3.2* and, if necessary, disperse with the aid of ultrasound to dissolve. Dilute with *phosphate buffer pH 3.2* to 100.0 ml and allow to stand for at least 15 minutes before use and filter.

Reference solution (a). Dissolve 50 mg of *budesonide IPRS* in 30 ml of *acetonitrile*. Add about 60 ml of *phosphate buffer pH 3.2* and disperse, if necessary, with the aid of ultrasound to dissolve. Dilute to 100.0 ml *with phosphate buffer pH 3.2* and allow to stand for at least 15 minutes before use and filter.

Reference solution (b). Dilute reference solution (a) with the mobile phase to get a 0.00025 per cent w/v solution of budesonide.

Use the chromatographic system described under Assay.

Inject reference solution (a). The test is not valid unless the resolution between epimer B peak and epimer A peak is not less than 1.5, the tailing factor for epimer B peak is not more than 1.5 and the relative standard deviation of sum of epimer A and epimer B peaks for replicate injections is not more than 2.0 per cent.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution: the area of any peak, other than the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of the areas of all the peaks, other than the principal peak, is not greater than thrice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent).

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 30 ml of *acetonitrile* and dilute to 100.0 ml with *phosphate buffer solution pH 3.2* and filter.

Reference solution. Dissolve 50 mg of *budesonide IPRS* in 30 ml of *acetonitrile* and dilute to 100.0 ml with *phosphate buffer solution pH 3.2*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 34 volumes of *acetonitrile* and 66 volumes of a buffer solution prepared by adding 100 ml of 0.25 per cent w/v solution of *orthophosphoric acid* to 900 ml of 0.4 per cent w/v solution of *sodium dihydrogen phosphate* and adjusted to pH 3.2,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between epimer B peak and epimer A peak is not less than 1.5, the tailing factor for epimer B peak is not more than 1.5, the column efficiency determined for epimer B peak is not less than 4000 theoretical plates and the relative standard deviation for the sum of epimer A and B peaks for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{25}H_{34}O_6$.

Storage. Store protected from light.

Budesonide Inhalation

Budesonide Inhalation is a suspension of Budesonide in a suitable liquid, filled in a suitable pressurized container.

Budesonide Inhalation delivers not less than 80.0 per cent and not more than 120.0 per cent of the stated amount of budesonide, $C_{25}H_{34}O_6$ per inhalation by actuation of the valve.

Usual strengths. 100 µg; 200 µg.

Identification

A. Dilute a quantity of the inhalation with *water* to produce a solution containing 0.002 per cent w/v of Budesonide and filter. When examined in the range 200 nm to 350 nm (2.4.7), the solution exhibits a maximum only at about 247 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light.

Solvent mixture. 34 volumes of *acetonitrile* and 66 volumes of *phosphate buffer pH 3.2*.

Test solution. Discharge the container into a small, dry flask a sufficient number of times to obtain 1 mg of Budesonide and dissolve the residue in 3.4 ml of *acetonitrile*. Mix with the aid of ultrasound and add sufficient *phosphate buffer solution pH 3.2* to produce 10 ml and filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (3 µm) (Such as Spherisorb ODS-2),
- column temperature: 50°,
- mobile phase: A. a mixture of 2 volumes of *ethanol*, 34 volumes of *acetonitrile* and 66 volumes of *phosphate buffer pH 3.2*,
  B. a mixture of equal volumes of *acetonitrile* and *phosphate buffer pH 3.2*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 100 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
38	100	0
50	0	100
60	0	100
61	100	0
70	100	0

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to budesonide epimer B and epimer A is not less than 1.5 in the chromatogram obtained with reference solution (a) and the signal to noise ratio of the peaks due to budesonide epimer A and epimer B is not less than 10.0 in the chromatogram obtained with reference solution (b).

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the sum of areas of epimer peaks in the chromatogram obtained with reference solution (a) (0.5 per cent). The sum of the areas of all the secondary peaks is not more than 3 times the sum of areas of epimer peaks in the chromatogram obtained with reference solution (a) (1.5 per cent). Ignore any peak with an area less than the sum of the areas of epimer peaks in the chromatogram obtained with reference solution (b) (0.05 per cent).

Epimer A. The content of epimer A (second peak) is 40.0 per cent to 51.0 per cent of the sum of areas of two epimer peaks of budesonide.

Determine by liquid chromatography (2.4.14), as described under Assay using the test solution.

Other tests. Comply with the tests stated under Inhalation Preparations (Pressurised Metered-dose Preparations).

Assay. Carry out the test for Content of active ingredient delivered per actuation stated under Inhalation Preparations (Pressurised Metered-dose Preparations).

Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light.

Solvent mixture. 34 volumes of *acetonitrile* and 66 volumes of *phosphate buffer pH 3.2.*

Test solution. Determine the content of active ingredient by first 10 successive combined actuations of the valve after priming. Carry out the test for Content of active ingredient delivered by actuation of valve stated under Inhalation Preparations (Pressurised Metered-dose Preparations), beginning at the words 'Remove the pressurised container from the actuator ...' and ending at the words '... to the volume specified in the monograph', using 32 ml of *acetonitrile* in the vessel. Transfer the combined solution and washings obtained from the set of 10 combined actuations to a flask to obtain a solution containing 0.002 per cent w/v of Budesonide in the solvent mixture.

Reference solution. A 0.002 per cent w/v solution of *budesonide IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (3 µm) (Such as Spherisorb ODS-2),
- column temperature: 50°,
- mobile phase: a mixture of 2 volumes of *ethanol*, 34 volumes of *acetonitrile* and 66 volumes of *phosphate buffer pH 3.2*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to budesonide epimer B and epimer A is not less than 1.5.

Inject the reference solution and the test solution.

Calculate the content of $C_{25}H_{34}O_6$ in the inhalation from the sum of the areas of two budesonide epimer peaks. Determine the content of active ingredient a second and third time by repeating the procedure on the middle 10 and on the last 10 successive combined actuations of the valve, as estimated from the number of deliveries available from the container as stated on the label. For each of the three determinations the average content of $C_{25}H_{34}O_6$ delivered by a single actuation of the valve is within the limits stated under Content of budesonide.

Budesonide Powder for Inhalation

Budesonide Powder for Inhalation consists of Budesonide in microfine powder either alone or admixed with Lactose in a pre-metered unit for use in a suitable powder inhaler.

Budesonide Powder for Inhalation contains not less than 80.0 per cent and not more than 120.0 per cent of the stated amount of budesonide, $C_{25}H_{34}O_6$ per unit dose.

Usual strengths. 100 µg; 200 µg.

Identification

A. Dilute a quantity of the powder for inhalation with sufficient *water* to produce a solution containing 0.002 per cent w/v of Budesonide and filter. When examined in the range 200 nm to 350 nm (2.4.7), the solution exhibits a maximum only at 247 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

C. *For products containing lactose*- disperse 0.25 g of the powder for inhalation in 5 ml of *water*. Add 5 ml of *6 M ammonia* and heat in a water-bath at 80° for 10 minutes; an orange-red colour is produced.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light.

Solvent mixture. 34 volumes of *acetonitrile* and 66 volumes of *phosphate buffer pH 3.2.*

Test solution. Dissolve a quantity of the powder for inhalation containing 1 mg of Budesonide in 3.4 ml of *acetonitrile* with the aid of ultrasound and dilute to 10.0 ml with *phosphate buffer pH 3.2,* filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (3 µm) (Such as Spherisorb ODS-2),
- column temperature: 50°,
- mobile phase: A. a mixture of 2 volumes of *ethanol*, 34 volumes of *acetonitrile* and 66 volumes of *phosphate buffer pH 3.2*,
  B. a mixture of equal volumes of *acetonitrile* and *phosphate buffer pH 3.2*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 100 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
38	100	0
50	0	100
60	0	100
61	100	0
70	100	0

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to budesonide epimer B and epimer A is not less than 1.5 in the chromatogram obtained with reference solution (a) and in the chromatogram obtained with reference solution (b), the signal to noise ratio of the peaks due to budesonide epimer A and epimer B is not less than 10.0.

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the sum of areas of epimer peaks in the chromatogram obtained with reference solution (a) (0.5 per cent). The sum of the areas of all the secondary peaks is not more than 3 times the sum of areas of epimer peaks in the chromatogram obtained with reference solution (a) (1.5 per cent). Ignore any peak with an area less than the sum of the areas of the epimer peaks in the chromatogram obtained with reference solution (b) (0.05 per cent).

Epimer A. The content of epimer A (second peak) is 40.0 per cent to 51.0 per cent of the sum of areas of two epimer peaks of budesonide.

Determine by liquid chromatography (2.4.14), as described under Assay using reference solution (b).

Uniformity of delivered dose. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light.

Solvent mixture. 34 volumes of *acetonitrile* and 66 volumes of *phosphate buffer pH 3.2.*

Test solution. Collect single doses of the powder for inhalation using the procedure described in Inhalation Preparations under (Powders for Inhalation) – Uniformity of delivered dose and dissolve the collected dose in sufficient of the solvent mixture to produce a solution containing 0.0004 per cent w/v of Budesonide.

Reference solution. A 0.001 per cent w/v solution of *budesonide IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (3 µm) (Such as Spherisorb ODS-2),
- column temperature: 50°,
- mobile phase: a mixture of 2 volumes of *ethanol*, 34 volumes of *acetonitrile* and 66 volumes of *phosphate buffer pH 3.2*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 100 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to budesonide epimer B and epimer A is not less than 1.5.

Inject the reference solution and the test solution.

Calculate the content of budesonide, $C_{25}H_{34}O_6$ per delivered dose.

Other tests. Comply with the tests stated under Inhalation Preparations (Powders for Inhalation).

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light.

Solvent mixture. 34 volumes of *acetonitrile* and 66 volumes of *phosphate buffer pH 3.2.*

Test solution. Dissolve a quantity of the mixed contents of capsules in sufficient of the solvent mixture to get a solution containing 0.01 per cent w/v of budesonide.

Reference solution (a). A 0.01 per cent w/v solution of *budesonide IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the test solution to 200.0 ml with the solvent mixture.

Use chromatographic system as described in Uniformity of delivered dose.

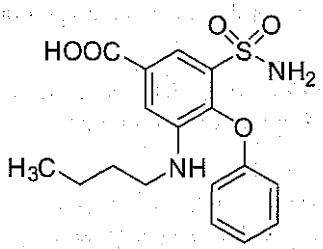
Inject reference solution (b). The test is not valid unless the resolution between the peaks due to budesonide epimer B and epimer A is not less than 1.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{25}H_{34}O_6$ per unit dose.

Calculate the content of $C_{25}H_{34}O_6$ in the inhalation from the sum of the areas of two budesonide epimer peaks.

Bumetanide



$C_{17}H_{20}N_2O_5S$ Mol. Wt. 364.4

Bumetanide is 3-(aminosulphonyl)-5-(butylamino)-4-phenoxybenzoic acid

Bumetanide contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{17}H_{20}N_2O_5S$, calculated on the dried basis.

Category. Diuretic.

Description. A white crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *bumetanide IPRS* or with the reference spectrum of bumetanide.

Tests

Appearance of solution. A 0.5 per cent w/v solution in 0.6 per cent w/v solution of *potassium hydroxide* is clear (2.4.1) and colourless (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 25.0 ml of the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Further dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 2 mg each of *3-nitro-4-phenoxy-5-sulphamoylbenzoic acid (bumetanide impurity A IPRS)* and *3-amino-4-phenoxy-5-sulphamoylbenzoic acid (bumetanide impurity B IPRS)* in 10.0 ml of the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with encapped octylsilane bonded to porous silica (3.5 µm),
- mobile phase: a mixture of 70 volumes of *methanol,* 25 volumes of *water* and 5 volumes of a 2.72 per cent w/v solution of *potassium dihydrogen phosphate,* previously adjusted to pH 7.0 with 28 per cent w/v solution of *potassium hydroxide.* Add *tetrahexylammonium bromide* to this mixture to obtain a 0.22 per cent w/v solution,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to bumetanide impurity A and bumetanide impurity B is not less than 2.0. The relative retention time with reference to bumetanide for bumetanide impurity B is about 0.4, for bumetanide impurity A is about 0.6, for 3-[[(2*RS*)-2-ethylhexyl]amino]-4-phenoxy-5-sulphamoyl benzoic acid (bumetanide impurity D) is about 2.5 and for butyl 3-(butylamino)-4-phenoxy-5-sulphamoylbenzoate (bumetanide impurity C) is about 4.4.

Inject reference solution (a) and the test solution. Run the chromatogram 5 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of secondary peak corresponding to bumetanide impurities A, B, C and D is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with

reference solution (a) (0.2 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

Assay. Weigh 0.3 g and dissolve in 50 ml of *ethanol (95 per cent)*. Add 0.1 ml of *phenol red solution* and titrate with *0.1 M sodium hydroxide* until a violet-red colour is obtained. Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.03644 g of $C_{17}H_{20}N_2O_5S$.

Storage. Store protected from light.

Bumetanide Injection

Bumetanide Injection is a sterile solution of Bumetanide in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Bumetanide Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of bumetanide, $C_{17}H_{20}N_2O_5S$.

Usual strength. 0.25 mg per ml.

Identification

A. Disperse a quantity of the injection containing 10 mg of Bumetanide with 20 ml of *ether*, filter the ether layer through *anhydrous sodium sulphate* and evaporate. The residue complies with the following tests. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *bumetanide IPRS* or with the reference spectrum of bumetanide.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.24). 6.0 to 7.8.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 2.5 volumes of *methanol*, 10 volumes of *glacial acetic acid*, 10 volumes of *cyclohexane* and 80 volumes of *chloroform*.

Test solution (a). To a quantity of the injection containing 5.0 mg of Bumetanide, adjusted to pH 12 with *0.1 M sodium hydroxide* and extract with two 20 ml quantities of *ether*. Discard the ether, adjusted to pH 4 using *1 M acetic acid*, extract with two further 20 ml quantities of *ether*, dry the ether by filtering through *anhydrous sodium sulphate*, wash the filter with 5 ml of *ether* and evaporate the combined filtrate and washings to dryness. Dissolve the residue in 5 ml of *methanol* and centrifuge. Evaporate the supernatant liquid to dryness using a rotary evaporator and dissolve the residue in 0.5 ml of *methanol*.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol*. Dilute 1 ml of the solution to 30 ml with *methanol*.

Test solution (c). Dilute 1 ml of test solution (b) to 3 ml with *methanol*.

Reference solution. A 0.005 per cent w/v solution of *3-amino-4-phenoxy-5-sulphamoylbenzoic acid IPRS (bumetanide impurity A IPRS)* in *methanol*.

Apply to the plate 25 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in a current of warm air and examine in ultraviolet light at 365 nm. Any secondary spot in the chromatogram obtained with test solution (a) corresponding to 3-amino-4-phenoxy-5-sulphamoylbenzoic acid is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent), any other secondary spot is not more intense than the spot in the chromatogram obtained with test solution (b) (0.3 per cent) and not more than two other such spots are more intense than the spot in the chromatogram obtained with test solution (c) (0.1 per cent).

Bacterial endotoxins (2.2.3). Not more than 350.0 Endotoxin Units per mg of bumetanide.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 2 volumes of *glacial acetic acid*, 5 volumes of *tetrahydrofuran* and 45 volumes of *methanol*.

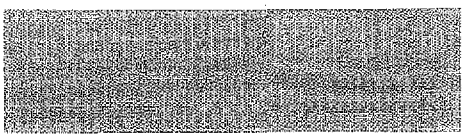
Test solution. Dilute a quantity of the injection containing 2.5 mg of Bumetanide to 25.0 ml with the solvent mixture.

Reference solution (a). A 0.025 per cent w/v solution of *bumetanide IPRS* in the solvent mixture. Dilute 10.0 ml of the solution to 25.0 ml with *water*.

Reference solution (b). A 0.0125 per cent w/v solution of *3-amino-4-phenoxy-5-sulphamoylbenzoic acid IPRS* in reference solution (a).

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (10 µm) (such as Bondapak ODS),



- mobile phase: a mixture of 2 volumes of *glacial acetic acid*, 5 volumes of *tetrahydrofuran*, 45 volumes of *water* and 50 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to bumetanide and 3-amino-4-phenoxy-5-sulphamoylbenzoic acid is not less than 15.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{17}H_{20}N_2O_5S$ in the injection.

Bumetanide Oral Solution

Bumetanide Oral Solution is a solution of Bumetanide in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Bumetanide Oral Solution contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of bumetanide, $C_{17}H_{20}N_2O_5S$.

Usual strength. 0.25 mg per ml.

Identification

A. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 2.5 volumes of *methanol*, 10 volumes of *glacial acetic acid*, 10 volumes of *cyclohexane* and 80 volumes of *chloroform*.

Test solution (a). Mix a quantity of the oral solution containing 2 mg of Bumetanide with 10 ml of *water* and 0.6 ml of *1 M hydrochloric acid*, add 5 ml of *ethyl acetate*, shake for 15 minutes, centrifuge and decant the *ethyl acetate*. Add a further 5 ml of *ethyl acetate* to the residue, shake for 15 minutes, centrifuge and decant the *ethyl acetate*. Evaporate the combined ethyl acetate extracts to dryness and dissolve the residue in 0.5 ml of *methanol*.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with *methanol*.

Test solution (c). Dilute 1.0 ml of test solution (b) to 10.0 ml with *methanol*. Dilute 1 ml of the solution to 3 ml with *methanol*.

Test solution (d). Dilute 1.0 ml of test solution (c) to 100.0 ml with *methanol*.

Reference solution (a). A 0.04 per cent w/v solution of *bumetanide IPRS* in *methanol*.

Reference solution (b). A 0.002 per cent w/v solution of *3-amino-4-phenoxy-5-sulphamoylbenzoic acid IPRS* in *methanol*.

Apply to the plate 25 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 365 nm. Any secondary spot in the chromatogram obtained with test solution (a) corresponding to 3-amino-4-phenoxy-5-sulphamoyl-benzoic acid is not more intense than the spot in the chromatogram obtained with test solution (c) (0.5 per cent), any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.3 per cent) and not more than two other such spots are more intense than the spot in the chromatogram obtained with test solution (d) (0.1 per cent).

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 2 volumes of *glacial acetic acid*, 5 volumes of *tetrahydrofuran* and 45 volumes of *methanol*.

Test solution. Mix a quantity of the oral solution containing 2.5 mg of Bumetanide with 12.5 ml of *water* and 0.8 ml of *1 M hydrochloric acid*, add 10 ml of *ethyl acetate*, shake for 15 minutes, centrifuge and decant the *ethyl acetate*. Repeat the extraction procedure twice using a further two 10 ml quantities of *ethyl acetate* and beginning at the words 'add 10 ml of ... '. Evaporate the combined ethyl acetate extracts to dryness, dissolve the residue in 10 ml of the solvent mixture and dilute to 20 ml with *water*.

Reference solution (a). A 0.025 per cent w/v solution of *bumetanide IPRS* in the solvent mixture. Dilute 5 ml of the solution to 10.0 ml with *water*.

Reference solution (b). A 0.0125 per cent w/v solution of *3-amino-4-phenoxy-5-sulphamoyl-benzoic acid IPRS* in reference solution (a).

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (10 µm) (such as µBondapak ODS),
- mobile phase: a mixture of 2 volumes of *glacial acetic acid*, 5 volumes of *tetrahydrofuran*, 45 volumes of *water* and 50 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to bumetanide and 3-amino-4-phenoxy-5-sulphamoylbenzoic acid is not less than 15.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{17}H_{20}N_2O_5S$ in oral solution.

Determine the weight per ml of the oral solution (2.4.29) and calculate the content of $C_{17}H_{20}N_2O_5S$, weight in volume.

Bumetanide Tablets

Bumetanide Tablets contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of bumetanide, $C_{17}H_{20}N_2O_5S$.

Usual strengths. 0.5 mg; 1 mg; 2 mg.

Identification

A. Disperse a quantity of the powdered tablets containing 50 mg of Bumetanide with 25 ml of *ether*, filter through *anhydrous sodium sulphate* and evaporate the filtrate to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *bumetanide IPRS* or with the reference spectrum of bumetanide.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and *water*.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A 0.0056 per cent w/v solution of *bumetanide IPRS* in the solvent mixture. Dilute a suitable volume of the solution with the dissolution medium to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Chromatographic system
- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: a mixture of 70 volumes of buffer solution prepared by dissolving 2.72 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 7.0 with *1.8 M potassium hydroxide* and 30 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 222 nm,
- injection volume: 100 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{20}N_2O_5S$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{17}H_{20}N_2O_5S$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 2.5 volumes of *methanol*, 10 volumes of *glacial acetic acid*, 10 volumes of *cyclohexane* and 80 volumes of *chloroform*.

Test solution. weigh and transfer a quantity of the powdered tablets containing 0.0125 g of bumetanide in 20 ml of a mixture of equal volumes of *acetonitrile* and *methanol*, shake for 20 minutes. Centrifuge for 10 minutes, decant and reserve the supernatant liquid. Extract the residue with 5 ml of a mixture of equal volumes of *acetonitrile* and *methanol*, shaking mechanically for 30 seconds, centrifuge for 10 minutes, decant and combine the extracts. Evaporate the combined extracts to dryness under reduced pressure, dissolve the residue in 0.5 ml of *methanol* and centrifuge for 10 minutes.

Reference solution (a). Dilute 0.3 ml of the test solution to 100 ml with *methanol*.

Reference solution (b). Dilute 0.1 ml of the test solution to 100 ml with *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.3 per cent) and not more than three such spots are more intense than the spot in the chromatogram obtained with reference solution (b) (0.1 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14).

Test solution. Disperse 1 tablet in 10.0 ml of the solvent mixture, shake with the aid of ultrasound for 5 minutes, dilute to 20.0 ml with *water* and filter.

Reference solution. A 0.01 per cent w/v solution of *bumetanide IPRS* in the solvent mixture. Dilute 10.0 ml of the solution to 20.0 ml with *water*.

Use the chromatographic system as described under Assay.

Calculate the content of $C_{17}H_{20}N_2O_5S$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 2 volumes of *glacial acetic acid,* 5 volumes of *tetrahydrofuran* and 45 volumes of *methanol.*

Test solution. Weigh and powder 20 tablets. Disperse an quantity of the powder containing 2.5 mg of Bumetanide in 10 ml of the solvent mixture, shake for 5 minutes and dilute to 25.0 ml with *water.*

Reference solution (a). A 0.025 per cent w/v solution of *bumetanide IPRS* in the solvent mixture. Dilute 10.0 ml of the solution to 25.0 ml with *water.*

Reference solution (b). A 0.0125 per cent w/v solution of *3-amino-4-phenoxy-5-sulphamoylbenzoic acid IPRS* in reference solution (a).

Chromatographic system

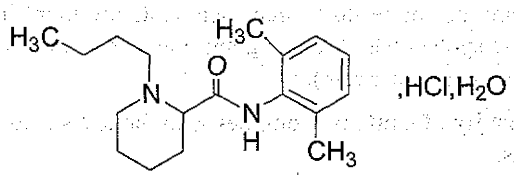
- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 2 volumes of *glacial acetic acid*, 5 volumes of *tetrahydrofuran*, 45 volumes of *water* and 50 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to bumetanide and 3-amino-4-phenoxy-5-sulphamoylbenzoic acid is not less than 15.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{17}H_{20}N_2O_5S$ in the tablets.

Bupivacaine Hydrochloride



$C_{18}H_{28}N_2O,HCl,H_2O$ Mol. Wt. 342.9

Bupivacaine Hydrochloride is (*RS*)-1-butyl-*N*-(2,6-dimethylphenyl)-2-piperidinecarboxamide hydrochloride monohydrate.

Bupivacaine Hydrochloride contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{18}H_{28}N_2O,HCl$, calculated on the dried basis.

Category. Local anaesthetic.

Description. A white, crystalline powder or colourless crystals; almost odourless.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrphotometry (2.4.6). Compare the spectrum with that obtained with *bupivacaine hydrochloride IPRS* or with the reference spectrum of bupivacaine hydrochloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.05 per cent w/v solution in *0.01 M hydrochloric acid* shows two absorption maxima at about 263 nm and 271 nm; absorbance at about 263 nm, about 0.70 and at about 271 nm, about 0.57.

C. Dissolve 0.1 g in 10 ml of *water*, add 2 ml of *2 M sodium hydroxide* and shake with two quantities, each of 15 ml, of *ether*. Dry the combined ether extracts over *anhydrous sodium sulphate*, filter, evaporate the ether, recrystallise the residue from *ethanol (90 per cent)* and dry the residue at a pressure of 1.5 to 2.5 kPa. The melting range (2.4.21) of the residue is between 105° and 108° (2.4.21).

D. A 10 per cent w/v solution gives reaction (A) of chlorides (2.3.1).

Tests

Acidity or alkalinity. To 10 ml of a 2.0 per cent w/v solution in *carbon dioxide-free water* add 0.2 ml of *0.01 M sodium hydroxide*; the pH is not less than 4.7. Add 0.4 ml of *0.01 M hydrochloric acid*; the pH is not more than 4.7 (2.4.24).

Appearance of solution. A 2.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and colourless (2.4.1).

Related substances. Determine by gas chromatography (2.4.13).

Internal standard solution. Dissolve 25 mg of *methyl behenate* in *dichloromethane* and dilute to 500.0 ml with *dichloromethane*.

Test solution. Dissolve 50 mg of the substance under examination in 2.5 ml of *water*, add 2.5 ml of *dilute sodium hydroxide solution* and extract with 2 quantities, each of 5 ml, of the internal standard solution. Filter the lower layer.

Reference solution (a). Dissolve 10 mg each of the substance under examination, *bupivacaine impurity B IPRS* and

bupivacaine impurity E IPRS in 2.5 ml of *water*, add 2.5 ml of *dilute sodium hydroxide solution* and extract with 2 quantities, each of 5 ml, of the internal standard solution. Filter the lower layer and dilute to 20.0 ml with the internal standard solution.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the internal standard solution.

Reference solution (c). Dilute 5.0 ml of reference solution (b) to 10.0 ml with the internal standard solution.

Reference solution (d). Dilute 1.0 ml of reference solution (b) to 10.0 ml with the internal standard solution.

Chromatographic system

- a fused silica column 30 m x 0.32 mm, packed with poly(dimethyl)(diphenyl)siloxane (film thickness 0.25 µm),
- temperature:

column	time (min.)	temperature (°)
	0	180
	10	230
	15	230

- inlet port and detector at 250°,
- split ratio. 1:12,
- flame ionization detector,
- flow rate: 2.5 ml per minute, using nitrogen as the carrier gas.

Name	Relative retention time
Bupivacaine impurity C[1]	0.5
Bupivacaine impurity A[2]	0.6
Bupivacaine impurity B[3]	0.7
Bupivacaine impurity D[4]	0.8
Bupivacaine (Retention time: about 10 minutes)	1.0
Bupivacaine impurity E[5]	1.1
Methyl behenate (Internal Standard)	1.4

[1] 1-(2,6-dimethylphenyl)-1,5,6,7-tetrahydro-2*H*-azepin-2-one,

[2] *N*-(2,6-dimethylphenyl)pyridine-2-carboxamide,

[3] (2RS)-*N*-(2,6-dimethylphenyl)piperidine-2-carboxamide,

[4] (2RS)-2,6-dichloro-*N*-(2,6-dimethylphenyl)hexanamide,

[5] 6-(butylamino)-*N*-(2,6-dimethylphenyl)hexanamide.

Inject 1 µl of reference solution (a). The test is not valid unless the resolution between the peaks corresponding to bupivacaine and bupivacaine impurity E is not less than 3.0.

Inject 1 µl each of reference solution (b), (c), (d) and the test solution.

Bupivacaine impurity B. Calculate the ratio (*R*) of the area of the principal peak to the area of the peak due to the internal standard from the chromatogram obtained with reference solution (c); from the chromatogram obtained with the test solution, calculate the ratio of the area of the peak due to bupivacaine impurity B to the area of the peak due to the internal standard. This ratio is not more than *R* (0.5 per cent).

Any other secondary peak. Calculate the ratio (*R*) of the area of the principal peak to the area of the peak due to the internal standard from the chromatogram obtained with reference solution (d); from the chromatogram obtained with the test solution, calculate the ratio of the area of any secondary peak other than the principal peak, bupivacaine impurity B peak and internal standard peak, to the area of the peak due to the internal standard. This ratio is not more than *R* (0.1 per cent).

The sum of all the secondary peaks. Calculate the ratio (*R*) of the area of the principal peak to the area of the peak due to the internal standard from the chromatogram obtained with reference solution (b); from the chromatogram obtained with the test solution, calculate the ratio of the sum of the areas of all the secondary peaks, to the area of the peak due to the internal standard. This ratio is not more than *R* (1.0 per cent). Ignore any peak with a ratio less than 0.01 times of *R* (0.01 per cent).

2,6-Dimethylaniline. To 2.0 ml of a 5.0 per cent w/v solution in *methanol* (solution A) add 1 ml of a freshly prepared 1 per cent w/v solution of *4-dimethylaminobenzaldehyde* in *methanol* and 2 ml of *glacial acetic acid* and allow to stand for 10 minutes. Any yellow colour produced is not more intense than that obtained with a solution prepared at the same time and in the same manner using 2 ml of a 0.0005 per cent w/v solution of *2,6-dimethylaniline* in *methanol* in place of solution A (100 ppm).

Heavy metals (2.3.13). A 10.0 per cent w/v solution in a mixture of 85 volumes of *methanol* and 15 volumes of *water* complies with the limit test for heavy metals Method D (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb)* obtained by diluting *lead standard solution (20 ppm Pb)* with a mixture of 85 volumes of *methanol* and 15 volumes of *water*.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). 4.5 to 6.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.25 g, dissolve in a mixture of 5.0 ml of *0.01 M hydrochloric acid* and 50 ml of *ethanol (95 per cent)* and titrate with *0.1 M ethanolic sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Note the volume added between the inflections.

1 ml of *0.1 M ethanolic sodium hydroxide* is equivalent to 0.03249 g of $C_{18}H_{28}N_2O,HCl$.

Storage. Store protected from light.

Bupivacaine Injection

Bupivacaine Hydrochloride Injection

Bupivacaine Injection is a sterile solution of Bupivacaine Hydrochloride in Water for Injection.

Bupivacaine Injection contains not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of anhydrous bupivacaine hydrochloride, $C_{18}H_{28}N_2O,HCl$.

Usual strengths. The equivalent of 25, 50 and 75 mg of anhydrous bupivacaine hydrochloride in 10 ml.

Identification

A. To a volume containing 25 mg of anhydrous bupivacaine hydrochloride add 2 ml of *strong ammonia solution*, shake and filter. Wash the precipitate with *water* and dry at 60° at a pressure of 2 kPa for 16 hours. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *bupivacaine hydrochloride IPRS* treated in the same manner or with the reference spectrum of bupivacaine.

B. To a volume containing 50 mg of anhydrous bupivacaine hydrochloride add 2 ml of a 10 per cent w/v solution of *disodium hydrogen phosphate* and sufficient *iodine solution* to produce a distinct brown colour. Remove the excess iodine by adding *0.1 M sodium thiosulphate*; no pink colour is produced.

Tests

pH (2.4.24). 4.0 to 6.5.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 100 volumes of *methanol* and 0.1 volume of *strong ammonia solution*.

Test solution. Evaporate almost to dryness a volume containing 0.1 g of anhydrous bupivacaine hydrochloride using a rotary evaporator, add sufficient *methanol* to the residue to produce 2 ml, mix well, centrifuge and use the supernatant liquid.

Reference solution. Dilute 1 volume of the test solution to 100 volumes with *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and spray with *dilute potassium iodobismuthate solution*. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

2,6-Dimethylaniline. To a volume containing 25 mg of anhydrous bupivacaine hydrochloride add *water*, if necessary, to produce 10 ml and sufficient *2 M sodium hydroxide* to make the solution just alkaline. Extract with three quantities, each of 5 ml, of *chloroform*. Dry the combined extracts over anhydrous *sodium sulphate*, filter, wash the filter with 5 ml of *chloroform* and evaporate the filtrate to dryness using a rotary evaporator. Dissolve the residue in 2 ml of *methanol*. Add 1 ml of a freshly prepared 1 per cent w/v solution of *4-dimethylaminobenzaldehyde* in *methanol* and 2 ml of *glacial acetic acid* and allow to stand for 10 minutes. Any yellow colour produced is not more intense than that obtained with a solution prepared at the same time and in the same manner using 2 ml of a 0.0005 per cent w/v solution of *2,6-dimethylaniline* in *methanol* in place of the injection under examination.

Bacterial endotoxins (2.2.3). Not more than 2.5 Endotoxin Units per mg of bupivacaine hydrochloride.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a quantity of the injection with sufficient mobile phase to produce a solution containing 0.0025 per cent w/v of anhydrous bupivacaine hydrochloride.

Reference solution (a). A 0.0025 per cent w/v solution of *bupivacaine hydrochloride IPRS* in the mobile phase.

Reference solution (b). A 0.1 per cent w/v solution of *2,6-dimethylaniline* in *acetonitrile*, dilute 10 volumes to 20 volumes with the mobile phase and then dilute 1 volume of the resulting solution to 100 volumes with reference solution (a).

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (10 µm), (Such as µBondapak C_{18})
- mobile phase: a mixture of 40 volumes of *0.02M phosphate buffer pH 8.0* and 60 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to bupivacaine hydrochloride and 2,6-dimethylaniline is not less than 8.0.

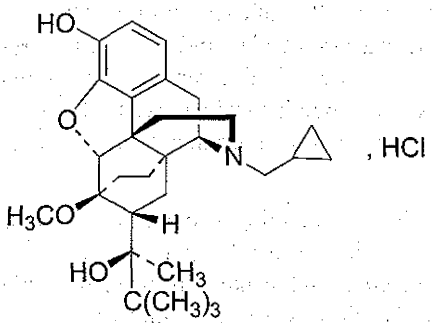
Inject reference solution (a) and the test solution.

Calculate the content of $C_{18}H_{28}N_2O,HCl$.

Storage. Store in single dose or multiple dose containers, preferably of Type 1 glass.

Labelling. The label states the strength in terms of the equivalent amount of anhydrous bupivacaine hydrochloride in a suitable dose-volume.

Buprenorphine Hydrochloride



$C_{29}H_{41}NO_4,HCl$ Mol. Wt. 504.1

Buprenorphine Hydrochloride is (6*R*,7*R*,14*S*)-17-cyclopropylmethyl-7,8-dihydro-7-[(1*S*)-1-hydroxy-1,2,2-trimethylpropyl]-6-*O*-methyl-6,14-ethano-17-normorphine hydrochloride.

Buprenorphine Hydrochloride contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{29}H_{41}NO_4,HCl$, calculated on the dried basis.

Category. Narcotic analgesic.

Description. A white to off-white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *buprenorphine hydrochloride IPRS* or with the reference spectrum of buprenorphine hydrochloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.01 per cent w/v solution in *0.01 M hydrochloric acid* shows an absorption maximum at about 286 nm, about 0.33.

C. Dissolve about 5 mg in 5 ml of hot *water*, add 2 ml of *dilute hydrochloric acid* and 2 ml of a 2 per cent w/v solution of *sodium nitrite* and allow to stand for 10 minutes; a yellow colour is produced.

D. Dissolve 10 mg in 10 ml of hot *water*, add 2 ml of *dilute nitric acid*, shake and add 1 ml of *silver nitrate solution*; a white precipitate is produced.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in *methanol* and dilute to 10.0 ml with *methanol*.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with *methanol*. Dilute 1.0 ml of the solution to 10.0 ml with *methanol*.

Chromatographic system

- a stainless steel column 5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3.5 µm),
- mobile phase: A. a mixture of 10 volumes of *acetonitrile* and 90 volumes of a 0.544 per cent w/v solution of *potassium dihydrogen orthophosphate* previously adjusted to pH 4.5 with *orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.3 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 5 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)

[1]norbuprenorphine,

[2](2*S*)-2-[17-(cyclopropylmethyl)-4,5α -epoxy-3-hydroxy-6-methoxy-6α,14- etheno-14α-morphinan-7α-yl]-3,3-dimethylbutan-2-ol,

[3]17-(cyclopropylmethyl)-4,5α-epoxy-6-methoxy-7α-[1-(1,1-dimethylethyl) ethenyl]-6α,14-ethano-14α-morphinan-3-ol,

[4](2*S*)-2-[17-butyl-4,5 α-epoxy-3-hydroxy-6-methoxy-6α, 14-ethano-14α-morphinan-7α-yl]3,3-dimethylbutan-2-ol,

[5](2*S*)-2-[17-(but-3-enyl)-4,5α-epoxy-3-hydroxy-6- methoxy-6α,14-ethano-14α-morphinan-7α-yl]-3,3-dimethylbutan-2-ol,

[6]2,2'-bibuprenorphine.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 2.5 times the area of the

principal peak in the chromatogram obtained with the reference solution (0.25 per cent). The sum of the areas of all the secondary peaks is not more than 7 times the area of the principal peak in the chromatogram obtained with the reference solution (0.7 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 0.5 g by drying in an oven at 105° for 4 hours.

Assay. Weigh 0.5 g, dissolve in 60 ml of *anhydrous glacial acetic acid*, add 10 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, using 0.1 ml of *crystal violet solution* as indicator to a green end-point. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.05041 g of $C_{29}H_{41}NO_4,HCl$.

Buprenorphine Injection

Buprenorphine Hydrochloride Injection

Buprenorphine Injection is a sterile solution of Buprenorphine Hydrochloride in Water for Injection.

Buprenorphine Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of buprenorphine, $C_{29}H_{41}NO_4$.

Usual strength. The equivalent of 300 µg of buprenorphine per ml.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254*.

Mobile phase. A mixture of 85 volumes of *toluene*, 15 volumes of *methanol* and 0.5 volume of *strong ammonia solution*.

Test solution. Transfer a volume of the injection containing 1.5 mg of Buprenorphine Hydrochloride to a 125-ml separator, add 0.5 ml of *dilute ammonia solution*, shake and extract with three quantities, each of 10 ml, of *chloroform*, washing each chloroform extract with the same 10 ml of *water* and discard the *water*. Evaporate the combined chloroform extracts to dryness on a water-bath and dissolve the residue in 1.5 ml of *chloroform*.

Reference solution. Dissolve 1.5 mg of *buprenorphine hydrochloride IPRS* in 5 ml of *0.01 M hydrochloric acid*, transfer the solution to a 125-ml separator and repeat the above procedure beginning at the words "add 0.5 ml of *dilute ammonia solution*.....".

Apply to the plate 10 µl of each solution. After development, dry the plate in a current of air and examine in ultraviolet light at 254 nm or expose to iodine vapours. The principal spot in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. To a volume containing about 5 mg of Buprenorphine Hydrochloride in a 125-ml separator, add 1 ml of *dilute ammonia solution* and shake with three quantities, each of 10 ml, of *chloroform*. Wash each chloroform extract with the same 10 ml of *water* and discard the washings. Evaporate the combined chloroform extracts to dryness on a water-bath and dissolve the residue in 50 ml of *0.1 M hydrochloric acid*. When examined in the range 230 to 360 nm (2.4.7) the resulting solution shows an absorption maximum only at about 286 nm.

Tests

pH (2.4.24). 3.5 to 6.5.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a quantity of the injection, if necessary, with *methanol* to obtain a solution containing 0.03 per cent w/v of buprenorphine.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with *methanol*. Further dilute 1.0 ml of the solution to 2.0 ml with *methanol*.

Chromatographic system

- a stainless steel column 5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3.5 µm),
- mobile phase: A. a mixture of 10 volumes of *acetonitrile* and 90 volumes of a 0.544 per cent w/v solution of *potassium dihydrogen orthophosphate* previously adjusted to pH 4.5 with *orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.3 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	89	11
2	89	11
12	64	36

[1]norbuprenorphine,

[2](2*S*)-2-[17-(cyclopropylmethyl)-4,5α -epoxy-3-hydroxy-6-methoxy-6α,14- etheno-14α-morphinan-7α-yl]-3,3-dimethylbutan-2-ol,

[3]17-(cyclopropylmethyl)-4,5α-epoxy-6-methoxy-7α-[1-(1,1-dimethylethyl) ethenyl]-6α,14-ethano-14α-morphinan-3-ol,

[4](2*S*)-2-[17-butyl-4,5α-epoxy-3-hydroxy-6-methoxy-6α, 14-ethano-14α-morphinan-7α-yl]3,3-dimethylbutan-2-ol,

[5](2*S*)-2-[17-(but-3-enyl)-4,5α-epoxy-3-hydroxy-6- methoxy-6α,14-ethano-14α-morphinan-7α-yl]-3,3-dimethylbutan-2-ol,

[6]2,2'-bibuprenorphine.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent). The sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent).

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Measure a volume containing 1.5 mg of buprenorphine and transfer to a 25-ml volumetric flask. Add 1 ml of *1 M hydrochloric acid*, 2 ml of a 2 per cent w/v solution of *sodium nitrite* and shake well. Stopper the flask and allow to stand for 15 minutes. Dilute the solution to volume with *dilute ammonia solution* and measure the absorbance of the resulting solution at the maximum at about 460 nm (2.4.7), using as the blank a solution prepared in the same manner by treating 5 ml of *water* instead of the preparation under examination.

Calculate the content of $C_{29}H_{41}NO_4$ from the absorbance obtained by repeating the procedure with 5 ml of a solution containing *buprenorphine hydrochloride IPRS* equivalent to 0.03 per cent w/v of buprenorphine.

Labelling. The label states the strength in terms of the equivalent amount of buprenorphine in a suitable dose-volume.

Buprenorphine Sublingual Tablets

Buprenorphine Hydrochloride Tablets

Buprenorphine Sublingual Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of buprenorphine, $C_{29}H_{41}NO_4$.

Usual strengths. The equivalent of 200 µg and 400 µg of buprenorphine .

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. Evaporate 10 ml of the test solution obtained in the Assay to dryness. Dissolve the residue in 5 ml of *water*, add sufficient amount of *dilute hydrochloric acid* to turn litmus paper red and add 1 ml of *potassium iodobismuthate solution*. An orange red precipitate is formed.

Tests

Disintegration (2.5.1). Not more than 2 minutes.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 4 mg of buprenorphine with 4 ml of *methanol* with the aid of ultrasound and filter.

Reference solution. Dilute 1.0 ml of the test solution to 50.0 ml with *methanol*.

Chromatographic system

- a stainless steel column 5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3.5 µm) (Such as Sunfire C18),
- mobile phase: A. a mixture of 10 volumes of *acetonitrile* and 90 volumes of a 0.544 per cent w/v solution of *potassium dihydrogen orthophosphate* previously adjusted to pH 4.5 with *orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.3 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 10 µl.

[1]norbuprenorphine,

[2](2*S*)-2-[17-(cyclopropylmethyl)-4,5α -epoxy-3-hydroxy-6-methoxy-6α,14- etheno-14α-morphinan-7α-yl]-3,3-dimethylbutan-2-ol,

[3]17-(cyclopropylmethyl)-4,5α-epoxy-6-methoxy-7α-[1-(1,1-dimethylethyl) ethenyl]-6α,14-ethano-14α-morphinan-3-ol,

[4](2*S*)-2-[17-butyl-4,5 α-epoxy-3-hydroxy-6-methoxy-6α, 14-ethano-14α-morphinan-7α-yl]3,3-dimethylbutan-2-ol,

[5](2*S*)-2-[17-(but-3-enyl)-4,5α-epoxy-3-hydroxy-6- methoxy-6α,14-ethano-14α-morphinan-7α-yl]-3,3-dimethylbutan-2-ol,

[6]2,2'-bibuprenorphine.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent). The area of not more than one secondary peak is more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). The sum of the areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with the reference solution (6.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Related substances using 25 µl injection volume and with the following modifications.

Test solution. Disperse 1 tablet in 1 ml of *methanol*, with the aid of ultrasound and dilute with the mobile phase to obtain a solution containing 0.004 per cent w/v of buprenorphine.

Reference solution. A 0.004 per cent w/v solution of *buprenorphine hydrochloride IPRS* in *methanol*.

Inject the reference solution and the test solution.

Calculate the content of $C_{29}H_{41}NO_4$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 2 mg of buprenorphine in *methanol*, with the aid of ultrasound and dilute to 20.0 ml with *methanol*.

Reference solution. A 0.01 per cent w/v solution of *buprenorphine hydrochloride IPRS* in *methanol*.

Chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{29}H_{41}NO_4$ in the tablets.

1 mg of $C_{29}H_{41}NO_4$,HCl is equivalent to 0.9276 mg of $C_{29}H_{41}NO_4$.

Labelling. The label states the strength in terms of the equivalent amount of buprenorphine.

Buprenorphine and Naloxone Sublingual Tablets

Buprenorphine Hydrochloride and Naloxone Hydrochloride Sublingual Tablets

Buprenorphine and Naloxone Sublingual Tablets contain Buprenorphine Hydrochloride and Naloxone Hydrochloride equivalent to not less than 90.0 per cent and not more than 110.0 per cent of stated amount of buprenorphine, $C_{29}H_{41}NO_4$ and naloxone, $C_{19}H_{21}NO_4$.

Usual strengths. Buprenorphine, 0.4 mg and Naloxone, 0.1 mg; Buprenorphine, 2 mg and Naloxone, 0.5 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 500 ml of *water*,
Speed and Time: 100 rpm and 10 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Buffer solution. Dissolve 2.4 g of *monobasic potassium phosphate* and 0.5 g of *sodium hydroxide* in 1000 ml of *water*, adjusted to pH 6.8 with *orthophosporic acid.*

Solvent mixture. Equal volumes of *water* and *methanol.*

Test solution. Use the filtrate, dilute, if necessary, with the dissolution medium.

Reference solution. Dissolve a suitable quantity of *buprenorphine hydrochloride IPRS* and *naloxone hydrochloride IPRS* in the solvent mixture and dilute with the dissolution medium to obtain a solution of the similar concentration as that of the test solution.

Chromatographic system

- a stainless steel column 50 mm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 40 volumes of *acetonitrile,* 20 volumes of *methanol* and 40 volumes of the buffer solution,
  B. a mixture of 78 volumes of *acetonitrile,* and 22 volumes of the buffer solution,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 40 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
2	100	0
3	0	100
6	0	100
6.1	100	0
8	100	0

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent for buprenorphine and naloxone peaks.

Inject the reference solution and the test solution.

Calculate the content of $C_{29}H_{41}NO_4$ and $C_{19}H_{21}NO_4$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{29}H_{41}NO_4$ and $C_{19}H_{21}NO_4$.

Related substances. Determine by liquid chromatography (2.4.14), using chromatographic system, buffer solution, solvent mixture and test solution as described under Assay.

Reference solution. A solution containing 0.00016 per cent w/v of *buprenorphine hydrochloride IPRS* and 0.00005 per cent w/v of *naloxone hydrochloride IPRS* in the solvent mixture.

Name	Relative retention time

[1]Quantified relative to naloxone,

[2](S)-2-(4,5α-Epoxy-3-hydroxy-6-methoxy-6α,14-ethanomorphinan-7α-yl)-3,3-dimethylbutan-2-ol,

[3]These are process impurities and are excluded from the total degradation products,

[4]4,5α-Epoxy-7α-[(S)-2-hydroxy-3,3-dimethylbutan-2-yl]-3,6-dimethoxy-6α,14-ethanomorphinan-17-carbonitrile,

[5](S)-2-[17-(Cyclopropylmethyl)-4,5α-epoxy-3,6-dihydroxy-6α,14-ethanomorphinan-7α-yl]-3,3-dimethylbutan-2-ol,

[6]Quantified relative to buprenorphine,

[7](S)-2-[17-(Cyclopropylmethyl)-4,5α-epoxy-3-hydroxy-6-methoxy-6α,14-ethanomorphinan-7α-yl]-3,3-dimethylbutan-2-ol,

[8](S)-2-[17-(But-3-en-1-yl)-4,5α-epoxy-3-hydroxy-6-methoxy-6α,14-ethanomorphinan-7α-yl]-3,3-dimethylbutan-2-ol,

[9](S)-2-[17-(Cyclopropylmethyl)-4,5α-epoxy-3,6-dimethoxy-6α,14-ethanomorphinan-7α-yl]-3,3-dimethylbutan-2-ol.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 5.0 per cent for both the peaks.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to naloxone degradation product 1, 2 and 3, each of, is not more than 5 times the area of the naloxone peak in the chromatogram obtained with the reference solution (0.5 per cent), the area of any peak corresponding to buprenorphine degradation product 1 is not more than the area of the buprenorphine peak in the chromatogram obtained with the reference solution (0.3 per cent). The area of any other secondary peak is not more than 3 times the area of the naloxone peak in the chromatogram obtained with the reference solution (0.3 per cent) and the sum of areas of all the secondary peaks excluding process impurities is not more than 30 times the area of the naloxone peak in the chromatogram obtained with the reference solution (3.0 per cent). Ignore any peak with an area less than 0.5 times the area of the naloxone peak

in the chromatogram obtained with the reference solution (0.05 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modification.

Test solution. Disperse one tablet in the solvent mixture and dilute with the solvent mixture to obtain a solution of the similar concentration as that of the reference solution.

Reference solution. A solution containing 0.0023 per cent w/v of *buprenorphine hydrochloride IPRS* and 0.00056 per cent w/v of *naloxone hydrochloride IPRS* in the solvent mixture.

Calculate the content of the $C_{29}H_{41}NO_4$ and $C_{19}H_{21}NO_4$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 7 volumes of *acetonitrile,*3 volumes of *methanol,* and 90 volumes of 0.1 per cent v/v solution of *orthophosporic acid.*

Buffer solution. A *0.009 M dibasic ammonium phosphate buffer,* adjusted to pH 6.2 with 50 per cent v/v solution of *orthophosporic acid.*

NOTE — Protect all solution from light.

Test solution. Disperse a suitable numbers of intact tablets (not less than 13 tablets) in 35 ml of the solvent mixture with the aid of ultrasound for 15 minutes with occasional swirling and shake for 15 minutes, dilute with the solvent mixture to obtain a solution containing 0.052 per cent w/v of Buprenorphine. Centrifuge at 3000 rpm for 10 minutes and use supernatant.

Reference solution. A solution containing 0.057 per cent w/v of *buprenorphine hydrochloride IPRS* and 0.016 per cent w/v of *naloxone hydrochloride IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 mm × 4.6 mm, packed with phenyl group bonded to porous silica (5 µm),
- column temperature: 60°,
- mobile phase: A. a mixture of 7 volumes of *acetonitrile,* 3 volumes of *methanol* and 90 volumes of the buffer solution,

  B. a mixture of 56 volumes of *acetonitrile,* 24 volumes of *methanol* and 20 volumes of the buffer solution,
- a gradient programme using the conditions given below,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 100 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	99	1
30	1	99
45	1	99
45.1	99	1
55	99	1

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviationn for replicate injections is not more than 2.0 per cent for both the peaks.

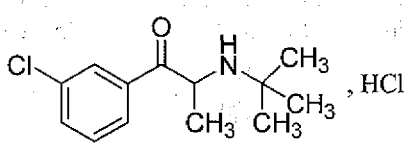
Inject the reference solution and the test solution.

Calculate the content of $C_{29}H_{41}NO_4$ and $C_{19}H_{21}NO_4$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The quantity of active ingredients is stated in terms of the equivalent amount of Buprenorphine and Naloxone.

Bupropion Hydrochloride



$C_{13}H_{18}ClNO,HCl$ Mol. Wt. 276.2

Bupropion Hydrochloride is 1-propanone,1-(3-chlorophenyl)-2-[(1,1-dimethylethyl) amino]-, hydrochloride, (±) -;(±) -2- (tert-butyl amino)-3′-chloropropiophenone hydrochloride.

Bupropion Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{13}H_{18}ClNO,HCl$, calculated on the anhydrous basis.

Category. Anti depressant.

Description. A white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained from *bupropion hydrochloride IPRS* or with the reference spectrum of bupropion hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. Gives the reaction (A) of chlorides (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Use the test solution, reference solution and chromatographic system as described under Assay.

Name	Relative retention time	Correction factor

[7]2-(tert-butylamino)-1-(3,5-dichlorophenyl) propan-1-one; 2-(tert-butylamino)-3',5'-dichloropropiophenone.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to bupropion hydrochloride related compound A and bupropion is not less than 1.3 and resolution between the peaks due to bupropion and bupropion hydrochloride related compound B is not less than 1.3. The relative standard deviation for bupropion is not more than 2.0 per cent and bupropion hydrochloride related compound B is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of deschloro bupropion peak is not more than 0.005 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent). The area of bupropion dione derivative, bupropion hydrochloride related compound A, bupropion hydrochloride related compound B, 4-chlorobupropion and 5- chlorobupropion peak is not more than 0.002 times the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent). The area of o-bupropion, chloropropiophenone, bromochloropropionphenone and any other single impurity peak is not more than 0.001 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent). The sum of the areas of all the secondary peaks is not more than 0.01 times the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Limit of 3-Chlorobenzoic Acid. Determine by liquid chromatography (2.4.14).

Solvent mixture. 20 volumes of *methanol* and 80 volumes of *0.001M hydrochloric acid*.

NOTE — Prepare the solutions immediately before use and protect from light.

Test solution. Dissolve 60 mg of the substance under examination in 100.0 ml of the solvent mixture.

Reference solution(a). A solution containing 0.002 per cent w/v of *bupropion hydrochloride related compound C IPRS (1-(3-chlorophenyl)-2-hydroxypropan-1-one), bupropion hydrochloride related compound F IPRS((1-(3-chlorophenyl)-1-hydroxypropan-2-one)* and 0.0012 per cent w/v of *3-chlorobenzoic acid IPRS* in *methanol*.

Reference solution (b). Dilute 10.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Reference solution (c). A 0.012 per cent w/v solution of *3-chlorobenzoic acid IPRS* in *methanol*. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 10 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (3.5 µm),
- column temperature: 40°,
- mobile phase: A. a mixture of 100 volumes of *acetonitrile* and 900 volumes of *water*, add 0.4 ml of *trifluoro acetic acid*,

  B. a mixture of 950 volumes of *acetonitrile* and 50 volumes of *water*, add 0.3 ml of *trifluoro acetic acid*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 226 nm,
- injection volume: 5 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
3.4	87	13
10.0	15	85
10.1	0	100
13.0	0	100
13.2	90	10
19.0	90	10

Name	Relative retention time
Bupropion	1.0
Bupropion hydrochloride related compound F	1.71
Bupropion hydrochloride related compound C	1.75
3- Chlorobenzoic acid	1.80

Inject reference solution (b). The test is not valid unless the resolution between bupropion hydrochloride related compound F and bupropion hydrochloride related compound C is not less than 1.5 and the resolution between bupropion hydrochloride related compound C and 3-chlorobenzoic acid is not less than 1.3. The relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution, the area of 3-chlorobenzoic acid peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent).

Water (2.3.43). Not more than 0.5 per cent.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of *methanol* and 50 volumes of *water*.

Test solution. Dissolve 100 mg of the substance under examination in 100.0 ml of the solvent mixture.

Reference solution. A solution containing 0.1 per cent w/v of *bupropion hydrochloride IPRS* and 0.0002 per cent w/v each of *bupropion hydrochloride related compound A IPRS (2-tert-butylamino)-4'-chloropropiophenone hydrochloride)* and *bupropion hydrochloride related compound B IPRS (2-tert-butylamino)3'bromopropiophenone hydrochloride)* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm × 3.9 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of a buffer solution prepared by dissolving 3.4 g of *monobasic potassium phosphate* in 1000 ml of *water*, adjusted to pH 7.0 with *1 M sodium hydroxide solution*, and diluting to 1000 ml with *water*, 11 volumes of *tetrahydrofuran* and 39 volumes of *methanol*,
- flow rate: 1.1 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to bupropion hydrochloride related compound A and bupropion is not less than 1.3, the resolution between the peaks due to bupropion hydrochloride related compound B and bupropion is not less than 1.3 . The relative standard deviation for replicate injections for the peak due to bupropion is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{13}H_{18}ClNO$, HCl.

Storage. Store protected from light and moisture, at temperature not exceeding 30°.

Bupropion Hydrochloride Prolonged-release Tablets

Bupropion Hydrochloride Sustained-release Tablets; Bupropion Hydrochloride Extended-release Tablets

Bupropion Hydrochloride Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Bupropion Hydrochloride Prolonged-release Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the labeled amount of bupropion hydrochloride, $C_{13}H_{18}ClNO$, HCl.

Usual strengths. 100 mg; 150 mg; 300 mg.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *bupropion hydrochloride IPRS* or with the reference spectrum of bupropion hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with test solution (a) or (b) corresponds to the peak in the chromatogram obtained with reference solution (g).

Tests

Dissolution (2.5.2). Complies with the test stated under Tablets.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture A. 20 volumes of *methanol* and 80 volumes of *0.001 M hydrochloric acid*.

Solvent mixture B. a mixture of 80 volumes of buffer solution prepared by dissolving 100 g of *anhydrous disodium hydrogen phosphate* in 1000 ml of *water*. Add 50 ml of *orthophosphoric acid* with the aid of ultrasound and mix. Adjusted to pH 3.0 with *orthophosphoric acid* and 20 volumes of *methanol*.

Test solution (a). Disperse a quantity of the powdered tablets, containing 300 mg of Bupropion Hydrochloride in 100.0 ml of *methanol* with the aid of ultrasound and centrifuge at

20000 rpm for about 3 minutes. Filter, discarding the first few ml of filtrate. Dilute 10.0 ml of the solution to 50.0 ml with *0.001 M hydrochloric acid*.

NOTE—Alternatively, the sample can be prepared as follows.

Test solution (b). Weigh and powder 20 tablets. Disperse a quantity of powder containing 300 mg of Bupropion Hydrochloride in 75 ml of solvent mixture (b). Stir for 30 minutes and ultrasound for 15 minutes and dilute to 100.0 ml with the same solvent and centrifuge, use the supernatant. Dilute 10.0 ml of the solution to 50.0 ml with solvent mixture B.

Reference solution (a). A solution containing 0.002 per cent w/v of *bupropion hydrochloride C IPRS* [1-(3-chlorophenyl)-2-hydroxypropan-1-one], *bupropion hydrochloride F IPRS* [1-(3-chlorophenyl)-1-hydroxypropan-2-one] and 0.0012 per cent w/v of *3-chlorobenzoic acid IPRS* in *methanol*.

Reference solution (b). Dilute 10.0 ml of reference solution (a) to 100.0 ml with solvent mixture A.

Reference solution (c). A 0.0012 per cent w/v solution of *3-chlorobenzoic acid IPRS* in *methanol*.

Reference solution (d). Dilute 10.0 ml of reference solution (c) to 100.0 ml with solvent mixture A.

Reference solution (e). A 0.00012 per cent w/v solution of *bupropion hydrochloride IPRS* in the solvent mixture A.

Chromatographic system

- a stainless steel column 10 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (3.5 µm),
- column temperature: 40°,
- mobile phase: A. a mixture of 10 volumes of *acetonitrile*, 0.04 volume of *trifluoroacetic acid* and 90 volumes of *water*,
  B. a mixture of 95 volumes of *acetonitrile*, 0.03 volume of *trifluoroacetic acid* and 5 volumes of *water*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 226 ± 2 nm so that the correction factor requirement is met,
  (*NOTE — The peak responses of the compounds of interest are very sensitive to change in the detection wave length*),
- injection volume: 5 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
3.4	87	13
10.0	15	85
10.1	0	100
13.0	0	100
13.2	90	10
19.0	90	10

Name	Relative retention time	Correction factor
Bupropion amine[1]	0.38	0.83
S,S,S-Thiomorpholine derivative[2]	0.56	0.90
S,R,R-Thiomorpholine derivative[3]	0.78	0.90
Bupropion	1.0	—
Bupropion related compound F	1.71	0.55
Bupropion related compound C	1.75	0.58
3-Chlorobenzoic acid	1.80	—
Bupropion dione derivative[4]	2.25	1.0
Unknown impurity	---	1.0

[1]2-Amino-1-(3-chlorophenyl)-1-propanone,

[2](3*S*,5*S*,6*S*)-6-(3-Chlorophenyl)-6-hydroxy-5-methyl-3-thiomorpholine carboxylic acid,

[3](3*S*,5*R*,6*R*)-6-(3-Chlorophenyl)-6-hydroxy-5-methyl-3-thiomorpholine carboxylic acid,

[4]1-(3-chlorophenyl) propane-1,2-dione.

Inject reference solution (b), (d) and (e). The test is not valid unless the resolution between the peaks due to bupropion hydrochloride related compound F and bupropion hydrochloride related compound C is not less than 1.3 and peak due to bupropion hydrochloride related compound C and 3-chlorobenzoic acid is not less than 1.3 in the chromatogram obtained with reference solution (b) and relative standard deviation for replicate injections is not more than 10.0 per cent in the chromatogram obtained with reference solution (e).

For 100 mg or less —

Inject reference solution (c), (e) and test solution (a) or (b). In the chromatogram obtained with test solution (a) or (b), the area of any peak due to bupropion amine is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (e) (0.3 per cent), the area of the any peak due to S,S,S-thiomorpholine derivative is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (e) (1.0 per cent), the area of any peak due to S,R,R-thiomorpholine derivative is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (e) (0.5 per cent), the area of any peak due to bupropion related compound F is not more than 6.0 times the area of the principal peak in the chromatogram obtained with reference solution (e) (1.2 per cent), the area of any peak due to bupropion related compound C is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (e) (0.3 per cent), the area of any peak due to 3- chlorobenzoic acid is not more than 0.15 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.3 per cent), the area of any peak due to bupropion dione

derivative is not more than 2.0 times the area of the principal peak in the chromatogram obtained with reference solution (e) (0.4 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (e) (0.2 per cent). The sum of areas of all the secondary peaks is not more than 16 times the area of the principal peak in the chromatogram obtained with reference solution (e) (3.2 per cent).

For 150 mg or more —

Inject reference solution (c), (e) and test solution (a) or (b). In the chromatogram obtained with test solution (a) or (b), the area of any peak due to bupropion amine is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (e) (0.3 per cent), the area of any peak due to S,S,S-thiomorpholine derivative is not more than 7.5 times the area of the principal peak in the chromatogram obtained with reference solution (e) (1.5 per cent), the area of any peak due to S,R,R-thiomorpholine derivative is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (e) (0.4 per cent),the area of any peak due to bupropion related compound F is not more than 11.5 times the area of the principal peak in the chromatogram obtained with reference solution (e) (2.3 per cent),the area of any peak due to bupropion related compound C is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (e) (0.3 per cent), the area of any peak due to 3- chlorobenzoic acid is not more than 0.15 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.3 per cent),the area of any peak due to bupropion dione derivative is not more than 2.0 times the area of the principal peak in the chromatogram obtained with reference solution (e) (0.4 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (e) (0.2 per cent). The sum of areas of all the secondary peaks is not more than 16.5 times the area of the principal peak in the chromatogram obtained with reference solution (e) (3.3 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14). Use Solvent mixture (a), mobile phase (a) and (b), test solution (a) or test solution (b) as described under Related substances.

Reference solution (f). A solution containing 0.002 per cent w/v of *bupropion hydrochloride C IPRS* [1-(3-chlorophenyl)-2-hydroxypropan-1-one] and 0.02 per cent w/v of *bupropion hydrochloride F IPRS* [1-(3-chlorophenyl)-1-hydroxypropan-2-one] in *methanol*. Dilute 10.0 ml of the solution to 100.0 ml with solvent mixture (a).

Reference solution (g). A 0.06 per cent w/v solution of *bupropion hydrochloride IPRS* in solvent mixture (a).

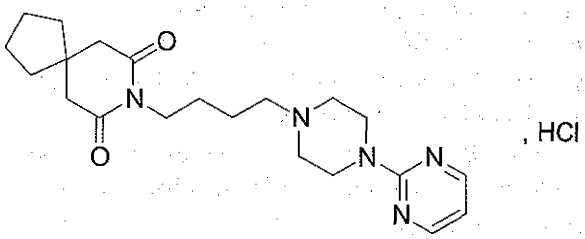
Inject reference solution (f) and (g). The test is not valid unless the resolution between the peaks due to bupropion hydrochloride related compound F and bupropion hydrochloride related compound C is not less than 1.3 in the chromatogram obtained with reference solution (f). The tailing factor is not more than 1.9 and the relative standard deviation for replicate injections is not more than 1.5 per cent in the chromatogram obtained with reference solution (g).

Inject reference solution (g) and test solution (a) or (b).

Calculate the content of $C_{13}H_{18}ClNO$, HCl in the tablets.

Storage. Store protected from moisture and at a temperature not exceeding 30°.

Buspirone Hydrochloride



$C_{21}H_{31}N_5O_2$,HCl Mol. Wt. 422.0

Buspirone Hydrochloride is 8-[4-[4-(pyrimidin-2-yl) piperazin-1-yl]butyl]-8-azaspiro[4.5]decane-7,9-dione hydrochloride.

Buspirone Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{21}H_{31}N_5O_2$,HCl, calculated on the dried basis.

Category. Anxiolytic.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *buspirone hydrochloride IPRS* or with the reference spectrum of buspirone hydrochloride. If the spectra obtained show differences, dissolve the substance under examination and the reference substance separately in *methanol,* evaporate to dryness on a water-bath and record new spectra using the residues.

B. It gives reaction (A) of chlorides (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 25.0 ml of mobile phase A.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A. Dilute 1.0 ml of the solution to 10.0 ml with mobile phase A.

Reference solution (b). A 0.05 per cent w/v solution of *buspirone impurity A IPRS (2,2' (piperazine-1, 4-diyl) dipyrimidine IPRS)* in the test solution.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. 95 volumes of a solution containing 0.68 per cent w/v of *potassium dihydrogen phosphate* and 0.093 per cent w/v of *sodium hexanesulphonate monohydrate*, previously adjusted to pH 3.4 with *orthophosphoric acid* and 5 volumes of *acetonitrile*,
  B. 25 volumes of a solution containing 0.34 per cent w/v of *potassium dihydrogen phosphate* and 0.352 per cent w/v of *sodium hexanesulphonate monohydrate*, previously adjusted to pH 2.2 with *orthophosphoric acid* and 75 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm and at 210 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
6	90	10
34	42	58
45	42	58
55	0	100
56	100	0
60	100	0
61	90	10

Inject reference solution (b). The test is not valid unless the peak-to-valley ratio at 240 nm is not less than 5.0, where H_p = height above the baseline of the peak due to impurity A and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to buspirone.

Inject reference solution (a) and the test solution and set the spectrophotometer at 240 nm. In the chromatogram obtained with the test solution, the area of any secondary peak obtained is not more than 3 times the area obtained with reference solution (a) (0.3 per cent). The sum of the areas of all the secondary peaks is not more than 5 times the area obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Inject reference solution (a) and the test solution and set the spectrophotometer at 210 nm. In the chromatogram obtained with the test solution, the area of any secondary peak obtained is not more than 3 times the area obtained with reference solution (a) (0.3 per cent). The sum of the areas of all the secondary peaks is not more than 5 times the area obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.15 g in 10 ml of *glacial acetic acid* and add 50 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.0211 g of $C_{21}H_{32}ClN_5O_2$.

Storage. Store protected from light.

Buspirone Tablets

Buspirone Hydrochloride Tablets

Buspirone Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of buspirone, $C_{21}H_{31}N_5O_2$.

Usual strengths. 5 mg; 10 mg.

Identification

A. Extract a quantity of the powdered tablets containing 50 mg of buspirone with 50 ml of *chloroform*, filter and evaporate to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *buspirone hydrochloride IPRS* or with the reference spectrum of buspirone hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).
Apparatus No. 2 (Paddle),
Medium. 500 ml of *0.01 M hydrochloric acid*,

Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the medium if necessary, at the maximum at about 235 nm (2.4.7). Calculate the content of $C_{21}H_{31}N_5O_2$ in the medium from the absorbance obtained from a solution of known concentration of *buspirone hydrochloride IPRS* in the same medium.

Q: Not less than 80 per cent of the stated amount of $C_{21}H_{31}N_5O_2$.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), using the chromatographic conditions and the reference solution as described under Assay.

Test solution. Disperse one tablet in the minimum amount of *1 M hydrochloric acid* and dilute with water to produce a solution containing 0.005 per cent w/v of buspirone, shake and filter.

Calculate the content of $C_{21}H_{31}N_5O_2$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 25 mg of buspirone, disperse in 15 ml of *1 M hydrochloric acid* and dilute to 50.0 ml with *water*, filter. Dilute 10.0 ml of filtrate to 100.0 with *water*.

Reference solution. Dissolve 30 mg of *buspirone hydrochloride IPRS* in 15 ml of *1 M hydrochloric acid* and dilute to 50.0 ml with *water*. Dilute 10.0 ml of the solution to 100.0 ml with *water*.

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of *methanol* and 35 volumes of *0.067 M monobasic potassium phosphate*, adjusted to pH 4.0 with *orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

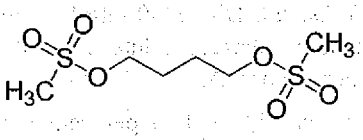
Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{31}N_5O_2$ in the tablets.

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the equivalent amount of buspirone.

Busulphan



$C_6H_{14}O_6S_2$ Mol. Wt. 246.3

Busulphan is 1,4-butanediol dimethanesulphonate.

Busulphan contains not less than 99.0 per cent and not more than 100.5 per cent of $C_6H_{14}O_6S_2$, calculated on the dried basis.

Category. Anticancer.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *busulphan IPRS* or with the reference spectrum of busulphan.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of equal volumes of *acetone* and *toluene*.

Test solution. Dissolve 1 g of the substance under examination in 100 ml of *acetone*.

Reference solution. A 1 per cent w/v solution of *busulphan IPRS* in *acetone*.

Apply to the plate 5 µl of each solution. After development, dry the plate in a current of hot air, spray with *anisaldehyde solution* and heat at 120°. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

C. Heat 0.1 g with 5 ml of *1 M sodium hydroxide* until a clear solution is obtained and allow to cool. To 2 ml of the solution add 0.1 ml of a 3 per cent w/v solution of *potassium permanganate*; the purple colour changes to violet, then to blue and finally to green. Filter and add 1 ml of *ammoniacal silver nitrate solution*; a precipitate is produced.

D. Fuse 0.1 g with 0.1 g of *potassium nitrate* and 0.25 g of *potassium hydroxide*, cool and dissolve the residue in 5 ml of *water*. Acidify with *dilute hydrochloric acid* and add a few drops of *barium chloride solution*; a white precipitate is produced.

Tests

Appearance of solution. Dissolve 0.25 g in 20.0 ml of *acetonitrile*, dilute to 25 ml with *water* and examine

immediately. The solution is clear (2.4.1), and not more intensely coloured than reference solution BS6 (2.4.1).

Acidity. Dissolve 0.2 g in 50 ml of warm *ethanol* previously neutralised to *methyl red solution* and titrate with *0.1 M sodium hydroxide* using *methyl red solution* as indicator; not more than 0.05 ml of *0.1 M sodium hydroxide* is required.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 2.0 per cent, determined on 1.0 g by drying in an oven over *phosphorus pentoxide* at 60° at a pressure of 1.5 to 2.5 kPa.

Assay. Weigh 0.25 g and shake with 50 ml of *water*. Boil under a reflux condenser for 30 minutes and, if necessary, restore the initial volume with *water*. Allow to cool and titrate with *0.1 M sodium hydroxide*, using 0.3 ml of *dilute phenolphthalein solution* as indicator, until a pink colour is produced.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01232 g of $C_6H_{14}O_6S_2$.

Storage. Store protected from light.

Busulphan Tablets

Busulphan Tablets contain not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of busulphan, $C_6H_{14}O_6S_2$. The tablets are coated.

Usual strength. 2 mg.

Identification

A. Warm a quantity of the powdered tablets containing 10 mg of Busulphan with 10 ml of *acetone*, filter and evaporate the filtrate to dryness. Dry the residue at 60° at a pressure not exceeding 0.7 kPa for 1 hour. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *busulphan IPRS* or with the reference spectrum of busulphan.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution(b).

Tests

Disintegration (2.5.1). Maximum time, 15 minutes.

Uniformity of content. Complies with the test stated under Tablets.

Determine by gas chromatography (2.4.13).

Test solution. Add 1 ml of *water* to one tablet in a 50-ml volumetric flask and place in an ultrasonic bath until completely dispersed. Add 30 ml of *acetone*, shake for 15 minutes and dilute to 50.0 ml with *acetone*. Centrifuge and dilute a quantity of the supernatant liquid with *acetone* to produce a solution containing 0.0001 per cent w/v of Busulphan. To 5.0 ml of the resulting solution add 5 ml of a 30 per cent w/v solution of *sodium iodide* in *acetone*, stopper the flask lightly and heat in a water-bath at 50° for 90 minutes. Cool, add 10 ml of a 0.0001 per cent w/v solution of *1,5-di-iodopentane* (internal standard) in *acetone*, mix, add 10 ml of *water* and 20.0 ml of *hexane*, shake vigorously for 1 minute and allow to separate. Use the hexane layer.

Reference solution (a). Add 5 ml of a 30 per cent w/v solution of *sodium iodide* in *acetone* to 5.0 ml of a 0.0001 per cent w/v solution of *busulphan IPRS* in *acetone*, stopper the flask lightly and heat in a water-bath at 50° for 90 minutes. Cool, add 10 ml of the internal standard solution, mix, add 10 ml of *water* and 20.0 ml of *hexane*, shake vigorously for 1 minute and allow to separate. Use the hexane layer.

Reference solution (b). Prepare in the same manner as reference solution (a) but using 10 ml of *acetone* in place of internal standard solution.

Chromatographic system

- a glass column 1.5 m x 4 mm, packed with acid-washed, diatomaceous support (80 to 100 mesh) coated with 3 per cent w/w of phenyl methyl silicone fluid (50 per cent phenyl),
- temperature:
  column. 140°,
  inlet port and detector at 240°,
- electron capture detector,
- flow rate: 30 ml per minute, using nitrogen as the carrier gas.

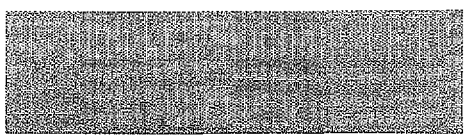
Inject 1 µl of reference solution(a), and the test solution.

Calculate the content of $C_6H_{14}O_6S_2$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by gas chromatography (2.4.13) as given under the test for Uniformity of content using the following test solution.

Test solution. Weigh and powder 20 tablets. Weigh a quantity of the powder containing 2.5 mg of Busulphan, add 5 ml of *water* and place in an ultrasonic bath until completely dispersed. Add 150 ml of *acetone*, shake for 15 minutes and dilute to 250.0 ml with *acetone*. Centrifuge and dilute 10.0 ml of the supernatant liquid to 100.0 ml with *acetone*. To 5.0 ml of the resulting solution add 5 ml of a 30 per cent solution of *sodium iodide* in *acetone*, stopper the flask lightly and heat in a water-bath at 50° for 90 minutes. Cool, add 10 ml of the internal standard solution, mix, add 10 ml of *water* and 20.0 ml of *hexane*, shake vigorously for 1 minute and allow to separate. Use the hexane layer.



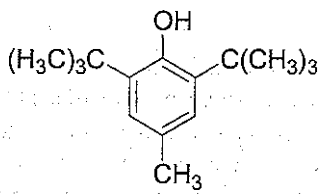
Inject 1 µl of reference solution(a), (b) and the test solution.

Calculate the content of $C_6H_{14}O_6S_2$ in the tablets.

Storage. Store protected from light.

Butylated Hydroxytoluene

BHT



$C_{15}H_{24}O$ Mol. Wt. 220.4

Butylated Hydroxytoluene is 2,6-bis(1,1-dimethylethyl)-4-methylphenol.

Category. Pharmaceutical aid (antioxidant).

Description. A white to yellowish white, crystalline powder.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B, C, D and E may be omitted if test A are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *butylated hydroxytoluene IPRS* or with the reference spectrum of butylated hydrochloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.005 per cent w/v solution in *ethanol* shows an absorption maximum only at about 278 nm, between 0.40 and 0.45.

C. Dissolve about 10 mg in 2 ml of *ethanol (95 per cent)*, add 1 ml of a 0.1 per cent w/v solution of *testosterone propionate* in *ethanol (95 per cent)* and 2 ml of *2 M sodium hydroxide*, heat in a water-bath at 80° for 10 minutes and allow to cool; a blue colour is produced.

D. Dissolve about 0.1 g in 10 ml of *ethanol (95 per cent)*, add 2 ml of a 2.0 per cent w/v solution of *sodium tetraborate* and a few crystals of *2,6-dichloroquinone-4-chlorimide*; not more than a faint blue colour is produced (distinction from butylated hydroxyanisole).

E. Dissolve a few crystals in 10 ml of *ethanol (95 per cent)*, add 0.5 ml of a 0.2 per cent w/v solution of *potassium ferricyanide* and 0.5 ml of a 0.2 per cent per cent w/v solution of *ferric ammonium sulphate* in *0.5 M sulphuric acid*; a green to blue colour is produced.

Tests

Freezing point (2.4.11). 69° to 70°.

Appearance of solution. A 10.0 per cent w/v solution in *methanol* is clear (2.4.1), and not more intensely coloured than reference solution YS5 or BYS5 (2.4.1).

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. Dichloromethane.

Test solution. Dissolve 2.0 g of the substance under examination in 100.0 ml of *methanol.*

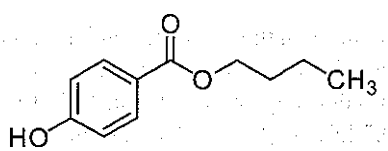
Reference solution. Dilute 1.0 ml of the test solution to 200.0 ml with *methanol.*

Apply to the plate 10 µl of each solution. After development, dry the plate in air and spray with a freshly prepared mixture of 70 volumes of *water*, 20 volumes of a 10.5 per cent w/v solution of *ferric chloride* and 10 volumes of *potassium ferricyanide solution*. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Butylparaben

Butyl Hydroxybenzoate; Butyl-4-hydroxybenzoate



$C_{11}H_{14}O_3$ Mol. Wt. 194.2

Butylparaben is *n*-butyl *p*-hydroxybenzoate.

Butylparaben contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{11}H_{14}O_3$.

Category. Pharmaceutical aid.

Description. A white or almost white, crystalline powder or colourless crystals.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *butylparaben IPRS* or with the reference spectrum of butylparaben.

B. In the test for Assay, the principal peak in the chromatogram obtained with test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

C. To about 10 mg in a test-tube, add 1 ml of *sodium carbonate solution*, boil for 30 second and cool (solution A). To a further 10 mg in a similar test-tube add 1 ml of *sodium carbonate solution*; the substance partly dissolves (solution B). Add at the same time to solution A and solution B, add 5 ml of *aminopyrazolone solution* and 1 ml of *potassium ferricyanide solution*. Solution B is yellow to orange-brown. Solution A is orange to red, the color being clearly more intense than any similar color which may be obtained with solution B.

Tests

Appearance of solution. A 10.0 per cent w/v solution in *ethanol (95 per cent)* is clear (2.4.1) and not more intensely colored than reference solution BYS7 (2.4.1).

Acidity. To 2 ml of 10 per cent w/v solution in *ethanol (95 per cent)*, add 3 ml of *ethanol (95 per cent)*, 5 ml of *carbon dioxide-free water and* 0.1 ml of *bromocresol green solution*. Not more than 0.1 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator to blue.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 2.5 ml of *methanol* and dilute to 50.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 5 mg of *4-hydroxybenzoic acid*, 5 mg of *propyl parahydroxybenzoate* (butylparaben impurity D) and 5 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 50 mg of *butyl paraben IPRS* in 2.5 ml of *methanol* and dilute to 50.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of the test solution to 20.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (d). Dissolve 5 mg of *iso-butyl parahydroxybenzoate IPRS* (*butylparaben impurity E IPRS*) in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (e). Dilute 0.5 ml of reference solution (d) to 50.0 ml with reference solution (b).

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: a mixture of 50 volumes of 0.68 per cent w/v solution of *potassium dihydrogen phosphate*, and 50 volumes of *methanol*,
- flow rate: 1.3 ml per minute,
- spectrophotometer set at 272 nm,
- injection volume: 10 µl.

The relative retention time with reference to butylparaben for 4-hydroxybenzoic acid is about 0.1, for butylparaben impurity D is about 0.5 and for butylparaben impurity E is about 0.9.

Inject reference solution (a) and (e). The test is not valid unless the resolution between the peaks corresponding to butylparaben and butylparaben impurity D is not less than 5.0 in the chromatogram obtained with reference solution (a) and the resolution between the peaks corresponding to butylparaben and butylparaben impurity E is not less than 1.5 in the chromatogram obtained with reference solution (e).

Inject reference solution (c) and the test solution. Run the chromatogram 1.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any peak corresponding to 4-hydroxybenzoic acid multiplied by 1.4 is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent). The sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent). Ignore the peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

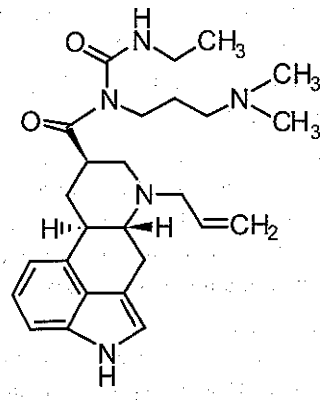
Assay. Determine by liquid chromatography (2.4.14), as described under Related substances.

Inject reference solution (b) and the test solution.

Calculate the content of $C_{11}H_{14}O_3$.

C

Cabergoline



$C_{26}H_{37}N_5O_2$ Mol. Wt. 451.6

Cabergoline is 1-[(6-Allylergolin-8β-yl)-carbonyl]-1-[3-(dimethylamino)propyl]-3-ethylurea.

Cabergoline contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{26}H_{37}N_5O_2$, calculated on the anhydrous basis.

Category. Prolactin Inhibitor.

Description. A white or almost white, crystalline powder. It shows polymorphism (2.5.11).

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cabergoline IPRS* or with the reference spectrum of cabergoline.

Tests

Specific optical rotation (2.4.22). −83° to −77°, determined in a 0.2 per cent w/v solution in *ethanol (95 per cent)*.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Use freshly prepared solutions and protected from light.

Test solution. Dissolve 30 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). A 0.12 per cent w/v solution of *cabergoline IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Further dilute 10.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (c). Dissolve 50 mg of the substance under examination in 10.0 ml of *0.1 M sodium hydroxide*. Stir for about 15 minutes. To 1.0 ml of the suspension add 1 ml of *0.1 M hydrochloric acid* and dilute to 10.0 ml with the mobile phase. The main degradation product obtained is cabergoline impurity A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 16 volumes of *acetonitrile* and 84 volumes of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen phosphate* in 1000 ml of *water* adjusted to pH 2.0 with *phosphoric acid* and 0.2 volume of *triethylamine*,
- flow rate: 1.3 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Name	Relative retention time
Cabergoline impurity D[1]	0.3
Cabergoline impurity B[2]	0.6
Cabergoline impurity A[3]	0.8
Cabergoline (Retention time: about 12 minutes)	1.0
Cabergoline impurity C[4]	2.9

[1](6a*R*,9*R*,10a*R*)-*N*-[3-(dimethylamino)propyl]-7-(prop-2-enyl)-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-*fg*]quinoline-9-carboxamide,

[2] (6a*R*,9*R*,10a*R*)-*N*⁹-[3-(dimethylamino)propyl]-*N*⁴-ethyl- 7-(prop-2-enyl)-6a,7,8,9,10,10a-hexahydroindolo[4,3-*fg*]quinoline-4,9(6*H*)- dicarboxamide,

[3](6a*R*,9*R*,10a*R*)-7-(prop-2-enyl)-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-*fg*]quinoline-9-carboxylic acid,

[4](6a*R*,9*R*,10a*R*)-*N*⁹-[3-(dimethylamino)propyl]-*N*⁴-ethyl-*N*⁹- (ethylcarbamoyl)-7-(prop-2-enyl)-6a,7,8,9,10,10a-hexahydroindolo[4,3-*fg*]quinoline- 4,9(6*H*)-dicarboxamide.

Inject reference solution (c).The test is not valid unless the resolution between the peaks due to cabergoline and cabergoline impurity A is not less than 3.0.

Inject reference solution (b) and the test solution. Run the chromatogram 4 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak due to cabergoline impurities A and C is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of any peak due to cabergoline impurities B and D is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The sum of areas of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.8 per cent). Ignore any peak with an area less

than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Water (2.3.43). Not more than 0.5 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{26}H_{37}N_5O_2$.

Storage. Store protected from light.

Cabergoline Tablets

Cabergoline Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of cabergoline, $C_{26}H_{37}N_5O_2$.

Usual strengths. 0.25 mg; 0.5 mg; 1 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2)

Apparatus No. 2 (Paddle),
Medium. 500 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 15 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate.

Reference solution. A solution of *cabergoline IPRS* in the dissolution medium suitably diluted to obtain a solution having the same concentration as that of the test solution.

Use the chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{26}H_{37}N_5O_2$ in the tablets.

Q. Not less than 70 per cent of the stated amount of $C_{26}H_{37}N_5O_2$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Use freshly prepared solutions and protected from light.

Test solution. Disperse a quantity of the powdered tablets containing 2.5 mg of Cabergoline in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). A 0.025 per cent w/v solution of *cabergoline IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (c). To 10.0 ml of *0.1 M sodium hydroxide*, add 50 mg of *cabergoline IPRS*. Stir for about 15 minutes. To 1 ml of the suspension, add 1 ml of *0.1 M hydrochloric acid*, and dilute to 10.0 ml with the mobile phase. The main degradation product obtainted is cabergoline impurity A.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 16 volumes of *acetonitrile* and 84 volumes of a buffer solution prepared by dissolving 6.8 g of *monobasic potassium phosphate* in 900 ml of *water*, adjusted to pH 2.0 with *orthophosphoric acid*, dilute to 1000 ml with *water*, add 0.2 ml of *triethylamine*,
- flow rate: 1.3 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 100 µl.

Name	Relative retention time
Cabergoline impurity A[1]	0.8
Cabergoline	1.0
Cabergoline impurity C[2]	1.4

[1](6a*R*,9*R*,10a*R*)-7-(Prop-2-enyl)-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-*fg*]quinoline-9-carboxylic acid,

[2](6a*R*,9*R*,10a*R*)-7-Allyl-*N*-(3-(dimethylazinoyl)propyl)-*N*-(ethylcarbamoyl)-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-*fg*] quinoline -9-carboxamide.

Inject reference solution (c). The test is not valid unless the resolution between the peaks corresponding to cabergoline and cabergoline impurity A is not less than 3.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to cabergoline impurity A is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent) and the area of any peak corresponding to cabergoline impurity C is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). The area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). The sum of areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.5 per cent).

Other tests. Comply with the tests stated under Tablets.

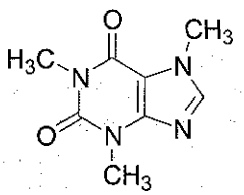
Assay. Determine by liquid chromatography (2.4.14) as described under Related substances.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{26}H_{37}N_5O_2$ in the tablets.

Storage. Store protected from light and moisture.

Caffeine



$C_8H_{10}N_4O_2$ Mol. Wt. 194.2 (anhydrous)

$C_8H_{10}N_4O_2,H_2O$ Mol. Wt. 212.2 (monohydrate)

Caffeine is 3,7-dihydro-1,3,7-trimethyl-1*H*-purine-2,6-dione or its monohydrate.

Caffeine contains not less than 98.5 per cent and not more than 101.5 per cent of $C_8H_{10}N_4O_2$, calculated on the dried basis.

Category. Central nervous system stimulant.

Description. Silky white crystals, white glistening needles or a white crystalline powder; odourless; sublimes readily.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6), after drying the substance under examination at 100° for 1 hour. Compare the spectrum with that obtained with *caffeine IPRS* or with the reference spectrum of caffeine.

B. To 10 mg in a porcelain dish, add 1 ml of *hydrochloric acid* and 0.1 g of *potassium chlorate* and evaporate to dryness on a water-bath. Expose the residue to the vapours of *dilute ammonia solution*; a purple colour is produced which disappears on addition of a solution of a fixed alkali.

C. To a saturated solution add a few drops of *tannic acid solution*; a white precipitate is produced which is soluble in excess of the reagent.

D. To 5 ml of saturated solution add 1.5 ml of *0.05 M iodine*, the solution remains clear. Add a few drops of *dilute hydrochloric acid*; a brown precipitate is formed which dissolves on neutralisation with *sodium hydroxide solution*.

Tests

Appearance of solution. A 1.0 per cent w/v solution is clear (2.4.1) and colourless (2.4.1).

Acidity or alkalinity. Dissolve 0.2 g in 10 ml of boiling *water* and cool. Add 0.1 ml of *bromothymol blue solution*. The solution is coloured green or yellow. Titrate with *0.02 M sodium hydroxide* to a blue colour; not more than 0.1 ml is required.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 10 mg of the substance under examination in 10 ml of the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution. Dissolve 5 mg of *caffeine IPRS* in 5.0 ml of 0.002 per cent w/v solution of *theophylline* in the mobile phase and 10 ml of the mobile phase with the aid of ultrasound and dilute to 25.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 1910 volumes of a solution prepared by dissolving 1.64 g of *anhydrous sodium acetate* in *water* and dilute to 2000 ml with *water*, 50 volumes of *acetonitrile* and 40 volumes of *tetrahydrofuran*, adjusted to pH 4.5 with *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 275 nm,
- injection volume: 10 µl.

The relative retention time with reference to caffeine for theophylline is about 0.69.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to theophylline and caffeine is not less than 6.0 and the tailing factor for each peak is not more than 2.0.

Inject the test solution. The area of any secondary peak is not more than 0.1 per cent and the sum of areas of all the secondary peaks is not more than 0.1 per cent, calculated by area normalization.

Arsenic (2.3.10). Mix 3.3 g with 3 g of *anhydrous sodium carbonate*, add 10 ml of *bromine solution* and mix thoroughly. Evaporate to dryness on a water-bath, gently ignite and dissolve the cooled residue in 16 ml of *brominated hydrochloric acid* and 45 ml of *water*. Remove the excess of bromine with 2 ml of *stannous chloride solution AsT*. The resulting solution complies with the limit test for arsenic (3 ppm).

Heavy metals (2.3.13). Dissolve 1.0 g in 5 ml of *0.1 M hydrochloric acid* and dilute to 25 ml with *water*. The solution complies with the limit test for heavy metals, Method A (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent (for the anhydrous form) and between 5.0 per cent to 9.0 per cent (for the monohydrate form), determined on 1.0 g by drying in an oven at 105° for 1 hour.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.02 per cent w/v solution of *caffeine IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 955 volumes of buffer solution prepared by dissolving 0.82 g of *anhydrous sodium acetate* in 1000 ml of *water*, adjusted to pH 4.5 with *glacial acetic acid*, 25 volumes of *acetonitrile* and 20 volumes of *tetrahydrofuran*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 275 nm,
- injection volume: 20 µl.

The retention time of the principal peak is about 10.0 minutes.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 4000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{10}N_4O_2$.

Storage. Store protected from light and moisture.

Labelling. The label states whether it is anhydrous or monohydrate.

Caffeine Citrate Oral Solution

Caffeine Citrate Oral Solution is a solution of caffeine citrate, prepared by the interaction of caffeine and citric acid monohydrate, in a suitable aqueous vehicle.

Caffeine Citrate Oral Solution contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of caffeine citrate, $C_8H_{10}N_4O_2$, $C_6H_8O_7$.

Usual strength. 20 mg per ml (equivalent to 10 mg of caffeine base).

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with reference solution (a).

B. It gives reaction (B) of citrates (2.3.1).

Tests

Other tests. Comply with the tests stated under Oral Solution.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a quantity of oral solution containing 50 mg of caffeine to 250.0 ml with *water* and filter.

Reference solution (a). A 0.02 per cent w/v solution of *caffeine IPRS* in *water*.

Reference solution (b). A solution containing 0.02 per cent w/v of *caffeine IPRS* and 0.0004 per cent w/v of *theophylline* in *water*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 4 volumes of *tetrahydrofuran*, 5 volumes of *acetonitrile* and 191 volumes of *0.01M sodium acetate*, adjusted to pH 4.5 with *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 275 nm,
- injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to caffeine and theophylline is not less than 6.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_8H_{10}N_4O_2$,$C_6H_8O_7$ and determining the weight per ml (2.4.29) of the oral solution.

1 mg of $C_8H_{10}N_4O_2$ is equivalent to 0.002 g of $C_8H_{10}N_4O_2$,$C_6H_8O_7$.

Labelling. The label states the quantity of active ingredient in terms of the amount of caffeine citrate and the equivalent amount of caffeine.

Calamine

Prepared Calamine

Calamine is Zinc Oxide with a small proportion of ferric oxide.

Calamine contains not less than 98.0 per cent and not more than 100.5 per cent of ZnO, calculated on the ignited basis.

Category. Topical protectant.

Description. A fine, amorphous, impalpable, pink or reddish-brown powder.

Identification

A. Shake 1 g with 10 ml of *dilute hydrochloric acid* and filter; the filtrate gives the reactions of zinc salts (2.3.1).

B. To 1 g add 10 ml of *dilute hydrochloric acid*, heat to boiling and filter. To the filtrate add a few drops of *ammonium thiocyanate solution*; a reddish colour is produced.

Tests

Acid-insoluble substances. Not more than 1 per cent w/w, determined by the following method. Dissolve 1.0 g in 25 ml of warm *dilute hydrochloric acid*. If any insoluble residue remains, filter, wash with *water*, dry to constant weight at 105°, cool and weigh.

Alkaline substances. Digest 1.0 g with 20 ml of warm *water*, filter and add 2 drops of *phenolphthalein solution* to the filtrate. If a red colour is produced, not more than 0.2 ml of *0.05 M sulphuric acid* is required to decolorise it.

Water-soluble dyes. Shake 1.0 g with 10 ml of *water* and filter; the filtrate is colourless.

Ethanol-soluble dyes. Shake 1.0 g with 10 ml of *ethanol (90 per cent)* and filter; the filtrate is colourless.

Arsenic (2.3.10). Dissolve 1.25 g in 15 ml of *brominated hydrochloric acid AsT*, add 45 ml of *water* and remove the excess of bromine with a few drops of *stannous chloride solution AsT*. The resulting solution complies with the limit test for arsenic (8 ppm).

Lead. Dissolve 2.0 g in a mixture of 20 ml of *water* and 5 ml of *glacial acetic acid*, filter and add 0.25 ml of *potassium chromate solution*; the solution remains clear for 5 minutes.

Calcium. Dissolve 0.5 g in a mixture of 10 ml of *water* and 2.5 ml of *glacial acetic acid* by warming on a water-bath, if necessary and filter. To 0.5 ml of the filtrate, add 15 ml of *dilute ammonia solution* and 2 ml of a 2.5 per cent w/v solution of *ammonium oxalate* and allow to stand for 2 minutes; the solution remains clear.

Soluble barium salts. To the remainder of the filtrate obtained in the test for Calcium add 2 ml of *1 M sulphuric acid* and allow to stand for 5 minutes; the solution remains clear.

Chlorides (2.3.12). Dissolve 0.33 g in *water* with the addition of 1 ml of *nitric acid* and dilute to 30 ml with *water*. The resulting solution complies with the limit test for chlorides (750 ppm).

Sulphates (2.3.17). Dissolve 0.025 g in *water* with the addition of 3 ml of *2 M hydrochloric acid* and dilute to 15 ml with *water*; filter. The filtrate complies with the limit test for sulphates (0.6 per cent).

Loss on ignition (2.4.20). Not more than 2.0 per cent, determined on 2.0 g by igniting to constant weight at a temperature not less than 900°.

Microbial contamination (2.2.9). 1.0 g is free from *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

Assay. Weigh accurately about 1.5 g and digest with 50.0 ml of *0.5 M sulphuric acid*, applying gentle heat until no further solution occurs. Filter and wash the residue with hot *water* until the last washing is neutral to *litmus paper*. To the combined filtrate and washings, add 2.5 g of *ammonium chloride*, cool and titrate with *1 M sodium hydroxide* using *methyl orange solution* as indicator.

Repeat the operation without the substance under examination. The difference between the titrations represents the amount of sodium hydroxide required.

1 ml of *0.5 M sulphuric acid* is equivalent to 0.04068 g of ZnO.

Storage. Store protected from light and moisture.

Aqueous Calamine Cream

Calamine	40 g
Zinc Oxide	30 g
Liquid Paraffin	200 g
Self-Emulsifying Glyceryl Monostearate	50 g
Cetostearyl Alcohol	40 g
Cetomacrogol 1000	10 g
Phenoxyethanol	5 g
Purified Water, freshly boiled and cooled	625 g

Melt together the Cetostearyl Alcohol and Cetomacrogol 1000, stir until cold and dissolve this mixture and the Self-Emulsifying Glyceryl Monostearate in the Liquid Paraffin at 60°. Add with rapid stirring to a solution of the Phenoxyethanol in 450 g of the Purified Water at the same temperature and stir until cold. Triturate the Calamine and the Zinc Oxide with the remainder of the Purified Water and incorporate in the cream with stirring.

Aqueous Calamine Cream contains not less than 6.30 per cent and not more than 7.67 per cent w/w of ZnO.

Identification

The residue obtained in the Assay is yellow when hot and white when cool.

Tests

Other tests. Comply with the tests stated under Creams.

Assay. Weigh accurately about 4.0 g. Heat carefully, taking care to avoid spurting, until the liquid is completely evaporated and the solid is charred. Ignite the residue to constant weight at a temperature of not less than 900°.

Storage. Store at a temperature not exceeding 30°. Do not freeze.

Labelling. The label states (1) the concentrations of Calamine and Zinc Oxide in the preparation; (2) that the preparation is intended for external use only; (3) the storage conditions.

Calamine Lotion

Calamine	150 g
Zinc Oxide	50 g
Bentonite	30 g
Sodium Citrate	5 g
Liquefied Phenol	5 ml
Glycerin	50 ml
Purified Water, freshly boiled and cooled sufficient to produce	1000 ml

Triturate the Calamine, the Zinc Oxide and the Bentonite with a solution of the Sodium Citrate in about 700 ml of Purified Water and add the Liquified Phenol, the Glycerin and sufficient Purified Water to produce 1000 ml. Calamine Lotion contain not less than 18.0 per cent w/v and not more 22.0 per cent w/v of zinc oxide, ZnO.

Identification

A. To 2 ml add 2 ml of *periodic acid reagent*, shake, centrifuge and add 0.5 ml of the supernatant liquid to 2 ml of *ammonical silver nitrate solution* in a test-tube; a silver mirror is produced on the walls of the tube.

B. Mix 2 ml with 50 ml of *water*, centrifuge and decant the supernatant liquid. Suspend the residue in 20 ml of *water*, add 1 ml of *hydrochloric acid*, mix and filter. 5 ml of the filtrate, after neutralisation by dropwise addition of *2 M sodium hydroxide*, gives the reactions of zinc salts (2.3.1).

Tests

Microbial contamination (2.2.9). 1.0 g is free from *Staphylococcus aureus* and *Pseudomonas aeruginosa.*

Other tests. Comply with the tests stated under Lotions.

Assay. Weigh 0.5 g in a porcelain dish, heat gently over a small flame until the base is completely volatilised or charred. Increase the heat until all the carbon is removed. Dissolve the residue in 10 ml of *2 M acetic acid* and add sufficient *water* to produce 50 ml. Keep the solution on water bath for about 10 minutes. Cool it and to the resulting solution add about 50 mg of *xylenol orange triturate* and sufficient *hexamine* to produce violet-pink colour. Add a further 2 g of *hexamine* and titrate with *0.05 M disodium edetate* until the solution becomes yellow.

Calculate the content of ZnO, determining the weight per ml (2.4.29) of the lotion.

1 ml of *0.05 M disodium edetate* is equivalent to 0.00407 g of ZnO.

Storage. Store at a temperature not exceeding 30°. Do not freeze.

Labelling. The label states (1) the concentrations of Calamine and Zinc Oxide in the preparation; (2) that the preparation is intended for external use only; (3) that the contents should be shaken before use; (4) the conditions under which the preparation should be stored.

Calamine Ointment

Calamine	150 g
White Soft Paraffin	850 g

Triturate the calamine with part of the White Soft Paraffin until smooth and gradually incorporate the remainder of the White Soft Paraffin.

Calamine Ointment contains not less than 13.5 per cent and not more than 16.5 per cent w/w of ZnO.

Identification

The residue obtained in the Assay is yellow when hot and white when cool.

Tests

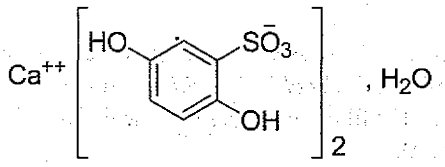
Other tests. Comply with the tests stated under Ointments.

Assay. Weigh accurately about 1.0 g. Heat gently until the base is completely volatalised or charred. Increase the heat until all the carbon is removed and ignite the residue until, after further ignition, two successive weighings do not differ by more than 0.2 per cent of the weight of the residue.

Storage. Store in well-closed containers, at a temperature not exceeding 30°.

Labelling. The label states (1) the concentration of Calamine in the preparation; (2) that the preparation is intended for external use only; (3) the storage conditions.

Calcium Dobesilate Monohydrate



$C_{12}H_{10}CaO_{10}S_2, H_2O$ Mol Wt. 436.4

Calcium Dobesilate Monohydrate is calcium di(2,5-dihydroxybenzenesulfonate) monohydrate.

Calcium Dobesilate Monohydrate contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{12}H_{10}CaO_{10}S_2$, calculated on the anhydrous basis.

Category. Indicated in prostatic hypertrophy.

Description. A white to almost white, hygroscopic powder.

Identification

A. When examined in the range 210 nm to 350 nm (2.4.7) a 0.0025 per cent w/v solution shows absorption maxima at 221 nm and 301 nm. Specific absorbance at the absorption maximum at 301 nm is 174 to 181.

B. To 5.0 ml of solution A, add a mixture of 1 ml of *ferric chloride solution*, 1 ml of 1.0 per cent w/v solution of *potassium ferricyanide* and 0.1 ml of *nitric acid*. A blue colour and a precipitate are immediately produced.

C. 2 ml of solution A gives reaction (A) of calcium (2.3.1).

Tests

Solution A. A 10.0 per cent w/v solution in *carbon dioxide-free water*.

Appearance of solution. Solution A is clear (2.4.1) and colourless (2.4.1).

pH (2.4.24). 4.5 to 6.0, determined on solution A.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in 10.0 ml of *water*.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *water*. Dilute 1.0 ml of the solution to 10.0 ml with *water*.

Reference solution (b). A solution containing 0.001 per cent w/v, each of, the substance under examination and dobesilate impurity A in *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with spherical end-capped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 10 volumes of *acetonitrile* and 90 volumes of buffer solution prepared by mixing 1.2 g of *anhydrous sodium dihydrogen phosphate* in 900 ml of *water*, adjusted to pH 6.5 with *disodium hydrogen phosphate solution* and dilute to 1000 ml with *water*.
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Dobesilate (Retention time: about 6 minutes)	1.0	---
Dobesilate impurity A[1]	1.7	0.6

[1]hydroquinone.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to dobesilate and dobesilate impurity A is not less than 8.0.

Inject reference solution (a) and the test solution. Run the chromatogram 2.5 times the retention time of the principal peak. In the chromatogram obtained with test solution, the area of the peak due to dobesilate impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). The sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 1.33 g complies with the limit test for heavy metals, method B (15 ppm).

Iron (2.3.14). 10 ml of solution A complies with the limit test for iron (10 ppm), using 1.0 ml of *iron standard solution (10 ppm)*.

Water (2.3.43). 4.0 to 6.0 per cent, determined on 0.5 g.

Assay. Dissolve 0.2 g in a mixture of 10 ml of *water* and 40 ml of *dilute sulphuric acid*. Titrate with *0.1 M cerium sulphate*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M cerium sulphate* is equivalent to 0.01045 g of $C_{12}H_{10}CaO_{10}S_2$.

Storage. Store protected from light and moisture.

Calcium Stearate

Octadecanoic acid, calcium salt

Calcium Stearate, is a compound of calcium with a mixture of solid organic acids obtained from fats and consists chiefly of variable proportions of calcium stearate and calcium palmitate.

Calcium Stearate contains the equivalent of not less than 9.0 per cent and not more than 10.5 per cent of calcium oxide (CaO). Stearic acid in the fatty acid fraction is not less than 40.0 per cent and sum of stearic acid and palmitic acid in the fatty acid fraction is not less than 90.0 per cent.

Category. Pharmaceutical aid.

Description. A white or almost white powder.

Identification

A. Heat 1 g with a mixture of 25 ml of *water* and 5 ml of *hydrochloric acid*; fatty acids are liberated and appear as an oily layer floating on the surface of the liquid. The water layer gives the tests for calcium (2.3.1).

B. Mix 25 g with 200 ml of hot *water*, add 60 ml of *2 M sulphuric acid*, and heat the mixture, with frequent stirring, until the separated fatty acid layer is clear. Wash the fatty acids with boiling *water* until free from sulphate, collect them in a small beaker, and warm on a steam bath until the *water* has separated and the fatty acids are clear. Allow the acids to cool, pour off the water layer, melt the acids, filter into a dry beaker, and dry at 105° for 20 minutes; the fatty acids so obtained congeal at a temperature not below 54° (2.4.10).

Tests

Compositions of fatty acids. Determine by gas chromatography (2.4.13).

Test solution. Dissolve 0.1 g of the substance under examination in 5 ml of *boron trifluoride- methanol solution*. Boil under a reflux condenser for 10 minutes. Add 4 ml of *heptane* through the condenser. Boil under a reflux condenser for 10 minutes. Allow to cool. Add 20 ml of a saturated *sodium chloride solution*. Shake and allow the layers to separate. Remove about 2 ml of the organic layer and dry over 0.2 g of *anhydrous sodium sulphate*. Dilute 1.0 ml of the solution to 10.0 ml with *heptane*.

Reference solution. Dissolve 50.0 mg, each of, *palmitic acid IPRS* and *stearic acid IPRS* in 5 ml of *boron trifluoride-methanol solution*. Boil under a reflux condenser for 10 minutes. Add 4 ml of *heptane* through the condenser. Boil under a reflux condenser for 10 minutes. Allow to cool. Add 20 ml of a saturated *sodium chloride solution*. Shake and allow the layers to separate. Remove about 2 ml of the organic layer and dry over 0.2 g of *anhydrous sodium sulphate*. Dilute 1.0 ml of the solution to 10.0 ml with *heptane*.

Chromatographic system

- a capillary column 30 m x 0.32 mm, packed with fused silica coated with macrogol 20000 (film thickness 0.5 µm);
- temperature:

column	time (min)	temperature (°)
	0-2	70
	2-36	70-240
	36-41	240

- Inlet port at 220° and detector at 260°,
- flame ionization detector,
- flow rate: 2.4 ml per minute using nitrogen as carrier gas.

The relative retention time with reference to methyl stearate for methyl palmitate is about 0.88.

Inject 1 µl of the reference solution. The test is not valid unless the resolution between the peaks due to methyl stearate and methyl palmitate is not less than 5.0.

Inject the reference solution and the test solution.

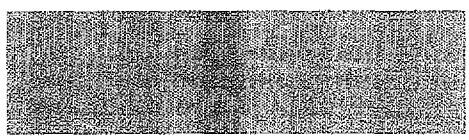
Calculate the content of palmitic acid and stearic acid.

Heavy metals (2.3.13).Place 2.5 g in a porcelain dish, place a 500 mg portion in a second dish to provide the control, and to each add 5 ml of a 1 in 4 solution of *magnesium nitrate* in *alcohol*. Cover the dishes with 7.5 cm short-stem funnels so that the stems are straight up. Heat on a hot plate at low heat for 30 minutes, then heat at medium heat for 30 minutes, and cool. Remove the funnels, add 2 ml of *standard lead solution* (*20 ppm Pb*) to the control, and heat each dish over a suitable burner until most of the carbon is burned off. Cool, add 10 ml of *nitric acid*, and transfer the solutions into 250 ml beakers. Add 5 ml of 70 per cent *perchloric acid*, cautiously evaporate to dryness, add 2 ml of *hydrochloric acid* to the residues, and wash down the insides of the beakers with *water*. Evaporate carefully to dryness again, swirling near the dry point to avoid spattering. Repeat the hydrochloric acid treatment, then cool, and dissolve the residues in about 10 ml of *water*. To each solution add 1 drop of *phenolphthalein solution* and add *sodium hydroxide solution* until the solutions just turn pink, then add *3 M hydrochloric acid* until the solutions become colourless. Add 1 ml of *1 M acetic acid* and a small amount of charcoal to each solution, and filter through filter paper into 50 ml Nessler cylinders. Wash with water, dilute with *water* to 40 ml, add 1.2 ml of *thioacetamide reagent* and 2 ml of *pH* 3.5 *acetate buffer* to each tube, and allow to stand for 5 minutes; the color of the test solution does not exceed that of the control *(10 ppm Pb)*.

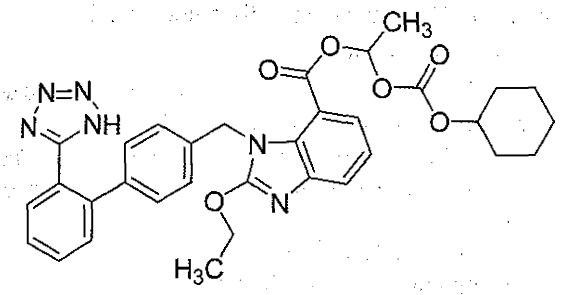
Loss on drying (2.4.19). Not more than 4.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Boil about 1.2 g accurately weighed, with 50 ml of *1 M sulphuric acid* for about 3 hours using a watch glass cover to avoid splattering, or until the separated fatty acid layer is clear, adding *water*, if necessary to maintain the original volume. *[Note-Stirring may be helpful in obtaining a clear layer and decreasing extraction time.]* Cool, filter, and wash the filter and the flask thoroughly with *water* until the last washing is not acid to *litmus*. Neutralize the filtrate with 1 *M sodium hydroxide* to *litmus*. While stirring, preferably with a magnetic stirrer, titrate with *0.05 M disodium edetate* as follows. Add about 30 ml from a 50-ml burette, then add 1 ml of *1 M sodium hydroxide* and 300 mg of *hydroxy naphthol blue*, and continue the titration to a blue end-point.

1 ml of *0.05 M disodium edetate* is equivalent to 0.002804 g of calcium oxide.



Candesartan Cilexetil



$C_{33}H_{34}N_6O_6$ Mol. Wt. 610.7

Candesartan Cilexetil is (±)-1-Hydroxyethyl 2-ethoxy-1-[p-(*o*-1*H*-tetrazol-5-ylphenyl)benzyl]-7-benzimidazolecarboxylate, cyclohexyl carbonate (ester).

Candesartan Cilexetil contains not less than 98.7 per cent and not more than 101.0 per cent of $C_{33}H_{34}N_6O_6$, calculated on anhydrous basis.

Category. Antihypertensive.

Production

As Nitrosamines are classified as probable human carcinogens, their presence in candesartan cilexetil should be avoided or limited as much as possible. For this reason, manufacturers of candesartan cilexetil for human use are expected to perform an assessment of the risk of *N*-nitrosamine formation and contamination during their manufacturing process; if this assessment identifies a potential risk, the manufacturing process should be modified to minimise contamination and a control strategy implemented to detect and control *N*-nitrosamine impurities in candesartan cilexetil. The general chapter 5.11. Nitrosamine Impurities is available to assist manufacturers.

Description. A white to off-white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *candesartan cilexetil IPRS* or with the reference spectrum of candesartan cilexetil.

B. In the Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with reference solution (b).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 60 volumes of *acetonitrile* and 40 volumes of *water*.

Test solution. Dissolve 20 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). A solution containing 0.004 per cent w/v of *candesartan cilexetil IPRS* and 0.0125 per cent w/v of *acenaphthene* in the solvent mixture.

Reference solution (b). A 0.0004 per cent w/v solution of *candesartan cilexetil IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm × 3.9 mm, packed with octadecylsilane bonded to porous silica (4 µm),
- mobile phase: A. a mixture of 57 volumes of *acetonitrile*, 1 volume of *glacial acetic acid* and 43 volumes of *water*.
  B. a mixture of 90 volumes of *acetonitrile* 1 volume of *glacial acetic acid* and 10 volumes of *water*.
- a gradient programme using the conditions given below,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
30	0	100
31	100	0
40	100	0

Name	Relative retention time
Ethyl candesartan A[1]	0.4
Desethyl candesartan cilexetil B[2]	0.5
Candesartan Cilexetil	1.0
N^2-Ethyl candesartan cilexetil C[3]	2.0

[1]Ethyl 1-{[2-(1*H*-tetrazol-5-yl) biphenyl-4-yl]methyl}-2-ethoxy-benzimidazole-7-carboxylate,

[2]±1-(Cyclohexyloxycarbonyloxy)ethyl 1-{[2-(1*H* -tetrazol-5-yl) biphenyl-4-yl]methyl}-2-oxobenzimidazole-7-carboxylate.

[3]±1-(Cyclohexyloxycarbonyloxy) ethyl 2-ethoxy-1-{[2-(*N*-ethyl-tetrazol-5-yl) biphenyl-4-yl]methyl} benzimidazole-7-carboxylate.

[NOTE —The mobile phase used for testing system suitability is 100 per cent mobile phase A in an isocratic mode].

Inject reference solution (a) and (b). The test is not valid unless the resolution between candesartan cilexetil and acenaphthene is not less than 5.0 for reference solution (a) and the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 3.0 per cent for reference solution (b).

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to ethyl candesartan and N^2 Ethyl candesartan cilexetil, each is not more than 0.2 times the area of the principal peak in the chromatogram obtained with the reference solution

(b) (0.2 per cent), the area of any peak due to desethyl candesartan cilexetil is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent). The area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The sum of the areas of all secondary peaks is not more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.6 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.3 per cent, determined on 1 g.

Assay. Dissolve 0.85 g in a 100 ml of *glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.06107 g of $C_{33}H_{34}N_6O_6$.

Storage. Store protected from moisture and at a temperature not exceeding 30°.

Candesartan Cilexetil Tablets

Candesartan Cilexetil Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of candesartan cilexetil $C_{33}H_{34}N_6O_6$.

Usual strengths. 4 mg; 8 mg; 16 mg.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. When examined in the range of 200 to 400 nm (2.4.7), a 0.08 per cent w/v solution in a mixture of 70 volumes of *acetonitrile* and 30 volumes of *water* shows an absorption maxima and minima as that of reference solution prepared in the similar manner as test solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of 0.35 per cent w/v solution of *polysorbate 20* in *0.05 M phosphate buffer pH 6.5*.

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A 0.045 per cent w/v solution of *candesartan cilexetil IPRS* in *acetonitrile*. Dilute 1.0 ml of the solution to 100.0 ml with the dissolution medium.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 55 volumes of *acetonitrile*, 0.1 volume of *trifluoroacetic acid* and 45 volumes of *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 50 µl.

Inject the reference solution and the test solution.

Q. Not less than 80 per cent of the stated amount of $C_{33}H_{34}N_6O_6$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 50 mg of candesartan cilexetil with 30 ml of *acetonitrile* and ultrasound for 15 minutes with intermittent shaking in cold water and dilute to 50.0 ml with *acetonitrile* and filter.

Reference solution (a). A solution containing 0.005 per cent w/v, each of, *candesartan cilexetil impurity A IPRS*, *candesartan cilexetil impurity B IPRS*, *candesartan cilexetil impurity D IPRS* and *candesartan cilexetil impurity F IPRS* in *acetonitrile*.

Reference solution (b). A 0.01 per cent w/v solution of *candesartan cilexetil IPRS* in *acetonitrile*.

Reference solution (c). A 0.05 per cent w/v solution of *candesartan cilexetil impurity G IPRS* in *methanol*.

Reference solution (d). Dilute 3.0 ml of reference solution (a), 1.0 ml each of reference solution (b) and (c) to 100.0 ml with *acetonitrile*.

Reference solution (e). Dilute 1.0 ml of reference solution (b) to 100.0 ml with *acetonitrile*.

Chromatographic system

- a stainless steel column 10 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (3.5 µm),
- mobile phase: A. a mixture of 10 volumes of *acetonitrile*, 0.1 volume of *trifluoroacetic acid* and 90 volumes of *water*,

  B. a mixture of 90 volumes of *acetonitrile*, 0.1 volume of *trifluoroacetic acid* and 10 volumes of *water*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)

[3]1-(Cyclohexyloxycarbonyloxy)ethyl 1-{[2'-(1*H*-tetrazol-5-yl)biphenyl-4-yl]methyl}-2-hydroxybenzimidazole-7-carboxylate,

[4]1-{[(Cyclohexyloxy)carbonyl]oxy}ethyl3-({2'-(2-ethyl-1*H*-tetrazol-5-yl)-[1,1'-biphenyl]-4-yl}methyl)-2-oxo-2,3-dihydro-1*H*-benzimidazole-4-carboxylate,

[5]1-(Cyclohexyloxycarbonyloxy)ethyl2-ethoxy-1-{[2'-(2-ethyltetrazol-5-yl)biphenyl-4-yl]methyl}benzimidazole-7-carboxylate.6l3-*O*-decladinosylazithromycin,

*It is a Process related impurity not included in total impurities.

Inject reference solution (d) and (e). The test is not valid unless the resolution between candesartan cilexetil impurity B and candesartan cilexetil peaks is not less than 5.0 with reference solution (d), the tailing factor is not more than 2.0 and the relative standard deviation is not more than 10 per cent with reference solution (e).

Inject reference solution (e) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to candesartan cilexetil impurity G is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (e) (1.0 per cent), the area of any peak due to candesartan cilexetil impurity B and F, each is not more than 15 times the area of the principal peak in the chromatogram obtained with reference solution (e) (1.5 per cent), the area of any peak due to candesartan cilexetil impurity D is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (e) (0.5 per cent). The area of any other secondary peak is not more than twice the area of the principal peak in the chromatogram obtained reference solution (e) (0.2 per cent) and the sum of areas of all the secondary peaks is not more than 40 times the area of the principal peak in the chromatogram obtained with reference solution (e) (4.0 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay using the following solutions.

Test solution. Disperse 1 tablet with sufficient quantity of the solvent mixture with the aid of the ultrasound to obtain a solution containing 0.04 per cent w/v of candesartan cilexetil.

Reference solution. A 0.04 per cent w/v solution of *candesartan cilexetil IPRS* in the solvent mixture.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14),

Solvent mixture. 70 volumes of *acetonitrile* and 30 volumes of *water.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 20 mg of Candesartan Cilexitil in about 20 ml of the solvent mixture with the aid of ultrasound for 25 minutes with intermittent shaking. Allow to cool and dilute to 25.0 ml with the solvent mixture and filter.

Reference solution. A 0.08 per cent w/v solution of *candesartan cilexetil IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 55 volumes of *acetonitrile*, 0.1 volume of *trifluoroacetic acid* and 45 volumes of *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 282 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{33}H_{34}N_6O_6$.

Storage. Store protected from light and moisture at a temperature not exceeding 30°.

Candesartan Cilexetil and Hydrochlorothiazide Tablets

Candesartan Cilexetil and Hydrochlorothiazide Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of stated amount of candesartan cilexetil, $C_{33}H_{34}N_6O_6$ and hydrochlorothiazide, $C_7H_8ClN_3O_4S_2$.

Usual strength. Candesartan Cilexetil, 16 mg and Hydrochlorothiazide, 12.5 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with reference solution (c).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of a 0.35 per cent w/v *polysorbate 20* in 0.05 *M phosphate buffer pH 6.5*.

Speed and Time: 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14),

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution (a). A 0.072 per cent w/v solution of *candesartan cilexetil IPRS* in *acetonitrile*.

Reference solution (b). A 0.028 per cent w/v solution of *hydrochlorothiazide IPRS* in *acetonitrile*.

Reference solution (c). Dilute suitable volume of reference solution (a) and reference solution (b) in the dissolution medium to obtain a solution having similar concentration to that of the test solution.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- sample temperature: 10°,
- mobile phase: A. a mixture of 10 volumes of *acetonitrile*, 90 volumes of *water* and 0.1 volume of *trifluoroacetic acid*,

  B. a mixture of 90 volumes of *acetonitrile*, 10 volumes of *water* and 0.1 volume of *trifluoroacetic acid*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 264 nm,
- injection volume: 50 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
3	80	20
5	30	70
10	30	70
13	80	20
16	80	20

Inject reference solution (c). The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for both the peaks is not more than 2.0 per cent.

Inject reference solution (c) and the test solution.

Calculate the content of $C_{33}H_{34}N_6O_6$ and $C_7H_8ClN_3O_4S_2$ in the medium.

Q. Not less than 80 per cent each of the stated amount of $C_{33}H_{34}N_6O_6$ and $C_7H_8ClN_3O_4S_2$.

Related substances. Determine by liquid chromatography (2.4.14),

Solvent mixture A. 70 volumes of *acetonitrile* and 30 volumes of *water*.

Solvent mixture B. 50 volumes of *acetonitrile* and 50 volumes of *water*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 75 mg of Candesartan Cilexetil in 30 ml of solvent mixture A with the aid of ultrasound for 20 minutes with intermittent shaking in cold water and dilute to 50.0 ml with solvent mixture A.

Reference solution (a). A solution containing 0.005 per cent w/v, each of, *benzothiadiazine related compound A IPRS*, *hydrochlorothiazide IPRS* and 0.01 per cent w/v of *chlorothiazide IPRS* in solvent mixture B. Dilute 5.0 ml of the solution to 100.0 ml with solvent mixture A.

Reference solution (b). A solution containing 0.16 per cent w/v of *candesartan cilexetil IPRS* and 0.06 per cent w/v of *hydrochlorothiazide IPRS* in solvent mixture A. Dilute 1.0 ml of the solution to 200.0 ml with solvent mixture A.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: A. a mixture of 10 volumes of *acetonitrile*, 90 volumes of *water* and 0.1 volume of *trifluoroacetic acid*,

  B. a mixture of 90 volumes of *acetonitrile*, 10 volumes of *water* and 0.1 volume of *trifluoroacetic acid*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	95	5
8	95	5
15	60	40
20	60	40
30	40	60
35	30	70
45	20	80
50	0	100
60	0	100
62	95	5
70	95	5

Name	Relative retention time	Correction factor
Candesartan cilexetil related compound G[1]	0.51	0.90
Candesartan cilexetil related compound A[2]*	0.73	—
Benzothiadiazine related compound A[3]	0.75	0.87
Chlorothiazide[4]	0.85	2.08
Candesartan cilexetil related compound B[5]	0.89	1.11
Candesartan cilexetil	1.00	—
Candesartan cilexetil related compound D[6]	1.06	1.10
Candesartan cilexetil related compound F[7]	1.24	1.20

[1]1-{[2'-(1*H*-Tetrazol-5-yl)biphenyl-4-yl]methyl}-2-ethoxybenzimidazole-7-carboxylic acid,

[2]Ethyl 1-{[2'-(1*H*-tetrazol-5-yl)biphenyl-4-yl]methyl}-2-ethoxybenzimidazole-7-carboxylate,

*Process related impurity not included in Total impurities,

[3]4-Amino-6-chloro-1,3-benzenedisulfonamide,

[4]6-Chloro-2-*H*-1,2,4-benzothiadiazine-7-sulfonamide-1-1-dioxide,

[5]1-(Cyclohexyloxycarbonyloxy)ethyl-1-{[2'-(1H-tetrazol-5-yl) biphenyl-4-yl]methyl}-2-hydroxybenzimidazole-7-carboxylate,

[6]1-{[(Cyclohexyloxycarbonyloxy)carbonyl]oxyethyl 3-{[2'-(2-ethyl-2*H*-tetrzol-5-yl)biphenyl-4-yl]methyl}-2-oxo-2,3-dihydro-1H-benzimidazole-4-carboxylate,

[7]1-(Cyclohexyloxycarbonyloxy)ethyl 2-ethoxy-1-{[2'-(2-ethyltetrazol-5-yl)biphenyl-4-yl]methyl}benzimidazole-7-carboxylate.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks corresponding to benzothiadiazine related compound A and chlorothiazide is not less than 1.5, chlorothiazide and hydrochlorothiazide is not less than 1.5 in the chromatogram obtained with reference solution (a). The tailing factor is not more than 2.0 and the relative standard deviation for replicate injection is not more than 10.0 per cent for both candesartan cilexetil and hydrochlorothiazide peaks in the chromatogram obtained with reference solution (b).

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to candesartan cilexetil related compound G is not more than 1.9 times the area of the candesartan cilexetil peak in the chromatogram obtained with reference solution (b) (1.0 per cent), the area of any peak due to benzothiadiazine related compound A is not more than 5 times the area of the hydrochlorothiazide peak in the chromatogram obtained with reference solution (b) (1.0 per cent), the area of any peak due to chlorothiazide is not more than 2.5 times the area of the hydrochlorothiazide peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any peak due to candesartan cilexetil related compound B is not more than 3.28 times the area of the candesartan cilexetil peak in the chromatogram obtained with reference solution (b) (1.75 per cent), the area of any peak due to candesartan cilexetil related compound D is not more than 0.94 times the area of the candesartan cilexetil peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any peak due to candesartan cilexetil related compound F is not more than 2.82 times the area of the candesartan cilexetil peak in the chromatogram obtained with reference solution (b) (1.5 per cent), the area of any other secondary peak is not more than 0.38 times the area of the candesartan cilexetil peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of areas of all the secondary peaks is not more than 7.5 times the area of the candesartan cilexetil peak in the chromatogram obtained with reference solution (b) (4.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14),

Solvent mixture. 70 volumes of *acetonitrile* and 30 volumes of *water*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 32 mg of Candesartan Cilexetil in the solvent mixture with the aid of ultrasound for about 25 minutes with intermediate shaking and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). A 0.32 per cent w/v solution of *candesartan cilexetil IPRS* in the solvent mixture.

Reference solution (b). A 0.125 per cent w/v solution of *hydrochlorothiazide IPRS* in the solvent mixture.

Reference solution (c). Dilute a suitable volume of reference solution (a) and reference solution (b) in the solvent mixture to obtain a solution having similar concentration to that of the test solution.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 10 volumes of *acetonitrile*, 90 volumes of *water* and 0.1 volume of *trifluoroacetic acid*,

  B. a mixture of 90 volumes of *acetonitrile*, 10 volumes of *water* and 0.1 volume of *trifluoroacetic acid*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 282 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
4	90	10
6	30	70
15	30	70
17	90	10
20	90	10

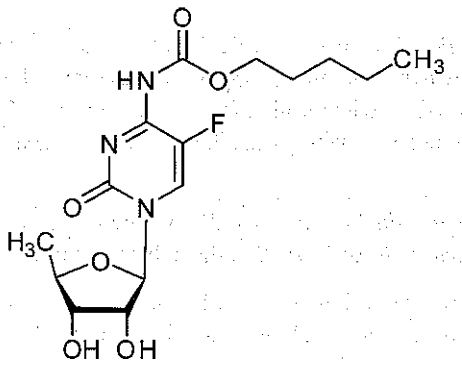
Inject reference solution (c). The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent for both the components.

Inject reference solution (c) and the test solution.

Calculate the content of $C_{33}H_{34}N_6O_6$ and $C_7H_8ClN_3O_4S_2$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Capecitabine



$C_{15}H_{22}FN_3O_6$ Mol. Wt. 359.4

Capecitabine is 5′-deoxy-5-fluoro-*N*-[(pentyloxy)carbonyl] cytidine.

Capecitabine contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{15}H_{22}FN_3O_6$, calculated on the anhydrous basis.

Category. Anticancer.

Description. A white to off-white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *capecitabine IPRS* or with the reference spectrum of capecitabine.

B. In the Assay, the retention time of principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). + 96° to + 100°, determined on 1.0 per cent w/v solution in *methanol*, at 20°.

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay.

Inject the reference solution and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any secondary peak is not more than 1.0 per cent the area of the principal peak. The sum of all the secondary peaks is not more than 2.0 per cent the area of the principal peak.

Heavy metals (2.3.13). 1.0 g of complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.3 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 60 volumes of *water*, 35 volumes of *methanol* and 5 volumes of *acetonitrile*.

Test solution. Dissolve about 60 mg of the substance under examination in 100.0 ml of the solvent mixture.

Reference solution. A 0.06 per cent w/v solution of *capecitabine IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS-3),
- column temperature: 40°,
- sample temperature. 5°,
- mobile phase: A. a mixture of 60 volumes of 0.1 per cent v/v solution of *acetic acid*, 35 volumes of *methanol* and 5 volumes of *acetonitrile*,
  B. a mixture of 80 volumes of *methanol*, 15 volumes of 0.1 per cent v/v solution of *acetic acid* and 5 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume:10 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
5	100	0
20	49	51
30	49	51
31	100	0
40	100	0

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{22}FN_3O_6$.

Storage. Store protected from moisture.

Capecitabine Tablets

Capecitabine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of capecitabine, $C_{15}H_{22}FN_3O_6$.

Usual strength. 500 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *phosphate buffer pH 6.8*,
Speed and time. 50 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve an accurately weighed quantity of *capecitabine IPRS* in the mobile phase and dilute with dissolution medium to obtain a solution having a known concentration similar to the test solution.

Use chromatographic system as described under Assay.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{22}FN_3O_6$.

Q. Not less than 80 per cent of the stated amount of $C_{15}H_{22}FN_3O_6$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing about 100 mg of Capecitabine in the mobile phase, sonicate for 30 minutes and dilute to 100.0 ml with the mobile phase.

Reference solution. A 0.001 per cent w/v solution of *capecitabine IPRS* in the mobile phase.

Use chromatographic system as described under Assay.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent).

Other tests. Comply with the tests stated in the Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and poder 20 tablets. Disperse a quantity of powder containing about 100 mg of Capecitabine in the mobile phase, sonicate for 30 minutes and dilute to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *capecitabine IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as YMC-pack),
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolving 2.5 g of *ammonium acetate* in 1000 ml of *water*, adjusted to pH 4.5 with *trifluoroacetic acid*, 20 volumes of *acetonitrile*, and 20 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the theoretical plates are not less than 2000, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

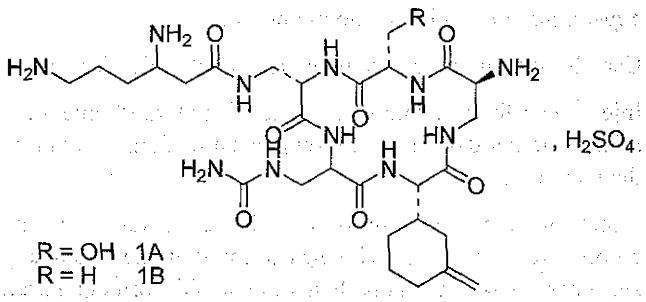
Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{22}FN_3O_6$.

Storage. Store at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the amount of Capecitabine.

Capreomycin Sulphate



Capreomycin 1A (free base)

$C_{25}H_{44}N_{14}O_8$ Mol. Wt. 668.71

Capreomycin 1A is 3,6-Diamino-*N*-({(2*S*,5*S*,11*S*,15*S*,*Z*)-15-amino-2-(hydroxymethyl)-11-[(*R*)-iminohexahydropyrimidin-4-yl]-3,6,9,12,16-pentaoxo-8-(ureidomethylene)-1,4,7,10,13-pentaazacyclohexadecan-5-yl}methyl)hexanamide.

Capreomycin 1B (free base)

$C_{25}H_{44}N_{14}O_7$ Mol. Wt. 652.71

Capreomycin 1B is 3,6-Diamino-*N*-({(2*S*,5*S*,11*S*,15*S*,*Z*)-15-amino-2-(hydroxymethyl)-11-[(*R*)-iminohexahydropyrimidin-4-yl]-3,6,9,12,16-pentaoxo-8-(ureidomethylene)-1,4,7,10,13-pentaazacyclohexadecan-5-yl}methyl)hexanamide.

Capreomycin Sulphate is the disulphate salt of capreomycin, a polypeptide mixture produced by the growth of *Streptomyces capreolus*, suitable for parenteral use.

It has a potency equivalent to not less than 700 µg and not more than 1050 µg of capreomycin per mg.

Category. Antituberculosis.

Description. A white or almost white powder.

Identification

A. In the Capreomycin 1 content, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with the reference solution.

B. It gives reaction A of sulphates (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *water* is clear (2.4.1), when examined immediately after preparation.

pH (2.4.24). 4.5 to 7.5, determined in a 3.0 per cent w/v solution.

Capreomycin I content. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25.0 mg of the substance under examination in 100.0 ml of *water*.

Reference solution. A 0.025 per cent w/v solution of *capreomycin sulphate IPRS* in *water*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with nitrile groups chemically bonded to porous silica particles (5 µm) (Such as Spherisorb CN),
- mobile phase: 55 volumes of the solution prepared by dissolving 0.5 g of *ammonium bisulphate* in 1000 ml of *water*, filter and 45 volumes of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 268 nm,
- injection volume: 20 µl.

The relative retention time with reference to capreomycin 1B for capreomycin 1A is 0.85.

Inject the reference solution. The test is not valid unless the resolution between the two principal peaks is at least 1.5 and the tailing factor is not more than 3.5 for both the peaks.

In the chromatogram obtained with the test solution, the sum of the areas of the two principal peaks, due to capreomycins 1A and 1B, is not less than 90 per cent of the total areas of all the peaks.

Sulphated ash (2.3.18). Not more than 3.0 per cent.

Loss on drying (2.4.19). Not more than 10.0 per cent, determined on 0.1 g by drying in an oven for 4 hours at 100° at a pressure not exceeding 0.7 kPa.

Assay. Determine by the microbiological assay of antibiotics (2.2.10).

Caproemycin Sulphate intended for use in the manufacture of parenteral preparations complies with the following additional requirements.

Bacterial endotoxins (2.2.3). Not more than 0.35 Endotoxin Unit per mg of capreomycin.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from moisture.

Capreomycin Injection

Capreomycin Injection is a sterile material consisting of Capreomycin Sulphate with or without auxiliary agents. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Usual strength. 1 g.

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Capreomycin injection contains an amount of Capreomycin Sulphate equivalent to not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of capreomycin.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

A. In the Capreomycin 1 content, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with the reference solution.

B. It gives reaction A of sulphates (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *water* is clear (2.4.1), when examined immediately after preparation.

pH (2.4.24). 4.5 to 7.5, determined in a 3.0 per cent w/v solution.

Capreomycin I content. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve a quantity of the injection containing about 25 mg of capreomycin in 100 ml of *water*.

Reference solution. A 0.025 per cent w/v solution of *capreomycin sulphate IPRS* in *water*.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with nitrile groups chemically bonded to porous silica particles (5 µm) (Such as Spherisorb CN),
- mobile phase: a mixture of 55 volumes of a solution prepared by dissolving 0.5 g of *ammonium bisulphate* in 1000 ml of *water*, filtered and 45 volumes of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 268 nm,
- injection volume: 20 µl.

he relative retention time with reference to capreomycin 1B for capreomycin 1A is 0.85.

Inject the reference solution. The test is not valid unless the resolution between the two principal peaks is at least 1.5 and the tailing factor is not more than 3.5 for both the peaks.

In the chromatogram obtained with the test solution, the sum of the areas of the two principal peaks, due to capreomycins 1A and 1B, is not less than 90 per cent of the total areas of all the peaks.

Bacterial endotoxins (2.2.3). Not more than 0.35 Endotoxin Unit per mg of capreomycin.

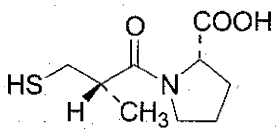
Loss on drying (2.4.19). Not more than 10.0 per cent, determined on 0.1 g by drying in an oven at 100°at a pressure not exceeding 0.7 kPa for 4 hours.

Assay. Determine by the microbiological assay of antibiotics (2.2.10).

Storage. Store protected from moisture, at a temperature not exceeding 25°.

Labelling. The label states the quantity of Capreomycin Sulphate in terms of the equivalent amount of capreomycin.

Captopril



$C_9H_{15}NO_3S$ Mol. Wt. 217.3

Captopril is 1-[(2*S*)-3-mercapto-2-methylpropionyl]-L-proline.

Captopril contains not less than 97.5 per cent and not more than 102.0 per cent of $C_9H_{15}NO_3S$, calculated on the dried basis.

Category. Antihypertensive.

Description. A white to off-white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *captopril IPRS* or with the reference spectrum of captopril.

B. Complies with the test for Specific optical rotation.

C. Melting range (2.4.21) 104° to 110°.

Tests

Specific optical rotation (2.4.22). – 134° to – 125°, determined in a 1.0 per cent w/v solution in *ethanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50.0 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). Dilute 2.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 10.0 mg of the substance under examination in the mobile phase, add 0.25 ml of *0.05 M iodine* and dilute to 100.0 ml with the mobile phase. Dilute 10 ml of the solution to 100 ml with the mobile phase.

Chromatographic system
- a stainless steel column 12.5 cm x 4.0 mm packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 0.05 volume of *orthophosphoric acid*, 50 volumes of *methanol* and 50 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject reference solution (b). The chromatogram shows three peaks. The test is not valid unless the resolution between the last 2 eluting peaks is not less than 2.0.

Inject reference solution (a) and the test solution. Run the chromatogram three times the retention time of the principal peak. In the chromatogram obtained with test solution, the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent) and sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). Ignore any peak with a retention time less than 1.4 minutes.

Heavy metals (2.3.13). 0.66 g complies with the limit test for heavy metals, Method B (30 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 60° at a pressure not exceeding 0.7 kPa.

Assay. Weigh 0.3 g, dissolve in 100 ml of *water* in a stoppered-flask, add 10 ml of *1.8 M sulphuric acid* and 1 g of *potassium iodide*. Titrate with *0.025 M potassium iodate* using 3 ml of *starch solution*, added towards the end-point, as indicator.

1 ml of *0.025 M potassium iodate* is equivalent to 0.03259 g of $C_9H_{15}NO_3S$.

Storage. Store protected from moisture.

Captopril Tablets

Captopril Tablets contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of captopril, $C_9H_{15}NO_3S$.

Usual strengths. 12.5 mg; 25 mg; 50 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *0.01 M hydrochloric acid*,
Speed and time. 50 rpm and 20 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance (2.4.7) of the filtrate, suitably diluted if necessary, at the maximum at about 212 nm.

Calculate the content of $C_9H_{15}NO_3S$ in the medium from the absorbance obtained from a solution of known concentration of *captopril IPRS*.

Q. Not less than 80 per cent of the stated amount of $C_9H_{15}NO_3S$.

Captopril disulphide. Determine by liquid chromatography (2.4.14)

Test solution. Transfer a quantity of the powdered tablets containing 25 mg of Captopril to a centrifuge tube, add 25 ml of *methanol*, centrifuge for 15 minutes and use the supernatant liquid.

Reference solution (a). A 0.003 per cent w/v solution of *captopril disulphide IPRS* in *methanol*.

Reference solution (b). Dilute 1.0 ml of test solution to 100.0 ml with reference solution (a).

Chromatographic system.
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 0.5 volume of *orthophosphoric acid*, 45 volumes of *water* and 55 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution (b). The test is not valid unless, the resolution between the peaks due to captopril and captopril disulphide is not less than 2.0.

Inject reference solution (a)and the test solution. In the chromatogram obtained with test solution the area of any peak corresponding to captopril disulphide is not more than the area of the peak in the chromatogram obtained with reference solution (a) (3.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from exposure to air and use within 8 hours of preparation.

Test solution. Disperse a quantity of the powdered tablets containing about 25.0 mg of Captopril in 25.0 ml of the mobile phase with the aid of ultrasound for 15 minutes, centrifuge and use the clear supernatant liquid.

Reference solution. A 0.1 per cent w/v solution of *captopril IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 to 10 µm),
- mobile phase: a mixture of 55 volumes of *methanol* and 45 volumes of *water* containing 0.05 volumes of *phosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_9H_{15}NO_3S$ in the tablets.

Storage. Store protected from moisture.

Captopril and Hydrochlorothiazide Tablets

Captopril and Hydrochlorothiazide tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of captopril $C_9H_{15}NO_3S$ and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$).

Usual strengths. Captopril, 25 mg and Hydrochlorothiazide, 15 mg; Captopril, 50 mg and Hydrochlorothiazide, 25 mg; Captopril, 25 mg and Hydrochlorothiazide, 25 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the principal peaks in the chromatogram obtained with reference solution (b).

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),

Medium. 900 ml of *0.1 M hydrochloric acid,*

Speed and time. 50 rpm and 20 minutes for captopril and 30 minutes for hydrochlorothiazide,.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution(a). A 0.028 per cent w/v solution of *captopril IPRS* in dissolution medium.

Reference solution(b). A 0.028 per cent w/v solution of *hydrochlorothizide IPRS* in dissolution medium.

Reference solution(c). Dilute reference solution (a) and (b) with the dissolution medium to obtain a solution having a known concentration similar to the test solution.

Use the chromatographic system as described under Assay.

Inject reference solution (c). The relative standard deviation for replicate injections for each peak is not more than 3.0 per cent.

Inject reference solution (c) and the test solution.

Q. Not less than 80 per cent of the stated amount of captopril $C_9H_{15}NO_3S$ and not less than 60 per cent of the stated amount of hydrochlorothiazide $C_7H_8ClN_3O_4S_2$.

Captopril disulphide. Determine by liquid chromatography (2.4.14). Not more than 3.0 per cent.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 25 mg of captopril in 50-ml volumetric flask, add 20 ml of the mobile phase and sonicate for 15 minutes with occasional shaking. Dilute with the mobile phase to volume, and centrifuge. Use the clear supernatant.

Reference solution (a). A solution containing 0.00075 per cent w/v, each of, *Captopril IPRS, hydrochlorothiazide IPRS* and 0.0015 per cent w/v of *Captopril disulphide IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.0015 per cent w/v of *Captopril disulphide IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),

- mobile phase: a mixture of 550 volumes of *water*, 450 volumes of *methanol* and 0.5 volumes of *orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

The relative retention time with reference to captopril disulphide for captopril is about 0.3.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to captopril and captopril disulphide is not less than 4.0 obtained with reference solution (a). Both peaks are properly resolved from hydrochlorothiazide peak and the relative standard deviation for replicate injections is not more than 3.0 per cent obtained with reference solution (b).

Inject reference solution (b) and the test solution.

Calculate the content of captopril disulphide.

Benzothiadiazine related impurity A. Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Reference solution. A solution containing 0.001 per cent w/v of *benzothiadiazine impurity A IPRS* in the mobile phase.

Inject reference solution and test solution. In the chromatogram obtained with the test solution, the area of any peak due to Benzothiadiazine related impurity A is not more than 0.3 times the area of principal peak in the reference solution (1.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Transfer a quantity of the powder containing 15 mg of hydrochlorothiazide in a 50-ml volumetric flask, add about 30 ml of mobile phase. Sonicate for 15 minute with occasional shaking, dilute to volume with the mobile phase and centrifuge.

Reference solution (a). A solution containing 0.03 per cent w/v, each of, *captopril IPRS, hydrochlorothiazide IPRS* and *benzothiadiazine impurity A IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.03 per cent w/v *hydrochlorothiazide IPRS* and appropriate concentration of *captopril IPRS* in mobile phase to produce concentration similar to the test solution concentration in the mobile phase.

Chromatographic system

- a stainless steel column 30 cm x 4.6 mm packed with phenyl group bonded to porous silica (5 µm),
- mobile phase: a mixture of 750 volumes of *water*, 250 volumes of *methanol* and 0.5 volumes of *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

The relative retention time for benzothiadiazine impurity A is about 0.4, for hydrochlorothiazide is about 0.5 and for captopril is about 1.0.

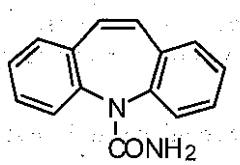
Inject reference solution (a) and (b). The test is not valid unless the resolution between the void volume and benzothiadiazine impurity A is not less than 1.7, between the benzothiadiazine impurity A and hydrochlorothiazide is not less than 1.8 and between captopril and hydrochlorothiazide is not less than 2.0 obtained with reference solution (a) and the relative standard deviation for replicate injections is not more than 3.0 per cent obtained with reference solution (b).

Inject reference solution (b) and the test solution.

Calculate the content of $C_9H_{15}NO_3S$ and $C_7H_8ClN_3O_4S_2$ in the tablets.

Storage. Store protected from moisture.

Carbamazepine



$C_{15}H_{12}N_2O$ Mol. Wt. 236.3

Carbamazepine is 5*H*-dibenz[*b*,*f*]azepine-5-carboxamide.

Carbamazepine contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{15}H_{12}N_2O$, calculated on the dried basis.

Category. Anticonvulsant.

Description. A white or yellowish-white, crystalline powder; almost odourless; exhibits polymorphism.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *carbamazepine IPRS* or with the reference spectrum of carbamazepine.

B. In the Assay, the principal peak in the chromatogram obtained with test solution (b) corresponds to the peak in the chromatogram obtained with the reference solution (b).

Tests

Acidity or alkalinity. Stir 1.0 g with 20 ml of *carbon dioxide-free water* for 15 minutes and filter. Titrate 10 ml of the filtrate with *0.01 M sodium hydroxide* using 0.05 ml of *phenolphthalein solution* as indicator; not more than 0.5 ml is required. Add 0.15 ml of a 0.05 per cent w/v solution of *methyl red* and titrate with *0.01 M hydrochloric acid* until the colour changes to red; not more than 1.0 ml is required.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution (a). Dissolve 0.15 g of the substance under examination in *methanol* and dilute to 50.0 ml with the same solvent. Mix with the aid of ultrasound and dilute 10.0 ml of the solution to 20.0 ml with *water*.

Test solution (b). Dilute 10.0 ml of test solution (a) to 50.0 ml with a mixture of equal volumes of *methanol* and *water*.

Reference solution (a). Dissolve 7.5 mg of *carbamazepine IPRS*, 7.5 mg of *10,11-dihydrocarbamazepine IPRS* and 7.5 mg of *iminodibenzyl* in *methanol* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 50.0 ml with a mixture of equal volumes of *methanol* and *water*.

Reference solution (b). Dissolve 0.15 g of *carbamazepine IPRS* in *methanol* and dilute to 50.0 ml with the same solvent. Dilute 5.0 ml of the solution to 50.0 ml with a mixture of equal volumes of *methanol* and *water*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with nitrile groups chemically bonded to porous silica particles (10 µm),
- mobile phase: a mixture of 3 volumes of *tetrahydrofuran*, 12 volumes of *methanol* and 85 volumes of *water* adding 0.2 ml of *formic acid* and 0.5 ml of *triethylamine* to 1000 ml of the solution,
- flow rate: 2 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to carbamazepine and 10,11-dihydrocarbamazepine is more than 1.7.

Inject test solution (a). Run the chromatograms 6 times the retention time of carbamazepine (about 10 minutes). The area of any peak corresponding to 10,11-dihydrocarbamazepine and iminodibenzyl is not more than the areas of the corresponding peaks in the chromatogram obtained with reference solution (a) (0.1 per cent), the area of any other secondary peak is not more than the area of the principal peak due to carbamazepine (0.1 per cent) and the sum of all the secondary peaks is not more than 5 times the area of the principal peak due to carbamazepine (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Chlorides (2.3.12). Boil 1.5 g in 30 ml of *water* for 5 minutes, cool and filter. The filtrate complies with the limit test for chlorides (165 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

Assay. Determine by liquid chromatography (2.4.14) as given under the test for Related substances using test solution (b) and reference solution (b).

Inject reference solution (b). The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (b) and test solution (b).

Calculate the content of $C_{15}H_{12}N_2O$.

Storage. Store protected from moisture.

Carbamazepine Prolonged-release Tablets

Carbamazepine Sustained-release Tablets;
Carbamazepine Extended-release Tablets

Carbamazepine Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Carbamazepine Prolonged-release Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of carbamazepine, $C_{15}H_{12}N_2O$.

Usual strengths. 100 mg; 200 mg; 400 mg.

Identification

Boil a quantity of the powdered tablets containing 0.2 g of Carbamazepine with 15 ml of *acetone*, filter the hot solution, wash the filtrate with two quantities, each of 5 ml, of hot *acetone*, cool in ice, evaporate the combined filtrates to dryness. The residue complies with the following test

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *carbamazepine IPRS* or with the reference spectrum of carbamazepine.

Tests

Dissolution (2.5.2). Complies with the test stated under tablets.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 0.3 g of Carbamazepine with 100 ml of *methanol*, with the aid of ultrasound for 15 minutes and dilute to 200.0 ml with *water*, mix and filter.

Reference solution. Dissolve 7.5 mg, each of, *carbamazepine IPRS*, *10,11-dihydrocarbamazepine* and *iminodibenzyl* in *methanol* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the resulting solution to 50.0 ml with *methanol (50 per cent)*.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with nitrile groups chemically bonded to porous silica particles (10 µm) (Such as Nucleosil 10 CN),
- mobile phase: a mixture of 30 volumes of *tetrahydrofuran*, 120 volumes of *methanol* and 850 volumes of *water*, to which is added 0.2 ml of *anhydrous formic acid* and 0.5 ml of *triethylamine*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to carbamazepine and 10, 11-dihydrocarbamazepine is at least 1.7.

Inject the reference solution and the test solution and continue the chromatography for 6 times the retention time of carbamazepine (about 10 minutes). In the chromatogram obtained with the test solution, the areas of any peaks corresponding to 10,11-dihydrocarbamazepine and iminodibenzyl are not greater than the areas of the corresponding peaks in the chromatogram obtained with the reference solution (0.1 per cent), the area of any other secondary peak is not greater than the area of the principal peak due to carbamazepine (0.1 per cent) and the sum of the areas of any such peaks is not greater than 5 times the area of the principal peak due to carbamazepine (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the peak due to carbamazepine in the chromatogram obtained with the reference solution (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14) as given under the test for Related substances using the following solutions.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.3 g of Carbamazepine with 100.0 ml of *methanol* for 15 minutes. Dilute to 200.0 ml with *water*, mix, filter and further dilute 1 volume of the filtrate to 5 volumes with *methanol (50 per cent)*.

Reference solution. A 0.03 per cent w/v solution of *carbamazepine IPRS* in *methanol (50 per cent)*.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{12}N_2O$ in the tablets.

Storage. Store protected from moisture.

Carbamazepine Tablets

Carbamazepine Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of carbamazepine, $C_{15}H_{12}N_2O$.

Usual strength. 200 mg.

Identification

Boil a quantity of the powdered tablets containing 0.2 g of Carbamazepine with 15 ml of *acetone*, filter the hot solution, wash the filtrate with two 5 ml quantities of hot acetone, cool in ice, evaporate the combined filtrates to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *carbamazepine IPRS* or with the reference spectrum of carbamazepine.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium: 900 ml of *water* containing 1 per cent w/v of *sodium lauryl sulphate*,
Speed and time: 75 rpm for 60 minutes.

Withdraw a suitable volume of the medium and filter, rejecting the first few ml of filtrate. Dilute a suitable volume of the filtrate with the medium, if necessary. Measure the absorbance of the resulting solution at the maximum at about 288 nm (2.4.7). Calculate the content of carbamazepine, $C_{15}H_{12}N_2O$ in the medium from the absorbance obtained from a solution of known concentration of *carbamazepine IPRS* in the dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_{15}H_{12}N_2O$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 0.3 g of Carbamazepine with 100 ml of *methanol* for 15 minutes. Dilute to 200 ml with *water*, mix and filter.

Reference solution. Dissolve 7.5 mg, each of, *carbamazepine IPRS*, *10,11-dihydrocarbamazepine* and *iminodibenzyl* in *methanol* and dilute to 100 ml with the same solvent. Dilute 1.0 ml of the resulting solution to 50.0 ml with *methanol (50 per cent)*.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with nitrile groups chemically bonded to porous silica particles (10 µm) (Such as Nucleosil 10 CN),
- mobile phase: a mixture of 30 volumes of *tetrahydrofuran*, 120 volumes of *methanol* and 850 volumes of *water*, adding 0.2 ml of *anhydrous formic acid* and 0.5 ml of *triethylamine* to 1000 ml of the solution,
- flow rate: 2 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to carbamazepine and 10,11-dihydrocarbamazepine is at least 1.7.

Inject the test solution and continue the chromatography for 6 times the retention time of carbamazepine which is about 10 minutes.

In the chromatogram obtained with the test solution, the areas of any peaks corresponding to 10,11-dihydrocarbamazepine and iminodibenzyl are not greater than the areas of the corresponding peaks in the chromatogram obtained with the reference solution (0.1 per cent). The area of any other secondary peak is not greater than the area of the principal peak due to carbamazepine (0.1 per cent) and the sum of the areas of any such peaks is not greater than 5 times the area of the principal peak due to carbamazepine (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the peak due to carbamazepine in the chromatogram obtained with the reference solution (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14) as given under the test for Related substances using the following solutions.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.3 g of Carbamazepine with 100.0 ml of *methanol* for 15 minutes. Dilute to 200.0 ml with water, mix, filter and further dilute 1 volume of the filtrate to 5 volumes with *methanol (50 per cent)*.

Reference solution. A 0.03 per cent w/v solution of *carbamazepine IPRS* in *methanol (50 per cent)*.

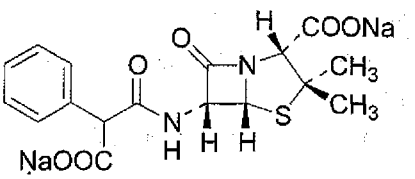
Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{12}N_2O$ in the tablets.

Storage. Store protected from moisture.

Carbenicillin Sodium

Carbenicillin Disodium



$C_{17}H_{16}N_2Na_2O_6S$ Mol. Wt. 422.4

Carbenicillin Sodium is the disodium (6*R*)-6-[(2*RS*)-2-carboxylato-2-phenylacetamido]penicillinate.

Carbenicillin Sodium contains the equivalent of not less than 770 µg of carbenicillin per mg, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white or slightly yellowish powder; odourless; hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *carbenicillin sodium IPRS* or with the reference spectrum of carbenicillin sodium.

B. Heat 0.5 g in a small sealed container on a water-bath for 3 minutes, remove the seal, and immediately replace by a cork fitted with a platinum loop carrying a drop of a solution freshly prepared by mixing 1 ml of a 0.5 per cent w/v solution of *sodium carbonate*, 1 ml of *phenolphthalein solution* and 10 ml of *water*; the reagent is decolourised within 2 minutes.

C. A 5 per cent w/v solution gives the reactions of sodium salts (2.3.1).

Tests

pH (2.4.24). 6.5 to 8.0, determined in a 10.0 per cent w/v solution.

Specific optical rotation (2.4.22). +182° to +196°, determined at 20° in a 1.0 per cent w/v solution.

Iodine-absorbing substances. Not more than 8.0 per cent, calculated on the anhydrous basis, determined by the following method. Weigh accurately about 0.13 g and dissolve in sufficient mixed *phosphate buffer pH 7.0* to produce 25.0 ml. To 10.0 ml add 10 ml of *mixed phosphate buffer pH 4.0* and 10.0 ml of *0.01 M iodine* and titrate immediately with *0.01 M sodium thiosulphate* using *starch solution*, added towards the end of the titration, as indicator. Repeat the operation without the substance under examination. The difference between the titration represents the amount of iodine-absorbing substances present.

1 ml of *0.01 M sodium thiosulphate* is equivalent to 0.000489 g of iodine-absorbing substances.

Bacterial endotoxins (2.2.3). Not more than 0.05 Endotoxin Unit per mg of carbenicillin.

Water (2.3.43). Not more than 6.0 per cent, determined on 0.15 g.

Assay. Determine by the microbiological assay of antibiotics, Method A (2.2.10) and express the result in µg of carbenicillin per mg.

Storage. Store in sterile containers, sealed so as to exclude micro-organisms, in a refrigerator (2° to 8°).

Carbenicillin Sodium Injection

Carbenicillin Injection; Carbenicillin Disodium Injection

Carbenicillin Sodium Injection is a sterile material consisting of Carbenicillin Sodium, with or without auxilliary substances. It is filled in sealed containers.

The injection is constituted by dissolving the contents of a sealed container in the requisite amount of Water for Injections immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Carbenicillin Sodium Injection contains the equivalent of not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of carbenicillin, $C_{17}H_{18}N_2O_6S$.

Usual strengths. The equivalent of 1 g and 5 g of carbenicillin.

Description. A white or almost white powder; odourless; hygroscopic.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *carbenicillin sodium IPRS* or with the reference spectrum of carbenicillin sodium.

B. Heat 0.5 g in a small sealed container on a water-bath for 3 minutes, remove the seal, and immediately replace by a cork fitted with a platinum loop carrying a drop of a solution freshly prepared by mixing 1 ml of a 0.5 per cent w/v solution of *sodium carbonate*, 1 ml of *phenolphthalein solution* and 10 ml of *water*; the reagent is decolourised within 2 minutes.

C. A 5 per cent w/v solution gives the reactions of sodium salts (2.3.1).

Tests

pH (2.4.24). 6.5 to 8.0, determined in a 10.0 per cent w/v solution.

Specific optical rotation (2.4.22). +182° to +196°, determined at 20° in a 1.0 per cent w/v solution.

Iodine-absorbing substances. Not more than 8.0 per cent, calculated on the anhydrous basis, determined by the following method. Weigh accurately about 0.13 g and dissolve in sufficient mixed *phosphate buffer pH 7.0* to produce 25.0 ml. To 10.0 ml add 10 ml of *mixed phosphate buffer pH 4.0* and 10.0 ml of *0.01 M iodine* and titrate immediately with *0.01 M sodium thiosulphate* using *starch solution*, added towards the end of the titration, as indicator. Repeat the operation without the substance under examination. The difference between the titration represents the amount of iodine-absorbing substances present.

1 ml of *0.01 M sodium thiosulphate* is equivalent to 0.000489 g of iodine-absorbing substances.

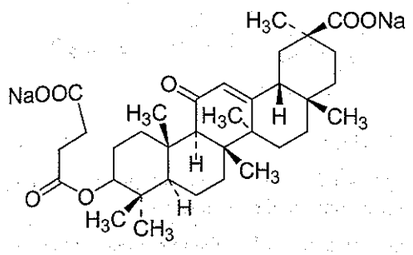
Bacterial endotoxins (2.2.3). Not more than 0.05 Endotoxin Unit per mg of carbenicillin.

Water (2.3.43). Not more than 6.0 per cent, determined on 0.15 g.

Assay. Mix the contents of 10 containers and determine by the microbiological assay of antibiotics, Method A (2.2.10) using the mixed contents of the 10 containers.

Labelling. The label states the quantity of Carbenicillin Sodium contained in the sealed container in terms of the equivalent amount of carbenicillin.

Carbenoxolone Sodium



$C_{34}H_{48}Na_2O_7$ Mol. Wt. 614.7

Carbenoxolone Sodium is disodium 3β-(3-carboxylatopropionyloxy)-11-oxoolean-12-en-30-oate.

Carbenoxolone Sodium contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{34}H_{48}Na_2O_7$, calculated on the anhydrous basis.

Category. Antiulcer.

Description. A white or pale cream powder; hygroscopic; irritant to nasal membranes.

Identification

A. Dissolve 0.1 g in 5 ml of *water*, just acidify with *2 M hydrochloric acid*, stir well and filter. Wash the residue with *water* until the washings are no longer acidic and dry to constant weight at 105°. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *carbenoxolone sodium IPRS* treated in the same manner or with the reference spectrum of carbenoxolone.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.0025 per cent w/v solution in a mixture of equal volumes of methanol and *0.02 M sodium carbonate* shows an absorption maximum only at about 256 nm, about 0.5.

C. Mix 5 mg with 50 mg of resorcinol and 2 ml of *sulphuric acid (80 per cent)*. Heat at 200° for 10 minutes, cool, pour into 200 ml of water and add sufficient *5 M sodium hydroxide* to make the mixture just alkaline; an intense green fluorescence is produced.

D. A 5.0 per cent w/v solution gives the reactions of sodium salts (2.3.1).

Tests

pH (2.4.24). 8.0 to 9.2, determined in a 10.0 per cent w/v solution.

Specific optical rotation (2.4.22). +132° to +140°, determined in a 1.0 per cent w/v solution in a mixture of equal volumes of *methanol* and *0.02 M sodium carbonate*.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel F254* (such as precoated Merck silica gel 60 F254 plates).

Mobile phase. A mixture of 60 volumes of *ethyl acetate*, 20 volumes of *methanol*, 11 volumes of *water* and 1 volume of *strong ammonia solution*.

Test solution. A 1.5 per cent w/v solution of the substance under examination in *methanol*.

Reference solution. A 0.03 per cent w/v solution of the substance under examination in *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Spray with a 1.5 per cent w/v solution of *vanillin* in *sulphuric acid (60 per cent)* and heat at 105° for 10 to 15 minutes. By both methods of visualisation, any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Water (2.3.43). Not more than 4.0 per cent, determined on 0.6 g.

Assay. Weigh accurately about 1.0 g and dissolve in 30 ml of *water*. Add 30 ml of *chloroform* and 15 ml of a mixture of 10 volumes of *2 M hydrochloric acid* and 90 volumes of *water*, shake and allow to separate. Add the *chloroform layer* to 40 ml of a 20 per cent w/v solution of *sodium chloride*, shake and allow to separate. Repeat the extraction with four quantities, each of 15 ml, of *chloroform*, combine the chloroform extracts and add sufficient *chloroform* to produce 100.0 ml. Evaporate 25.0 ml, dry the residue at 100° at a pressure of 2 kPa and dissolve in 10 ml of *dimethylformamide*. Titrate with *0.1 M tetrabutylammonium hydroxide* using *thymol blue solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.03073 g of $C_{34}H_{48}Na_2O_7$.

Carbenoxolone Tablets

Carbenoxolone Sodium Tablets

Carbenoxolone Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of carbenoxolone sodium, $C_{34}H_{48}Na_2O_7$.

Usual strength. 50 mg.

Identification

A. Shake a quantity of the powdered tablets containing 0.2 g of Carbenoxolone Sodium with 10 ml of *methanol*, filter and evaporate to dryness. The residue complies with the following tests.

1. When examined in the range 230 nm to 360 nm (2.4.7), a 0.0025 per cent w/v solution in a mixture of equal volumes of *methanol* and *0.02 M sodium carbonate* shows an absorption maximum only at about 256 nm, about 0.5.

2. Mix 5 mg with 50 mg of *resorcinol* and 2 ml of *sulphuric acid (80 per cent)*. Heat at 200° for 10 minutes, cool, pour into 200 ml of *water* and add sufficient *5 M sodium hydroxide* to make the mixture just alkaline; an intense green fluorescence is produced.

B. A 5 per cent w/v solution of the residue obtained in test A gives the reactions of sodium salts (2.3.1).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel F254*.

Mobile phase. A mixture of 60 volumes of *ethyl acetate*, 20 volumes of *methanol*, 11 volumes of *water* and 1 volume of *strong ammonia* solution.

Test solution. Triturate a quantity of the powdered tablets containing 0.1 g of Carbenoxolone Sodium with 20 ml of *methanol*, filter, evaporate the filtrate to low volume and add sufficient *methanol* to produce 10 ml.

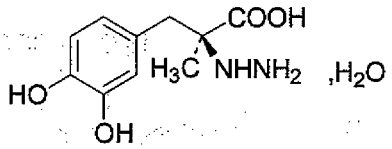
Reference solution. Dilute 3.0 ml of the test solution to 100.0 ml with *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Spray with a 1.5 per cent w/v solution of *vanillin* in *sulphuric acid (60 per cent)* and heat at 105° for 10 to 15 minutes. By both methods of visualisation, any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 75 mg of Carbenoxolone Sodium with a small volume of *methanol*, filter and add sufficient *methanol* to produce 250.0 ml. To 10.0 ml add 10 ml of *0.02 M sodium carbonate* and sufficient of a mixture of equal volumes of *methanol* and *0.02 M sodium carbonate* to produce 100.0 ml and measure the absorbance of the resulting solution at the maximum at about 256 nm (2.4.7). Calculate the content of $C_{34}H_{48}Na_2O_7$ taking 199 as the specific absorbance at the maximum at about 256 nm.

Carbidopa



$C_{10}H_{14}N_2O_4,H_2O$ Mol. Wt. 244.2

Carbidopa is (*S*)-3-(3,4-dihydroxyphenyl)-2-hydrazino-2-methylpropionic acid monohydrate.

Carbidopa contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{10}H_{14}N_2O_4$, calculated with on the dried basis.

Category. Antiparkinson.

Description. A white to creamy white powder.

Identification

Tests A and C may be omitted if tests B, D and E are carried out. Tests B, D and E may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *carbidopa IPRS* or with the reference spectrum of carbidopa.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.004 per cent w/v solution in a 1 per cent v/v solution of *hydrochloric acid* in *methanol* shows an absorption maximum only at about 282 nm, about 0.52.

C. Complies with the test for Specific optical rotation.

D. Shake vigorously about 5 mg with 10 ml of *water* for 1 minute and add 0.3 ml of *ferric chloride solution*; an intense green colour is produced, which quickly becomes reddish brown.

E. Suspend 20 mg in 5 ml of *water* and add 5 ml of *cupri-tartaric solution* and heat; the colour of the solution changes to dark brown and a red precipitate is produced.

Tests

Appearance of solution. Dissolve 0.25 g in 25 ml of *1 M hydrochloric acid*. The solution is clear (2.4.1) and not more intensely coloured than reference solution BYS6 or BS6 (2.4.1).

Specific optical rotation (2.4.22). −26.5° to −22.5°, determined in a solution prepared by dissolving 0.25 g in 25 ml of *aluminium chloride solution*.

Hydrazine. Determine by thin-layer chromatography (2.4.17), coating the plate with *silanised silica gel G*.

Mobile phase. A mixture of 2 volumes of *methanol* and 1 volume of *water*.

Test solution. Place 25 g of *strongly basic anion exchange resin* into each of two stoppered conical flasks, add 150 ml of *carbon dioxide-free water* to each flask and allow to stand for 30 minutes shaking occasionally. Decant the liquid from both flasks and repeat the process with further quantities, each of 150 ml, of *carbon dioxide-free water*. Separately transfer the resin portions into two 100-ml measuring cylinders, 3.5 to 4.5 cm in internal diameter, using 60 ml of *carbon dioxide-free water* for one portion (A) and 20 ml of *carbon dioxide-free water* for the other portion (B). Into each cylinder, insert a gas-inlet tube, 2 to 3 mm in internal diameter at the end and reaching almost to the bottom of the cylinder, and pass a rapid current of *nitrogen for chromatography* through each mixture so that homogeneous suspensions are produced. After 30 minutes, without interrupting the gas flow, add 1 ml of a solution prepared by dissolving 0.5 g of the substance under examination in sufficient *2 M hydrochloric acid* to produce 2 ml to cylinder A. After 1 minute stop the gas flow to cylinder A and transfer the contents, through a moistened filter paper, into cylinder B. After 1 minute, stop the gas flow to cylinder B and immediately pour the solution through a moistened filter paper into a freshly prepared mixture of 1 ml of a 20 per cent w/v solution of *salicylaldehyde* in *methanol* and 20 ml of *phosphate buffer solution pH 5.5*, shake thoroughly for 1 minute and heat in a water-bath at 60° for 15 minutes; the liquid becomes clear. Allow to cool, add 2 ml of *toluene*, shake vigorously for 2 minutes and centrifuge. Vigorously shake the toluene layer with two quantities, each of 20 ml, of a 20 per cent w/v solution of *sodium metabisulphite* and then with two quantities, each of 50 ml, of *water* and use the toluene layer.

Reference solution. Prepare at the same time and in the same manner but using 1 ml of a 0.002 per cent w/v solution of *hydrazine sulphate* in *2 M hydrochloric acid* in place of 1 ml of the solution of the substance under examination.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 365 nm. Any secondary spot in the chromatogram obtained with the test solution showing a yellow fluorescence is not more intense than the corresponding spot in the chromatogram obtained with the reference solution.

Methyldopa and 3-*O*-methylcarbidopa. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g in sufficient *0.1 M hydrochloric acid* to produce 10 ml.

Reference solution (a). A 0.005 per cent w/v solution, each of, *methyldopa IPR* and *3-O-methylcarbidopa IPRS* in *0.1 M hydrochloric acid*.

Reference solution (b). A 0.05 per cent w/v solution, each of, *carbidopa IPRS* and *methyldopa IPRS* in *0.1 M hydrochloric acid*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 98 volumes of a 1.4 per cent w/v solution of *potassium dihydrogen phosphate* and 2 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 282 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to methyldopa and carbidopa is greater than 4.0.

Inject reference solution (a) and the test solution

In the chromatogram obtained with the test solution, the areas of any peaks corresponding to methyldopa and 3-O-methylcarbidopa are not greater than the areas of the corresponding peaks in the chromatogram obtained with reference solution (a).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). 6.9 to 7.9 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.15 g and dissolve in 75 ml of *anhydrous glacial acetic acid* with the aid of gentle heat. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02262 g of $C_{10}H_{14}N_2O_4$.

Storage. Store protected from light.

Carbidopa and Levodopa Orally Disintegrating Tablets

Carbidopa and Levodopa Orally Disintegrating Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of carbidopa, $C_{10}H_{14}N_2O_4$ and levodopa, $C_9H_{11}NO_4$.

Usual strengths. 25 mg carbidopa and 100 mg levodopa; 25 mg carbidopa and 250 mg levodopa; 10 mg carbidopa and 100 mg levodopa.

Identification

In the Assay, the principal peak in the chromatogram obtained with test solution (b) corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Disintegration (2.5.1). Not more than 60 seconds.

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 750 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 10 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14)

Test solution. Use the filtrate, dilute if necessary with the dissolution medium.

Reference solution. Dissolve the suitable quantities of *carbidopa IPRS* and *levodopa IPRS* in the dissolution medium and dilute with the dissolution medium to obtain a solution having a known concentrations similar to the expected concentrations of carbidopa and levodopa in the test solution.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- sample temperature: 4°,
- mobile phase: a buffer solution prepared by dissolving 11 g of *monobasic potassium phosphate monohydrate* in 1000 ml of *water*, add 1.3 ml of 0.024 per cent w/v solution of *sodium 1-decanesulphonate* in *water*, adjusted to pH 2.5 with *orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

The relative retention time with reference to carbidopa for levodopa is 0.4.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{14}N_2O_4$ and $C_9H_{11}NO_4$ in the medium.

Q. Not less than 75.0 per cent of the stated amount of $C_{10}H_{14}N_2O_4$ and $C_9H_{11}NO_4$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light and use at or below 8°.

Solvent mixture. 30 volumes of *methanol* and 70 volumes of *0.1 M hydrochloric acid*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 250 mg of levodopa in the solvent mixture and dilute to 100.0 ml with the solvent mixture. Centrifuge and use the supernatant liquid.

Reference solution (a). A solution containing 0.0025 per cent w/v, each of, *carbidopa IPRS, levodopa IPRS, levodopa impurity A IPRS, levodopa impurity B IPRS* and *methyldopa IPRS* in the solvent mixture.

Reference solution (b). A 0.0025 per cent w/v solution of *levodopa IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- sample temperature: 4°,
- mobile phase: a buffer solution prepared by dissolving 13.8 g of *potassium dihydrogen orthophosphate monohydrate* in 1000 ml of *water*, adjusted to pH 2.7 with *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Levodopa impurity A[1]	0.45	1.25
Levodopa	0.52	—
Methyldopa[2]	0.84	1.0
Carbidopa	1.0	—
Levodopa impurity B[3]	1.2	—
Carbidopa impurity A[4]	3.1	—
3,4- dihydroxyphenylacetone	3.9	1.0

[1](3-(3,4,6-Trihydroxyphenyl)alanine. Individual impurity based on the label claim of levodopa

[2]Individual impurity based on the label claim of levodopa and carbidopa.

[3](3-Methoxytyrosine) Process-related impurities, included for identification only; not to be included in Total impurities.

[4]Process-related impurities, included for identification only; not to be included in Total impurities.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to levodopa impurity A and levodopa is not less than 1.5, the resolution between the peaks due to carbidopa and levodopa impurity B is not less than 2 and the resolution between the peaks due to methyldopa and carbidopa is not less than 1.5.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to levodopa impurity A is not more than 0.2 times the area of the principal peak in the chromatogram obtained with the reference solution (b) (0.2 per cent), the area of any peak corresponding to methyldopa and 3,4-dihydroxyphenylacetone is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (b) (0.5 per cent). The area of any other specified degradation impurity is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent). The sum of the areas of all the secondary peaks excluding 3,4- dihydroxyphenylacetone is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14)

Test solution (a). Weigh and powder 10 tablets, disperse in the mobile phase with the aid of ultrasound and dilute to 1000.0 ml with the mobile phase.

Test solution (b). Dilute test solution (a) with the mobile phase to obtain a solution containing 0.025 per cent w/v of levodopa.

Reference solution. A solution of *carbidopa IPRS* having known concentration similar to the expected concentration of carbidopa in the test solution and 0.025 per cent w/v of *levodopa IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- sample temperature: 6°,
- mobile phase: a mixture of 95 volumes of buffer solution prepared by dissolving 6.6 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 2.2 with *orthophosphoric acid* and 5 volumes of *ethanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

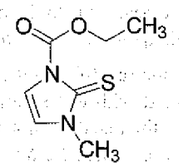
Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.4 and the relative standard deviation of replicate injections is not more than 2.0 for levodopa and carbidopa peaks.

Inject the reference solution and test solution (b).

Calculate the content of $C_{10}H_{14}N_2O_4$ and $C_9H_{11}NO_4$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Carbimazole



$C_7H_{10}N_2O_2S$ Mol. Wt. 186.2

Carbimazole is ethyl 3-methyl-2-thioxo-4-imidazoline-1-carboxylate.

Carbimazole contains not less than 98.0 per cent and not more than 102.0 per cent of $C_7H_{10}N_2O_2S$, calculated on the dried basis.

Category. Antithyroid.

Description. A white or creamy-white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *carbimazole IPRS* or with the reference spectrum of carbimazole.

B. In the test for Thiamazole and other related substances, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (c).

C. To a solution prepared by dissolving about 10 mg in a mixture of 50 ml of *water* and 0.05 ml of *dilute hydrochloric acid*, add 1 ml of *potassium iodobismuthate solution*; a red precipitate is produced.

Tests

Thiamazole and other related substances. Determine by liquid chromatography (2.4.14).

NOTE — Use freshly prepared solutions.

Solvent mixture. 20 volumes of *acetonitrile* and 80 volumes of *water*.

Test solution. Dissolve 5 mg of the substance under examination in 10.0 ml of the solvent mixture.

Reference solution (a). Dilute 1.0 ml of 0.005 per cent w/v solution of *thiamazole* (carbimazole impurity A) in the solvent mixture, and 2.0 ml of test solution to 10.0 ml with the solvent mixture.

Reference solution (b). Dissolve 5 mg of *thiamazole* in 10.0 ml of the solvent mixture. Dilute 1.0 ml of the solution to 100 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 3.9 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 10 volumes of *acetonitrile* and 90 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to carbimazole impurity A and carbimazole is not less than 5.0.

Inject reference solution (b) and the test solution. Run the chromatogram 1.5 times the retention time of the principal peak. In the chromatogram obtained with test solution, the area of secondary peak corresponding to carbimazole impurity A is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the areas of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The sum of areas of all the secondary peaks is not more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.6 per cent). Ignore any peak with area less than 0.05 times the area of principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa for 24 hours.

Assay. Determine by liquid chromatography (2.4.14), as described under test of Related substances with the following modifications.

Reference solution. Dissolve 5 mg of *carbimazole IPRS* to 10.0 ml with the solvent mixture.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_7H_{10}N_2O_2S$.

Storage. Store protected from light.

Carbimazole Tablets

Carbimazole Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of carbimazole, $C_7H_{10}N_2O_2S$.

Usual strengths. 5 mg; 10 mg; 20 mg.

Identification

A. Shake a quantity of the powdered tablets containing 50 mg of Carbimazole with two quantities, each of 5 ml of *chloroform*. Combine the chloroform extracts, filter and evaporate the filtrate to dryness. Dry the residue at 60° at a pressure not exceeding 0.7 kPa for 30 minutes The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *carbimazole IPRS* or with the reference spectrum of carbimazole.

B. To a small quantity of the powdered tablets add 1 drop of *dilute potassium iodobismuthate solution*; a scarlet colour is produced.

Tests

Thiamazole and other related substances. Determine by liquid chromatography (2.4.14).

NOTE —Use freshly prepared solutions and protect from light.

Test solution. Disperse a quantity of the powdered tablets containing 20 mg of Carbimazole in 10.0 ml of *acetonitrile* with the aid of ultrasound for 5 minutes, filter. Dilute 1.0 ml of the solution to 20.0 ml with *water*.

Reference solution (a). A 0.00005 per cent w/v of *carbimazole IPRS* in 5 per cent v/v of *acetonitrile*.

Reference solution (b). A 0.0001 per cent w/v of *thiamazole* in 5 per cent v/v of *acetonitrile*.

Reference solution (c). A solution containing 0.002 per cent w/v of *carbimazole IPRS* and 0.0001 per cent w/v of *thiamazole* in 5 per cent v/v of *acetonitrile*.

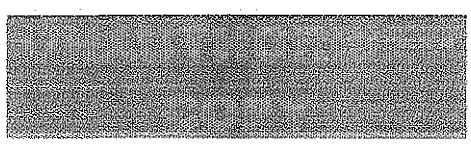
Chromatographic system

- a stainless steel column 15 cm x 3.9 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. 5.0 per cent v/v solution of *acetonitrile*,
  B. 20.0 per cent v/v solution of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 100 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
4.6	100	0
30	0	100
30.1	100	0
40	100	0

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to thiamazole (carbimazole impurity A) and carbimazole is not less than 5.0.

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with test solution, the area of any peak corresponding to thiamazole is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent).



Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modification.

Test solution. Disperse one tablet in 5 ml of *water* with the aid of ultrasound for 5 minutes and dilute with mobile phase A to obtain a solution having concentration of 0.005 per cent w/v of Carbimazole.

Inject reference solution (a) and the test solution.

Calculate the content of $C_7H_{10}N_2O_2S$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light and prepare immediately before use.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 20 mg of Carbimazole in 5 ml of *water,* with the aid of ultrasound for 5 minutes and dilute to 20.0 ml with *acetonetrile,* filter. Dilute 5.0 ml of the solution to 100.0 ml with mobile phase A.

Reference solution (a). A 0.005 per cent w/v solution of *carbimazole IPRS* in mobile phase A.

Reference solution (b). A solution containing 0.01 per cent w/v of *carbimazole IPRS* and 0.0005 per cent w/v of *thiamazole* in mobile phase A.

Use chromatographic conditions as described under test for Thiamazole and other related substances.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to thiamazole (carbimazole impurity A) and carbimazole is not less than 5.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_7H_{10}N_2O_2S$ in the tablets.

Storage. Store protected from light and moisture at a temperature not exceeding 30°.

Carbomers

Carbomers are high molecular mass polymers of acrylic acid cross-linked with polyalkenyl ethers of sugars or polyalcohols.

Carbomers contains not less than 56.0 per cent and not more than 68.0 per cent of carboxylic acid groups (-COOH), calculated on the dried basis.

Category. Excipient.

Description. A white, fluffy powder, hygroscopic.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B, C, D may be omitted if tests A and E are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *carbomers IPRS* or with reference spectrum of carbomers.

B. Adjust a 1 per cent w/v dispersion to about pH 7.5 with *1 M sodium hydroxide.* A highly viscous gel is formed.

C. Add 2 ml of a 10 per cent w/v solution of *calcium chloride* with continuous stirring to 10 ml of the gel obtained in test B. A white precipitate is immediately produced.

D. Add 0.5 ml of *thymol blue solution* to 10 ml of a 1 per cent w/v dispersion. An orange colour is produced. Add 0.5 ml of *cresol red solution* to 10 ml of a 1 per cent w/v dispersion. A yellow colour is produced.

E. It complies with the test for viscosity (2.4.28).

Tests

Apparent viscosity. The nominal apparent viscosity is in the range 300 mPa s to 115000 mPa s. For a product with a nominal apparent viscosity of 20000 mPa s or greater, the apparent viscosity is 70.0 per cent to 130.0 per cent of the value stated on the label; for a product with a nominal apparent viscosity less than 20 000 mPa s, the apparent viscosity is 50.0 per cent to 150.0 per cent of the value stated on the label.

Dry the substance under examination in vacuum at 80° for 1 hour. Carefully add 2.5 g of the previously dried substance under examination to 500 ml of *water* in a 1000-ml beaker while stirring continuously at 1000 ± 50 rpm, with the stirrer shaft set at an angle of 60° to one side of the beaker. Add the previously dried substance over a period of 45 to 90 seconds, at a uniform rate, ensuring that loose aggregates of powder are broken up and continue stirring at 1000 ± 50 rpm for 15 minutes. Remove the stirrer, and place the beaker containing the dispersion in a water-bath at 25 ± 0.2° for 30 minutes. Insert the stirrer to a depth necessary to ensure that air is not drawn into the dispersion, and while stirring at 300 ± 25 rpm, titrate with a glass-calomel electrode system to pH 7.3 to 7.8 by adding a 18 per cent w/v solution of *sodium hydroxide* below the surface, determining the end-point potentiometrically (2.4.25). The total volume of the 18 per cent w/v solution of *sodium hydroxide* used is about 6.2 ml. Allow 2-3 minutes before the final pH determination. If the final pH exceeds 7.8, discard the preparation, and prepare another using a smaller amount of sodium hydroxide for titration. Return the neutralised preparation to the water-bath at 25° for 1 hour, then perform the viscosity determination without delay to avoid slight viscosity changes that occur 75 minutes after neutralisation. Determine the viscosity (2.4.28) with a rotating

viscometer with a spindle rotating at 20 rpm, using a spindle suitable for the expected apparent viscosity.

Free acrylic acid. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.125 g of the substance under examination in 25 ml of a 2.5 per cent w/v solution of *aluminium potassium sulphate*. Heat the suspension at 50° for 20 minutes with shaking. Then shake the suspension at room temperature for 60 minutes. Centrifuge and use the clear supernatant solution.

Reference solution. Dissolve 62.5 mg of *acrylic acid IPRS* in 100 ml of a 2.5 per cent w/v solution of *aluminium potassium sulphate*. Dilute 1.0 ml of the solution to 50.0 ml with 2.5 per cent w/v solution of *aluminium potassium sulphate*.

Chromatographic system
- a stainless steel column 12 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. dissolve 0.136 g in 100 ml of *potassium dihydrogen phosphate*, adjusted to pH 2.5 using *dilute phosphoric acid*,
  B. equal volumes of a solution of 0.136 g of *potassium dihydrogen phosphate* in 100 ml of *water* and *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
8	100	0
9	0	100
20	0	100
21	100	0
30	100	0

Inject the reference solution and the test solution. The retention time for acrylic acid is about 6.0 minutes. The area of the peak in the chromatogram obtained with the test solution is not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.25 per cent).

Benzene. Determine by gas chromatography (2.4.13).

Solvent mixture. Dissolve 0.1 g of *benzene* in 100 ml of *dimethyl sulphoxide*. Further dilute 1.0 ml of the solution to 100.0 ml with *water*. Further dilute 1.0 ml of the solution to 100.0 ml with *water*.

Test solution. Weigh 50.0 mg of the substance under examination, add 5.0 ml of *water* and 1.0 ml of *dimethyl sulphoxide*.

Reference solution. Weigh 50.0 mg of the substance under examination, add 4.0 ml of *water*, 1.0 ml of *dimethyl sulphoxide* and 1.0 ml of the solvent mixture.

Close the vials with a tight rubber membrane stopper coated with polytetrafluoroethylene and secure with an aluminium crimped cap. Shake to obtain a homogeneous dispersion.

Chromatographic system
- a capillary column 30 m x 0.53 mm, packed with cyanopropyl phenyl polysiloxane,
- temperature :
  column at 130°,
  inlet port and detector at 240°,
- flow rate: 30 ml per minute using nitrogen as the carrier gas.

Stratic head-space conditions which may be used:
- equilibration temperature 80°,
- equilibration time 60 minutes,
- transfer line temperature 90°.

Inject 1 µl of the gaseous phase of the reference solution and 1 µl of the gaseous phase of the test solution; repeat these injections twice more. Maximum relative standard deviation of the differences in area between the analyte peaks obtained from the 3 replicate pair injections of the reference solution and the test solution is 15 per cent. The test is not valid unless the relative standard deviation for replicate injections is not more than 15 per cent.

The mean area of the peak corresponding to benzene in the chromatograms obtained with the test solution is not more than half the mean area of the peak corresponding to benzene in the chromatograms obtained with the reference solution (2 ppm).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 4.0 per cent, determined on 1.0 g.

Loss on drying (2.4.19). Not more than 3.0 per cent, determined on 1.0 g by drying in vacuum at 80° for 60 minutes.

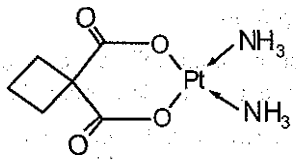
Assay. Weigh accurately about 0.12 g, add 50 ml of *water* slowly with stirring and heating at 60° for 15 minutes. Stop heating, add 150 ml of *water* and continue stirring for 30 minutes. Add 2 g of *potassium chloride* and titrate with *0.2 M sodium hydroxide* determining the end-point potentiometrically (2.4.25).

1 ml of *0.2 M sodium hydroxide* is equivalent to 0.009 g of carboxylic acid groups (-COOH).

Storage. Store protected from moisture.

Labelling. The label states the nominal apparent viscosity.

Carboplatin



$C_6H_{12}N_2O_4Pt$ Mol Wt .371.3

Carboplatin is (*SP*-4-2)-diammine[1,1-cyclo-butanedi (carboxylato-*kO*)(2-)]platinum.

Carboplatin contains not less than 98.0 per cent and not more than 102.0 per cent of $C_6H_{12}N_2O_4Pt$, calculated on the dried basis.

Category. Anticancer.

Description. A colourless crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *carboplatin IPRS* or with the reference spectrum of carboplatin.

Tests

Appearance of solution. A 1.0 per cent w/v solution in *carbon dioxide free water* (Solution A) is clear and colourless (2.4.1).

Acidity and Impurity B. Not more than 0.5 per cent w/v, calculated as carboplatin impurity B (cyclobutane-1, 1-dicarboxylic acid). To 10 ml of solution A, add 0.1 ml of *phenolphthalein solution*, solution is colourless. Not more than 0.7 ml of *0.01 M sodium hydroxide* is required to change the colour of indicator to pink.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and *water.*

Test solution. Dissolve 20 mg of the substance under examination in 20.0 ml of the solvent mixture.

Reference solution. Dilute 0.5 ml of the test solution to 200.0 ml of with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with amino propylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 13 volumes of *water* and 87 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

The relative retention time with reference to carboplatin (retention time: about 7 minutes) for carboplatin impurity A (cis-diaminedichloroplatinum (II)) is about 0.3.

Inject the test solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. Run the chromatogram 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to carboplatin impurity A is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.25 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent). Ignore any peak with the area less than 0.2 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Chlorides (2.3.12). Dissolve 0.4 g in *water*, heating slightly if necessary, and dilute to 15 ml with *water*, filter. The filtrate complies with the limit test of chlorides (100 ppm).Prepare the standard using 8.0 ml of chloride standard solution (5 ppm).

Ammonium. Not more than 100 ppm.

In a 25 ml jar fitted with a cap, dissolve or suspend 0.2 g of substance under examination in 1 ml of *water*. Add 0.3 g of *heavy magnesium oxide*. Close immediately after placing a piece of *silver manganese paper* 5 mm square, wetted with a few drops of *water*, under the polyethylene cap. Swirl, avoiding projections of liquid, and allow to stand at 40° for 30 minutes. If the silver manganese paper shows a grey colour, it is not more intense than that of a standard prepared at the same time and in the same manner using the prescribed volume of *ammonium standard solution*, 1 ml of *water* and 0.3 g of *heavy magnesium oxide*. Prepare the standard using 0.2 ml of *ammonium standard solution (100 ppm NH_4)*.

Silver. Not more than 10 ppm.

Determine by atomic emission spectrophotometry (2.4.3), measuring at 328.1 nm.

Test solution. Dissolve 0.5 g in a 1 per cent v/v solution of *nitric acid* and dilute to 50.0 ml with the same solution.

Reference solutions. Prepare the reference solutions using *silver standard solution (5 ppm Ag)*, diluting with a 1 per cent v/v solution of *nitric acid.*

Soluble barium. Not more than 10 ppm.

Determine by atomic emission spectrophotometry (2.4.3), measuring at 455.4 nm.

Test solution. Use the solution described under test for silver.

Reference solutions. Prepare the reference solutions using *barium standard solution (50 ppm Ba)*, diluting with 1.0 per cent v/v solution of *nitric acid.*

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Ignite 0.2 g of residue obtained in the test for loss on drying to a constant mass at 800°.

1 mg of the residue is equivalent to 0.001903 g of $C_6H_{12}N_2O_4Pt$.

Storage. Store protected from light.

Carboplatin Injection

Carboplatin Injection is a sterile solution of Carboplatin in Water for Injections.

Carboplatin Injection contains not less than 90.0 per cent and not more than 105.0 per cent of the stated amount of carboplatin, $C_6H_{12}N_2O_4Pt$.

Usual strength. 10 mg per ml.

Identification

A. Determine by thin layer chromatography (2.4.17), coating the plate with *silica gel.*

NOTE—Carry out the test protected from light and use freshly prepared solution.

Mobile phase. A mixture of 20 volumes of *water* and 80 volumes of *acetone.*

Test solution. Dilute a volume of injection to obtain a solution containing 1.0 per cent w/v of Carboplatin in *water.*

Reference solution. A 1.0 per cent w/v solution of *carboplatin IPRS* in *water.*

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air for 2 hours. Spray the plate with a solution prepared immediately by dissolving 5.6 g of *tin(II)chloride* in 10.0 ml of *hydrochloric acid*, and dilute to 100 ml with *water*, add 1.0 g of *potassium iodide* and stir. Heat the plate at 100° for 10 minutes and examine in daylight. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 5.0 to 7.0.

Cyclobutane-1,1-dicarboxylic acid. Determine by liquid chromatography (2.4.14).

NOTE — Carry out the test protected from light and use freshly prepared solution.

Test solution. Dilute a volume of injection to obtain a solution containing 0.1 per cent w/v of Carboplatin in *water.*

Reference solution (a). A 0.001 per cent w/v solution of *cyclobutane-1,1-dicarboxylic acid* in *water.*

Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 2 volumes of buffer solution prepared by dissolving 8.5 g of *tetrabutylammonium hydrogen sulphate* in 80 volumes of *water*, add 3.4 ml of *orthophosphoric acid* and adjusted to pH 7.5 with *10 M sodium hydroxide*, 10 volumes of *acetonitrile* and 88 volumes of *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 100 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peak corresponding to carboplatin and cyclobutane-1,1- dicarboxylic acid is not less than 2.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to cyclobutane-1,1- dicarboxylic acid is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (1.0 per cent).

Bacterial endotoxins (2.2.3). Not more than 5.4 Endotoxin Units per ml of 1.0 per cent w/v solution of Carboplatin.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Carry out the test protected from light and use freshly prepared solution.

Test solution. Dilute the injection with *water* if necessary to produce a solution containing 0.1 per cent w/v of Carboplatin.

Reference solution . A 0.1 per cent w/v solution of *carboplatin IPRS* in *water.*

Charomatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with aminopropylsilane bonded to porous silica (5 µm) (Such as µ Bondapak –NH_2),
- mobile phase: a mixture of 13 volumes of *water* and 87 volumes of *acetonitrile*,

– flow rate: 2 ml per minute,
– spectrophotometer set at 230 nm,
– injection volume: 20 µl.

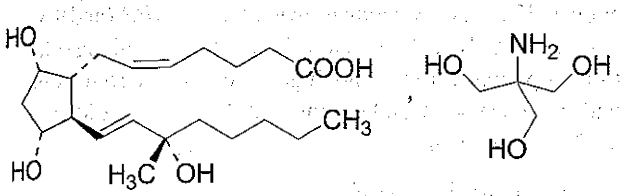
Inject the reference solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_6H_{12}N_2O_4Pt$ in the injection.

Storage. Store protected from light and free from contact with metals.

Carboprost Tromethamine



$C_{21}H_{36}O_5,C_4H_{11}NO_3$ Mol. Wt. 489.70

Carboprost Tromethamine is a salt of (5*Z*,13*E*)-(8*R*,9*S*,11*R*,12*R*,15*S*)-9,11,15-trihydroxy-15-methyl-prosta-5,13-dienoic acid with 2-amino-2-hydroxymethyl-1,3-propanediol.

Carboprost Tromethamine contains not less than 95.0 per cent and not more than 105.0 per cent of $C_{21}H_{36}O_5,C_4H_{11}NO_3$, calculated on the dried basis.

CAUTION — Great care should be taken to prevent inhaling particles of Carboprost Tromethamine and exposing the skin to it.

Category. Uterine stimulant; abortifacient.

Description. A white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *carboprost tromethamine IPRS* or with reference spectrum of carboprost tromethamine. Examine the substances as mulls.

Tests

Specific optical rotation. (2.4.22) + 18.0° to + 24.0°, determined in a 1.0 per cent w/v solution in *ethanol (95 per cent)*.

15*R*-Epimer and 5-*trans* isomer. Determine by liquid chromatography (2.4.14).

Follow the method described under Assay but using injection volume 25 µl. The usual order of elution is guaiphenesin, the 2-naphthacyl ester of 15*R*-epimer, the 2-naphthacyl ester of carboprost and the 2-naphthacyl ester of the *5-trans* isomer with retention times of about 7, 8, 11 and 13 minutes respectively. Measure the peak areas for the four components and calculate the contents of the 15*R*-epimer and *5-trans* isomer. The percentages of 15*R*-epimer (as tromethamine salt) and *5-trans* isomer are not more than 2.0 per cent and 4.0 per cent respectively.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined by drying in oven at 50° for 16 hours at a pressure not exceeding 0.7 kPa.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh accurately about 5 mg of the substance under examination, transfer to a stoppered 50-ml centrifuge tube. Add 20.0 ml of *dichloromethane* and 2 ml of citrate buffer prepared by dissolving 10.5 g of *citric acid monohydrate* in about 75 ml of *water*, adjusted the pH of the solution to 4.0 by addition of *sodium hydroxide solution* slowly and diluting to 100 ml with *water*. Shake the stoppered tube for about 10 minutes and centrifuge. Transfer 4.0 ml of the lower dichloromethane layer to a suitable vial and evaporate the solvent with the aid of a stream of nitrogen. To the dried material add 100 µl of a freshly prepared 2 per cent w/v solution of *α-bromo-2'-acetonaphthone* in *acetonitrile* and swirl to wash down the sides of the vial. Add 50 µl of a freshly prepared 1 per cent v/v solution of *diisopropylethylamine* in *acetonitrile*, swirl again and place the vial at a temperature of 30° to 35° for not less than 15 minutes. Evaporate the acetonitrile from the vial with the aid of a stream of nitrogen, add 2.0 ml of a 0.7 per cent w/v solution of guaiphenesin (internal standard) in the mobile phase, mix and filter the resulting solution through a fine porosity filter.

Reference solution. Prepare in the same manner but using *caroboprost tromethamine IPRS* in place of the substance under examination.

Chromatographic system
– stainless steel column 30 cm x 4 mm, packed with porous silica particles (3 to 10 µm),
– mobile phase: a mixture of 7 volumes of *1,3-butanediol*, 0.5 volume of *water* and 992 volumes of *dichloromethane*,
– flow rate: 1.5 ml per minute,
– spectrophotometer set 254 nm,
– injection volume: 10 µl.

The retention times for guaiphenesin and the 2-naphthacyl ester of carboprost are about 7 minutes and 11 minutes respectively.

Inject the reference solution. The test is not valid unless the resolution between these two peaks is greater than 4.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{36}O_5,C_4H_{11}NO_3$.

Storage. Store in a refrigerator (2° to 8°).

Carboprost Tromethamine Injection

Carboprost Tromethamine Injection is a sterile solution of Carboprost Tromethamine in Water for Injections. It may contain Benzyl alcohol, Sodium Chloride and Tromethamine.

Carboprost Tromethamine Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of carboprost, $C_{21}H_{36}O_5$.

Usual strengths. the equivalent of 250 µg and 500 µg of carboprost in 1 ml.

Description. A colourless solution.

Identification

Extract a volume of the injection containing 2.5 mg of Carboprost Tromethamine with 1.5 to 2 times its volume of *chloroform.* Discard the chloroform layer and acidify the aqueous layer with 3 to 5 drops of *hydrochloric acid.* Extract the acidified solution with an equivalent volume of *chloroform.* Filter the chloroform layer through a pledget of cotton and concentrate the filtrate to a volume of less than 1 ml. To the resulting solution add 150 mg to 180 mg of *potassium bromide IR* and mix well. Dry the potassium bromide mixture in vacuum overnight and prepare a disc from the dried mixture.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *carboprost tromethamine IPRS* treated in the same manner or with reference spectrum of carboprost tromethamine.

Tests

pH (2.4.24). 7.0 to 8.0.

Bacterial endotoxins. Not more than 714.3 Endotoxin Units per mg of carboprost tromethamine.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Transfer a volume of the injection containing 500 µg of carboprost to a stoppered 50-ml centrifuge tube. Add 20.0 ml of *dichloromethane* and 1.0 ml of citrate buffer prepared by dissolving 10.5 g of *citric acid monohydrate* in about 75 ml of *water,* adjusting the pH of the solution to 4.0 by addition of *sodium hydroxide solution* slowly and diluting to 100.0 ml with *water.* Shake the stoppered tube for about 10 minutes and centrifuge. Transfer 8.0 ml of the lower dichloromethane layer to a suitable vial and evaporate the solution with the aid of a stream of nitrogen (The residue may not evaporate to dryness because of the presence of benzyl alcohol). Add 100 µl of a freshly prepared 2 per cent w/v solution of *α-bromo-2'-acetonaphthone in acetonitrile* and swirl to wash down the sides of the vial. Add 50 µl of a freshly prepared 1 per cent v/v solution of *diisopropylethylamine* in *acetonitrile,* swirl again and place the vial at a temperature of 30° to 35° for not less than 15 minutes. Evaporate the acetonitrile from the vial with the aid of a stream of nitrogen, add 1.0 ml of a 0.3 per cent w/v solution of *guaiphenesin* (internal standard) in the mobile phase, mix and filter the resulting solution through a fine porosity filter.

Reference solution. Prepare an aqueous solution containing about 0.332 mg of *carboprost tromethamine IPRS* and 9 mg of *benzyl alcohol* per ml. Transfer 2.0 ml of the resulting solution to a stoppered 50-ml centrifuge tube and proceed as given under the test solution beginning at the words "Add 20.0 ml *of dichloromethane.....".*

Chromatographic system

- a stainless steel column 30 cm x 4 mm, packed with porous silica particles (3 to 10 µm),
- mobile phase: a mixture of 7 volumes of *1,3-butanediol,* 0.5 volume of *water* and 992 volumes of *dichloromethane,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set 254 nm,
- injection volume: 10 µl.

The retention times for guaiphenesin and the 2-naphthacyl ester of carboprost are about 7 minutes and 11 minutes respectively.

Inject the reference solution. The test is not valid unless the resolution between these two peaks is greater than 4.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

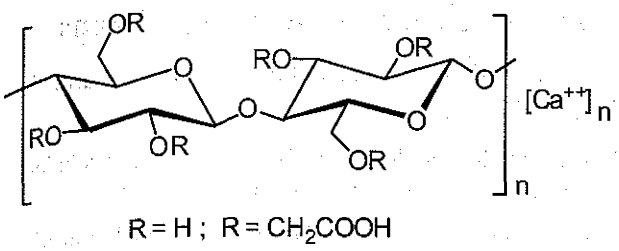
Calculate the quantity, in µg, of carboprost $C_{21}H_{36}O_5$ per ml of the injection from the ratios of the peak response of the 2-naphthacyl ester of carboprost and the internal standard obtained with the test solution, the ratios of the peak response of the 2-naphthacyl ester of carboprost and the internal standard obtained with the reference solution and the concentration, in µg per ml, of carboprost in *carboprost tromethamine IPRS* in the reference solution.

Storage. Store in a refrigerator (2° to 8°).

Labelling. The label states the strength in terms of the equivalent amount of carboprost in a suitable dose-volume.

Carboxymethylcellulose Calcium

Carmellose Calcium



R = H ; R = CH_2COOH

Carboxymethylcellulose Calcium is the calcium salt of a partially substituted poly(carboxymethyl) ether of cellulose.

Category. Pharmaceutical aid.

Description. A white to yellowish-white powder.

Identification

A. Shake 0.1 g thoroughly with 10 ml of *water*. Add 2 ml of *dilute sodium hydroxide solution* and allow to stand for 10 minutes (Solution A). Dilute 1 ml of solution A to 5 ml with *water*. To 0.05 ml of the solution, add 0.5 ml of a 0.05 per cent w/v solution of *chromotropic acid, sodium salt* in *sulphuric acid (75 per cent)* and heat on a water-bath for 10 minutes; a reddish-violet colour develops.

B. Shake 5 ml of solution A with 10 ml of *acetone*; a white, flocculent precipitate is produced.

C. Shake 5 ml of solution A with 1 ml of *ferric chloride solution*.; a brown, flocculent precipitate is formed.

D. Ignite 1 g and dissolve the residue in a mixture of 5 ml of *acetic acid* and 10 ml of *water*, boil for 5 minutes. Cool and neutralise with *dilute ammonia*. The solution gives reaction (a) of calcium (2.3.1).

Tests

Alkalinity. Shake 1.0 g thoroughly with 50 ml of *carbon dioxide-free water* and add 0.05 ml of *phenolphthalein solution*. No red colour develops.

Chlorides (2.3.12). Shake 1.0 g with 50 ml of *water*; add 5 ml of *dilute sodium hydroxide solution* and dilute to 100 ml with *water*. Heat 28 ml of the solution with 10 ml of *dilute nitric acid* on a water-bath until a flocculent precipitate is produced. Cool, centrifuge and separate the supernatant liquid. Wash the precipitate with 3 quantities, each of 10 ml of *water*, centrifuging each time. Combine the supernatant liquid and the washings and dilute to 100 ml with *water*. To 25 ml, add 6 ml of *dilute nitric acid* . This solution complies with the limit test for chlorides (0.36 per cent).

Sulphates (2.3.17). Shake 1.0 g with 50 ml of *water*, add 5 ml of *dilute sodium hydroxide solution* and dilute to 100 ml with *water*. Heat 20 ml of the solution with 1 ml of *hydrochloric acid* on a water-bath until a flocculent precipitate is produced. Cool, centrifuge and separate the supernatant liquid. Wash the precipitate with 3 quantities, each of 10 ml, of *water*, centrifuging each time. Combine the supernatant liquid and the washings and dilute to 100 ml with *water*. To 7.5 ml add 1 ml of *dilute hydrochloric acid* and dilute to 50 ml with *water*. The resulting solution complies with the limit test for sulphates (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). 10.0 per cent to 20.0 per cent.

Loss on drying (2.4.19). Not more than 10.0 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

Storage. Store protected from moisture.

Carboxymethylcellulose Sodium

Sodium Carboxymethylcellulose; Carmellose Sodium

Carboxymethylcellulose Sodium is the sodium salt of a partially-substituted poly(carboxymethyl) ether of cellulose.

Sodium Carboxymethylcellulose contains not less than 6.5 per cent and not more than 10.8 per cent of sodium, Na, calculated on the dried basis.

Category. Pharmaceutical aid.

Description. A white or almost white, granular powder; hygroscopic.

Identification

A. Sprinkle a quantity containing 1.0 g of the dried substance on to 90 ml of *carbon dioxide-free water* at 40° to 50°, stir vigorously until a colloidal solution is produced, cool and dilute to 100 ml with *carbon dioxide-free water* (solution A). To 10 ml of solution A add 1 ml of *copper sulphate solution*; a blue, cotton-like precipitate is produced.

B. Boil 5 ml of solution A for a few minutes; no precipitate is produced.

C. Solution A gives the reactions of sodium salts (2.3.1).

Tests

Appearance of solution. Solution A is not more opalescent than opalescence standard OS4 (2.4.1), and not more intensely coloured than reference solution YS6 (2.4.1).

pH (2.4.24). 6.0 to 8.0, determined in solution A.

Apparent viscosity. 75 to 140 per cent of the declared value, determined by the following method. To 50 ml of water heated to 90° add, with stirring, a quantity containing 2 g of the dried substance under examination or, for a product of low viscosity, use the quantity required to give the concentration on the label. Allow to cool, dilute to 100 ml with *water* and continue stirring until solution is complete. Determine the viscosity by Method C (2.4.28), at 20° using a shear rate of 10 s^{-1}. If necessary, use rates slightly below and slightly above 10 s^{-1} and interpolate.

Arsenic (2.3.10). Place 5.0 g in a dry Kjeldahl flask, add 20 ml of *nitric acid*, and warm cautiously until the reaction commences. Allow the reaction to subside without further heating, then add a mixture of 20 ml of *nitric acid* and 5 ml of *sulphuric acid* and heat until brown fumes cease to be evolved. Add 0.5 ml of *perchloric acid (60 per cent)*, heat until white fumes appear, and if the liquid is still dark add further small quantities of *nitric acid* and heat until the liquid becomes pale yellow. Heat again until the white fumes appear and continue heating for a further 15 minutes. Add 0.5 ml of *perchloric acid (60 per cent)* and continue heating for a few minutes. Allow the solution to cool add 10 ml of *water*, and heat until white fumes appear. Repeat the heating with a further 5 ml of *water*, cool and add 40 ml of *water* and 10 ml of *stannated hydrochloric acid AsT*. The resulting solution complies with the limit test for arsenic (1 ppm). Prepare the standard using 0.5 ml of *arsenic standard solution (10 ppm As)*.

Heavy metals (2.3.13). To the residue obtained in the test for Sulphated ash add 1 ml of *hydrochloric acid*, evaporate to dryness on a water-bath and dissolve the residue in 20 ml of *water*. 12 ml of the solution complies with the limit test for heavy metals, Method D (20 ppm). Prepare the standard using *lead standard solution (1 ppm Pb)*.

Chlorides (2.3.12). 10 ml of solution A complies with the limit test for chlorides (0.25 per cent).

Sulphated ash (2.3.18). 20.0 to 33.3 per cent, calculated on the dried basis, determined on 1.0 g dispersed in a mixture of equal volumes of *sulphuric acid* and *water*.

Loss on drying (2.4.19). Not more than 10.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.2 g and disperse in 80 ml of *anhydrous glacial acetic acid*. Heat on a water-bath for 2 hours, cool. Titrate with *0.1 M perchloric acid* determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.002299 g of Na.

Storage. Store protected from light and moisture.

Labelling. The label states the apparent viscosity in mPas of a 2 per cent w/v solution or, where the viscosity is low, the concentration of the solution to be used and the apparent viscosity in mPas.

Carboxymethylcellulose Eye Drops

Carboxymethylcellulose Sodium Eye Drops; Carmellose Sodium Eye Drops

Carboxymethylcellulose Eye Drops are a sterile solution of Carboxymethylcellulose Sodium in Purified Water.

Carboxymethylcellulose Eye Drops contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of carboxymethylcellulose Sodium.

Usual strength. 0.5 per cent w/v.

Identification

A. To 2 ml, add 1 ml of *water* to a test-tube, 5 drops of *1-napthol TS* and 2 ml of *sulphuric acid* to the test tube; red or purple colour is observed.

B. To 10 ml, add 5 ml of *barium chloride solution TS*; a white precipitate is formed.

C. To 4 ml, add 2 ml of 15 per cent w/v *potassium carbonate* solution and heat to boiling, no precipitate is formed. Add 4 ml of *potassium pyroantimonate TS*, heat to boil. Allow to cool in ice water; a dense precipitate is formed. Expose precipitate to non-luminous flame, the precipitate imparts an intense yellow colour to the flame.

Tests

pH(2.4.24). 5.0 to 8.0.

Other tests. Comply with the tests stated under Eye Drops.

Assay.

Solution A. A 20.0 per cent w/v solution of *polyhexanide* (vantocil 1B solution). Dilute 1.0 ml of the solution to 200 ml with *water*.

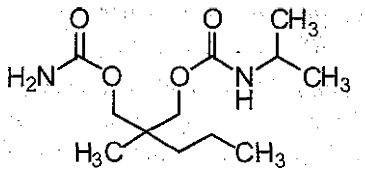
Test solution. To 5 ml, add sufficient *water* to produce 25 ml. To 5.0 ml of the solution, add 5 ml of solution A drop by drop while swirling the flask and dilute to 250.0 ml with *water*.

Reference solution. A 0.11 per cent w/v solution of *carboxymethylcellulose sodium IPRS* in *water*. To 5.0 ml of the solution, add 5 ml of solution A drop by drop while swirling the flask and dilute to 250.0 ml with *water*.

Measure the absorbance at the maximum at about 235 nm (2.4.7) using 5 ml of solution A diluted to 250 ml with *water* as the blank and calculate the content of carboxymethylcellulose sodium in the eye drops.

Storage. Store protected from light.

Carisoprodol



$C_{12}H_{24}N_2O_4$ Mol. Wt. 260.3

Carisoprodol is (*RS*)-2-{[(Aminocarbonyl)oxy]methyl}-2-methylpentylisopropylcarbamate.

Carisoprodol contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{12}H_{24}N_2O_4$, calculated on the dried basis.

Category. Muscle relaxant.

Description. A white crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *carisoprodol IPRS* or with the reference spectrum of carisoprodol.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of *acetonitrile* and 50 volumes of *water*.

Test solution. Dissolve 0.5 g of Carisoprodol in the solvent mixture and dilute to 50.0 ml with the solvent mixture, with the aid of ultrasound.

Reference solution (a). A 0.01 per cent w/v solution of *carisoprodol IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.0125 per cent w/v, each of, *carisoprodol impurity A IPRS*, *meprobamate IPRS* and *carisorprodol IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (4µm),
- mobile phase: A. a mixture of 25 volumes of *acetonitrile* and 75 volumes of *water*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 200 nm,
- injection volume: 25 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
35	100	0
36	80	20
51	80	20
52	100	0
60	100	0

Name	Relative retention time	Correction factor
Carisoprodol impurity A[1]	0.19	16.7
Meprobamate	0.24	12.5
Carisoprodol monocarbamate[2]	0.86	0.71
Carisoprodol	1.0	—

[1]2-hydroxymethyl-2-methylpentyl carbamate,

[2]N-Isopropyl-2-hydroxymethyl-2-methylpentyl carbamate.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to carisoprodol impurity A and meprobamate is not less than 1.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to carisoprodol impurity A and carisoprodol monocarbamate is not more than 0.1 times the area of the principal peak obtained in the chromatogram obtained with reference solution (a) (0.1 per cent), the area of any peak due to meprobamate is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent), the area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in vacuum at 60° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances using following modifications.

Test solution. Dissolve 25 mg of Carisoprodol in the solvent mixture and dilute to 10.0 ml with the solvent mixture with the aid of ultrasound.

Reference solution. A 0.25 per cent w/v solution of *carisoprodol IPRS* in the solvent mixture.

Inject the reference solution and the test solution.

Calculate the content of $C_{12}H_{24}N_2O_4$.

Storage. Store protected from moisture.

Carisoprodol Tablets

Carisoprodol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of carisoprodol, $C_{12}H_{24}N_2O_4$.

Usual strength. 350 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).

NOTE—Use only freshly prepared solutions containing -amylase; and equilibrate the dissolution medium at 37° for not more than one hour before beginning the dissolution test.

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.05 M phosphate buffer pH 6.9*, containing 5 units of a-amylase per ml,
Speed and time. 75 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter. Determine by liquid chromatography (2.4.14), as described under Assay using 150 µl injection volume:

Test solution. Use the filtrate, dilute if necessary, with *0.05 M phosphate buffer pH 6.9.*

Reference solution. A 0.04 per cent w/v solution of *carisoprodol IPRS* prepared by dissolving in minimum quantity of *acetonitrile* and suitably diluting with *0.05 M phosphate buffer pH 6.9.*

Inject the reference solution and the test solution.

Calculate the content of $C_{12}H_{24}N_2O_4$.

Q. Not less than 80 per cent of the stated amount of $C_{12}H_{24}N_2O_4$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 60 volumes of *methanol* and 40 volumes of *0.005 M sulphuric acid.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.35 g of Carisoprodol in the solvent mixture with the aid of ultrasound for 30 minutes and mechanically shaking for 60 minutes, dilute to 100.0 ml with the solvent mixture, and filter.

Reference solution (a). A 0.35 per cent w/v solution of *carisoprodol IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.24 per cent w/v of *2-methyl-2-propyl-1,3-propanediol IPRS* and 0.34 per cent w/v of *carisoprodol IPRS* in the mobile phase.

Charomatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of *water* and 60 volumes of *acetonitrile,*
- flow rate: 2 ml per minute,
- refractive index detector maintained at 30°,
- injection volume: 35 µl.

The relative retention time with respect to carisoprodol for 2-methyl-2-propyl-1,3-propanediol is about 0.5.

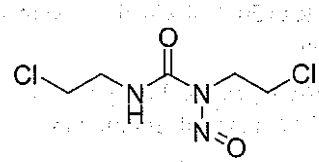
Inject reference solution (a) and (b). The test is not valid unless the resolution between the 2-methyl-2-propyl-1,3-propanediol and carisoprodol peaks is not less than 2.0 in the chromatogram obtained with reference solution (b) and in the chromatogram obatined with reference solution (a) the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{12}H_{24}N_2O_4$ in the tablets.

Storage. Store protected from moisture.

Carmustine



$C_5H_9Cl_2N_3O_2$ Mol. Wt. 214.1

Carmustine is urea, *N,N'*-bis(2-chloroethyl)-*N*-nitroso-;1,3-bis(2-chloroethyl)-1-nitrosourea.

Carmustine contains not less than 98.0 per cent and not more than 102.0 per cent of $C_5H_9Cl_2N_3O_2$, calculated on the anhydrous and solvent- free basis.

Category. Anticancer.

Description. Light yellow powder.

CAUTION — Use appropriate surgical gloves, arm covers and a dust mask. Perform all work under a fume hood approved for testing cytotoxic agents when possible.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Melt a sufficient quantity of sample between 33° to 40° in a water-bath or oven, prepare a thin film between two previously warmed bromide plates and record the spectrum immediately. Compare the spectrum with that obtained with *carmustine IPRS* treated in the same manner or with the reference spectrum of carmustine.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution.

Tests

Related substances (Carmustine Related Compound A). Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solution in low-actinic glassware and keep them refrigerated until use.

Test solution. Disperse 15.0 mg of substance under examination in *acetonitrile* and dilute to 10.0 ml with *acetonitrile.*

Reference solution (a). A 0.15 per cent w/v solution of *carmustine IPRS* in *acetonitrile.*

Reference solution (b). A 0.00075 per cent w/v solution of *carmustine related compound A IPRS [1-3-Bis(2-chloroethyl) urea]* in *acetonitrile.*

Reference solution (c). Dilute reference solution (b) to obtain a solution of 0.000075 per cent w/v solution of *carmustine related compound A IPRS* in *acetonitrile.*

Reference solution (d). A solution containing 0.00075 per cent w/v, each of, *carmustine IPRS* and *carmustine related compound A IPRS* in *acetonitrile.*

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- sample temperature: 5°,
- mobile phase: a mixture of 70 volumes of *water* and 30 volumes of *acetonitrile,*
- flow rate: 1.5 ml per minute,
- spectrophometer set at 200 nm,
- injection volume: 10 µl.

The relative retention time with reference to carmustine for carmustine related compound A is about 0.3.

Inject reference solution (d). The test is not valid unless the resolution between the peaks corresponding to carmustine related compound A and carmustine is not less than 10.0.

Inject reference solution (a) and (c). The test is not valid unless the tailing factor is not more than 1.9 in the chromatogram obtained with reference solution (a) and the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (c).

Inject reference solution (b) and the test solution. Run the chromatogram 1.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of the peak due to carmustine related compound A is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the area of any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Ether-insoluble substances. Not more than 0.1 per cent w/w, determined by the following method.

NOTE — Perform in a well-ventilated fume hood.

Weigh 1.0 g of sample and add to 10 ml of *anhydrous ether* in a suitable flask. Stir the solution for 5 minutes and immediately filter the solution through a tared sintered-glass filter, wash the flask with an additional 10 ml of *ether* and filter the solution through the same tared sintered-glass filter, dry to constant weight at 105° for 1 hour, cool in a desiccator and weigh.

2-Chloroethylamine. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

NOTE — Prepare the solution in low-actinic glassware and keep them refrigerated until use.

Mobile phase (a). Ethyl acetate.

Mobile phase (b). A mixture of 70 volumes of *ethyl acetate* and 30 volumes of *methanol.*

Test solution. A 40.0 per cent w/v solution of carmustine in *methanol.*

Reference solution (a). A 0.12 per cent w/v solution of *2-chloroethylamine hydrochloride* in *methanol.*

Reference solution (b). A 0.04 per cent w/v solution of *carmustine IPRS* in *methanol.*

Apply 1 µl of each solution. Develop the chromatograms using separately the two mobile phases. Develop the chromatograms for 30 minutes using mobile phase (a), dry the plate in a current of air. Develop the plate again using mobile phase (b) for 10 minutes, dry the plate in a current of air and spray with *diethylamine solution.* Place the plate in an oven maintained at 100° for 20 minutes. Cool and spray again with *0.1M silver nitrate solution*, place the plate to be exposed under ultraviolet light at 365 nm for 15 minutes and examine under ultraviolet light at 365 nm. Any corresponding spot in the chromatograms obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.2 per cent) and not more than two such spots are more intense than the spot in the chromatograms obtained with reference solution (b) (0.1 per cent).

2-Chloroethanol. Not more than 0.1 per cent w/w, determine by gas chromatography (2.4.13).

NOTE — Prepare the solution in low-actinic glassware and keep them refrigerated until use.

Test solution. A 1.0 per cent w/v solution of carmustine in *acetonitrile.*

Reference solution (a). A 0.002 per cent w/v solution of *2-chloroethanol* in *acetonitrile.*

Reference solution (b). Dilute reference solution (a) to obtain a 0.001 per cent w/v solution *2-chloroethanol* in the *acetonitrile.*

Chromatographic system

- a capillary column 30 m x 0.53 mm, packed with acid-washed diatomaceous support (80 to 100 mesh) coated with 3 per cent w/w of polyethylene glycol (Such as Carbowax 20 M),
- temperature:

column	time (min.)	temperature (°)
	0-6	40
	6-8	40 → 80
	8-22	80
	22-26	80 → 200
	26-29	200

- injector port: 90° and detector port at 260°,
- a flame ionisation detector,
- flow rate: 7 ml per minute, using nitrogen or helium as the carrier gas.

Inject 5 µl of reference solution (b).The test is not valid unless and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of 2-chloroethanol.

Acetaldehyde. Not more than 0.1 per cent w/w, determine by gas chromatography (2.4.13).

NOTE — Prepare the solution in low-actinic glassware and keep them refrigerated until use.

Test solution. A 1.0 per cent w/v solution of Carmustine in *acetonitrile.*

Reference solution. A 0.001 per cent w/v solution *acetaldehyde* in the *acetonitrile.*

Chromatographic system

- a capillary column 30 m x 0.53 mm packed with dimethylpolysiloxane (film thickness 5.0 µm),
- temperature:

column	time (min.)	temperature (°)
	0-6	40
	6-12	40 → 210
	12-15	210

- injector port: 70° and detector port at 260°,
- a flame ionisation detector,
- split ratio: 15:1,
- flow rate: 3 ml per minute, using nitrogen or helium as the carrier gas.

Inject 5 µl of the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of acetaldehyde.

Water (2.3.43). Not more than 0.5 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solution in low-actinic glassware and keep them refrigerated until use.

Test solution. Disperse 15.0 mg of the substance under examination in *acetonitrile* and dilute to 10.0 ml with *acetonitrile.*

Reference solution. A 0.15 per cent w/v solution of *carmustine IPRS* in *acetonitrile.*

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- sample temperature: 5°,
- mobile phase: a mixture of 70 volumes of *water* and 30 volumes of *acetonitrile,*
- flow rate: 1.5 ml per minute,
- spectrophometer set at 200 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.9 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_5H_9Cl_2N_3O_2$.

Storage. Store protected from light and moisture in a refrigerator between 2° to 8°.

Carmustine Injection

Carmustine Injection is a sterile lyophilized preparation of Carmustine.

The injection is prepared immediately before use by dissolving the contents of the sealed container which contains Carmustine with or without auxillary substances in a suitable diluent and then diluting with the requisite volume of a suitable diluent in accordance with the manufacturer's instructions.

The constituted solution complies with the requirements for the Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Carmustine Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of carmustine, $C_5H_9Cl_2N_3O_2$.

Usual strength. 100 mg.

CAUTION — Use appropriate surgical gloves, arm covers and a dust mask. Perform all work under a fume hood approved for testing of cytotoxic agents when possible.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Melt a sufficient quantity of sample between 33° to 40° in a water-bath or oven, prepare a thin film between two previously warmed bromide plates and record the spectrum immediately. Compare the spectrum with that obtained with *carmustine IPRS* treated in the same manner or with the reference spectrum of carmustine.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution (b) corresponds to the peak in the chromatogram obtained with reference solution (b).

Tests

pH (2.4.24).4.0 to 6.8 of the constituted solution prepared as directed in the labelling.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions in low-actinic glassware and keep them refrigerated until use.

Solvent mixture. 25 volumes of *acetonitrile* and 75 volumes of *water.*

Test solution (a). Dissolve a suitable quantity of the substance under examination in *acetonitrile* to obtain a solution containing 0.2 per cent w/v of Carmustine. (*NOTE — Allow test vials to warm to room temperature in desiccator for 1 hour).*

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with the solvent mixture.

Reference solution (a). A 0.2 per cent w/v solution of *carmustine IPRS* in *acetonitrile.*

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the solvent mixture.

Reference solution (c). A 0.01 per cent w/v solution of *carmustine related compound A IPRS [1-3-Bis(2-chloroethyl) urea]* in *acetonitrile.*

Reference solution (d). Dilute reference solution (a) and (c) to obtain a solution containing 0.02 per cent w/v of *carmustine IPRS* and 0.0002 per cent w/v of *carmustine related compound A IPRS* with the solvent mixture, respectively.

Reference solution (e). Dilute reference solution (c) to obtain a solution containing 0.0002 per cent w/v of *carmustine related compound A IPRS* with the solvent mixture.

Chromatographic system

- a stainless steel column 7.5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- sample temperature: 5°,
- mobile phase: A. *water*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophometer set at 200 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
2.5	90	10
7	40	60
8.5	90	10
10.5	90	10

The relative retention time with reference to carmustine for carmustine related compound A is about 0.5.

Inject reference solution (d). The test is not valid unless the resolution between the peaks corresponding to carmustine related compound A and carmustine is not less than 2.0, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent of the carmustine and carmustine related compound A peaks.

Inject reference solution (e) and test solution (b). In the chromatogram obtained with the test solution (b), the area of the peak due to carmustine related compound A is not more than the area of the principal peak in the chromatogram obtained with reference solution (e) (1.0 per cent).

Water (2.3.43). Not more than 1.0 per cent.

Bacterial endotoxins (2.2.3). Not more than 0.95 Endotoxin Unit per mg of carmustine.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances.

NOTE — Prepare solution in low-actinic glassware and keep them refrigerated until use.

Inject reference solution (b) and test solution (b).

Calculate the content of $C_5H_9Cl_2N_3O_2$ in the injection..

Storage. Store protected from light and moisture in a refrigerator between 2° to 8°.

Labelling. The label on the sealed container states (1) the equivalent amount of carmustine contained in it; (2) that it should be used immediately after preparation.

Carnauba Wax

Carnauba Wax is obtained from the leaves of *Copernicia cerifera* Mart. (Fam. Palmae) after purification to remove foreign matter.

Category. Pharmaceutical aid.

Description. A pale yellow to light brown coarse powder, flakes or lumps of hard brittle wax; odour, characteristic and free from rancidity.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 98 volumes of *chloroform* and 2 volumes of *ethyl acetate*.

Test solution. Dissolve 0.1 g of the substance under examination, with warming, in 5 ml of *chloroform* and use the warm solution.

Reference solution. Dissolve 5 mg of (+)-*menthol*, 5 µl of *menthyl acetate* and 5 mg of *thymol* in 10 ml of *toluene*.

Apply separately to the plate, as bands 20 mm x 3 mm, 10 µl of reference solution and 30 µl of test solution.

After development, dry the plate in air and spray with a freshly prepared 20 per cent w/v solution of *phosphomolybdic acid* in *ethanol (95 per cent)* and heat at 105° for 15 minutes. The chromatogram obtained with the reference solution shows in the lower part a dark blue band due to menthol, a reddish band above it due to thymol and a dark blue band in the upper part due to menthyl acetate. The chromatogram obtained with the test solution shows a large blue band due to triacontanol (melissyl alcohol) at an R_f value between those of the bands due to menthol and thymol in the chromatogram obtained with the reference solution and blue bands at R_f values between those of the bands due to menthyl acetate and thymol in the chromatogram obtained with the reference solution. In addition, the chromatogram obtained with the test solution shows further bands at higher R_f values than menthyl acetate, that with the highest R_f value being very pronounced, and a number of faint bands below that due to triacontanol; a band on the line of application is blue.

Tests

Melting range (2.4.21). 78° to 88°, determined by Method II.

Acid value. Not more than 12.0, determined by the following method. Weigh accurately about 2.0 g *(w)* in a flask fitted with a reflux condenser, add 40 ml of *xylene* and heat until the substance has dissolved. Add 20 ml of *ethanol (95 per cent)* and titrate the hot solution with *0.5 M ethanolic potassium hydroxide*, using *phenolphthalein solution* as indicator, until a pink colour persists for at least 10 seconds (n_1 ml). Repeat the operation without the substance under examination (n_2 ml). Calculate the acid value from the expression $28.05(n_1-n_2)/w$.

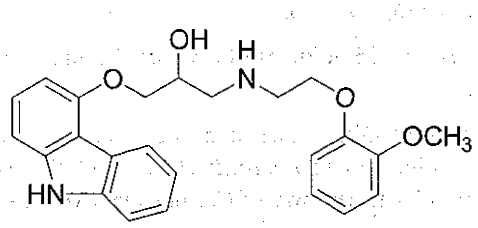
Saponification value. Between 78 and 95, determined by the following method. To the titrated solution from the determination of the Acid value, add 20.0 ml of *0.5 M ethanolic potassium hydroxide* and boil under a reflux condenser for 3 hours. Titrate the hot solution immediately with *0.5 M hydrochloric acid*, using 1 ml of *phenolphthalein solution* as indicator, until the red colour is discharged. Reheat the solution to boiling and continue the titration, if necessary, until the red colour no longer reappears on heating (n_3 ml). Repeat the operation without the substance under examination (n_4 ml). Calculate the saponification value from the expression $a+[28.05(n_4-n_3)/w]$ where a is the acid value.

Heavy metals (2.3.13). 0.5 g complies with the limit test for heavy metals, Method B (40 ppm).

Sulphated ash (2.3.18). Not more than 0.25 per cent, determined on 2.0 g.

Storage. Store protected from light and moisture.

Carvedilol



$C_{24}H_{26}N_2O_4$ Mol. Wt. 406.5

Carvedilol is (*RS*)-1-(9*H*-carbazol-4-yloxy)-3-[[2-(2-methoxyphenoxy)ethyl]amino]propan-2-ol.

Carvedilol contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{24}H_{26}N_2O_4$, calculated on the dried basis.

Category. Antihypertensive.

Description. A white or almost white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *carvedilol IPRS* or with the reference spectrum of carvedilol.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25.0 mg of the substance under examination in sufficient mobile phase to produce 25.0 ml.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 0.005 g of *1-[[9-[2-hydroxy-3-[[2-(2-methoxyphenoxy)ethyl] amino]propyl]-9H-carbazol-4-yl]oxy]-3-[[2-(2-methoxyphenoxy)ethyl] amino]propan-2-ol (carvedilol impurity A) IPRS* in 5.0 ml of the test solution and dilute to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 100.0 ml with the mobile phase. Dilute 2.0 ml of the solution to 10.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 12.5 cm x 4.6 mm packed with octylsilane bonded to porous silica (5 µm) (Such as YMC- Pack pro C8),
- column temperature: 55°,
- mobile phase: dissolve 1.77 g of *potassium dihydrogen phosphate* in *water* and dilute to 650 ml with the same solvent, adjusted to pH 2.0 with dilute *orthophosphoric acid* and add 350 ml of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to carvedilol and carvedilol impurity A is not less than 1.7.

Inject the reference solution and the test solutions. Run the chromatograms 8 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of the peak due to carvedilol impurity A is not more than twice the area of the peak in the chromatogram obtained with reference solution (c) (0.02 per cent), the area of the peak due to any other impurity is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than five times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.01 per cent).

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm Pb).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.35 g and dissolve in 60 ml of *glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04065 g of $C_{24}H_{26}N_2O_4$.

Storage. Store protected from light, at a temperature not exceeding 30°.

Carvedilol Tablets

Carvedilol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of carvedilol, $C_{24}H_{26}N_2O_4$.

Usual strengths. 3.125 mg; 6.25 mg; 12.5 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).
Apparatus No. 2 (Paddle),
Medium. 900 ml of gastric buffer pH 1.3 prepared by dissolving 2 g of *sodium chloride* in 7 ml of *hydrochloric acid* and 500 ml of *water* and diluting to 1000 ml with *water*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14) using the chromatographic conditions as described under Assay.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Prepare a solution using *carvedilol IPRS* in the dissolution medium to obtain the same concentration as expected in the test solution.

Inject the reference solution and the test solution.

Calculate the content of $C_{24}H_{26}N_2O_4$.

Q. Not less than 70 per cent of the stated amount of $C_{24}H_{26}N_2O_4$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the powdered tablets containing 25 mg of Carvedilol with 15 ml of the mobile phase, dilute to 25 ml with the mobile phase and filter.

Reference solution (a). A 0.1 per cent w/v solution of *carvedilol IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 12.5 cm x 4.6 mm packed with octylsilane bonded to porous silica (5 µm) (Such as YMC-Pack pro C8),
- column temperature: 55°,
- mobile phase: dissolve 1.77 g of *potassium dihydrogen phosphate* in *water*, dilute to 650 ml with the same solvent, adjusted to pH 2.0 with dilute *orthophosphoric acid* and add 350 ml of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the column efficiency in not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. Run the chromatograms 8 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the peak in the chromatogram obtained with reference solution (b) (2.0 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), using the chromatographic conditions as described under Assay.

Test solution. Disperse one tablet in 5 ml of *water* and dilute to 25.0 ml with the mobile phase and filter.

Reference solution. Prepare a solution using *carvedilol IPRS* in the mobile phase to obtain the same concentration as expected in the test solution.

Calculate the content of $C_{24}H_{26}N_2O_4$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg of Carvedilol, disperse in 10 ml of *water*. Shake by hand add 35 ml of the mobile phase, mix with the aid of ultrasound for 30 minutes and shake on a mechanical shaker for about 30 minutes and dilute to 50 ml with the mobile phase and filter. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *carvedilol IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 12.5 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as YMC-Pack pro C8),
- mobile phase: a mixture of 50 volumes of 2 per cent w/v solution of *sodium heptane sulphonate* in *water*, 25 volumes of *acetonitrile* and 25 volumes of *methanol*, adjusted to pH 3.1 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 285 nm,
- injection volume: 10 µl.

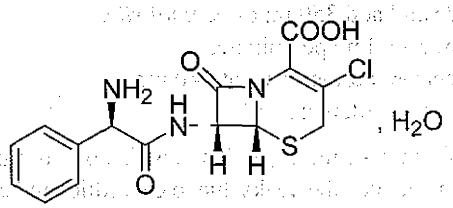
Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{24}H_{26}N_2O_4$ in the tablets.

Storage. Store protected from light, at a temperature not exceeding 30°.

Cefaclor



$C_{15}H_{14}ClN_3O_4S,H_2O$ Mol. Wt 385.8

Cefaclor is (6*R*,7*R*)-7-[[(2*R*)-2-amino-2-phenylacetyl]amino]-3-chloro-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene -2-carboxylic acid monohydrate.

Cefaclor contains not less than 96.0 per cent and not more than 102.0 per cent of $C_{15}H_{14}ClN_3O_4S$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white or slightly yellow powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cefaclor IPRS* or with the reference spectrum of cefaclor.

Tests

pH (2.4.24). 3.0 to 4.5, determined in a suspension, prepared by dispersing 0.25 g in 10 ml of *carbon dioxide-free water*.

Specific optical rotation (2.4.22). +101° to +111°, determined in 1.0 per cent w/v solution in a 1.0 per cent w/v solution of *hydrochloric acid*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. A 0.27 per cent w/v solution of *sodium dihydrogen phosphate*, adjusted to pH 2.5 with *phosphoric acid*.

Test solution. Dissolve 50 mg of the substance under examination in 10 ml of the solvent mixture.

Reference solution (a) A solution containing 0.0025 per cent w/v *cefaclor IPRS* and 0.005 per cent w/v *delta-3-cefaclor IPRS* in the solvent mixture.

Reference solution (b) Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a 0.78 per cent w/v solution of *sodium dihydrogen phosphate* adjusted to pH 4.0 with *phosphoric acid*,
  B. mix 45 ml of *acetonitrile* with 55 ml of mobile phase A,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Increase the concentration of mobile phase B continuously and linearly by 0.67 per cent v/v per minute for 30 minutes (25 per cent v/v). Then increase the concentration of mobile phase B continuously and linearly by 5 per cent v/v per minute for 15 minutes (100 per cent v/v). Finally elute with mobile phase B for 10 minutes.

Equilibrate the column with a mixture of 5 volumes of mobile phase B and 95 volumes of mobile phase A for at least 15 minutes between each analysis. Inject the solutions. At the end of the programme change the composition of the mobile phase to a mixture of 5 volumes of mobile phase B and 95 volumes of mobile phase A to re-equilibrate the column.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to cefaclor and delta-3-cefaclor is not less than 2.0 and the tailing factor of the cefaclor peak is not more than 1.2. If necessary, adjust the *acetonitrile* content of the mobile phase.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak, other than the principal peak and any peaks due to the mobile phase, is not greater than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of the areas of all such peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Water (2.3.43). 3.0 to 6.5 per cent, determined on 0.2 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 15 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). A 0.03 per cent w/v solution of *cefaclor IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.03 per cent w/v, each of, *cefaclor IPRS* and *delta-3-cefaclor IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture prepared by adding 22 volumes of *methanol* to a mixture of 78 volumes of *water*, 1 volume of *triethylamine* and 0.1 g of *sodium pentanesulphonate*, adjusted to pH 2.5 with *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to cefaclor and delta-3-cefaclor is not less than 2.5 and the tailing factor of the cefaclor peak is not more than 1.5. Adjust the concentration of methanol in the mobile phase, if necessary.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{15}H_{14}ClN_3O_4S$.

Storage. Store protected from moisture.

Cefaclor Capsules

Cefaclor Capsules contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of cefaclor, $C_{15}H_{14}ClN_3O_4S$.

Usual strengths. 250 mg; 500 mg.

Identification

A. Shake a quantity of the contents of the capsules containing 0.3 g of anhydrous cefaclor with 100 ml of *water*, filter and dilute 1 ml of the filtrate to 100 ml with *water*.

When examined in the range 190 nm to 310 nm (24.7), the resulting solution shows an absorption maximum only at about 264 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *water*,

Speed and time. 50 rpm and 45 minute.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the medium if necessary, at the maximum at about 264 nm (2.4.7). Calculate the content of $C_{15}H_{14}ClN_3O_4S$ in the medium from the absorbance obtained from a solution of known concentration of *cefaclor IPRS* in the same medium.

Q. Not less than 70 per cent of the stated amount of $C_{15}H_{14}ClN_3O_4S$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. A 0.27 per cent w/v solution of *sodium dihydrogen orthophosphate*, adjusted pH to 2.5, if necessary, with *orthophosphoric acid*.

Test solution. Shake a quantity of the contents of the capsules containing 0.5 g of anhydrous cefaclor with 200 ml of the solvent mixture, dilute to 250 ml with the solvent mixture and filter.

Reference solution (a). A 0.002 per cent w/v solution of *cefaclor IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.0025 per cent w/v of *cefaclor IPRS* and 0.005 per cent w/v of *delta-3-cefaclor IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Spherisorb ODS-2),
- mobile phase: A. a 0.78 per cent w/v solution of *sodium dihydrogen orthophosphate*, adjusted to pH 4.0 with *orthophosphoric acid*,

  B. a mixture of 45 volumes of *acetonitrile* and 55 volumes of mobile phase A,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	95	5
30	75	25
45	0	100
55	0	100
70	95	5

Equilibrate the column with a mixture of 5 volumes of mobile phase B and 95 volumes of mobile phase A for at least 15 minutes.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to cefaclor and delta-3-cefaclor is not less than 2.0. If necessary, adjust the proportion of acetonitrile in the mobile phase.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of the areas of any such peaks is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the contents of capsules containing about 75 mg of anhydrous cefaclor with 200 ml of the mobile phase, dilute to 250.0 ml with the mobile phase and filter.

Reference solution (a). A 0.03 per cent w/v solution of *cefaclor IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.03 per cent w/v, each of, *cefaclor IPRS* and *delta-3-cefaclor IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Beckman Ultrasphere ODS and Supelcosil LC-18-DB),

- mobile phase: a solution prepared by dissolving 0.1 g of *sodium pentanesulphonate* in a mixture of 78 volumes of *water* and 1 volume of *triethylamine*, adjusted to pH 2.5 with *orthophosphoric acid* adding 220 volumes of *methanol* and mixing,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to cefaclor and delta-3-cefaclor is not less than 2.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{15}H_{14}ClN_3O_4S$ in the capsules.

Storage. Store protected from moisture.

Labelling. The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous cefaclor.

Cefaclor Oral Suspension

Cefaclor Oral Suspension is a mixture consisting of Cefaclor with buffering agents and other excipients. It contains a suitable flavouring agent. It is filled in a sealed container.

The suspension is constituted by dispersing the contents of the sealed container in the specified volume of Water just before use.

Cefaclor Oral Suspension contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of cefaclor, $C_{15}H_{14}ClN_3O_4S$.

When stored at the temperature and for the period stated on the label during which the constituted suspension may be expected to be satisfactory for use, it contains not less than 80.0 per cent of the stated amount of cefaclor, $C_{15}H_{14}ClN_3O_4S$.

Usual strengths. 125 mg per 5 ml; 250 mg per 5 ml.

Storage. Store protected from moisture at a temperature not exceeding 30°.

The constituted suspension complies with the tests stated under Oral liquids and with the following tests.

Identification

A. Shake a quantity of the oral suspension containing 0.3 g of anhydrous cefaclor with 500 ml of *water* and filter.

When examined in the range 190 nm to 310 nm (2.4.7), the filtrate shows an absorption maximum only at about 264 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. A 0.27 per cent w/v solution of *sodium dihydrogen orthophosphate*, adjusted to pH 2.5 with *orthophosphoric acid*.

Test solution. Shake a quantity of the oral suspension containing about 0.25 g of anhydrous cefaclor with 200 ml of the solvent mixture, dilute to 250 ml with the solvent mixture and filter.

Reference solution (a). A 0.001 per cent w/v solution of *cefaclor IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.0025 per cent w/v of *cefaclor IPRS* and 0.005 per cent w/v of *delta-3-cefaclor IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Spherisorb ODS-2),
- mobile phase: A. a 0.78 per cent w/v solution of *sodium dihydrogen orthophosphate*, adjusted to pH 4.0 with *orthophosphoric acid*,
  B. a mixture of 45 volumes of *acetonitrile* and 55 volumes of mobile phase A,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	95	5
30	75	25
45	0	100
55	0	100
70	95	5

Equilibrate the column with a mixture of 5 volumes of mobile phase B and 95 volumes of mobile phase A for at least 15 minutes.

Inject reference solution (b). The test is not valid unless resolution between the peaks due to cefaclor and delta-3-cefaclor is not less than 2.0. If necessary, adjust the proportion of acetonitrile in the mobile phase.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent) and the sum of the areas of any such peaks is not greater than three times the area of the principal peak in the chromatogram obtained with reference solution (a)

(3.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the oral suspension containing about 75 mg of anhydrous cefaclor with 200 ml of the mobile phase, dilute to 250.0 ml with the mobile phase and filter.

Reference solution (a). A 0.03 per cent w/v solution of *cefaclor IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.03 per cent w/v, each of, *cefaclor IPRS* and *delta-3-cefaclor IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Beckman Ultrasphere ODS and Supelcosil LC-18-DB),
- mobile phase: a solution prepared by dissolving 0.1 g of *sodium pentanesulphonate* in a mixture of 78 volumes of *water* and 1 volume of *triethylamine*, adjusted to pH 2.5 using *orthophosphoric acid*, adding 22 volumes of *methanol* and mixing,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to cefaclor and delta-3-cefaclor is not less than 2.5 and the tailing factor of the peak due to cefaclor is not more than 1.5.

Inject reference solution (a) and the test solution.

Determine the weight per ml of the oral suspension (2.4.29) and calculate the content of $C_{15}H_{14}ClN_3O_4S$, weight in volume.

Repeat the procedure using a portion of the constituted suspension that has been stored at the temperature and for the period stated on the label.

Storage. Store at the temperature and use within the period stated on the label.

Labelling. The label states the quantity in terms of the equivalent amount of anhydrous cefaclor.

Cefaclor Prolonged-release Tablets

Cefaclor Sustained-release Tablets; Cefaclor Extended-release Tablets

Cefaclor Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Cefaclor Prolonged-release Tablets contains not less than 90.0 per cent and not more than 105.0 per cent of the stated amount of cefaclor, $C_{15}H_{14}ClN_3O_4S$.

Usual strengths. 125 mg; 250 mg.

Identification

A. Shake a quantity of the powdered tablets containing 0.3 g of anhydrous cefaclor with 100 ml of *water*, filter and dilute 1 ml of the filtrate to 100 ml with *water*.

When examined in the range 190 nm to 310 nm (2.4.7), the resulting solution shows an absorption maximum at about 264 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2). Complies with the test stated under tablets.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. A 0.27 per cent w/v solution of *sodium dihydrogen orthophosphate*, adjusted pH to 2.5, if necessary, with *orthophosphoric acid*.

Test solution. Shake a quantity of the powdered tablets containing 0.75 g of anhydrous cefaclor with 200 ml of the solvent mixture, dilute to 250 ml with the solvent mixture and filter.

Reference solution (a). A 0.003 per cent w/v solution of *cefaclor IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.0025 per cent w/v of *cefaclor IPRS* and 0.005 per cent w/v of *delta-3-cefaclor IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Spherisorb ODS-2),
- mobile phase: A. a 0.78 per cent w/v solution of *sodium dihydrogen orthophosphate*, adjusted to pH 4.0 with *orthophosphoric acid*,
  B. a mixture of 45 volumes of *acetonitrile* and 55 volumes of mobile phase A,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	95	5
30	75	25
45	0	100
55	0	100
70	95	5

Equilibrate the column with a mixture of 5 volumes of mobile phase B and 95 volumes of mobile phase A for at least 15 minutes.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to cefaclor and delta-3-cefaclor is not less than 2.0. If necessary, adjust the proportion of acetonitrile in the mobile phase.

Inject reference solution (a) and the test solution. In the chromatogram obtained with test solution the area of any secondary peak is not greater than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.6 per cent) and the sum of the areas of any such peaks is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (2 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 75 mg of anhydrous cefaclor, disperse in the mobile phase, shake, dilute to 250.0 ml with the mobile phase and filter.

Reference solution (a). A 0.03 per cent w/v solution of *cefaclor IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.03 per cent w/v, each of, *cefaclor IPRS* and *delta-3-cefaclor IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Beckman Ultrasphere ODS and Supelcosil LC-18-DB),
- mobile phase: a solution prepared by dissolving 0.1 g of *sodium pentanesulphonate* in a mixture of 78 volumes of *water* and 1 volume of *triethylamine*, adjusted to pH 2.5 with *orthophosphoric acid*, adding 22 volumes of *methanol* and mixing,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to cefaclor and delta-3-cefaclor is not less than 2.5.

Inject reference solution (a) and the test solution.

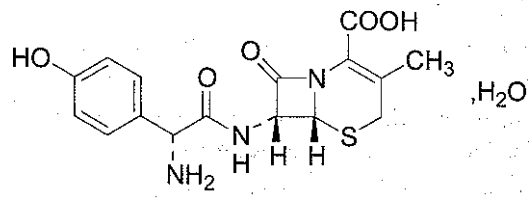
Calculate the content of $C_{15}H_{14}ClN_3O_4S$ in the tablets.

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the equivalent amount of anhydrous cefaclor.

Cefadroxil

Cefadroxil Monohydrate



$C_{16}H_{17}N_3O_5S,H_2O$ Mol. Wt. 381.4

Cefadroxil is 7-[(*R*)-2-amino-2-(4-hydroxyphenyl)acetamido]-3-methyl-3-cephem-4-carboxylic acid monohydrate.

Cefadroxil contains not less than 95.0 per cent and not more than 101.0 per cent of $C_{16}H_{17}N_3O_5S$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white to off-white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cefadroxil IPRS* or with the reference spectrum of cefadroxil.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H* and impregnating the dry plate by placing it in a tank containing a shallow layer of about 1 cm of a mixture of 95 volumes of *n-hexane* and 5 volumes of *1-tetradecane*, allowing the solvent to ascend to the top, removing the plate and allowing the solvent to evaporate.

Mobile phase. A mixture of 60 volumes of *0.1 M citric acid*, 40 volumes of *0.1 M disodium hydrogen phosphate* and 1.5 volumes of a 6.66 per cent w/v solution of *ninhydrin* in *acetone*.

Test solution. A 0.2 per cent w/v solution of the substance under examination in *water*.

Reference solution (a). A 0.2 per cent w/v solution of *cefadroxil IPRS* in *water*.

Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

Apply to the plate 20 µl of each solution. After development, dry the plate in air, spray with a 0.2 per cent w/v solution of

ninhydrin in *ethanol*, dry at 110° for 10 minutes and examine. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single compact spot.

Tests

pH (2.4.24). 4.0 to 6.0, determined in a 5.0 per cent w/v suspension.

Specific optical rotation (2.4.22). +165° to +178°, determined in a 1.0 per cent w/v solution.

Related substances Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 50.0 ml of mobile phase A.

Reference solution (a). Dissolve 10 mg of *D-α-(4-hydroxyphenyl)glycine IPRS (cefadroxil monohydrate impurity A IPRS)* in 10.0 ml of the mobile phase A.

Reference solution (b). Dissolve 10 mg of *7-aminodesacetoxycephalosporanic acid IPRS (cefadroxil monohydrate impurity B IPRS)* in 10.0 ml of the *phosphate buffer pH 7.0*.

Reference solution (c). Dilute 1.0 ml, each of, reference solution (a) and (b) to 100.0 ml with the mobile phase A.

Reference solution (d). Dissolve 10 mg, each of, *dimethylformamide* and *dimethylacetamide* in 10.0 ml of the mobile phase A. Dilute 1.0 of the solution to 100.0 ml with the mobile phase A.

Reference solution (e). Dilute 1.0 ml of the reference solution (c) to 25.0 ml with the mobile phase A.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. *phosphate buffer pH 5.0*,
  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	98	2
1	98	2
20	70	30
23	98	2
30	98	2

The relative retention time with respect to cefadroxil peak for dimethylformamide is about 0.4 and for diemthylacetamide is about 0.75.

Inject reference solution (c) and (e). The test is not valid unless the resolution between the peaks due to cefadroxil impurities A and B is not less than 5.0 in the chromatogram obtained with reference solution (c). In the chromatogram obtained with reference solution (e), signal- to- noise ratio for the second peak is not less than 10.

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution, the area of secondary peak due to cefadroxil impurity A is not more than the area of the first peak in the chromatogram obtained with reference solution (c) (1.0 per cent), the area of any secondary peak is not more than the area of the second peak in the chromatogram obtained with reference solution (c) (1.0 per cent). The sum of areas of all the secondary peaks is not more than 3 times the area of the second peak in the chromatogram obtained with reference solution (c) (3.0 per cent). Ignore any peak with an area less than 0.05 times the area of the second peak in the chromatogram obtained with reference solution (c) (0.05 per cent). Ignore the peaks due to dimethylformamide and dimethylacetamide.

***N,N*-Dimethylaniline** (2.3.21). Not more than 20 ppm, determined by Method B.

Water (2.3.43). 4.2 to 6.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. A freshly prepared 0.1 per cent w/v solution of the substance under examination in *phosphate buffer pH 5.0*.

Reference solution. A freshly prepared 0.1 per cent w/v solution of *cefadroxil IPRS* in *phosphate buffer pH 5.0*.

Chromatographic system
- a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica (3 to 10 µm),
- mobile phase: a mixture of 96 volumes of *phosphate buffer pH 5.0* and 4 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{17}N_3O_5S$.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Cefadroxil Capsules

Cefadroxil Capsules contain not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of anhydrous cefadroxil, $C_{16}H_{17}N_3O_5S$.

Usual strength. The equivalent of 500 mg of anhydrous cefadroxil.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H* and impregnating the dry plate by placing it in a tank containing a shallow layer of about 1 cm of a mixture of 95 volumes of *n-hexane* and 5 volumes of *1-tetradecane,* allowing the solvent to ascend to the top, removing the plate and allowing the solvent to evaporate.

Mobile phase. A mixture of 60 volumes of *0.1 M citric acid,* 40 volumes of *0.1 M disodium hydrogen phosphate* and 1.5 volumes of a 6.66 per cent w/v solution of *ninhydrin* in *acetone.*

Test solution. Shake a quantity of the contents of a capsule with sufficient *water* to produce a solution containing 0.2 per cent w/v of Cefadroxil.

Reference solution (a). A 0.2 per cent w/v solution of *cefadroxil IPRS* in *water.*

Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

Apply to the plate 20 µl of each solution. After development, dry the plate in air, spray with a 0.2 per cent w/v solution of *ninhydrin* in *ethanol,* dry at 110° for 10 minutes and examine. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single compact spot.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water,*
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance (2.4.7) of the filtrate, suitably diluted if necessary, at the maximum at about 263 nm.

Calculate the content of $C_{16}H_{17}N_3O_5S$ in the medium from the absorbance obtained from a solution of known concentration of *cefadroxil IPRS.*

Q. Not less than 75 per cent of the stated amount of $C_{16}H_{17}N_3O_5S$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve a quantity of content of capsules containing 0.5 g of anhydrous cefadroxil in 50 ml of the mobile phase, mix for 10 minutes and filter.

Reference solution (a). A 0.01 per cent w/v solution of *cefadroxil IPRS* in the mobile phase.

Reference solution (b). A 0.01 per cent w/v solution of *D-α-(4-hydroxyphenyl) glycine IPRS (cefadroxil impurity A IPRS)* in the mobile phase.

Reference solution (c). A 0.01 per cent w/v solution of *7-aminodesacetoxycephalosporanic acid IPRS (cefadroxil impurity B IPRS)* in the mobile phase.

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm packed with octadecylsilane bonded to porous silica (10 µm) (Such as Bondapak C18),
- column temperature: 40°,
- mobile phase: add 20 volumes of *1M potassium hydroxide,* 4 volumes of *0.4 M tetrabutylammonium hydroxide* and 8 volumes of *methanol* in 160 volumes of *water* and dilute to 200 volumes with *water,* adjusted to pH 7.0 with *orthophosphoric acid,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 50 µl.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 1500 theoretical plates and tailing factor is not more than 1.6 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a), (b), (c) and the test solution. Run the chromatogram 6 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of peak corresponding to cefadroxil impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent), the area of peak corresponding to cefadroxil impurity B is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent) and the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Water (2.3.43). Not more than 7.0 per cent, determined on 0.5 g of the mixed contents of 20 capsules.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Use freshly prepared solutions.

Test solution. Weigh accurately a quantity of the mixed contents of 20 capsules containing about 0.2 g of Cefadroxil, add sufficient *phosphate buffer pH 5.0,* shake for 30 minutes, dilute to 200.0 ml with the same solvent and filter.

Reference solution. A 0.1 per cent w/v solution of *cefadroxil IPRS* in *phosphate buffer pH 5.0.*

Chromatographic system
- a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 96 volumes of *phosphate buffer pH 5.0* and 4 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{17}N_3O_5S$ in the capsules.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of anhydrous cefadroxil.

Cefadroxil Oral Suspension

Cefadroxil Mixture

Cefadroxil Oral Suspension is a mixture of Cefadroxil with buffering agents and other excipients. It contains a suitable flavouring agent. It is filled in a sealed container.

The suspension is constituted by dispersing the contents of the sealed container in the specified volume of *water* just before use.

Cefadroxil Oral Suspension contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of $C_{16}H_{17}N_3O_5S$.

When stored at the temperature and for the period stated on the label during which the constituted suspension may be expected to be satisfactory for use, it contains not less than 80.0 per cent of the stated amount of cefadroxil.

Usual strengths. The equivalent of 125 mg and 250 mg of anhydrous cefadroxil per 5 ml after reconstitution.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H* and impregnating the dry plate by placing it in a tank containing a shallow layer of about 1 cm of a mixture of 95 volumes of *n-hexane* and 5 volumes of *1-tetradecane*, allowing the solvent to ascend to the top, removing the plate and allowing the solvent to evaporate.

Mobile phase. A mixture of 60 volumes of *0.1 M citric acid*, 40 volumes of *0.1 M disodium hydrogen phosphate* and 1.5 volumes of a 6.66 per cent w/v solution of *ninhydrin* in *acetone*.

Test solution. Dilute a suitable quantity of the freshly prepared suspension with water to obtain a solution containing 0.2 per cent w/v of cefadroxil. Filter the solution.

Reference solution (a). A 0.2 per cent w/v solution of *cefadroxil IPRS* in *water*.

Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

Apply to the plate 20 µl of each solution After development, dry the plate in air, spray with a 0.2 per cent w/v solution of *ninhydrin* in *ethanol*, dry at 110° for 10 minutes and examine. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single compact spot.

Water (2.3.43). Not more than 2.0 per cent, determined on 1.0 g, using a mixture of 2 volumes of *carbon tetrachloride*, 2 volumes of *chloroform* and 1 volume of *methanol* in place of *methanol* in the titration vessel.

The constituted suspension complies with the tests stated under Oral liquids and with the following tests.

Tests

pH (2.4.24). 4.5 to 6.0.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve a quantity of the oral suspension containing about 0.1 g of Cefadroxil in 100.0 ml with mobile phase A, stir for 10 minutes and filter.

Reference solution (a). A 0.001 per cent w/v solution of *cefadroxil IPRS* in mobile phase A.
