Test solution. Dissolve about 50 mg of the substance under examination in 10.0 ml of internal standard solution. Dilute 1.0 ml of the solution to 50 ml with solvent mixture.

Reference solution (a). A solution containing 0.01 per cent w/v each of *lansoprazole IPRS* and *lansoprazole impurity A IPRS* in the solvent mixture.

Reference solution (b). A 0.5 per cent w/v solution of *lansoprazole IPRS* in internal standard solution. Dilute 1.0 ml of the solution to 50.0 ml with solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of *water*, 40 volumes of *acetonitrile* and 1 volume of *triethylamine*, adjusted to pH 7.0 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 285 nm,
- injection volume: 10 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due lansoprazole and lansoprazole impurity A is not less than 5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (b) and the test solution.

Calculate the content of $C_{16}H_{14}F_3N_3O_2S$.

Storage. Store protected from light and moisture.

Lansoprazole Gastro-resistant Capsules

Lansoprazole Gastro-resistant Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of lansoprazole, $C_{16}H_{14}F_3N_3O_2S$. They are made gastro-resistant by enteric-coating or by other means.

Usual strengths. 15 mg; 30 mg.

Identification

A. Shake the contents of Capsules containing about 5 mg of Lansoprazole in 5 ml of *methanol* and centrifuge. To 0.1 ml of the supernatant, add 10 ml of *methanol* and examine in the range 200 to 400 nm (2.4.7). The spectra obtained with the test solution exhibits the maxima at the same wavelength with that of the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

A. Apparatus No. 2 (Paddle),
Medium. 500 ml of *0.1 M hydrochloric acid*,
Speed and time. 75 rpm and 60 minutes.

Withdraw 25 ml of the medium and proceed as directed for test solution in the test B, leaving the remaining 475 ml in the vessel for use in the test B and measure the absorbance of the filtrate, suitably diluted if necessary with dissolution medium at 306 nm (2.4.7). Calculate the content of lansoprazole, $C_{16}H_{14}F_3N_3O_2S$ in the medium from the absorbance obtained from a solution of *lansoprazole IPRS* having a known concentration of about 8.0 per cent of the stated amount of lansoprazole dissolved per 500 ml of test A medium.

Complies with the acceptance criteria given under acid stage.

B. Apparatus No. 2 (Paddle),

Medium. 500 ml of buffer solution prepared by dissolving 16.35 g of *monobasic sodium phosphate*, 7.05 g of *sodium hydroxide* and 3 g of *sodium dodecyl sulphate* in 1000 ml of *water*,
Speed and time. 75 rpm and 60 minutes.

Add 425 ml of buffer solution to the remaining 475 ml of solution in each vessel from the test A. Adjusted to pH 6.8 with either *orthophosphoric acid* or *sodium hydroxide*, filter and measure the absorbances at 286 nm and 650 nm. Calculate the content of lansoprazole, $C_{16}H_{14}F_3N_3O_2S$ in the medium from the difference between the absorbances at 286 nm and 650 nm obtained from a solution of *lansoprazole IPRS* having a known concentration of about 70 per cent of the stated amount of lansoprazole dissolved in 900 ml of buffer stage medium.

Q. Not less than 80 per cent of the stated amount of $C_{16}H_{14}F_3N_3O_2S$.

NOTE — A volume of methanol not to exceed 0.5 per cent of the total volume of standard solution may be used to dissolve Lansoprazole IPRS prior to dilution with acid stage medium and the amount of methanol not to exceed 2.0 per cent of the total volume of standard solution may be used to dissolve Lasoprazole IPRS prior to dissolution with buffer stage medium.

Uniformity of content. Shake the content of 1 Capsule with 30 ml of *0.1 M sodium hydroxide* in a 100-ml volumetric flask and sonicate to disintegrate. Dilute to volume with *acetonitrile*, centrifuge and filter. Dilute a volume of the filtrate with a mixture of 7 volumes of *acetonitrile* and 3 volumes of *0.1 M sodium hydroxide* to obtain a solution containing about 0.012 mg of lansoprazole per ml and measure the absorbance at about 294 nm.

Calculate the content of lansoprazole, $C_{16}H_{14}F_3N_3O_2S$ by using a 0.0012 per cent w/v solution of *lansoprazole IPRS* in a mixture of 7 volumes of *acetonitrile* and 3 volumes of *0.1 M sodium hydroxide*.

Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 1 g of the contents of capsules by drying in an oven at 60° in vacuum over *phosphorus pentoxide*, at a pressure not exceeding 5 mm of Hg.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 60 volumes of *water*, 40 volumes of *acetonitrile* and 1 volume of *triethylamine*, adjusted to pH 10.0 with *orthophosphoric acid*.

Internal standard solution. A 0.75 per cent w/v solution of *4'-ethoxyacetophenone* in *acetonitrile*.

Test solution. Shake the contents of 10 Capsules containing about 300 mg of Lansoprazole with 60 ml of *0.1 M sodium hydroxide* in a 300-ml conical flask and sonicate until completely disintegrated. Add 20.0 ml of *acetonitrile* and 20 ml of internal standard solution, shake well and centrifuge. Dilute a volume of supernatant with solvent mixture to obtain a concentration of 0.1 mg of lansoprazole per ml and filter.

Reference solution (a). A solution containing 0.01 per cent w/v each of *lansoprazole IPRS* and *2-[[[3-methyl-4-(2,2,2-trifluoroethoxy)-2-pyridyl]methyl]sulfonyl]benzimidazole IPRS (lansoprazole impurity A IPRS)* in the solvent mixture.

Reference solution (b). A 0.3 per cent w/v solution of *lansoprazole IPRS* in a mixture of 3 volumes of *0.1 M sodium hydroxide* and 2 volumes of *acetonitrile*. To 25.0 ml of the solution, add 5.0 ml of internal standard solution and dilute to 50.0 ml with the solvent mixture. Dilute this solution with the solvent mixture to obtain a solution containing 0.01 per cent w/v of Lansoprazole.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of *water*, 40 volumes of *acetonitrile* and 1 volume of *triethylamine*, adjusted to pH 7.0 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 285 nm,
- injection volume: 10 µl.

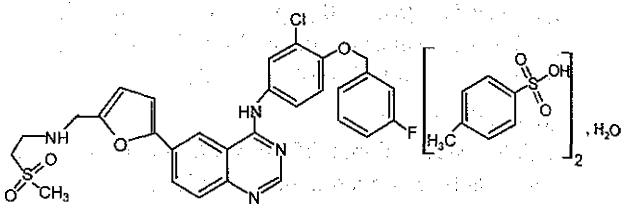
Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to lansoprazole and lansoprazole impurity A is not less than 5.0 in reference solution (a). The relative standard deviation for replicate injections is not more than 2.0 per cent in reference solution (b).

Inject reference solution (b) and the test solution.

Calculate the content of $C_{16}H_{14}F_3N_3O_2S$ in the Capsules.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Lapatinib Ditosylate



$C_{29}H_{26}ClFN_4O_4S,2C_7H_8O_3S$ (anhydrous) Mol. Wt. 925.5

$C_{29}H_{26}ClFN_4O_4S,2C_7H_8O_3S,H_2O$ (monohydrate) Mol. Wt. 943.5

Lapatinib Ditosylate is *N*-[3-chloro-4-[(3-fluorophenyl) methoxy]phenyl]-6- [5-[(2-methylsulfonyl ethylamino)methyl]-2-furanyl]-4-quinazolinamine ditosylate.

Lapatinib Ditosylate contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{29}H_{26}C1FN_4O_4S, 2C_7H_8O_3S$, calculated on the anhydrous basis.

Category. Anticancer.

Description. A yellow powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *lapatinib ditosylate IPRS* or with the reference spectrum of lapatinib ditosylate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

p-Toluenesulphonic acid. Not less than 36.1 per cent w/w and not more than 38.0 per cent w/w, calculated on anhydrous basis.

Dissolve 0.4 g of the substance under examination in 60 ml of *methanol* and 10 ml of *water*. Titrate with *0.1 M sodium hydroxide* using *phenolphthalein solution* as indicator.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01722 g of p-toluenesulphonic acid.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and *methanol*.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution. A solution containing 0.001 per cent w/v each of *lapatinib ditosylate IPRS* and *lapatinib impurity B IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column of 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: A. dissolve 2.72 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 7.0 with *triethylamine*,

  B: a mixture of 80 volumes of *acetonitrile* and 20 volumes *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	45	55
8	45	55
25	30	70
45	30	70
50	45	55
60	45	55

Name	Relative retention time
Lapatinib impurity B[1]	0.7
Lapatinib	1.0
Lapatinib impurity A[2]	1.4
Lapatinib impurity C[3]	1.3

[1]N-(4-(3-fluorobenzyloxy)phenyl)-6-(5-((2-methylsulfonyl) ethylamino)methyl)furan-2-l) quinazolin-4-amine-bis-4-methylbenzene sulfonate,

[2]5-(4-[3-chloro-4-(3-fluorobenzyloxy)amino]-6-quinazolinyl)-furan-2-carbaldehyde,

[3]4-(3-chloro-4-(3-fluorobenzyloxy)-phenylamino)-6-(5-hydroxy-methyl-furan-2-yl)quinazoline.

Inject the reference solution. The test is not valid unless the resolution between lapatinib impurity B and lapatinib is not less than 2.0, the column efficiency of the principal peak is not less than 3000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore the peak due to tosylate at relative retention time of about 0.14.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.0 per cent (for anhydrous form) and 1.6 per cent to 2.5 per cent (for monohydrate form), determined on 0.5g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 50.0 ml of the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *lapatinib ditosylate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column of 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of buffer solution prepared by dissolving 2.72 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 7.0 with *triethylamine* and 65 volumes of a mixture of 80 ml of *acetonitrile* and 20 ml of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{29}H_{26}C1FN_4O_4S, 2C_7H_8O_3S$.

Storage. Store protected from light.

Lapatinib Tablets

Lapatinib Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of lapatinib, $C_{29}H_{26}ClFN_4O_4S$.

Usual strength. 250 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with test solution (b) corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid* containing 2 per cent of *Tween 80*,
Speed and time. 55 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *methanol* and *acetonitrile*.

Test solution. Dilute 2 ml of the filtrate to 25 ml with the solvent mixture.

Reference solution. A 0.0036 per cent w/v solution of *lapatinib ditosylate IPRS* in the solvent mixture.

Use chromatographic system as described under Assay.

Q. Not less than 75 per cent of the stated amount of $C_{29}H_{26}ClFN_4O_4S$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and *methanol*.

Test solution. Disperse a quantity of powdered tablets containing 100 mg of lapatinib in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution. A 0.00016 per cent w/v solution of *lapatinib ditosylate IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column, 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: A. a mixture of 98 volumes of buffer solution prepared by dissolving 2.72 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 7.0 with *triethylamine* and 2 volumes of *methanol*,
  B: a mixture of 80 volumes of *acetonitrile* and 20 volumes of *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	50	50
8	50	50
40	40	60
50	20	80
55	20	80
60	50	50
70	50	50

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of areas of all the secondary peaks is not more than 15 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent). Ignore the peak due to tosylate at relative retention time of about 0.14.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and *methanol*.

Test solution (a). Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.25 g of lapatinib in the solvent mixture and dilute to 250.0 ml with the solvent mixture.

Test solution (b). Dilute 2.0 ml of test solution (a) to 100.0 ml with the solvent mixture.

Reference solution. A 0.00325 per cent w/v solution of *lapatinib ditosylate IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 530 volumes of a buffer solution prepared by dissolving 2.72 g of *potassium dihydrogen orthophosphate* in 1000 ml *water*, adjusted to pH 3.0 with *orthophosphoric acid*, 395 volumes of *acetonitrile* and 75 volumes of *tetrahydrofuran*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 10 µl.

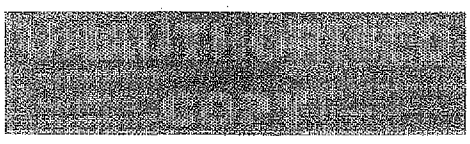
Inject the reference solution. The test is not valid unless the column efficiency is not less than 1000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and test solution (b).

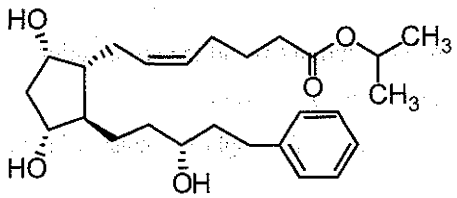
Calculate the content of $C_{29}H_{26}ClFN_4O_4S$ in the tablets.

Storage. Store protected from light.

Labelling. The label states the strength in terms of the equivalent amount of Lapatinib.



Latanoprost



$C_{26}H_{40}O_5$ Mol. Wt. 432.6

Latanoprost is isopropyl (*Z*)-7-[(1*R*, 2*R*, 3*R*, 5*S*)-3,5-dihydroxy-2-[(*R*)-3-hydroxy-5-phenylpentyl]cyclopentyl]-5-heptenoate.

Latanoprost contains not less than 94.0 per cent and not more than 102.0 per cent of $C_{26}H_{40}O_5$, calculated on the anhydrous basis.

Category. Antiglucoma.

Description. A colourless to slightly yellow oil.

Identification

NOTE — Wear protective glasses and gloves while handling the material. Avoid contact during pregnancy or while nursing.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *latanoprost IPRS* or with the reference spectrum of latanoprost.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

Tests

Specific optical rotation (2.4.22). + 31.0° to + 38.0°, determined in a 1.0 per cent w/v solution of latanoprost in *acetonitrile.*

Related substances. Determine by liquid chromatography (2.4.14) as described under Assay using the following modifications.

Solvent mixture. 80 volumes of *hexane* and 20 volumes of *ethanol.*

Reference solution (b). A 0.004 per cent w/v solution of *latanoprost IPRS* in the solvent mixture.

Name	Relative retention time	Correction factor
Isopropyl diphenyl phosphoryl pentanoate[1]	0.79	0.4
Latanoprost impurity B[2]	0.89	—
Latanoprost	1.0	—
Latanoprost impurity A[3]	1.1	—

[1]isopropyl 5-(diphenylphosphoryl) pentanoate,

[2]isopropyl (Z)-7-[(1R, 2R, 3R, 5S)-3, 5-dihydroxy-2-[(3S)-3-hydroxy-5-phenylpentyl] cyclopentyl]-5-heptenoate,

[3]isopropyl (E)-7-[(1R, 2R, 3R, 5S)-3, 5-dihydroxy-2-[(3R)-3-hydroxy-5-phenylpentyl] cyclopentyl]-5-heptenoate.

Inject reference solution (a).The test is not valid unless the resolution between the peaks due to latanoprost and latanoprost impurity A is not less than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to isopropyl diphenylphosphoryl pentanoate is not more than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent), the area of any peak corresponding to latanoprost impurity A is not more than 1.75 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.5 per cent), the area of any peak corresponding to latanoprost impurity B is not more than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any other secondary peak is not more than 0.05 times the area of the principal peak obtained with reference solution (b) (0.1 per cent) and the sum of the areas of all the secondary peaks excluding latanoprost impurity A and impurity B is not more than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with the area less than 0.025 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Latanoprost impurity E. Determine by liquid chromatography (2.4.14).

Solvent mixture. 30 volumes of *acetonitrile* and 70 volumes of *water.*

Test solution. Dissolve 100 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution. A 0.0001 per cent w/v solution of *latanoprost impurity E IPRS ((Z)-7-[(1R,2R,3R,5S)-3,5-dihydroxy-2-[(3R)-3-hydroxy-5-phenylpentyl]-5-heptanoic acid IPRS)* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 60°,
- mobile phase: A. a mixture of 300 volumes of *acetonitrile*, 1 volume of *orthophosphoric acid* and 700 volumes of *water*,
  B. a mixture of 800 volumes of *acetonitrile*, 1 volume of *orthophosphoric acid* and 200 volumes of *water*,
- a gradient programme using the conditions given below,

– flow rate: 1 ml per minute,
– spectrophotometer set at 200 nm,
– injection volume: 50 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
9	100	0
10	0	100
15	0	100
16	100	0
21	100	0

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to latanoprost impurity E is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent).

Sulphated ash (2.3.18). Not more than 0.5 per cent.

Water (2.3.43). Not more than 2.0 per cent, determined on a 10.0 per cent solution of latanoprost in *ethyl acetate*. Carry out blank determination.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 200 mg of substance under examination in 20 ml of *ethanol* and dilute to 100.0 ml with *hexane*.

Reference solution (a). Dissolve weighed quantities of *latanoprost IPRS* and *latanoprost impurity A IPRS* in *ethanol* (equivalent to 20 per cent of the final volume) and dilute with *hexane* to obtain a solution having concentration equivalent to 0.2 per cent of latanoprost and 0.002 per cent of latanoprost impurity A.

Reference solution (b). Dissolve 20 mg of *latanoprost IPRS* in 2 ml of *ethanol* and dilute to 10.0 ml with *hexane*.

Chromatographic system
– a stainless steel column 25 cm x 4.0 mm, packed with porous silica (5 µm),
– mobile phase: a mixture of 94 volumes of *hexane* and 6 volumes of *ethanol*,
– flow rate: 1 ml per minute,
– spectrophotometer set at 210 nm,
– injection volume: 10 µl.

The relative retention time with reference to latanoprost for latanoprost impurity A is about 1.1.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to latanoprost and latanoprost impurity A is not less than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (b) and the test solution.

Calculate the content of $C_{26}H_{40}O_5$.

Storage. Store protected from light and moisture in a refrigerator or freezer.

Latanoprost Eye Drops

Latanoprost Eye Drops is a sterile solution of Latanoprost in Purified Water.

Latanoprost Eye Drops contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of Latanoprost, $C_{26}H_{40}O_5$.

Usual strength. 0.005 per cent w/v.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 6.4 to 7.0.

Related substances. Determine by liquid chromatography (2.4.14) as described under Assay.

Inject the test solution. The area of any peak due to latanoprost free acid and 15-keto latanoprost is not more than 0.5 per cent. The area of any other secondary peak is not more than 0.5 per cent and the sum of areas of all the secondary peaks is not more than 2.0 per cent, calculated by area normalization. Ignore peak due to impurity at relative retention time about 1.03 and the peaks having an area less than 0.1 per cent. Ignore all the peaks eluted till the retention time of 6 minutes.

Name	Relative retention time
Latanoprost free acid	0.40
Latanoprost	1.0
15-keto Latanoprost	1.21

Other tests. Comply with the tests stated under Eye Drops.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of equal volumes of *water* and *acetonitrile*.

Test solution. Prepare a composite solution by pooling the contents of 10 containers of eye drops into a suitable vessel. Weigh and transfer composite sample containing 0.35 mg of Latanoprost, into 10.0 ml volumetric flask. Add 2 ml of *acetonitrile*, sonicate for 5 minutes and dilute to volume with *solvent mixture.*

Reference solution. Dissolve 22 mg of *latanoprost IPRS* in 30.0 ml of the *acetonitrile* and dilute to 50.0 ml with the *acetonitrile*. Dilute 2.0 ml of the solution to 25.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 58°,
- sample temperature: 5°,
- mobile phase: A. a mixture of 30 volumes of *acetonitrile*, 4 volumes of *isopropyl alcohol* and 66 volumes of a buffer solution prepared by dissolving 0.3 g of *sodium dihydrogen orthophosphate monohydrate* in 1000 ml *water*, adjusted to pH 5.0 with *orthophosphoric acid* or *dilute sodium hydroxide solution* and filter.

  B. a mixture of 16 volumes of *water*, 4 volumes of *isopropyl alcohol* and 80 volumes of *acetonitrile,*
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 100 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
8	95	5
10	80	20
30	80	20
35	70	30
40	50	50
40.1	100	0
50	100	0

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Determine the weight per ml of the sample (2.4.29) and calculate the content of $C_{26}H_{40}O_5$ as weight in volume.

Storage. Store at a temperature between 2° to 8°.

Latanoprost and Timolol Ophthalmic Solution

Latanoprost and Timolol Maleate Ophthalmic Solution

Latanoprost and Timolol Ophthalmic Solution is a sterile solution of Latanoprost and Timolol Maleate in a suitable aqueous vehicle.

Latanoprost and Timolol Ophthalmic Solution contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of latanoprost, $C_{26}H_{40}O_5$ and timolol, $C_{13}H_{24}N_4O_3S$.

Usual strength. Latanoprost, 50 mcg and Timolol Maleate equivalent to Timolol 5 mg per ml.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution corresponds to the peaks in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 5.5 to 6.5.

Related substances. Determine by liquid chromatography (2.4.14).

For Timolol —

Buffer solution. A buffer solution prepared by dissolving 1.7 g of *potassium dihydrogen orthophosphate* and 4.68 g of *octane sulphonic acid* in 1000 ml of *water* and adjusted to pH 3.0 with *glacial acetic acid.*

Solvent mixture. 45 volumes of buffer solution and 55 volumes of *methanol.*

Test solution. Measure a volume of ophthalmic solution containing 20 mg of Timolol, add 15 ml of solvent mixture and dissolve with the aid of ultrasound for 10 minutes, allow to cool to room temperature, dilute to produce 25.0 ml with solvent mixture. Dilute 5.0 ml to 100.0 ml with solvent mixture.

Reference solution. A 0.001367 per cent w/v solution *timolol maleate IPRS* in solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- sample temperature: 5°,
- mobile phase: a mixture of 450 volumes of buffer solution, 530 volumes of *methanol* and 20 volumes of *tetrahydrofuran*,
- flow rate: 1 ml per minute,

– spectrophotometer set at 295 nm,
– injection volume: 20 µl.

Name	Relative retention time	Correction factor
Isotimolol	0.72	1.03
Timolol phenol	0.56	0.57
Timolol	1.0	---

The retention time of timolol is about 11.7 minutes, Isotimolol is about 8.37 minutes and timolol phenol is about 6.52 minutes.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injection is not more than 10.0 per cent.

Inject the test solution. The area of the peaks due to Isotimolol, timolol phenol is not more than 1.0 per cent and the area of secondary peak is not more than 1.0 per cent and the sum of areas of all the secondary peaks is not more than 2.0 per cent, calculated by area normalisation. Ignore the peak due to maleic acid at relative retention time of about 0.22.

For Latanoprost —

Solvent mixture. 40 volumes of *water* and 60 volumes of *isopropyl alcohol.*

Test solution. Measure a volume of ophthalmic solution containing 0.2 mg of Latanoprost, add 4.0 ml of *isopropyl alcohol* and dissolve with the aid of ultrasound for 10 minutes, dilute 10.0 ml with the same solvent.

Reference solution (a). Dissolve 5 mg of *latanoprost IPRS* in 75 ml of solvent mixture, shake, dilute to 100.0 ml with the same solvent.

Reference solution (b). A 1.0 per cent w/v solution of *latanoprost acid impurity IPRS* in the solvent mixture. Dilute 0.2 ml to 100.0 ml with the solvent mixture.

Reference solution (c). Dilute to 1.0 ml of reference solution (a) and 2.5 ml of reference solution (b) with 50.0 ml of solvent mixture.

Reference solution (d). Dilute to 2.0 ml of reference solution (c) with 10.0 ml of solvent mixture.

Chromatographic system
– a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
– mobile phase: A. dissolve 2.0 g of *sodium dihydrogen orthophosphate* in 800 ml of *water*, add 200.0 ml of *acetonitrile*, adjusted to pH 2.5 with *orthophosphoric acid*,

B. *acetonitrile*,

– a gradient programme using the conditions given below,
– flow rate: 0.5 ml per minute,
– spectrophotometer set at 210 nm,
– injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	82	18
11	82	18
20	80	20
42	60	40
53	60	40
54	45	55
59	45	55
60	82	18
70	82	18

Name	Relative retention time	Correction factor
Latanoprost acid impurity	0.42	0.95
Latanoprost	1	---

The retention time of latanoprost is about 48 minutes.

Inject reference solution (d). The test is not valid unless the relative standard deviation for replicate injection is not more than 15.0 per cent.

Inject the test solution. The area of latanoprost acid impurity is not more than 1.0 per cent, calculated by area normalisation.

Other tests. Comply with the tests stated under Eye Drops.

Assay. Determine by liquid chromatography (2.4.14).

For Timolol —

Solvent mixture. 90 volumes of *water* and 10 volumes of *acetonitrile.*

Test solution. Measure a volume of ophthalmic solution containing 50.0 mg of Timolol, add 70 ml of solvent mixture and dissolve with the aid of ultrasound for 10 minutes, allow to cool to room temperature, dilute to 100.0 ml with solvent mixture. Dilute 5.0 ml to 50.0 ml with solvent mixture.

Reference solution. A 0.068 per cent w/v solution of *timolol maleate IPRS* in solvent mixture. Dilute 5.0 ml to 50.0 ml with solvent mixture.

Chromatographic system
– a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
– sample temperature: 5°,
– mobile phase: a mixture of 650 volumes of a buffer solution prepared by dissolving 11.1 g of *monobasic sodium phosphate* in 1000 ml of *water* and adjusted to pH 2.8 with *orthophosphoric acid* and 350 volumes of *methanol*,

- flow rate: 1.2 ml per minute,
- spectrophotometer set at 295 nm,
- injection volume: 10 µl.

Inject the reference solution. Retention time of timolol peak is at about 4.0 minutes for timolol, the test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{13}H_{24}N_4O_3S$.

For Latanoprost —

Solvent mixture. 500 volumes of *water*, 500 volumes of *acetonitrile* and 60 volumes of *isopropyl alcohol*.

Test solution. Measure a volume of Ophthalmic Solution containing 0.25 mg of Latanoprost, add 10 ml of solvent mixture and dissolve with the aid of ultrasound for 10 minutes, allow to cool to room temperature, dilute with solvent mixture to 25.0 ml, mix and filter.

Reference solution. A 0.01 per cent w/v solution of *latanoprost IPRS* in solvent mixture. Dilute to 5.0 ml to 50.0 ml with solvent mixture.

Chromatographic system

- a stainless steel column 5.0 cm x 4.6 mm, packed with octylsilane bonded to porous silica (3 µm),
- sample temperature: 5°,
- mobile phase: a mixture of 550 volumes of a buffer solution prepared by dissolving 1.882 g of *hexane sulphonic acid sodium salt* in 1000 ml of *water* and adjusted to pH 3.0 with *dilute orthophosphoric acid* and 450 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. Retention time of about 3.2 minutes for latanoprost, the test is not valid unless the column efficiency is not less than 2000 theoretical plates, tailing factor is not more than 2.0 and relative standard deviation for replicate injections is not more than 2.0 per cent.

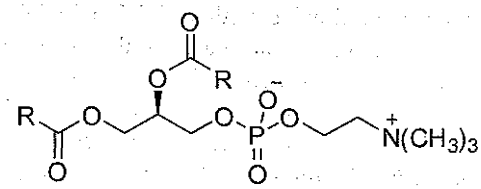
Inject the reference solution and the test solution.

Calculate the content of $C_{26}H_{40}O_5$.

Storage. Store protected from light and moisture. The container should be sterile, tamper evident and sealed so as to exclude microorganism.

Labelling. The label states the strength in terms of the equivalent amount of timolol and latanoprost in the labelled amount of ophthalmic solution.

Lecithin



Lecithin is a complex mixture of acetone-insoluble phosphatides, which consist chiefly of phosphatidyl choline, phosphatidyl ethanolamine, phosphatidyl serine and phosphatidyl inositol, combined with various amounts of other substances such as triglycerides, fatty acids and carbohydrates, as separated from the crude vegetable oil source.

Lecithin contains not less than 50.0 per cent of stated amount of acetone-insoluble matter.

Category. Pharmaceutical aid (excipient).

Identification

A. Transfer 1.0 g of Lecithin to a Kjeldahl flask, add 5.0 g of *potassium sulphate*, 0.5 g of *cupric sulpahte* and 20 ml of *sulphuric acid*. Incline the flask to a 45 degree angle, heat gently until the effervescence almost ceases and raise the temperature to boiling. After the contents become a blue, transparent solution, heat for 1 to 2 hours, cool and add an equal volume of *water*. To 5 ml of the solution, add 10 ml of 20 per cent w/v solution of *ammonium molybdate* and heat; a yellow precipitate is produced.

B. Determine by paper chromatography (2.4.15), coating the plate with cellulose.

Mobile phase. A mixture of 40 volumes of *n-butanol*, 20 volumes of *water* and 10 volumes of *acetic acid*.

Test solution. Dissolve 0.5 g of substance under examination in 5.0 ml of 50 per cent w/v solution of *hydrochloric acid*, heat in a water-bath for 2 hours, filter.

Reference solution. A 0.5 per cent w/v solution of *choline chloride IPRS*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in a current of air, spray with *dragendorff's reagent* and examine in day light. The principal spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with the reference solution.

Tests

Acid value. Not more than 36 mg of potassium hydroxide, determined by the following method (2.3.23). Weigh 2.0 g of substance under examination in a 250-ml conical flask and dissolve it in 50 ml of *petroleum ether (40° to 60°)*, add 50 ml of *ethanol (95 per cent)*, previously neutralized to *phenolphthalein solution* with *0.1 M sodium hydroxide*, mix. Add *phenolphthalein solution* and titrate with *0.1 M sodium hydroxide* to a pink end point that persists for 5 seconds. Calculate the number of mg of *potassium hydroxide* required to neutralize the free acids in 1.0 g of lecithin.

Peroxide value. Not more than 10.

Weigh 5.0 g of substance under examination into a 250 ml Erlenmeyer flask with a ground-glass stopper; add 35 ml of a mixture of 2 volumes of *chloroform* and 1 volume of *acetic acid*, mix. Completely dissolve the substance while shaking gently. The solution becomes transparent. Completely replace the air in the flask with nitrogen. While purging with nitrogen, add 1 ml of 16.5 per cent w/v solution of *potassium iodide*, then stop the flow of the nitrogen and immediately place a stopper in the flask. Shake for 1 minute and allow to stand in a dark place for 5 minutes, add 75 ml of *water*, replace the stopper again, shake vigorously. Titrate with *0.01 M sodium thiosulphate*, adding starch as the endpoint is approached and continue the titration until the blue colour of starch has just disappeared. Carry out a blank titration.

Calculate the content of peroxide value.

Water (2.3.43). Not more than 1.5 per cent, determined on 1 g.

Hexane-insoluble matter. Not more than 0.3 per cent. Weigh 10.0 g into a 250-ml conical flask, add 100 ml of *hexane* and shake until solution is apparently complete or until no more of any residue seems to be dissolving. Pass through a coarse-porosity filtering funnel that previously has been heated at 105° for 1 hour, cooled and weighed, wash the flask with two 25 ml portions of *hexane* and pour both washings through the funnel. Dry the funnel at 105° for 1 hour. Cool to room temperature and determine the gain in weight: not more than 0.3 per cent is found.

Lead (2.3.15). Not more than 0.001 per cent.

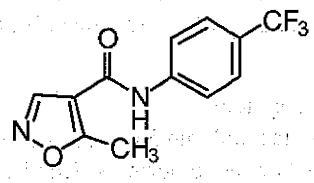
Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Acetone-insoluble matter. Weigh 2.0 g of substance under examination to a 40 ml centrifuge tube that previously has been tared along with a stirring rod, cool, Add 15.0 ml of *acetone*, warm carefully in a water-bath to melt the substance without evaporating the *acetone*, but with stirring to aid complete dissolution and place in an ice-water-bath for 5 minutes. Add *acetone* that previously has been chilled to 0° to 5° to the 40 ml mark on the tube, stirring during the addition. Cool in an ice-water-bath for 15 minutes, stir, remove the rod, clarify by centrifuging at about 2000 rpm for 5 minutes and decant. Break up the residue with the stirring rod and refill the centrifuge tube to the 40 ml mark with chilled *acetone*, while stirring. Cool in an ice-water-bath for 15 minutes, stir, remove the rod, centrifuge and decant. Break up the residue with the stirring rod. Place the tube in a horizontal position until most of the acetone has evaporated, mix again and heat the tube containing the acetone-insoluble residue and the stirring rod at 105° to constant weight. Determine the weight of the residue and calculate the percentage of acetone-insoluble matter.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Labelling. The label states that it is flammable.

Leflunomide



$C_{12}H_9F_3N_2O_2$ Mol. Wt. 270.2

Leflunomide is 5-Methyl-*N*-[4-(trifluoromethyl)phenyl]-4-isoxazolecarboxamide.

Leflunomide contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{12}H_9F_3N_2O_2$, calculated on the dried basis.

Category. Antirheumatoid arthritis.

Description. A white to off-white powder. It shows polymorphism (2.5.11).

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *leflunomide IPRS* or with the reference spectrum of leflunomide.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

Tests

Impurity A (4-(trifluoromethyl)aniline). Not more than 0.02 per cent.

Determine by liquid chromatography (2.4.14) as described under Assay with the following modifications.

Test solution. Dissolve 25 mg of the substance under examination in 10 ml of a mixture of 10 volumes of *acetonitrile* and 90 volumes of the mobile phase.

Reference solution. A 0.00005 per cent w/v solution of *leflunomide impurity A IPRS* in a mixture of 10 volumes of *acetonitrile* and 90 volumes of the mobile phase.

Inject the reference solution and the test solution.

Calculate the content of leflunomide impurity A.

Related substances. Determine by liquid chromatography (2.4.14) as described under Assay.

Inject reference solution (a). The test is not valid unless the resolution between the principal peak and leflunomide impurity C is not less than 1.0.

Name	Relative retention time
5-Methylisoxazole-carboxylic acid	0.05
Leflunomide Impurity B[1]	0.22
N-(2'-Trifluoromethylphenyl)-5-methylisoxazole-4-Carboxamide	0.29
2-Cyano-acetic acid-(4'-trifluoromethyl)-anilide	0.36
Leflunomide impurity C[2]	0.94
Leflunomide	1.0

[1]2-cyano-3-hydroxy-N-(4'-trifluoromethylphenyl)-crotene amide,

[2](N-(3'-trifluoromethylphenyl)-5-methylisoxazole-4-carboxamide).

Inject the test solution. Run the chromatogram twice the retention time of the principal peak. The area of any peak corresponding to leflunomide impurity B is not more than 0.3 per cent. The area of any other secondary peak is not more than 0.1 per cent. The sum of areas of other secondary peaks is not more than 0.4 per cent, calculated by area normalization.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in vacuum over *phosphorus pentoxide* at 60° for 4 hours.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light.

Test solution. Dissolve 50 mg of the substance under examination in *acetonitrile* and dilute to 100.0 ml with mobile phase.

Reference solution (a). A solution containing 0.05 per cent w/v of *leflunomide IPRS*, 0.015 per cent w/v of *leflunomide impurity B IPRS* and 0.005 per cent w/v of *leflunomide impurity C IPRS* in the mobile phase (dissolve in *acetonitrile* and dilute with the mobile phase).

Reference solution (b). A 0.05 per cent w/v solution of *leflunomide IPRS* in the mobile phase (dissolve in *acetonitrile* and dilute with mobile phase).

Chromatographic system

- a stainless steel column 12.5 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of *acetonitrile*, 1 volume of *triethylamine* and 130 volumes of *water*, adjusted to pH 4.0 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Name	Relative retention time
Leflunomide impurity B[1]	0.2
Leflunomide impurity C[2]	0.9
Leflunomide	1.0

[1]2-Cyano-3-hydroxy-N-(4'-trifluoromethylphenyl)-crotone amide,

[2]N-(3'-Trifluoromethylphenyl)-5-methylisoxazole-4-carboxamide.

Inject reference solution (a). The test is not valid unless the resolution between the leflunomide and leflunomide impurity C is not less than 1.0.

Inject reference solution (b) and the test solution.

Calculate the content of $C_{12}H_9F_3N_2O_2$.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Leflunomide Tablets

Leflunomide Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of leflunomide, $C_{12}H_9F_3N_2O_2$.

Usual strengths. 10 mg; 20 mg and 100 mg.

Identification

A. When examined in the range 220 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* shows an absorption maximum similar to that of *leflunomide IPRS*.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 1000 ml of *water (for tablets containing 10 mg or 20 mg);* 1000 ml of *water* containing 0.6 per cent of *polyoxyethylene lauryl ether (for tablets containing 100 mg)*,

Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution immediately, suitably diluted with the dissolution medium, if necessary, at the maximum at about 262 nm (2.4.7). Calculate the content of $C_{12}H_9F_3N_2O_2$ in the medium from the absorbance obtained from a solution of known concentration of *leflunomide IPRS* prepared by dissolving in minimum quantity of *methanol* and diluted with the dissolution medium.

Q. Not less than 70 per cent of the stated amount of $C_{12}H_9F_3N_2O_2$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 100 mg of Leflunomide in 20 ml of *acetonitrile* and dilute to 100.0 ml with the mobile phase, filter.

Reference solution. A 0.1 per cent w/v solution of *leflunomide IPRS* in the mobile phase (dissolve in minimum quantity of *acetonitrile* and dilute with the mobile phase).

Chromatographic system

- a stainless steel column 12.5 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of *acetonitrile*, 1 volume of *triethylamine* and 130 volumes of *water*, adjusted to pH 4.0 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

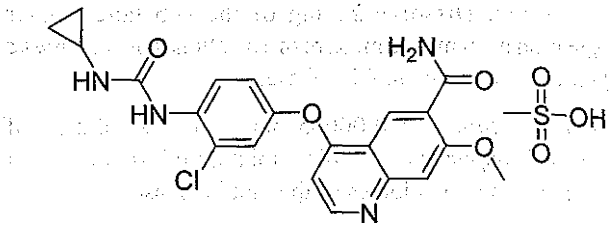
Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, tailing factor for the principal peak is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{12}H_9F_3N_2O_2$ in the tablets.

Storage. Store protected from light and moisture.

Lenvatinib Mesylate



$C_{21}H_{19}ClN_4O_4CH_4O_3S$ Mol. Wt. 523.0

Lenvatinib Mesylate is 4-[3-chloro-4-(N'-cyclopropylureido) phenoxy]-7-methoxyquinoline-6-carboxamide methane sulphonate.

Lenvatinib Mesylate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{21}H_{19}ClN_4O_4.CH_4O_3S$, calculated on anhydrous basis.

CAUTION — Lenvatinib Mesylate is cytotoxic, extra care required to prevent inhaling particles and exposing the skin to it.

Category. Anticancer.

Description. A white to pale reddish yellow powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *lenvatinib mesylate IPRS* or with the reference spectrum of lenvatinib mesylate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in chromatogram obtained with the reference solution.

Tests

Methane sulphonic acid content. 17.5 per cent to 19.5 per cent, calculated on anhydrous basis.

Dissolve 0.4 g in 50 ml of a mixture of 2 volumes of *dimethylsulphoxide*, 2 volumes of *methanol* and 1 volume of *water*. Titrate with *0.1 M sodium hydroxide*, determining the end point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.00961 g of *methane sulphonic acid*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture (a). Equal volumes of *methanol* and *water*.

Solvent mixture (b). 70 volumes of *methanol* and 30 volumes of *water*.

NOTE — Prepare the solutions immediately before use.

Test solution. Dissolve 25 mg of substance under examination in 40 ml of *methanol* and dilute to 100.0 ml with solvent mixture (a).

Reference solution (a). Dissolve 25 mg of *lenvatinib mesylate IPRS* in 40 ml of *methanol* and dilute to 100.0 ml with solvent mixture (a). Dilute 1.0 ml of the solution to 25.0 ml with solvent mixture (b). Further, dilute 5.0 ml of the solution to 100.0 ml with solvent mixture (b).

Reference solution (b). Dilute 3.0 ml of reference solution (a) to 10.0 ml with solvent mixture (b).

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as X-Bridge Shield RP-18),
- sample temperature: 10°,
- mobile phase: A. a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 3.25 with *dilute orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume: 15 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
15	70	30
20	70	30
35	60	40
45	60	40
55	30	70
57	90	10
65	90	10

Name	Relative retention time	Correction factor
Descyclopropyl lenvatinib[1]	0.65	0.78
Methyl analogue of lenvatinib[2]	0.79	0.79
Lenvatinib carboxylic acid[3]	0.87	0.98
Lenvatinib (Retention time: about 17 minutes)		1.00
Carbamate derivative of APQC[4]	1.90	1.19
Carbamoyl derivative of lenvatinib[5]	2.18	0.99
Nitrile analogue of lenvatinib[6]	2.57	1.05

[1]4-[4-(carbamoylamino)-3-chlorophenoxy]-7-methoxyquinoline-6-carboxamide,

[2]4-(3-chloro-4-[(methylcarbamoyl)amino]phenoxy)-7-methoxyquinoline-6-carboxamide,

[3]4-(3-chloro-4-[(cyclopropylcarbamoyl)amino]phenoxy)-7- methoxyquinoline-6- carboxylic acid,

[4]phenyl(4-[(6-carbamoyl-7-methoxyquinolin-4-yl)oxy]-2-chlorophenyl)carbamate,

[5]4-(3-chloro-4-[(cyclopropylcarbamoyl)amino]phenoxy)-N-(cyclopropylcarbamoyl)-7- methoxyquinoline-6- carboxamide,

[6]1-(2-chloro-4-[(6-cyano-7- methoxyquinolin-4- yl)oxy]phenyl)-3-cyclopropylurea.

Inject reference solution (a) and (b). The test is not valid unless the column efficiency is not less than 50000 theoretical plates, the tailing factor is not more than 1.5, the relative standard deviation for replicate injections is not more than 10.0 per cent in the chromatogram obtained with reference solution (a) and the signal-to-noise ratio is not less than 10 in the chromatogram obtained with reference solution (b).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to descyclopropyl lenvatinib, methyl analogue of lenvatinib, lenvatinib carboxylic acid, carbamate derivative of APQC, carbamoyl derivative of lenvatinib and nitrile analogue of lenvatinib, each of, is not more than 0.75 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent), the area of any other secondary peaks is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 7.5 per cent, determined on 0.2 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture (a). Equal volumes of *methanol* and *water*.

Solvent mixture (b). 70 volumes of *methanol* and 30 volumes of *water*.

NOTE — Prepare the solutions immediately before use.

Test solution. Dissolve 50 mg of the substance under examination in 40 ml of *methanol* and dilute to 100.0 ml with solvent mixture (a). Dilute 5.0 ml of the solution to 100.0 ml with solvent mixture (b).

Reference solution. Dissolve 50 mg of *lenvatinib mesylate IPRS* in 40 ml of *methanol* and dilute to 100.0 ml with solvent mixture (a). Dilute 5.0 ml of the solution to 100.0 ml with solvent mixture (b).

Solvent mixture (c). 70 volumes of *methanol* and 30 volumes of *water.*

Test solution. Disperse a suitable quantity of intact capsules containing 40 mg of the Lenvatinib in 100 ml of solvent mixture (a), with the aid of magnetic stirrer for 20 minutes. Add 50 ml of solvent mixture (b), sonicate for 10 minutes with intermittent shaking and dilute to 200.0 ml with solvent mixture (b). Dilute 2.0 ml of the solution to 10.0 ml with solvent mixture (c).

Reference solution. Dissolve 50 mg of *lenvatinib mesylate IPRS* in 40 ml of *methanol* and dilute to 100.0 ml with solvent mixture (b). Dilute 1.0 ml of the solution to 10.0 ml with solvent mixture (c).

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3.5 µm) (Such as XBridge C 18),
- column temperature: 40°,
- sample temperature: 10°,
- mobile phase: A. a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water,* adjusted to pH 3.35 with *dilute orthophosphoric acid,*
  B. *acetonitrile,*
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	75	25
8	75	25
10	35	65
15	35	65
17	75	25
25	75	25

Inject the reference solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

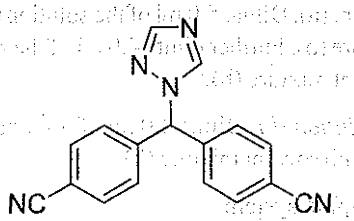
Calculate the content of $C_{21}H_{19}ClN_4O_4$ in the capsules.

1 mg of the lenvatinib mesylate, $C_{21}H_{19}ClN_4O_4$, CH_4O_3S is equivalent to 0.816 mg of lenvatinib, $C_{21}H_{19}ClN_4O_4$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of lenvatinib.

Letrozole



$C_{17}H_{11}N_5$ Mol Wt. 285.3

Letrozole is benzonitrile, 4,4'-(1H-1,2,4-triazol-1-ylmethylene) bis; 4,4'-(1H-1,2,4-Triazol-1-ylmethylene) dibenzonitrile.

Letrozole contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{17}H_{11}N_5$, calculated on the anhydrous basis.

Category. Aromatase inhibitor; treatment of breast cancer.

Description. A white or almost white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *letrozole IPRS* or with the reference spectrum of letrozole.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 70 volumes of *water* and 30 volumes of *acetonitrile.*

Test solution. Dissolve 25 mg of the substance under examination in the 250-ml volumetric flask add 75 ml of *acetonitrile,* mix and dilute with *water* to volume.

Reference solution (a). A 0.0002 per cent w/v solution of *letrozole related compound A IPRS* and 0.001 per cent w/v solution of *letrozole IPRS* in the solvent mixture.

Reference solution (b). A 0.0001 per cent w/v solution of *letrozole IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 12.5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. *water,*
  B. *acetonitrile,*
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	70	30
25	30	70
25.1	70	30
30	70	30

Name	Relative retention time
Letrozole related compound A[1]	0.67
Letrozole	1.0
4,4',4"-Methanetriyltribenzonitrile	2.4
Individual impurity	---

[1]4,4'-(1*H*-1,3,4-triazol-1-ylmethylene) dibenzonitrile.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to letrozole related compound A and letrozole is not less than 2.0.

Inject reference solution (b). The test is not valid unless the relative standard deviation for replicate injections is not more than 10.0 per cent.

Inject reference solution (b) and the test solution. In the chromatogram obtained with test solution, the area of impurity due to letrozole related compound (A) is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of impurity due to 4,4',4"-Methanetriyltribenzonitrile is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the areas of all the secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances.

Test solution. Dissolve 10 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.001 per cent w/v solution of *letrozole IPRS* in the solvent mixture.

Inject reference solution. The test is not valid unless the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{11}N_5$.

Storage. Store protected from light and moisture.

Letrozole Tablets

Letrozole Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of letrozole, $C_{17}H_{11}N_5$.

Usual strength. 2.5 mg.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Solvent mixture. 70 volumes of *water* and 30 volumes of *acetonitrile*.

Mobile phase. A mixture of 90 volumes of *ethyl acetate* 10 volumes of *methanol*.

Test solution. Disperse a quantity of the powdered tablets containing 2 mg of letrozole in 1 ml of *methanol*, ultrasound for 10 minutes and centrifuge.

Reference solution. A 0.2 per cent w/v solution of *letrozole IPRS* in *methanol*.

Apply to the plate 5 µl of reference solution and test solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spots obtained in the chromatogram obtained with the test solution correspond to that in the chromatogram obtained with the reference solution .

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 500 ml of *0.1 M hydrochloric acid*.
Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Weigh accurately a suitable quantity of *letrozole IPRS,* dissolve in minimum quantity of *acetonitrile* and dilute with the dissolution medium to obtain a solution having the similar concentration as that of the test solution.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 480 volumes of *acetonitrile* and 520 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{11}N_5$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{17}H_{11}N_5$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 70 volumes of *water* and 30 volumes of *acetonitrile.*

Test solution. Weigh a quantity of powders tablets containing 10 mg of Letrozole, disperse in 20 ml of solvent mixture with the aid of ultrasound for 10 minutes, cool dilute to 100.0 ml with solvent mixture. Mix well and centrifuge, use the supernatant liquid.

Reference solution (a). A 0.0002 per cent w/v solution of *letrozole related compound A IPRS* and 0.001 per cent w/v solution of *letrozole IPRS* in the solvent mixture.

Reference solution (b). A 0.0001 per cent w/v solution of *letrozole IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 12.5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. *water*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 50 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	70	30
25	30	70
25.1	70	30
30	70	30

Name	Relative retention time
Letrozole related compound A[1]	0.67
Letrozole	1.0
4,4',4"-Methanetriyltribenzonitrile	2.4
Individual impurity	—
Total impurity	—

[1]4,4'-(1*H*-1,3,4-triazol-1-ylmethylene) dibenzonitrile, this is process impurity.

(*NOTE — Letrozole related compound A and 4,4',4"-Methanetriyltribenzonitrile are process impurities and are controlled in the drug substance monograph*)

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to letrozole related compound A and letrozole is not less than 2.0.

Inject reference solution (b). The test is not valid unless the relative standard deviation for replicate injections is not more than 10.0 per cent.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 0.3 times the area of the peak in the chromatogram obtained with reference solution (b) (0.3 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14) as given under Assay using the following test solution.

Test solution. Transfer one tablet to a 25.0 ml volumetric flask, add about 1 ml of *water* and swirl to disperse the tablet, add 7.5 ml of *acetonitrile* and ultrasound for about 20 minutes. Cool and dilute with *water* to volume. Shake, mix well and filter, rejecting the first few ml of filtrate. Dilute further suitably with mobile phase to produce a solution containing 0.001 per cent w/v of letrozole.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{11}N_5$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 70 volumes of *water* and 30 volumes of *acetonitrile.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 20 mg of Letrozole in 100-ml

volumetric flask, shake with 10 ml *water* for 5.0 minutes, mix add 50.0 ml *acetonitrile,* shake for 30.0 minutes, dilute to produce 100.0 ml with *water*. Dilute 5.0 ml to 100.0 ml in the mobile phase.

Reference solution. A 0.02 per cent w/v solution of *letrozole IPRS* in *Solvent mixture*. Dilute to 5.0 ml to 100.0 ml in *mobile phase.*

Chromatographic system

- a stainless steel column 12.5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: 48 volumes of *acetonitrile and* 52 volumes of *water,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

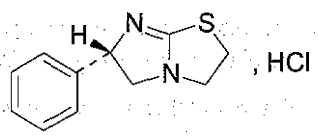
Inject the reference solution. The tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{11}N_5$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Levamisole Hydrochloride



$C_{11}H_{12}N_2S,HCl$ Mol. Wt. 240.8

Levamisole Hydrochloride is (*S*)-2,3,5,6-tetrahydro-6-phenylimidazo[2,1-*b*]thiazole hydrochloride.

Levamisole Hydrochloride contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{11}H_{12}N_2S,HCl$, calculated on the dried basis.

Category. Anthelmintic.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B and D may be omitted if tests A, C and E are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *levamisole hydrochloride IPRS* or with the reference spectrum of levamisole hydrochloride.

B. In the test for Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

C. Complies with the test for Specific optical rotation.

D. Dissolve 0.5 g in 20 ml of *water* and add 6 ml of *1 M sodium hydroxide.* Extract with 20 ml of *dichloromethane*, wash the lower layer with two quantities, each of 10 ml, of *water*, dry over *anhydrous sodium sulphate*, filter and evaporate the solvent at a temperature not exceeding 40° under reduced pressure. The residue melts at 58° to 61° (2.4.21).

E. It gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1) and not more intensely coloured than reference solution YS7 (2.4.1).

pH (2.4.24). 3.0 to 4.5, determined in a 5.0 per cent w/v solution.

Specific optical rotation (2.4.22). –128° to –121°, determined in a 5.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use, protect from light and keep below 25°.

Test solution. Dissolve 0.1 g of the substance under examination in *methanol,* add 1.0 ml of *ammonia* and dilute to 10.0 ml with *methanol.*

Reference solution. Dissolve 10 mg of the *levamisole hydrochloride IPRS* in *methanol,* add 1.0 ml of *ammonia* and dilute to 100.0 ml with *methanol.* Further dilute 5.0 ml of the solution to 25.0 ml with *methanol.*

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with base- deactivated octadecylsilane bonded to porous silica (3 µm),
- mobile phase: A. dissolve 0.5 g of *ammonium dihydrogen phosphate* in 90 ml of *water*, adjusted to pH 6.5 with a 4.0 per cent w/v solution of *sodium hydroxide* and dilute to 100 ml with *water*,

  B. *acetonitrile,*
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
8	30	70
10	30	70
12	90	10
17	90	10

Name	Relative retention time	Correction factor
Levamisole impurity A[1]	0.9	2.0
Levamisole (Retention time: about 3 minutes)	1.0	—
Levamisole impurity B[2]	1.4	1.7
Levamisole impurity C[3]	1.5	2.9
Levamisole impurity D[4]	1.6	1.3
Levamisole impurity E[5]	2.0	2.7

[1]3-[(2*RS*)-2-amino-2-phenylethyl]thiazolidin-2-one,

[2]3-[(*E*)-2-phenylethenyl]thiazolidin-2-imine,

[3](4*RS*)-4-phenyl-1-(2-sulfanylethyl)imidazolidin-2-one,

[4]6-phenyl-2,3-dihydroimidazo[2,1-*b*]thiazole,

[5]1,1'-[(disulphane-1,2-diyl)bis(ethylene)]bis[(4*RS*)-4-phenylimidazolidin-2-one].

Inject the reference solution. The test is not valid unless the tailing factor of the principal peak is not more than 3.5.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of peaks corresponding to levamisole impurities A, B, C, D and E is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.3 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method A (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

Assay. Weigh 0.2 g, dissolve in 30 ml of *ethanol (95 per cent)*, add 5 ml of *0.01 M hydrochloric acid*. Titrate with *0.1 M sodium hydroxide* determining the end-point potentiometrically (2.4.25). Record the volume added between the two inflections. Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.02408 g of $C_{11}H_{12}N_2S,HCl$.

Storage. Store protected from light and moisture.

Levamisole Tablets

Levamisole Hydrochloride Tablets

Levamisole Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of levamisole, $C_{11}H_{12}N_2S$.

Usual strengths. The equivalent of 50 mg, 150 mg of levamisole.

Identification

In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).
Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.01 M hydrochloric acid,*
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the medium if necessary, at the maximum at about 214 nm (2.4.7). Calculate the content of $C_{11}H_{12}N_2S$, in the medium from the absorbance obtained by repeating the determination using a solution of *levamisole IPRS* in the same medium.

Q. Not less than 80 per cent of the stated amount of $C_{11}H_{12}N_2S$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254.*

Mobile phase. A mixture of 60 volumes of *toluene*, 40 volumes of *acetone* and 1 volume of *strong ammonia solution.*

Test solution (a). Shake a quantity of the powdered tablets containing 100 mg of levamisole with 5 ml of *methanol* for 2 minutes and filter.

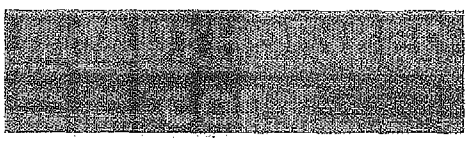
Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol.*

Reference solution (a). A 0.24 per cent w/v solution of *levamisole hydrochloride IPRS* in *methanol.*

Referece solution (b). Dilute 1 ml of reference solution (a) to 20 ml with *methanol.*

Apply to the plate 10 µl of each solution. After development, dry the plate at 105° for 15 minutes and examine under ultraviolet light at 254 nm as well as after exposure to iodine vapour. Any secondary spot the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b).

Other tests. Comply with the tests stated under Tablets.



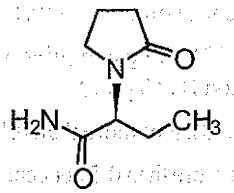
Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 300 mg of levamisole, add 30 ml of *water* and shake for 10 minutes. Filter, wash the filter with 20 ml of *water* and add the washings to the filtrate. To the combined filtrate add *dilute ammonia solution* to make it alkaline and extract with three quantities each of 25 ml, 15 ml and 15 ml, of *chloroform*, filter through cotton wool covered with a layer of *anhydrous sodium sulphate*. Combine the chloroform extracts and evaporate to dryness. Dissolve the residue in 50 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02043 g of $C_{11}H_{12}N_2S$.

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the equivalent amount of levamisole.

Levetiracetam



$C_8H_{14}N_2O_2$ Mol. Wt. 170.2

Levetiracetam is 1-Pyrrolidineacetamide, α-ethyl-2-oxo-, (αS).

Levetiracetam contains not less than 98.0 per cent and not more than 102.0 per cent of $C_8H_{14}N_2O_2$, calculated on the anhydrous and solvent-free basis.

Category. Antiepileptic.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *levetiracetam IPRS* or with the reference spectrum of levetiracetam.

B. In the test for enantiomeric purity, the principal peak in the chromatogram obtained with reference solution (c) corresponds to the levetiracetam s-enantiomer peak in the chromatogram obtained with reference solution (b).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 125 mg of the substance under examination in mobile phase (a) and dilute to 25.0 ml with mobile phase (a).

Reference solution. A 0.0005 per cent w/v solution of *levetiracetam IPRS* in mobile phase (a).

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: A. a mixture of 95 volumes of a buffer solution prepared by dissolving 2.7 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 5.5 with 2 per cent w/v solution of *potassium hydroxide* and 5 volumes of *acetonitrile*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 0.9 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
3	100	0
20	71	29
25	100	0
28	100	0

Name	Relative retention time	Correction factor
Levetiracetam impurity C[1]	0.37	
Levetiracetam acid[2]	0.62	0.83
Levetiracetam	1.0	
Levetiracetam impurity A[3]	1.25	2.85

[1]Pyridin-2-ol (Not included in the total impurities limit).

[2](*S*)-2-(2-0xopyrrolidin-1-yl) butanoic acid.

[3]*(S)-N-(1*-Amino-1-oxobutan-2-yl)-4-chlorobutanamide.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to levetiracetam impurity C is not more than 0.25 times the area of the principal peak in a chromatogram obtain with the reference solution (0.025 per cent), the area of any peak corresponding to levetiracetam acid is not more than 3 times the area of the principal peak in the chromatogram obtained with the reference solution (0.3 per cent), the area of any peak corresponding to levetiracetam impurity A and any other secondary peak is not more than 0.5 times the area of

the principal peak in the chromatogram obtain with the reference solution (0.05 per cent) and the sum of areas of all the secondary peaks including impurity B obtained from the test for Levetiracetum impurity B is not more than 4 times the area of the principal peak in the chromatogram obtain with the reference solution (0.4 per cent). Ignore any peak with a relative retention time of 0.19 or less.

Enantiomeric purity. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). A 0.005 per cent w/v solution of *levetiracetam IPRS* in the mobile phase.

Reference solution (b). A 0.01 per cent w/v solution of *levetiracetam racemic mixture IPRS* in the mobile phase.

Reference solution (c). Dilute 5.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, amylase tris-3,5-dimethylphenylcarbamate (AD-H) bonded to porous silica (5 µm),
- mobile phase: a mixture of 80 volumes of *n-hexane* and 20 volumes of *dehydrated alcohol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

The relative retention time with respect to levetiracetam *S*-enantiomer for levetiracetam *R*-enantiomer is about 0.55.

Inject reference solution (b).The test is not valid unless the resolution between the peak due to levetiracetam *R*-enantiomer and levetiracetam *S*-enantiomer is not less than 4.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of any peak corresponding to levetiracetam *R*-enantiomer (impurity D) is not more than 1.6 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.8 per cent).

Levetiracetam impurity B. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.2 g of the substance under examination in the mobile phase and dilute to 100.0 ml with mobile phase.

Reference solution (a). A 0.2 per cent w/v solution of *levetiracetam impurity B IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 85 volumes of a buffer solution prepared by dissolving 1.22 g of *sodium1-decanesulfonate* in 1000 ml of *water*, add 1.3 ml of *orthophosphoric acid*, adjusted to pH 3.0 with 20 per cent w/v solution of *potassium hydroxide* and 15 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 200 nm,
- injection volume: 50 µl, for system suitability10 µl.

The retention time for levetiracetam impurity B is about 9 minutes.

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 3.0. and the relative standard deviation for the replicate injections is not more than 2.0 per cent.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to levetiracetam impurity B is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modifications.

Test solution. Dissolve 0.1 g of the substance under examination in mobile phase A and dilute to 100.0 ml with mobile phase A. Dilute 1.0 ml of the solution to 10.0 ml with mobile phase A.

Reference solution. A 0.01 per cent w/v solution of *levetiracetam IPRS* in mobile phase A.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{14}N_2O_2$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Levetiracetam Oral Solution

Levetiracetam Oral Solution is a solution of levetiracetam in a suitable aqueous vehicle.

Levetiracetam Oral Solution contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of levetiracetam $C_8H_{14}N_2O_2$.

Usual strength. 500 mg per 5 ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 4.8 to 6.3.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 5 volumes of *acetonitrile* and 95 volumes of *orthophosphoric acid* solution prepared by diluting 2.0 ml of *orthophosphoric acid* to 1000.0 ml with *water*.

Test solution. Dilute a volume of the oral solution containing 200 mg of levetiracetam in 60 ml of mobile phase A, mix with the aid of ultrasound for 5 min, allow the solution to cool and dilute it to 100.0 ml with mobile phase A.

Reference solution (a). Dissolve 20 mg of *levetiracetam IPRS* in 10 ml of *0.1M potassium hydroxide* allow to stand for 15 minute to react and then neutralize by adding of 10 ml of *0.1M hydrochloric acid.* Add 10 mg of *levetiracetam impurity A IPRS*, mix with the aid of ultrasound and dilute it to 100.0 ml with the solvent mixture.

Reference solution (b). A 0.0003 per cent w/v solution of *levetiracetam IPRS* in the mobile phase A.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: A. a solution of *orthophosphoric acid* prepared by diluting 2.0 ml of *orthophosphoric acid* in 1000 ml with *water.*

  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
7	95	5
20	90	10
30	75	25
35	50	50
40	50	50
41	100	0
50	100	0

Name	Relative retention time	Correction factor
Levetiracetam	1.00	—
Lvetiracetam impurity A[1]	1.38	—
Levetiracetam acid[2]	1.46	1.08

[1](S)-N-(1-Amino-1-oxobutan-2yl)-4-chlorobutanamide (This is a process impurity and include for peak identification only),

[2](S)-2-(2-Oxopyrrolodin-1-yl) butanoic acid.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to levetiracetam impurity A and levetiracetam acid is not less than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to levetiracetam acid is not more than twice the area of principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent) and the area of any other secondary peak is not more than 0.66 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1per cent). The sum of the areas of all the secondary peaks is not more than 6.66 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent).

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of the oral solution containing 200 mg of levetiracetam, in 120 ml of mobile phase A, mix with the aid of ultrasound for 5.0 minutes. Allow the solution to cool and dilute it to 200.0 ml with the mobile phase A.

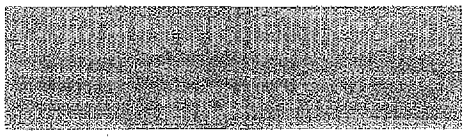
Refrence solution. A 0.1 per cent w/v solution of *levetiracetam IPRS* in the mobile phase A.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a solution of *orthophosphoric acid* prepared by diluting 1.0 ml of *orhophophoric acid* in 1000 ml with *water*,

  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	92	8
6	92	8
7	40	60
10	40	60
11	92	8
15	92	8



Inject the reference solution. The test is not valid unless the tailing factor for the principal peak is not more than 2.0 per cent and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{14}N_2O_2$ in the oral solution.

Storage. Store protected from light, at a temperature not exceeding 30°.

Levetiracetam Prolonged-release Tablets

Levetiracetam Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Levetiracetam Prolonged-release Tablets contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of levetiracetam, $C_8H_{14}N_2O_2$.

Usual strengths. 500 mg; 750 mg; 1000 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2). Complies with the test stated under Tablets.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 5 ml of *acetonitrile* and 95 ml of solution of *orthophosphoric acid* prepared by diluting 2ml of *orthophosphoric acid* with *water* to 1000 ml.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 0.25 g of levetiracetam in 80 ml of water, mix with the aid of ultrasound for 10 minutes and dilute it with *water* to 100.0 ml, filter.

Reference solution (a). Dissolve 30 mg of *levetiracetam IPRS* in 10 ml of *0.1M potassium hydroxide* allow to stand the solution for 5 minutes to react and then neutralize by adding 10 ml of *0.1M hydrochloric acid* dilute to 100.0 ml with the solvent mixture. *[NOTE—This solution contains levetiracetam and levetiracetam acid.]*

Reference solution (b). A 0.00125 per cent w/v solution of *levetiracetam IPRS* in *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 1 g of *sodium hexanesulphonate monohydrate* in 1000 ml of a solution containing a mixture of 5 volumes of *acetonitrile* and 95 volumes of buffer solution prepared by dissolving 1.4 g of *disodium hydrogen phosphate, anyhydrous* in *water*, adjusted to pH 3.5 with *orthophosphoric acid,*
- flow rate: 2 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 20 µl.

Name	Relative retention time
Levetiracetam impurity B[1]	0.40
Levetiracetm	1.0
Levetiracetam acid[2]	1.3
Levetiracetam impurity A[3]	1.9

[1](S)-2-Aminobutanamide,

[2](S)-2-(2-Oxopyrrolidin-1-yl)butanoic acid,

[3](S)-N-(1-Amino-1-oxobutan-2-yl)-4-chlorobutanamide.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to levetiracetam acid impurity and levetiracetam is not less than 1.5 in the chromatogram obtained with reference solution (a) and the tailing factor is not more than 2.0 in the chromatogram obtained with reference solution (b).

Inject reference solution (b) and the test solution. Run the chromatogram 5 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any peak corresponding to levetiracetam acid is not more than 0.6 times the area of principal peak in the chromatogram obtained with the reference solution (b) (0.3 per cent) and the area of any other secondary peak is not more than the 0.2 times the area of the principal peak in the chromatogram obtained with the reference solution (b) (0.1 per cent). The sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (b) (1.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determined by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 0.4 g of levetirecetam in 5 ml of *tetrahydrofuran.* Stir for 30 minutes and allow to stand for 5 minutes. Mix with the aid of ultrasound. Add 75 ml of mobile phase, mix with the aid of ultrasound for 30 min, add 10 ml of *methanol* and finally dilute to 100.0 ml with the mobile phase if necessary, filter. Dilute 2.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution. Dissolve 80 mg of *levetiracetam IPRS* in 60 ml of mobile phase, add 4 ml of *tetrahydrofuran*, mix with the aid of ultrasound and dilute it to 100.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 10 volumes of *acetonitrile* and 90 volumes of buffer solution prepared by dissolving 1.4 g of *anyhydrous dibasic sodium phosphate* in 1000 ml of *water*, adjusted to pH 3.5 with *orthophosphoric acid.*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{14}N_2O_2$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Levetiracetam Tablets

Levetiracetam Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of levetiracetam, $C_8H_{14}N_2O_2$.

Usual strengths. 250 mg; 500 mg; 750 mg; 1000 mg.

Identification

A. Transfer a quantity of the finely powdered tablets containing 250 mg of Levetiracetam to a 50-ml volumetric flask, add 35 ml of the *acetone*, sonicate for 15 minutes and dilute to 50.0 ml with *acetone*, filter 10.0 ml solution through a membrane filter and evaporate the filtrate to dryness for crystallisation, scratching the sides of the vessel, on the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with 0.1 per cent w/v solution of *levetiracetam IPRS* in *acetone*, treated in the same manner, beginning with "10 ml solution" or with the reference spectrum of levetiracetam.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *water*,

Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14), as described under assay with the following modifications.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A solution containing 0.04 per cent w/v of *levetiracetam IPRS* in the solvent mixture and sonicate, dilute further, if necessary.

Q. Not less than 80 per cent of the stated amount of $C_8H_{14}N_2O_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 120 mg of Levetiracetam in the mobile phase, dilute to 100.0 ml with mobile phase and filter.

NOTE — Sonicate if necessary and centrifuge the solution before passing through a suitable filter.

Reference solution (a). A solution containing 0.00036 per cent w/v each of *levetiracetam IPRS* and *levetiracetam impurity B IPRS* in *mobile phase.*

Reference solution (b). A solution containing 0.00036 per cent w/v of *Levetiracetam IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (4 µm),
- mobile phase: a mixture of 95 volumes of a buffer solution prepared by dissolving 6.8 g of *monobasic potassium phosphate* and 0.85 g of *sodium 1-heptanesulphonate* in 1000 ml of *water* and adjusted to pH 2.8 with *orthophosphoric acid* and 5 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 200 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Levetiracetam impurity B[1]	0.54	—
Levetiracetam	1.0	—
Levetiracetam impurity A[1,2]	1.7	—
Levetiracetam acid[3]	2.1	1.27

[1] (*S*)-2-aminobutanamide hydrochloride, this is process impurity,

[2](*S*)-*N*-(1-amino-1-oxobutan-2-yl)-4-chlorobutanamide,

[3](*S*)-2-(2-oxopyrrolidine-1-yl)butanoic acid.

Inject reference solution (a) and (b). The test is not valid unless the resolution between levetiracetam impurity B and

levetiracetam is not less than 2.0 obtained with reference solution (a), the tailing factor for levetiracetam peak is not more than 2.0 and the relative standard deviation for replicate injections is not more than 10.0 per cent obtained with reference solution (b).

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to levetiracetam acid is not more than area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of any other secondary peak is not more than 0.33 the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.6 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 20 volumes of *acetonitrile* and 80 volumes of *water*.

Test solution. Weigh and powder 20 tablets. Transfer a quantity of the powder containing about 40 mg of Levetiracetam in 100-ml volumetric flask and add about 80 ml of solvent mixture and disperse with aid the aid of ultrasound for about 10 minutes, cool and dilute to volume with solvent mixture and filter.

Reference solution. A solution containing 0.04 per cent w/v of *levetiracetam IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (4 µm),
- mobile phase: a mixture of 92 volumes of a buffer solution prepared by dissolving 1.4 g of *monobasic potassium phosphate* and 0.6 g of *sodium 1-haptanesulphonate* in 1000 ml of *water* and adjusted to pH 2.8 with *ortho phosphoric acid* and 8 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

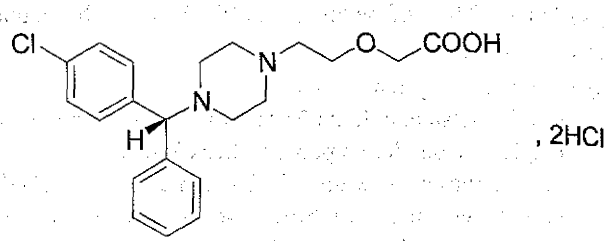
Inject the reference solution and the test solution.

Calculate the content of $C_8H_{14}N_2O_2$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Levocetirizine Hydrochloride

Levocetirizine Dihyrochloride



$C_{21}H_{25}N_2O_3Cl,2HCl$ Mol. Wt. 461.8

Levocetirizine Hydrochloride is (*R*)-2-[2-[4-[(4-chloro-phenyl) phenylmethyl]piperazin-1-yl]ethoxy]acetic acid dihydrochloride.

Levocetirizine Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{21}H_{25}N_2O_3Cl,2HCl$ calculated on the dried basis.

Category. Antihistaminic.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *levocetirizine dihydrochloride IPRS* or with the reference spectrum of levocetirizine dihydrochloride.

B. When examined in the range 200 nm and 350 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* shows an absorption maximum at about 230 nm.

Tests

Specific optical rotation (2.4.22). + 10° to +14°, determined in a 1 per cent w/v solution in *carbon dioxide-free water* at 365 nm.

Heavy metals (2.3.13). Dissolve the residue obtained in the test for sulphated ash in 20 ml *water*. 12 ml of the solution complies with limit test for heavy metals, Method D (20 ppm).

Enantiomeric purity. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 12.5 mg of the substance under examination in 1 ml of *ethanol (95 per cent)* and dilute to 25 ml with the mobile phase, filter.

Reference solution. Dissolve 12.5 mg of the *racemic cetirizine dihydrochloride IPRS* in 1 ml of *ethanol (95 per cent)* and dilute to 25 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with chiral Pak AD-H (5 µm),

- mobile phase: a mixture of 70 volumes of *n-hexane*, 15 volumes of *isopropyl alcohol*, 15 volumes of *ethanol (95 per cent)*, 0.2 volume of *trifluoro acetic acid* and 0.01 volume of *diethylamine*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Inject the reference solution and the test solution.

The relative retention time of levocetirizine isomer is about 2 with respect to levocetirizine peak.

Calculate the chiral purity of levocetirizine dihydrochloride by area normalization method, the enantiomeric purity is not less than 98 per cent.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Use the solutions within 16 hours.

Test solution. Dissolve 20 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase, filter.

Reference solution (a). A solution containing 0.00002 per cent w/v, each of, *levocetirizine dihydrochloride IPRS*, *levocetirizine amide IPRS* and *chlorobenzhydryl piperazine IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.02 per cent w/v of *levocetirizine dihydrochloride IPRS* and 0.00002 per cent w/v, each of, *levocetirizine amide IPRS* and *chlorobenzhydryl piperazine IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm packed with silica gel (5 µm),
- mobile phase: a mixture of 93 volumes of *acetonitrile*, 6.6 volumes of *water* and 0.4 volume of *1M sulphuric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Name	Relative retention time
Levocetirizine	1.0
Chlorobenzhydryl piperazine[1]	1.4
Levocetirizine amide[2]	2.1

[1](R)-1-[(4-chlorophenyl)phenylmethyl]piperazine,

[2](R)-2-(2-{4-[(4-chlorophenyl)phenylmethyl]piperazin-1-yl}ethoxy) acetamide.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to chlorobenzhydryl piperzine and levocetirizine is not less than 3.0, the tailing factor for levocetirizine peak is not more than 2.0 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections for levocetirizine is not more than 5.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. Run the chromatogram 3 times the retention time of levocetirizine peak. The area of any peak corresponding to chlorobenzhydryl piperzine or levocetirizine amide is not more than twice the area of the peak due to chlorobenzhydryl piperzine or levocetirizine amide in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any other secondary peak is not more than the area of the peak due to levocetirizine in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the peak due to levocetirizine in the chromatogram obtained with reference solution (a) (0.5 per cent).

Sulphated ash (2.3.18). Not more than 0.2 per cent, determined on 2 g.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1 g by drying in an oven at 100° at a pressure not exceeding 0.7 kPa.

Assay. Dissolve 0.1 g in 70 ml of a mixture of 30 ml of *water* and 70 ml of *acetone*. Titrate with *0.1 M sodium hydroxide* upto the second point of inflection. Determine the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01539 g of $C_{21}H_{25}N_2O_3Cl,2HCl$.

Storage. Store protected from moisture.

Levocetirizine Tablets

Levocetirizine Dihydrochloride Tablets

Levocetirizine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of levocetirizine hydrochloride, $C_{21}H_{25}N_2O_3Cl,2HCl$.

Usual strength. 5 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *phosphate buffer pH 6.8*,

Speed and time. 50 rpm for 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A 0.025 per cent w/v solution of *levocetirizine dihydrochloride IPRS* in mobile phase. Dilute 1 ml of the solution to 50 ml with dissolution medium.

Use chromatographic system as described under Assay.

Calculate the content of $C_{21}H_{25}N_2O_3Cl,2HCl$.

Q. Not less than 75 per cent of the stated amount of $C_{21}H_{25}N_2O_3Cl,2HCl$ in the medium.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing 50 mg of Levocetirizine Dihydrochloride, in 20 ml of a mixture of 5.7 volumes of *1 M of sulphuric acid* and 94.3 volumes of *water*, with the aid of ultrasound with intermittent shaking. Add 150 ml of *acetonitrile*, place the flask in an ultrasonic bath for 10 minutes, cool and dilute to 250.0 ml with *acetonitrile*. Centrifuge the solution and use the supernatant liquid.

Reference solution (a). A 0.0002 per cent w/v solution of *levocetirizine dihydrochloride IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.02 per cent w/v of *levocetirizine dihydrochloride IPRS* and 0.00002 per cent w/v of *chlorobenzhydryl piperazine IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm packed with silica gel (5 µm),
- mobile phase: a mixture of 93 volumes of *acetonitrile*, 6.6 volumes of *water* and 0.4 volume of *1M sulphuric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Name	Relative retention time
Levocetirizine	1.0
Chlorobenzhydryl piperazine[1,*]	1.4
Levocetirizin amide[2,*]	2.1

*Process impurity controlled in drug substance and no need to report in drug product,

[1](*R*)-1-[(4-chlorophenyl)phenylmethyl]piperazine,

[2](*R*)-2-(2-{4-[(4-chlorophenyl)phenylmethyl]piperazin-1-yl}ethoxy)acetamide.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to chlorobenzhydryl piperzine and levocetirizine is not less than 3.0, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections for levocetirizine is not more than 2.0 per cent and for chlorobenzhydryl piperzine is not more than 5.0 per cent.

Inject reference solution (a) and the test solution. Run the chromatogram 2.3 times the retention time of levocetirizine peak, the area of any secondary peak is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent) and the sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay, using following modifications.

Test solution. Transfer 1 tablet in a suitable volumetric flask. Add about 20 ml of mobile phase to disperse with shaking. Further dilute with the mobile phase to obtain a final concentration of 0.0025 per cent w/v.

Reference solution. A 0.0025 per cent w/v solution of *levocetirizine dihydrochloride IPRS* in the mobile phase.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powdered tablet containing 25 mg of Levocetirizine Dihydrochloride, disperse in 100.0 ml of mobile phase and filter. Dilute 5.0 ml of the solution to 25.0 ml with mobile phase.

Reference solution. A 0.005 per cent w/v solution of *levocetrizine dihydrochloride IPRS* in mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane chemically bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of *0.05 M potassium dihydrogen phosphate* and 40 volumes of *acetonitrile*, adjusted to pH 6.0 with 10 per cent w/v of *sodium hydroxide*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0. The column efficiency in not less than 1500 theoretical plates. The relative standard deviation for replicate injections is not more than 2.0 per cent.

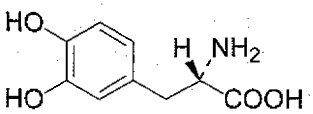
Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{25}N_2O_3Cl,2HCl$.

Storage. Store protected from light and moisture.

Levodopa

L-Dopa



$C_9H_{11}NO_4$ Mol. Wt. 197.2

Levodopa is 3-(3,4-dihydroxyphenyl)-L-alanine.

Levodopa contains not less than 98.5 per cent and not more than 101.0 per cent of $C_9H_{11}NO_4$, calculated on the dried basis.

Category. Antiparkinsonian.

Description. A white or slightly cream, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *levodopa IPRS* or with the reference spectrum of levodopa.

B. Dissolve about 2 mg in 2 ml of *water* and add 0.2 ml of *ferric chloride solution*; a green colour develops which changes to bluish violet on the addition of 0.1 g of *hexamine*.

C. Dissolve about 5 mg in a mixture of 5 ml of *1 M hydrochloric acid* and 5 ml of *water*. Add 0.1 ml of *sodium nitrite solution* containing 10 per cent w/v of *ammonium molybdate*; a yellow colour develops which changes to red on the addition of *10 M sodium hydroxide*.

D. Mix about 5 mg with 1 ml of *water*, 1 ml of *pyridine* and about 5 mg of *4-nitrobenzoyl chloride* and allow to stand for 3 minutes; a violet colour develops which changes to pale yellow on boiling. Add, while shaking, 0.2 ml of *sodium carbonate solution*; the violet colour reappears.

Tests

Appearance of solution. A 4.0 per cent w/v solution in *1 M hydrochloric acid* is not more intensely coloured than reference solution BYS6 (2.4.1).

pH (2.4.24). 4.5 to 7.0, determined in a suspension prepared by shaking 0.1 g with 10 ml of *carbon dioxide-free water* for 15 minutes.

Optical rotation (2.4.22). – 1.34° to – 1.27°, determined at 20° in a solution prepared in the following manner. Dissolve a quantity containing 0.2 g of the substance on the dried basis and 5 g of *hexamine* in 10 ml of *1 M hydrochloric acid*, add sufficient *1 M hydrochloric acid* to produce 25 ml and allow to stand for 3 hours, protected from light.

Light absorption. Dissolve 30 mg in sufficient *0.1 M hydrochloric acid* to produce 100.0 ml and dilute 10.0 ml to 100.0 ml with *0.1 M hydrochloric acid*.

When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows an absorption maximum only at about 280 nm; absorbance at 280 nm, 0.41 to 0.44.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Use freshly prepared solutions.

Solution A. 1.03 per cent w/v solution of *hydrochloric acid*.

Test solution. Dissolve 0.1 g of the substance under examination in solution A and dilute to 25 ml with solution A.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with solution A. Further dilute 5.0 ml of the solution to 100.0 ml with solution A.

Reference solution (b). A solution containing 0.0008 per cent w/v of *tyrosine* (levodopa impurity B), 0.0004 per cent w/v of *3-methoxy-l-tyrosine* (L-isomer of levodopa impurity C) and 0.0008 per cent w/v of the substance under examination in solution A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with spherical di-isobutyloctadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. *0.1 M phosphate buffer pH 3.0*,
  B. a mixture of 18 volumes of *methanol* and 85 volumes of *0.1 M phosphate buffer pH 3.0*,
- a gradient programme using the conditions given below,
- flow rate: 1ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
18	90	10
22	0	100
35	0	100
40	90	10

Name	Relative retention time	Correction factor
Levodopa impurity A[1]	0.7	—
Levodopa (Retention time: about 6 minutes)	1.0	—
Levodopa impurity B[2]	2.0	2.2
Levodopa impurity C[3]	3.5	—

[1]((2*S*)-2-amino-3-(2,4,5-trihydroxyphenyl)propanoic acid,

[2]tyrosine,

[3]3-methoxy-DL-tyrosine.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to levodopa impurity B and levodopa is not less than 10.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of the peak due to levodopa impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). The area of the peak due to levodopa impurity B is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). The area of the peak due to levodopa impurity C is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent) and the sum of areas of all the secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.03 per cent).

Enantiomeric purity. Determine by liquid chromatography (2.4.14).

NOTE—Use freshly prepared solutions.

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dilute 5.0 ml of the test solution to 20.0 ml with the mobile phase. Further dilute 1.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (b). Dissolve 10 mg of *D-dopa* (levodopa impurity D) in 10.0 ml of the test solution. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve separately 200 mg of *copper acetate* and 387 mg of *N,N- dimethyl-l-phenylalanine* in *water*, mix the 2 solutions and adjust the pH 4.0 to with *acetic acid*; add 50 ml of *methanol* and dilute to 1000 ml with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

The relative retention time with reference to levodopa (Retention time: about 6 minutes) for levodopa impurity D is about 0.4.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to levodopa impurity D and levodopa is not less than 5.0.

Inject reference solution (a) and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with test solution, the area of the peak due to levodopa impurity D is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.3 g, dissolve, heating if necessary, in 5 ml of *anhydrous formic acid* and add 25 ml of *anhydrous glacial acetic acid* and 25 ml of *dioxan*. Titrate with *0.1 M perchloric acid*, using 0.1 ml of *crystal violet solution* as indicator and titrating to a green end-point. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01972 g of $C_9H_{11}NO_4$.

Storage. Store protected from light and moisture.

Levodopa Capsules

L-Dopa Capsules

Levodopa Capsules contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of levodopa, $C_9H_{11}NO_4$.

Usual strengths. 125 mg; 250 mg; 500 mg.

Identification

A. Dissolve as completely as possible a quantity of the contents of the capsules containing 0.5 g of Levodopa in 25 ml of *1 M hydrochloric acid* and filter. Adjusted to pH 3 with *5 M ammonia*, added dropwise with stirring and allow to

stand for several hours, protected from light. Filter, wash the precipitate and dry it at 105°.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *levodopa IPRS* or with the reference spectrum of levodopa.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *microcrystalline cellulose.*

Mobile phase. A mixture of 50 volumes of *1-butanol*, 25 volumes of *glacial acetic acid* and 25 volumes of *water.*

Test solution. Shake a quantity of the contents of the capsules containing 0.1 g of Levodopa with 10 ml of *1 M hydrochloric acid* and filter.

Reference solution. A 1 per cent w/v solution of *levodopa IPRS* in *1 M hydrochloric acid.*

Apply to the plate 5 µl of each solution. After development, dry the plate in a current of warm air and spray with a freshly prepared mixture of equal volumes of a 10 per cent w/v solution of *ferric chloride* and a 5 per cent w/v solution of *potassium ferricyanide.* The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). −41.5° to −38.5°, determined in the following manner. Weigh accurately a quantity of the contents of the capsules containing 1.25 g of Levodopa, shake with 25.0 ml of *0.5 M hydrochloric acid* for 30 minutes, centrifuge and filter the supernatant liquid. To 10.0 ml of the filtrate add 10 ml of a 21.5 per cent w/v solution of *aluminium sulphate*, 20 ml of a 21.8 per cent w/v solution of *sodium acetate* and sufficient *water* to produce 50.0 ml and measure the optical rotation of the resulting solution at 20°. Separately dilute 5.0 ml of the filtrate to 200.0 ml with *0.1 M hydrochloric acid*, mix well and dilute 10.0 ml to 200.0 ml with *0.1 M hydrochloric acid.* Measure the absorbance of the resulting solution at the maximum at about 280 nm (2.4.7). Calculate the content of $C_9H_{11}NO_4$, in the filtrate taking 142 as the specific absorbance at 280 nm and from the result so obtained calculate the specific optical rotation.

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the resulting solution at the maximum at about 280 nm (2.4.7). Calculate the content of $C_9H_{11}NO_4$ taking 141 as the specific absorbance at 280 nm.

Q. Not less than 75 per cent of the stated amount of $C_9H_{11}NO_4$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *microcrystalline cellulose.*

Mobile phase. A mixture of 50 volumes of *1-butanol*, 25 volumes of *glacial acetic acid* and 25 volumes of *water.*

Test solution. A solution prepared immediately before use by shaking a quantity of the contents of the capsules containing 0.1 g of Levodopa with 10 ml of a mixture of equal volumes of *anhydrous formic acid* and *methanol.*

Reference solution (a). Dilute 1 volume of the test solution to 200 volumes with *methanol.*

Reference solution (b). A mixture of equal volumes of the test solution and a solution prepared by dissolving 30 mg of *L-tyrosine* in 1 ml of *anhydrous formic acid* and diluting to 100 ml with *methanol.*

Apply to the plate 10 µl of each of the test solution and reference solution (a) and 20 µl of reference solution (b) as bands. Allow the mobile phase to rise 20 cm. After development, dry the plate in a current of warm air, spray with a freshly prepared mixture of equal volumes of a 10 per cent w/v solution of *ferric chloride* and a 5 per cent w/v solution of *potassium ferricyanide* and examine the plate immediately. Any secondary band in the chromatogram obtained with the test solution is not more intense than the band in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows a distinct band, at a higher R_f value than the principal band, which is more intense than the band in the chromatogram obtained with reference solution (a).

Other tests. Comply with the tests stated under Capsules.

Assay. Weigh a quantity of the mixed contents of 20 capsules containing about 0.4 g of Levodopa, dissolve as completely as possible in 10 ml of *anhydrous formic acid*, add 80 ml of *anhydrous glacial acetic acid.* Titrate with *0.1 M perchloric acid*, using *oracet blue B solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01972 g of $C_9H_{11}NO_4$.

Storage. Store protected from light and moisture.

Levodopa Tablets

L-Dopa Tablets

Levodopa Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of levodopa, $C_9H_{11}NO_4$.

Usual strengths. 250 mg; 500 mg.

Identification

A. Dissolve as completely as possible a quantity of the tablet containing 0.5 g of Levodopa in 25 ml of *1 M hydrochloric acid* and filter. Adjusted to pH 3 with *5 M ammonia*, added dropwise with stirring and allow to stand for several hours, protected from light. Filter, wash the precipitate and dry it at 105°.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *levodopa IPRS* or with the reference spectrum of levodopa.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *microcrystalline cellulose.*

Mobile phase. A mixture of 50 volumes of *1-butanol*, 25 volumes of *glacial acetic acid* and 25 volumes of *water.*

Test solution. Shake a quantity of the powdered tablets containing 0.1 g of Levodopa with 10 ml of *1 M hydrochloric acid* and filter.

Reference solution. A 1 per cent w/v solution of *levodopa IPRS* in *1 M hydrochloric acid.*

Apply to the plate 5 µl of each solution. After development, dry the plate in a current of warm air and spray with a freshly prepared mixture of equal volumes of a 10 per cent w/v solution of *ferric chloride* and a 5 per cent w/v solution of *potassium ferricyanide*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). −41.5° to −38.5°, determined in the following manner. Weigh accurately a quantity of the powdered tablets containing 1.25 g of Levodopa, shake with 25.0 ml of *0.5 M hydrochloric acid* for 30 minutes, centrifuge and filter the supernatant liquid. To 10.0 ml of the filtrate add 10 ml of a 21.5 per cent w/v solution of *aluminium sulphate*, 20 ml of a 21.8 per cent w/v solution of *sodium acetate* and sufficient *water* to produce 50.0 ml and measure the optical rotation at 20°. Separately dilute 5.0 ml of the filtrate to 200.0 ml with *0.1 M hydrochloric acid*, mix well and dilute 10.0 ml to 200.0 ml with *0.1 M hydrochloric acid*. Measure the absorbance of the resulting solution at the maximum at about 280 nm (2.4.7). Calculate the content of $C_9H_{11}NO_4$, in the filtrate taking 142 as the specific absorbance at 280 nm and from the result so obtained calculate the specific optical rotation.

Dissolution (2.5.2):

Apparatus No. 1 (Basket),
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the resulting solution at the maximum at about 280 nm (2.4.7). Calculate the content of $C_9H_{11}NO_4$ taking 141 as the specific absorbance at 280 nm.

Q. Not less than 75 per cent of the stated amount of $C_9H_{11}NO_4$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *microcrystalline cellulose.*

Mobile phase. A mixture of 50 volumes of *1-butanol*, 25 volumes of *glacial acetic acid* and 25 volumes of *water.*

Test solution. Shake a quantity of the powdered tablets containing 0.1 g of Levodopa with 10 ml of a mixture of equal volumes of *anhydrous formic acid* and *methanol.*

Reference solution (a). Dilute 1 volume of the test solution to 200 volumes with *methanol.*

Reference solution (b). A mixture of equal volumes of the test solution and a solution prepared by dissolving 30 mg of *L-tyrosine* in 1 ml of *anhydrous formic acid* and diluting to 100 ml with *methanol.*

Apply to the plate 10 µl each of the test solution and reference solution (a) and 20 µl of reference solution (b) as bands. Allow the mobile phase to rise 20 cm. Dry the plate in a current of warm air, spray with a freshly prepared mixture of equal volumes of a 10 per cent w/v solution of *ferric chloride* and a 5 per cent w/v solution of *potassium ferricyanide* and examine the plate immediately. Any secondary band in the chromatogram obtained with the test solution is not more intense than the band in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows a distinct band, at a higher R_f value than the principal band, which is more intense than the band in the chromatogram obtained with reference solution (a).

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.4 g of Levodopa, dissolve as completely as possible in 10 ml of *anhydrous formic acid*, add 80 ml of anhydrous *glacial acetic acid.* Titrate with *0.1 M perchloric acid,* using *oracet blue B solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01972 g of $C_9H_{11}NO_4$.

Storage. Store protected from light and moisture.

Levodopa and Carbidopa Prolonged-release Tablets

Levodopa and Carbidopa Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not

interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Levodopa and Carbidopa Prolonged-release tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of levodopa $C_9H_{11}NO_4$ and carbidopa, $C_{10}H_{14}N_2O_4$.

Usual strengths. Carbidopa 25 mg and Levodopa 100 mg; Carbidopa 50 mg and Levodopa 200 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2). Complies with the test stated under Tablets.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE— Protect the solutions from light and maintain them at 2° to 8° until they are injected.

Test solution. Weigh and powder 10 tablets. Disperse suitable quantity of the powder in mobile phase. Filter and dilute a quantity of the filtrate with sufficient of the mobile phase to produce a solution containing 0.0125 per cent w/v of carbidopa and 0.05 per cent w/v of levodopa.

Reference solution (a). A solution containing 0.0001 per cent w/v of *levodopa impurity B IPRS* and 0.0125 per cent w/v of *carbidopa IPRS* in mobile phase.

Reference solution (b). A solution containing 0.000125 per cent w/v of *carbidopa IPRS* and 0.0005 per cent w/v of *levodopa IPRS* in mobile phase.

Reference solution (c). A solution containing 0.0000125 per cent w/v of *carbidopa IPRS* and 0.00005 per cent w/v of *levodopa IPRS* from reference solution (b) in mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- sample temperature: 6°,
- mobile phase: a mixture of 95 volumes of a buffer solution prepared by dissolving 6.0 g of *anhydrous monobasic sodium phosphate* in 1000 ml of *water*, adjusted to pH 2.2 with *orthophosphoric acid* and 5 volumes of *ethanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Levodopa impurity A[1]	0.9	1.43
Levodopa	1.0	—
Methyldopa[2]	1.9	—
Levodopa impurity B[3]	2.1	—
Carbidopa	2.3	—
Dihydroxybenzaldehyde[4]	5.7	0.17
Dihydroxyphenylacetone[5]	6.3	1.0
3-O-Methylcarbidopa[6]	6.9	—

[1]3-(3,4,6-trihydroxyphenyl)alanin, impurity based on label claim of levodopa,

[2]Impurity based on label claim of carbidopa, it is process impurity,

[3]3-methoxy-*L*-tyrosine, impurity based on label claim of levodopa,

[4]3,4-dihydroxybenzaldehyde, impurity based on label claim of carbidopa,

[5]3,4-dihydroxyphenylacetone, impurity based on label claim of carbidopa,

[6](s)-2-hydrazinyl-3-(4-hydroxy-3-methoxyphenyl)-2-methyl-propanoic acid, it is process impurity.

Inject reference solution (a) and (c). The test is not valid unless the resolution between the peaks due to carbidopa and levodopa impurity B is not less than 1.5 obtained with reference solution (a) and the signal to noise ratio is not less than 10 for the carbidopa peak, obtained with reference solution (c).

Inject reference solution (b) and the test solution. Run the chromatogram 6 times the retention times of the carbidopa peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to levodopa impurity A is not more than 0.1 times the area of the levodopa peak in the chromatogram obtained with reference solution (b) (0.1 per cent), the area of any peak corresponding to dihydroxybenzaldehyde is not more than 0.2 times the area of the carbidopa peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the area of any peak corresponding to dihydroxyphenylacetone is not more than the area of the carbidopa peak in the chromatogram obtained with reference solution (b) (1.0 per cent), the area of any other secondary peak due to carbidopa is not more than 0.2 times the area of the carbidopa peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the area of any other secondary peak due to levodopa is not more than 0.2 times the area of the levodopa peak in the chromatogram obtained with reference solution (b) (0.2 per cent) The sum of area of all the secondary peaks is not more than 4 times the area of the levodopa peak in the chromatogram obtained with reference solution (b) (4.0 per cent). Disregard any peak with an area less than 0.05 times the area of carbidopa peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light.

Test solution. Weigh and finely powder 20 tablets. Disperse a quantity of the powder containing about 10 mg of Carbidopa and 40 mg of Levodopa in a 100.0 ml volumetric flask, add 10.0 ml of *0.1 M orthophosphoric acid*, sonicate for 10 minutes and stir for 30 minutes. Dilute to volume with the *water*, stir for another 20 minutes. Filter through 0.45 µm nylon membrane filter.

Reference solution. Dissolve 5 mg of *carbidopa IPRS* and 20 mg of *levodopa IPRS* in a 50.0 ml volumetric flask, add 5 ml of *0.1 M orthophosphoric acid*, sonicate. Dilute to volume with the *water.*

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 0.13 volumes of the final volume of a buffer solution prepared by dissolving 0.24 g of *sodium 1-decanesulfonate* in 1000 ml of *water* and 95 volumes of the final volume of a buffer solution prepared by dissolving 11.6 g of *monobasic sodium phosphate* in 1000 ml of *water,* adjusted to pH 2.8 with *orthophosphoric acid.* Dilute with *water* to final volume,
- flow rate: 2 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between levodopa and carbidopa peaks is not less than 6.0, the tailing factor is not more than 1.5 for carbidopa and levodopa peaks and the relative standard deviation for replicate injections of carbidopa and levodopa is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{14}N_2O_4$ and $C_9H_{11}NO_4$ in the tablets.

Storage. Store protected from light and moisture.

Levodopa and Carbidopa Tablets

Co-careldopa Tablets

Levodopa and Carbidopa Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of anhydrous carbidopa, $C_{10}H_{14}N_2O_4$ and not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of levodopa, $C_9H_{11}NO_4$.

Usual strengths. Expressed in the form *x/y* where *x* and *y* are the strengths, in mg, of anhydrous carbidopa and levodopa respectively as 10/100; 25/100; 25/250.

Identification

A. In the Assay, the chromatogram obtained with the test solution shows two principal peaks that correspond to those due to carbidopa and levodopa in the chromatogram obtained with the reference solution.

B. Shake a quantity of the powdered tablets containing 50 mg of Levodopa with 4 ml of *ethanol (95 per cent)* and 1 ml of *1 M sulphuric acid.* Add 2 ml of *cinnamaldehyde*, allow to stand for 20 minutes, add 50 ml of *0.1 M hydrochloric acid*, shake for 2 minutes and allow to stand. Filter the aqueous layer and to 5 ml of the filtrate add 0.1 ml of *ferric chloride test solution*. To half of the solution add an excess of *dilute ammonia solution*; a purple colour is produced. To the remainder add an excess of *sodium hydroxide solution*; a deep red colour is produced.

C. Shake a quantity of the powdered tablets containing 1 mg of anhydrous carbidopa with 5 ml of *0.05 M sulphuric acid* and filter. Add 5 ml of *dimethylaminobenzaldehyde reagent* to the filtrate; a yellow colour is produced.

Tests

Dissolution (2.5.2).
Apparatus No. 1 (Basket),
Medium. 750 ml of *0.1 M hydrochloric acid,*
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14)

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A solution containing 0.005 per cent w/v of *levodopa IPRS* and 0.00054 per cent w/v of *carbidopa IPRS* in the dissolution medium.

Chromatographic system
- a stainless steel column 20 cm × 4.0 mm, packed with octylsilane bonded to porous silica (10 µm) (Such as Lichrosorb RP8),
- mobile phase: a *0.1 M potassium dihydrogen orthophosphate*, adjusted to pH 3.0 with *1 M orthophosphoric acid,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 282 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution.

Calculate the contents of $C_{10}H_{12}N_2O_4$ and $C_9H_{11}NO_4$ in the medium.

Q. Not less than 75 per cent of the stated amounts of $C_{10}H_{12}N_2O_4$ and $C_9H_{11}NO_4$.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14).

Test solution. Disperse one tablet with 20 ml of *0.1 M phosphoric acid* for 30 minutes, add sufficient *water* to produce 200.0 ml, mix and filter.

Reference solution. Weigh 10 mg of *carbidopa IPRS*, dissolve in 20 ml of *0.1 M orthophosphoric acid* by gentle warming and add sufficient *water* to produce 200.0 ml.

Carry out the chromatographic procedure described under Assay.

Calculate the content of $C_{10}H_{14}N_2O_4$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 250 mg of Levodopa and 25 mg of Carbidopa, with 50 ml of *0.1 M orthophosphoric acid* for 30 minutes, add sufficient *water* to produce 500.0 ml, mix and filter.

Reference solution. Dissolve 250 mg of *levodopa IPRS* and 25 mg of *carbidopa IPRS* in 50.0 ml of *0.1 M phosphoric acid* by gentle warming and add sufficient *water* to produce 500.0 ml.

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with octylsilane chemically bonded to porous silica (5 µm),
- mobile phase: mix 950 ml of *sodium dihydrogen phosphate solution (1.162 per cent w/v)* with 1.3 ml of *sodium 1-decanesulfonate solution (0.024 per cent w/v)*, adjusted to pH 2.8 with *orthophosphoric acid* and dilute with *water* to produce 1000 ml,
- flow rate: 2 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

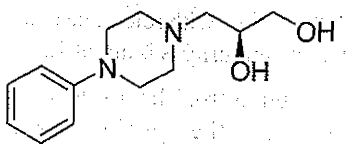
Inject alternately the test solution and the reference solution. The retention times are about 4 minutes and 11 minutes for levodopa and carbidopa respectively.

Calculate the content of $C_{10}H_{14}N_2O_4$ and $C_9H_{11}NO_4$ in the tablets.

Storage. Store protected from light and moisture.

Labelling. The label states the quantity of Carbidopa in terms of the equivalent amount of anhydrous carbidopa and the quantity of Levodopa in each tablet.

Levodropropizine



$C_{13}H_{20}N_2O_2$ Mol. Wt. 236.3

Levodropropizine is (2*S*)-3-(4-phenylpiperazin-1-yl)propane-1,2-diol.

Levodropropizine contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{13}H_{20}N_2O_2$, calculated on the dried basis.

Category. Antihistamine.

Description. A white or almost white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *levodropropizine IPRS* or with the reference spectrum of levodropropizine.

Tests

Specific optical rotation (2.4.22). – 33.5° to – 30.0°, determined in 3 per cent w/v solution in 2.1 per cent w/v of *hydrochloric acid*.

pH (2.4.24). 9.2 to 10.2, determined in a 2.5 per cent w/v solution in *carbon dioxide-free water*, heat to dissolve and cool.

Impurity B and related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). A 0.025 per cent w/v solution of *1-phenylpiperazine IPRS (levodropropizine impurity B IPRS)* in *methanol*. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). Mix 1.0 ml of the test solution with 1.0 ml of reference solution (a).

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with end capped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 12 volumes of *methanol* and 88 volumes of a 0.68 per cent w/v solution of *potassium dihydrogen phosphate*, adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,

- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

The relative retention time with reference to levodropropizine for levodropropizine impurity B is about 1.2.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to levodropropizine and levodropropizine impurity B is not less than 2.0.

Inject reference solution (a) and the test solution. Run the chromatogram twice the retention times of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to levodropropizine impurity B is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent), the area of any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 1.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.6 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Impurity C. Determine by gas chromatography (2.4.13).

NOTE—Prepare the solutions immediately before use.

Test solution. Dissolve 0.5 g of the substance under examination in *dichloromethane* and dilute to 2.5 ml with *dichloromethane*.

Reference solution (a). A 0.2 per cent w/v solution of *[(2RS)-oxiran-2-yl]methanol IPRS (levodropropizine impurity C IPRS)* in *dichloromethane*. Dilute 0.5 ml of the solution to 100.0 ml with *dichloromethane*.

Reference solution (b). Dissolve 0.5 g of the substance under examination in *dichloromethane*, add 250 µl of reference solution (a) and dilute to 2.5 ml with *dichloromethane*.

Chromatographic system

- a fused-silica column 30 m x 0.53 mm, packed with poly[(cyanopropyl)(phenyl)][dimethyl]siloxane (film thickness 3.0 µm),
- temperature:
  column.140°,
  inlet port. 170° and detector at 250°,
- a flame ionisation detector,
- flow rate: 2.5 ml per minute, using nitrogen as the carrier gas.

Inject 1 µl of reference solution (b) and the test solution.

Inject reference solution (b). Run the chromatogram 2.5 times the retention time of levodropropizine impurity C peak. The test is not valid unless the signal-to-noise ratio for levodropropizine impurity C peak is not less than 10.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (5 ppm).

Enantiomeric purity. Determine by liquid chromatography (2.4.14).

Solvent mixture. 40 volumes of *ethanol* and 60 volumes of *hexane*.

Test solution. Dissolve 10 mg of the substance under examination in 10.0 ml of the solvent mixture. Dilute 1.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution (a). A 0.002 per cent w/v solution of *levodropropizine IPRS* in the solvent mixture.

Reference solution (b). A 0.002 per cent w/v solution of *(2R)-3-(4-phenylpiperazin-1-yl)propane-1,2-diol (dextrodropropizine) IPRS (levodropropizine impurity A IPRS)* in the solvent mixture.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 50.0 ml with the solvent mixture.

Reference solution (d). Dilute 0.5 ml of reference solution (b) to 25 ml with reference solution (a).

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with silica gel OD for chiral separations,
- mobile phase: a mixture of 0.2 volume of *diethylamine*, 5 volumes of *ethanol* and 95 volumes of *hexane*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (d). The test is not valid unless the resolution between the peaks corresponding to levodropropizine impurity A and levodropropizine is not less than 1.3.

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to levodropropizine impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (2.0 per cent).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

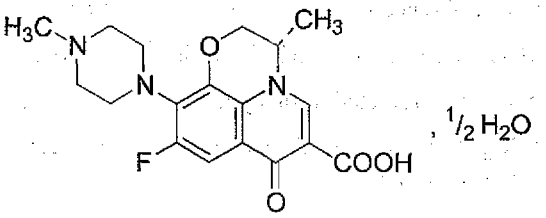
Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 0.5 g by drying in an oven over *phosphorus pentoxide* at 60° at a pressure not exceeding 0.25 kPa for 4 hours.

Assay. Dissolve 0.1 g in 50 ml of *anhydrous acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01182 g of $C_{13}H_{20}N_2O_2$.

Storage. Store protected from light.

Levofloxacin Hemihydrate



$C_{18}H_{20}FN_3O_4, ½ H_2O$ Mol. Wt. 370.4

Levofloxacin Hemihydrate is (*S*)-9-fluoro-2,3-dihydro-3-methyl-10-(4-methylpiperazin-1-yl)-7-oxo-7*H*-pyrido[1,2,3-*de*]-1,4-benzoxazine-6-carboxylic acid hemihydrate.

Levofloxacin Hemihydrate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{18}H_{20}FN_3O_4$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A yellowish white to yellow powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *levofloxacin hemihydrate IPRS* or with the reference spectrum of levofloxacin hemihydrate.

Tests

Specific optical rotation (2.4.22). – 106° to – 92°, determined in a 0.5 per cent w/v solution in *methanol*, at 20°.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 100 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). A 0.1 per cent w/v solution of *levofloxacin hemihydrate IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Reference solution (c). A 0.00003 per cent w/v solution of *levofloxacin hemihydrate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: a mixture of 30 volumes of *methanol* and 70 volumes of buffer solution prepared by dissolving 8.5 g of *ammonium acetate*, 1.25 g of *cupric sulphate pentahydrate* and 1.3 g of *l-isoleucine* in *water* and diluting to 1000 ml with *water*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 360 nm,
- injection volume: 25 µl.

Name	Relative retention time	Correction factor
N-Desmethyl levofloxacin[1]	0.47	—
Diamine derivative[2]	0.52	1.11
Levofloxacin N-oxide[3]	0.63	0.9
9-Desfluoro levofloxacin[4]	0.73	—
Levofloxacin	1.0	—
D-Isomer[5]	1.23	—

[1](S)-9-fluoro-2,3-dihydro-3-methyl-10-(piperazin-1-yl)-7-oxo-7H-pyrido[1,2,3-de][1,4]benzoxazine-6-carboxylic acid,

[2](S)-9-fluoro-2,3-dihydro-3-methyl-10-[2-(methylamino)ethylamino]-7-oxo-7H -pyrido[1,2,3-de][1,4]benzoxazine-6-carboxylic acid,

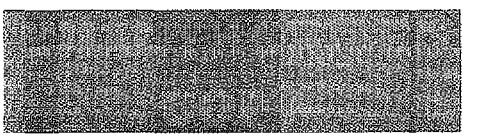
[3](S)-4-(6-carboxy-9-fluoro-2,3-dihydro-3-methyl-7-oxo-7H-pyrido-[1,2,3-de][1,4]benzoxazine-10-yl)-1-methyl-piperazine-1-oxide,

[4](S)-2,3-dihydro-3-methyl-10-(4-methyl-1-piperazinyl)-7-oxo-7H-pyrido[1,2,3-de][1,4]benzoxazine-6-carboxylic acid,

[5](R)-9-fluoro-2,3-dihydro-3-methyl-10-(4-methyl-1-piperazinyl)-7-oxo-7H-pyrido[1,2,3-de][1,4]benzoxazine-6-carboxylic acid.

Inject reference solution (a) and (c). The test is not valid unless the relative standard deviation for replicate injections obtained with reference solution (a) is not more than 1.0 per cent and the signal to noise ratio for the principal peak in the chromatogram obtained with reference solution (c) is not less than 10.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to D-isomer is not more than 0.8 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.8 per cent). The area of any other identified peak is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the area of all the secondary peaks other than D-isomer is not more than 0.5 times the areas of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).



Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent, determined on 1.0 g.

Water (2.3.43). 2.0 per cent to 3.0 per cent, determined on 0.2 g.

Assay. Weigh 0.18 g, dissolve in 50 ml of *anhydrous acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml *0.1 M perchloric acid* is equivalent of 0.03614 g of $C_{18}H_{20}FN_3O_4$.

Storage. Store protected from light.

Levofloxacin Infusion

Levofloxacin Infusion is a sterile solution of levofloxacin in 5 per cent dextrose injection or in 0.9 per cent sodium chloride injection.

Levofloxacin Infusion contain not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of levofloxacin, $C_{18}H_{20}FN_3O_4$.

Usual strength. 5 mg per ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution.

Tests

pH (2.4.24). 3.8 to 5.8.

Other tests. Comply with the tests stated under Parenteral Preparation (Infusions).

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Use freshly prepared solutions and carry out the test protected from light.

Test solution. Measure accurately a volume containing 50 mg of levofloxacin, dilute to 50.0 ml with *0.1 M hydrochloric acid*. Dilute 5.0 ml of the solution to 25.0 ml with *water*.

Reference solution. A 0.1 per cent w/v solution of *levofloxacin hemihydrate IPRS* in *0.1 M hydrochloric acid*. Dilute 5.0 ml of the solution to 25.0 ml with a *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 85 volumes of buffer solution prepared by mixing 84 volumes of *0.05 M citric acid monohydrate* and 1 volume of *1 M ammonium acetate* and 15 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 293 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and column efficiency is not less than 3000 theoretical plates and the relative standard deviation is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{20}FN_3O_4$ in the infusion.

Storage. store protected from light.

Labelling. The label state the strength in terms of equivalent amount of levofloxacin.

Levofloxacin Injection

Levofloxacin Injection is a sterile solution of levofloxacin in Water for Injections.

Levofloxacin Injection contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of levofloxacin, $C_{18}H_{20}FN_3O_4$.

Usual strengths. 25 mg per ml; 50 mg per ml.

Description. A clear, yellowish colour solution.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 3.8 to 5.8.

Appearance of solution. A 2.5 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1) and not more intensly coloured than reference solution GYS1 (2.4.1).

Light absorption. The absorbance of 0.25 per cent w/v solution in *carbon dioxide-free water* at 420 nm (2.4.7) is not more than 0.6.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Use freshly prepared solutions and carry out the test protected from light.

Solvent mixture. 60 volumes of buffer solution containing 0.73 per cent w/v of *sodium perchlorate monohydrate*, 0.44 per cent w/v of *ammonium acetate* in *water*, adjusted to pH 2.2 with *orthophosphoric acid* and 40 volumes of *acetonitrile*.

Test solution. Dilute a volume of injection containing 25 mg of Levofloxacin to 100.0 ml with the solvent mixture.

Reference solution (a). A 0.025 per cent w/v solution of *levofloxacin IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 85 volumes of buffer solution and 15 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 294 nm,
- injection volume: 10 µl.

The retention time of levofloxacin peak is about 8 minutes.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent).

Bacterial endotoxins (2.2.3). Not more than 2.0 Endotoxin Units per mg of Levofloxacin.

Other tests. Comply with the tests stated under Parenteral Preparation (Injections).

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Use freshly prepared solutions and carry out the test protected from light.

Test solution. Dilute a volume containing 50 mg of Levofloxacin, to 50.0 ml with *0.1 M hydrochloric acid*. Dilute 5.0 ml of the solution to 25.0 ml with *water*.

Reference solution. A 0.1 per cent w/v solution of *levofloxacin IPRS* in *0.1 M hydrochloric acid*. Dilute 5.0 ml of the solution to 25.0 ml with *water*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 85 volumes of buffer solution prepared by mixing 84 volumes of *0.05 M citric acid monohydrate* and 1 volume of *1 M ammonium acetate* and 15 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 293 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{20}FN_3O_4$ in the injection.

Storage. Store protected from light, at a temperature not exceeding 30°.

Labelling. The label state the strength in terms of equivalent amount of levofloxacin.

Levofloxacin Oral Solution

Levofloxacin Oral Solution contains not less than 90.0 per cent and not more than 110.0 per cent of levofloxacin, $C_{18}H_{20}FN_3O_4$.

Usual strength. 125 mg per 5 ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.24). 5.0 to 6.0.

Related substances. Determine by liquid chromatography (2.4.14) as described under Assay with the following modifications.

Name	Relative retention time	Correction factor
9-desfluorolevofloxacin[1]	0.64	—
Diamine derivative[2]	0.75	—
Levofloxacin impurity A[3]	0.91	1.23
Levofloxacin	1.0	—
Levofloxacin *N*-oxide[4]	1.55	1.07

[1](*S*)-2,3-Dihydro-3-methyl-10-(4-methyl-1-piperazinyl)-7-oxo-7*H* -pyrido[1,2,3-*de*][1,4]benzoxazine-6-carboxylic acid,

[2](*S*)-9-Fluoro-2,3-dihydro-3-methyl-10-[2-(methylamino) ethylamino]-7-oxo-7*H* -pyrido[1,2,3-*de*][1,4]benzoxazine-6-carboxylic acid,

[3](*S*)-9-Fluoro-2,3-dihydro-3-methyl-10-(piperazin-1-yl)-7-oxo-7*H*-pyrido[1,2,3-*de*][1,4]benzoxazine-6-carbocylic acid,

[4](*S*)-4-(6-Carboxy-9-fluoro-2,3-dihydro-3-methyl-7-oxo-7*H* -pyrido-[1,2,3-*de*][1,4]benzoxazine-10-yl)-1-methylpiperazine 1-oxide.

Inject the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to levofloxacin impurity A and levofloxacin N-oxide is not more than 0.5 per cent each. The area of any other secondary peak

is not more than 0.2 per cent. The sum of areas of all the secondary peaks is not more 1.0 per cent calculated by area normalization.

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14)

NOTE — Protect the solutions from light.

Solvent mixture. 18 volumes of *acetonitrile* and 82 volumes of *water.*

Test solution. Dilute a weighed quantity of the Oral Solution containing about 50 mg of Levofloxacin to 50.0 ml with solvent mixture. Further dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution (a). A solution containing about 0.01 per cent of *levofloxacin hemihydrate IPRS* in the solvent mixture.

Reference solution (b). A solution each of 0.01 per cent of *levofloxacin hemihydrate IPRS and levofloxacin impurity A IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, with phenyl groups bonded to porous silica (3.5 µm),
- mobile phase: a mixture of 82 volumes of *water,*18 volumes of *acetonitrile* and 1.0 ml of *trifluoroacetic acid,*
- flow rate: 0.7 ml per minute,
- spectrophotometer set at 294 nm,
- injection volume: 20 µl.

Inject reference solution (a) and (b). Run the chromatogram 2.5 times the retention time of the principal peak. The test is not valid unless the resolution between levofloxacin impurity A and levofloxacin is not less than 1.9 obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 2.0 per cent obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_{18}H_{20}FN_3O_4$ in the oral solution.

Determine the weight per ml of the preparation (2.4.29) and calculate the content of $C_{18}H_{20}FN_3O_4$ weight in volume.

Storage. Store protected from light at a temperature not exceeding 30°.

Labelling. The label state the strength in terms of equivalent amount of levofloxacin.

Levofloxacin Tablets

Levofloxacin Tablets contain Levofloxacin hemihydrate.

Levofloxacin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of levofloxacin, $C_{18}H_{20}FN_3O_4$.

Usual strengths. 250 mg; 500 mg; 750 mg.

Identification

In the Assay, the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution.

Tests

Dissolution (2.5.2).
Apparatus No. 1 (Basket),
Medium. 900 ml of *0.01 M hydrochloric acid,*
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the medium if necessary, at the maximum at about 293 nm (2.4.7). Calculate the content of $C_{18}H_{20}FN_3O_4$ in the medium from the absorbance obtained from a solution of known concentration of *levofloxacin hemihydrate IPRS* in the same medium.

Q. Not less than 70.0 per cent of the stated amount of $C_{18}H_{20}FN_3O_4$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Use freshly prepared solutions and carry out the test protected from light.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powdered tablet containing 100 mg of Levofloxacin, disperse in 100.0 ml of *0.1 M hydrochloric acid* and filter. Dilute 5 ml of the solution to 10.0 ml with *water.*

Reference solution (a). A 0.1 per cent w/v solution of *levofloxacin hemihydrate IPRS* in *0.1 M hydrochloric acid.* Dilute 5 ml of the solution to 10 ml with a *water.*

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with *water.*

Chromatographic system as described under Assay.

Inject reference solution (a). Test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 3.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than the area of the peak in the chromatogram obtained with the reference solution (b) (1.0 per cent).

Other tests. Comply with the tests stated under the Tablets.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Use freshly prepared solutions and carry out the test protected from light.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powdered tablet containing 100 mg of levofloxacin, disperse in 100.0 ml of *0.1 M hydrochloric acid* and filter. Dilute 5.0 ml of the solution to 50.0 ml with *water.*

Reference solutionn. A 0.1 per cent w/v solution of *levofloxacin hemihydrate IPRS* in *0.1 M hydrochloric acid.* Dilute 5 ml of the solution to 50 ml with *water.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Cosmosil C18 MS II),
- mobile phase: a mixture of 85 volume of buffer solution prepared by dissolving 84 volumes of *0.05 M citric acid monohydrate* and 1 volume of *1 M ammonium acetate*, filter and 15 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 293 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, column efficiency is not less than 3000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

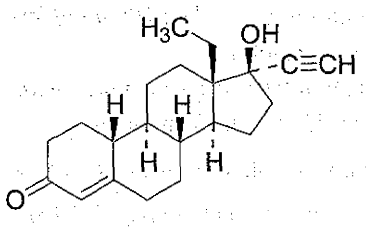
Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{20}FN_3O_4$ in the tablets.

Storage. Store protected from light and moisture.

Labelling. The label state the strength in terms of equivalent amount of levofloxacin.

Levonorgestrel



$C_{21}H_{28}O_2$ Mol. Wt. 312.5

Levonorgestrel is 13β-ethyl-17β-hydroxy-18,19-dinor-17α-pregn-4-en-20-yn-3-one.

Levonorgestrel contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{21}H_{28}O_2$, calculated on the dried basis.

Category. Progestogen.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *levonorgestrel IPRS* or with the reference spectrum of levonorgestrel.

B. When examined in the range 220 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* shows an absorption maximum only at about 240 nm.

C. Melts at about 237° (2.4.21).

Tests

Specific optical rotation (2.4.22). −35.0° to −30.0°, determined in a 1.0 per cent w/v solution in *dichloromethane.*

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 30 volumes of *water* and 70 volumes of *acetonitrile.*

Test solution. Dissolve 10 mg of the substance under examination in 7 ml of *acetonitrile* with the aid of ultrasound and dilute to 10.0 ml with *water.*

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Further dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octylsilane bonded to porous silica with polar incorporated groups (5 µm),
- mobile phase: A. a mixture of 40 volumes of *acetonitrile* and 60 volumes of *water*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 0.7 ml per minute,
- spectrophotometer set at 215 nm and for impurity O at 200 nm,
- injection volume: 50 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
50	20	80
55	100	0

Name	Relative retention time	Correction factor
Levonorgestrel impurity H[1]	0.5	—
Levonorgestrel impurity U[2]	0.8	—
Levonorgestrel impurity K[3]	0.85	—
Levonorgestrel impurity A[4]	0.91	0.4
Levonorgestrel impurity M[5]	0.95	3.1
Levonorgestrel (Retention time: about 20 minutes)	1.0	—
Levonorgestrel impurity O[6]	1.16	2.6

Levonorgestrel impurity S[8]	1.9	—

[1]6β-hydroxylevonorgestrel,

[2]norethisterone,

[3]18-methylnandrolone,

[4]13-ethyl-17-hydroxy-18,19-dinor-17α-pregna-4,8(14)-dien-20-yn-3-one,

[5]13-ethyl-17-hydroxy-18,19-dinor-17α-pregna-4,6-dien-20-yn-3-one,

[6]4,5- dihydro-5α-methoxylevonorgestrel,

[7]13-ethyl-17-hydroxy-18,19-dinor-17α-pregn-5(10)-en-20-yn-3-one,

[8]13-ethyl-3-methoxy-18,19-dinor-17α-pregna-3,5-dien-20-yn-17-ol.

Inject the reference solution. The test is not valid unless the signal-to-noise ratio is not less than 60 for the principal peak in the chromatogram obtained with reference solution.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 3 times the area of the principal peak in the chromatogram obtained with the reference solution (0.3 per cent). The area of any peak due to levonorgestrel impurity O at 200 nm is not more than 3 times the area of the principal peak in the chromatogram obtained with the reference solution (0.3 per cent). The sum of the areas of all the secondary peaks other than levonorgestrel impurity O is not more than 10 times the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.3 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.1 g, dissolve in sufficient *ethanol (95 per cent)* to produce 100.0 ml, dilute stepwise with *ethanol (95 per cent)* to obtain a solution containing 0.001 per cent w/v of Levonorgestrel and measure the absorbance of the resulting solution at the maximum at about 241 nm (2.4.7).

Calculate the content of $C_{21}H_{28}O_2$ from the absorbance obtained with a 0.001 per cent w/v solution of *levonorgestrel IPRS* in *ethanol (95 per cent)*.

Storage. Store protected from light and moisture.

Levonorgestrel Tablets

Levonorgestrel Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of levonorgestrel, $C_{21}H_{28}O_2$.

Usual strengths. 30 µg; 750 µg; 1.5 mg.

Identification

Determine by liquid chromatography (2.4.14).

Solvent mixture. 20 volumes of *water* and 80 volumes of *methanol*.

Test solution. Weigh a quantity of powdered tablets containing 0.15 mg of Levonorgestrel, disperse in 25 ml of the solvent mixture, heat on a water-bath at 60° for 10 minutes, cool and filter.

Reference solution (a). A 0.0006 per cent w/v solution of *levonorgestrel IPRS* in the solvent mixture.

Reference solution (b). A 0.0012 per cent w/v solution of *norgestrel IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 12.5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of *methanol* and 50 volumes of 1.0 per cent w/v solution of *gamma-cyclodextrin*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 242 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to levonorgestrel and dextronorgestrel is not less than 1.0.

Inject reference solution (a) and the test solution. The principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).

For tablets containing less than 100 µg of levonorgestrel —

Apparatus No. 2 (Paddle),

Medium. 500 ml of *0.01 M hydrochloric acid*,

Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14)

Test solution. Use the filtrate, dilute if necessary, with 0.1 per cent w/v solution of *sodium dodecyl sulphate* in dissolution medium to produce a solution containing 0.000006 per cent w/v of levonorgestrel.

Reference solution. A 0.006 per cent w/v solution of *levonorgestrel IPRS* in *methanol*. Dilute 1.0 ml of the solution to 100.0 ml with the dissolution medium. Dilute 1.0 ml of the solution to 10.0 ml with the dissolution medium.

Chromatographic system
- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Spherisorb ODS2),

- mobile phase: a mixture of equal volumes of *acetonitrile* and *water*,
- flow rate: 1.3 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 500 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{28}O_2$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{21}H_{28}O_2$.

For tablets containing 100 µg or more of levonorgestrel —

Apparatus No. 2 (Paddle),
Medium. 500 ml of 0.1 per cent w/v solution of *sodium lauryl sulphate* in *0.1 M hydrochloric acid*,
Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14)

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A 0.015 per cent w/v solution of *levonorgestrel IPRS* in *methanol*. Dilute 1.0 ml of the solution to 100.0 ml with the dissolution medium.

Use the chromatographic system as described under Dissolution (for tablets containing less than 100 µg of levonorgestrel) with the following modification.

- injection volume: 25 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{28}O_2$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{21}H_{28}O_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of *water* and 50 volumes of *methanol*.

Test solution. Weigh a quantity of powdered tablets containing 0.18 mg of Levonorgestrel, disperse in 5 ml of the solvent mixture, with the aid of ultrasound for 30 minutes, stir vigorously for 15 minutes centrifuge and use the supernatant liquid.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Reference solution (b). A 0.004 per cent w/v solution of *ethinylestradiol IPRS* and *levonorgestrel IPRS* in the solvent mixture.

Reference solution (c). Dilute 1.0 ml of the reference solution (a) to 10.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 10 volumes of *methanol*, 24 volumes of *acetonitrile* and 50 volumes of *water*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 200 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to ethinylestradiol and levonorgestrel is not less than 12.0.

Inject reference solution (a) and the test solution. The area of any secondary peak is not more than the area of principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). The sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent).

Uniformity of content. Complies with the test stated under Tablets, as described under Assay using the following solution as test solution.

Test solution. Disperse one tablet in 5 ml of the mobile phase with the aid of ultrasound for 45 minutes and dilute to 10 ml with the mobile phase and centrifuge. Dilute the supernatant liquid with the mobile phase to get concentration of 0.0006 per cent w/v of levonorgestrel.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a sufficient quantity of the powdered tablets and disperse in the mobile phase with the aid of ultrasound, filter and dilute if necessary to get concentration of 0.0006 per cent w/v of levonoregestrel.

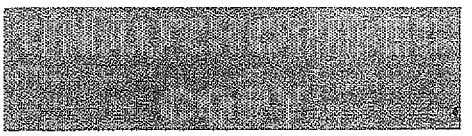
Reference solution. A 0.0006 per cent w/v solution of *levonorgestrel IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 12.5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of equal volumes of *acetonitrile* and *water*,
- flow rate: 1.3 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 25 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{28}O_2$ in the tablets.

Storage. Store protected from light and moisture.



Levonorgestrel and Ethinyloestradiol Tablets

Levonorgestrel and Ethinyloestradiol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of levonorgestrel, $C_{21}H_{28}O_2$ and ethinylo-estradiol, $C_{20}H_{24}O_2$.

Category. Oral contraceptive.

Usual strengths. Levonorgestrel, 150 µg and Ethinyloestradiol, 30 µg; Levonorgestrel, 250 µg and Ethinyloestradiol, 30 µg; Levonorgestrel, 250 µg and Ethinyloestradiol, 50 µg.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*

Mobile phase. A mixture of 96 volumes of *dichloromethane* and 4 volumes of *ethanol (95 per cent)*.

Test solution. Powder 20 tablets finely, triturate with 20 ml of *dichloromethane*, allow the solids to sediment and use the clear supernatant liquid.

Reference solution. A solution containing 0.06 per cent w/v of *levonorgestrel IPRS* and 0.006 per cent w/v of *ethinyloestradiol IPRS* in *dichloromethane*.

Apply to the plate 40 µl of each solution. After development, dry the plate in air, spray with *ethanolic sulphuric acid (80 per cent v/v)*, heat at 110° for 10 minutes and examine under ultraviolet light at 365 nm. The principal spots in the chromatogram obtained with the test solution correspond to the spots for levonorgestrel (red fluorescence) and ethinylo-estradiol (orange-yellow fluorescence) in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 500 ml of 0.0005 per cent w/v solution of *polysorbate 80*,
Speed and time. 75 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *levonorgestrel IPRS* and *ethinylestradiol IPRS* in the dissolution medium to obtain a solution of known concentration similar to the expected concentration of the test solution.

NOTE — A volume of ethanol (95 per cent) not exceeding 2 per cent of the total volume may be used to facilitate the dissolution of reference solution.

Chromatographic system
- a stainless steel column 15 cm x 4 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as Zorbax C8),
- mobile phase: a mixture of 60 volumes of *acetonitrile* and 40 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 247 nm for levonorgestrel, connected in series with a spectrofluorometre for ethinylestradiol, with an excitation wavelength of 285 nm and an emission wavelength of 310 nm,
- injection volume: 100 µl.

The relative retention time with respect to levonorgestrel for ethinylestradiol is about 0.7.

Inject the reference solution. The relative standard deviation for replicate injections is not more than 3.0 per cent for both the peaks.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{28}O_2$ and $C_{20}H_{24}O_2$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{21}H_{28}O_2$ and not less than 75 per cent of the stated amount of $C_{20}H_{24}O_2$.

Uniformity of content. Complies with the test stated under Tablets.

Carry out the procedure described under Assay using the following solution.

Test solution. Disperse one tablet in 5 ml of mobile phase with the aid of ultrasound for 30 minutes, cool and dilute to 10.0 ml with the mobile phase. Shake to mix and centrifuge, use the clear supernatant liquid.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 1.5 mg of Levonorgestrel with 75 ml of mobile phase with the aid of ultrasound for 30 minutes, cool and dilute to 100.0 ml with the mobile phase. Shake to mix and centrifuge, use the clear supernatant liquid.

Reference solution (a). A 0.015 per cent w/v solution of *levonorgestrel IPRS* in mobile phase.

Reference solution (b). A 0.003 per cent w/v solution of *ethinylostradiol IPRS* in mobile phase.

Reference solution (c). Dilute reference solution (a) and reference solution (b) with mobile phase to obtain a solution having a concentration similar to the test solution.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of *acetonitrile*, 15 volumes of *methanol* and 45 volumes of *water*,
- flow rate: 1 to 1.5 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 50 µl.

Inject reference solution (c). The test is not valid unless the resolution between the two major peaks is not less than 2.5 and the relative standard deviation for replicate injections is not more than 2.0.

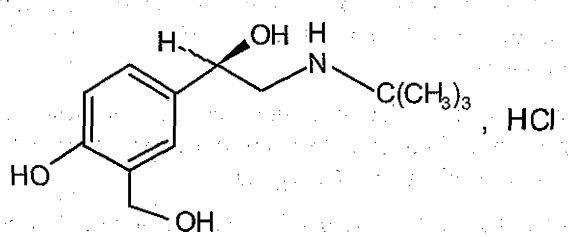
Inject reference solution (c) and the test solution. The relative retention time with reference to levonorgestrel for ethinyloestradiol is about 0.7.

Calculate the contents of $C_{21}H_{28}O_2$ and $C_{20}H_{24}O_2$ in the tablets.

Storage. Store protected from moisture.

Levosalbutamol Hydrochloride

R- Albuterol Hydrochloride



$C_{13}H_{21}NO_3,HCl$ Mol.Wt. 275.8

Levosalbutamol Hydrochloride is (R) α^1-[(tert-Butylamino)methyl]-4-hydroxy-m-xylene- α, α^1-diol hydrochloride.

Levosalbutamol Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{13}H_{21}NO_3$, HCl, calculated on the anhydrous basis.

Category. Bronchodialator.

Description. A white to off white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *levosalbutamol hydrochloride IPRS* or with the reference spectrum of levosalbutamol hydrochloride.

Tests

pH (2.4.24). 4.5 to 5.5, determined on 1.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of the substance under examination in mobile phase A and dilute to 100.0 with mobile phase A.

Reference solution. A 0.0001 per cent w/v solution of *levosalbutamol hydrochloride IPRS* in mobile phase A.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: A. a 0.1 per cent v/v solution of *orthophosphoric acid* in *water*,
  B. a mixture of 35 volumes of *acetonitrile*, 35 volumes of *methanol*, 0.1 volume of *orthophosphoric acid* and 30 volumes of *water*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 50 µl.

Time (in min.)	Mobile Phase A (per cent v/v)	Mobile Phase B (per cent v/v)
0	100	0
30	70	30
50	28	72
50.1	0	100
55	0	100
55.1	100	0

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

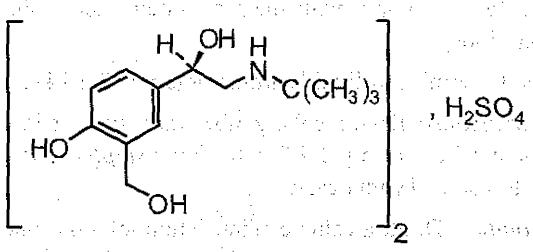
Calculate the content of $C_{13}H_{21}NO_3$ in the inhalation solution.

Storage. Store protected from light, at a temperature not exceeding 30°.

Labelling. The label indicates the dose and that the ampoules should be discarded if the solution is not colourless.

Levosalbutamol Sulphate

(*R*)-Albuterol Sulphate



$(C_{13}H_{21}NO_3)_2.H_2SO_4$ Mol. Wt. 576.7

Levosalbutamol Sulphate is (*R*)-2-*tert*-butylamino-1-(4-hydroxy-3-hydroxymethylphenyl)ethanol sulphate.

Levosalbutamol Sulphate contains not less than 98.0 per cent and not more than 102.0 per cent of $(C_{13}H_{21}NO_3)_2.H_2SO4$, calculated on the dried basis.

Category. β_2-adrenoreceptor agonist.

Description. A white to off-white powder.

Identification

A. Determine by infrared absorption spectrphotometry (2.4.6). Compare the spectrum with that obtained with *levosalbutamol sulphate IPRS* or with the reference spectrum of levosalbutamol sulphate.

B. When examined in the range 200 to 350 nm (2.4.7), a 0.002 per cent w/v solution in *methanol* shows absorption maxima at about 227 nm and 278 nm.

Tests

Specific optical rotation (2.4.22). −40° to −30°, determined on 1.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 100 mg of the substance under examination in 50 ml of the mobile phase.

Reference solution. A 0.1 per cent w/v solution of *levosalbutamol sulphate IPRS* in the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as Waters symmetry C8),
- mobile phase. a mixture of 22 volumes of *acetonitrile* and 78 volumes of a solution containing 0.29 per cent w/v of *sodium heptanesulphonate* and 0.25 per cent w/v of *potassium dihydrogen phosphate*, adjusted to pH 3.7 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Enantiomeric purity. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 10 mg of the substance under examination in 4 ml of methanol and dilute to 10.0 ml with the mobile phase.

Reference solution. Dissolve 10 mg of *Salbutamol sulphate IPRS* in 4 ml of *methanol* and dilute to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, bonded to porous silica (5 µm), (Such as Chirex 3022),

- mobile phase. a mixture of 70 volumes of *n-hexane*, 23 volumes of *dichloroethane*, 7 volumes of *methanol* and 0.1 volume of *trifluoroacetic acid*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to levosalbutamol and dextrosalbutamol is not less than 1.0. The first peak is due to dextrosalbutamol and the second peak is due to levosalbutamol.

Inject the reference solution and the test solution. Run the chromatogram for 60 minutes. The content of the peak due to (S)-salbutamol sulphate is not more than 1.0 per cent.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 2.0 per cent, determined on 1.0 g at 105°.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 50 mg of the substance under examination in 100.0 ml of the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.005 per cent w/v solution of *levosalbutamol sulphate IPRS* in the mobile phase.

Chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the theoretical plates for the principal peak is not less than 2000, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

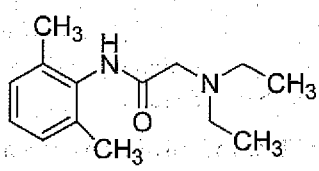
Inject the reference solution and the test solution.

Calculate the content of $(C_{13}H_{21}NO_3)_2.H_2SO_4$.

Storage. Store at a temperature not exceeding 30°.

Lignocaine

Lidocaine



$C_{14}H_{22}N_2O$ Mol. Wt. 234.3

Lignocaine is acetamide, 2-(diethylamino)-*N*-(2,6-dimethylphenyl)-; 2-(Diethylamino)-2',6'-acetoxylidide.

Lignocaine contains not less than 97.5per cent and not more than 102.5 per cent of $C_{14}H_{22}N_2O$.

Category. Local anaesthetic.

Description. A white or slightly yellow, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *lignocaine IPRS* or with the reference spectrum of lignocaine.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. Melting range (2.4.21). 66° to 69°.

Tests

Chlorides (2.3.12). Dissolve 7.14 g of the substance under examination in *water* add 10 ml of dilute *nitric acid*, dilute to 50 ml with *water*. The resulting solution complies with the limit test for chlorides (35 ppm).

Sulphates (2.3.17). 0.15 g complies with the limit test of sulphates (1000 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 85 mg of the substance under examination with heating, if necessary in 0.5 ml of *1 M hydrochloric acid* and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 85 mg *lignocaine IPRS* with heating if necessary in 0.5 ml of *1 M hydrochloric acid* and dilute to 50.0 ml with the mobile phase.

Reference solution (b). A 0.022 per cent w/v solution of *methylparaben* in the mobile phase.

Reference solution (c). A solution containing 2 volumes of reference solution (b) and 20 volumes of reference solution (a).

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 80 volumes of a solution prepared by diluting 50 volumes of *glacial acetic acid* to 980 volumes of *water*, adjusted to pH 3.4 with *1M sodium hydroxide* and 20 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b) and (c). The test is not valid unless the resolution between the peaks due to lignocaine and methylparaben is not less than 3.0 obtained with reference solution (c) and the relative standard deviation for replicate injections is not more than 1.5 per cent obtained with reference solution (b)

Inject reference solution (b) and the test solution.

Calculate the content of $C_{14}H_{22}N_2O$.

Storage. Store at a temperature not exceeding 30°

Lignocaine Oral Topical Solution

Lidocaine Oral Topical solution

Lignocaine Oral Topical Solution contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of lignocaine, $C_{14}H_{22}N_2O$. It contains a suitable flavour.

Usual strengths. 2 per cent w/v; 4 per cent w/v.

Identification

Transfer a quantity of Oral Topical Solution, containing 250 mg of lignocaine, to a separator with 20 ml of *water* and extract with 20 ml of *chloroform*. Wash the *chloroform* extract with 20 ml of *water* and evaporate the *chloroform* extract to dryness in a current of warm air. Dissolve the residue in *hexane*, evaporate in a current of warm air and dry the residue in vacuum over silica gel for 24 hours, crystalline precipitate is produced. The precipitate complies with the following tests.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *lignocaine IPRS* or with the reference spectrum of lidocaine.

Tests

Other tests. Comply with the tests stated under Oral Solution.

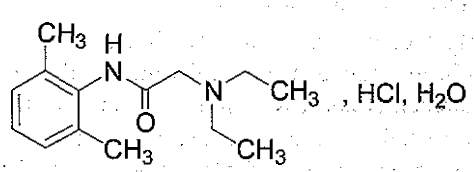
Assay. Transfer an accurately measured volume containing about 0.15 g of lignocaine to a 125 ml conical flask and protect from atmospheric moisture with a stopper fitted with a tube containing silica gel. Add 20 ml of *glacial acetic acid*. Titrate immediately with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02343 g of $C_{14}H_{22}N_2O$.

Storage. Store protected from moisture.

Lignocaine Hydrochloride

Lidocaine Hydrochloride



$C_{14}H_{22}N_2O,HCl,H_2O$ Mol. Wt. 288.8

Lignocaine Hydrochloride is 2-diethylaminoaceto-2′,6′-xylidide hydrochloride monohydrate.

Lignocaine Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{14}H_{22}N_2O,HCl$, calculated on the anhydrous basis.

Category. Local anaesthetic; antiarrhythmic.

Description. A white, crystalline powder.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B, C, D and E may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *lignocaine hydrochloride IPRS* or with the reference spectrum of lignocaine hydrochloride.

B. To 10 ml of a 2.5 per cent w/v solution add *sodium hydroxide solution* till alkaline and filter. Wash the residue with *water*, dissolve half of the residue in 1 ml of *ethanol (95 per cent)* and add 0.5 ml of a 10 per cent w/v solution of *cobalt chloride*; a bluish-green precipitate is produced.

C. To 5 mg add 0.5 ml of *fuming nitric acid*, evaporate to dryness on a water-bath, cool, dissolve the residue in 5 ml of *acetone* and add 1 ml of *0.1 M ethanolic potassium hydroxide*; a green colour is produced.

D. Dissolve 0.2 g in 10 ml of *water* and add 10 ml of *picric acid solution*. The precipitate, after washing with *water* and drying, melts at about 229° (2.4.21).

E. It gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1) and colourless (2.4.1).

pH (2.4.24). 4.0 to 5.5, determined in a 0.5 per cent w/v solution.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method A (10 ppm).

Sulphates. Dissolve 0.2 g in 20 ml of *water*, add 2 ml of *3 M hydrochloric acid*, mix and divide into two parts. To one part add 1 ml of *barium chloride solution*; no more opalescence is produced than in the remaining portion of the solution to which nothing has been added.

2,6-Dimethylaniline. To 2 ml of a 2.5 per cent w/v solution in *methanol* (solution A), add 1 ml of a 1 per cent w/v solution of *4-dimethylaminobenzaldehyde* in *methanol* and 2 ml of *glacial acetic acid* and allow to stand for 10 minutes at room temperature. Any yellow colour produced is more intense than

that obtained by repeating the test using 2 ml of *methanol* in place of solution A and less intense than the colour produced using a mixture of 1 ml of a solution of *2,6-dimethylaniline* in *methanol* containing 5 µg per ml and 1 ml of *methanol* in place of solution A (100 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 5.0 to 7.5 per cent, determined on 0.25 g.

Assay. Weigh 0.5 g, dissolve in 30 ml of *anhydrous glacial acetic acid*, add 6 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02708 g of $C_{14}H_{22}N_2O,HCl$.

Lignocaine Hydrochloride intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 1.1 Endotoxin Units per mg of lignocaine hydrochloride.

Storage. Store protected from moisture.

Lignocaine Gel

Lignocaine Hydrochloride Gel; Lidocaine Hydrochloride Gel

Lignocaine Gel is a sterile solution of Lignocaine Hydrochloride in a suitable water-miscible base. It may contain suitable antioxidants, stabilisers and antimicrobial preservatives.

Lignocaine Gel contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of anhydrous lignocaine hydrochloride, $C_{14}H_{22}N_2O,HCl$.

Usual strengths. The equivalent of 1 per cent and 2 per cent w/v of anhydrous lignocaine hydrochloride.

Identification

To a quantity of the gel containing 80 mg of anhydrous lignocaine hydrochloride add 4 ml of *hydrochloric acid* and heat on a water-bath for 10 minutes. Allow to cool, transfer to a separating funnel with the aid of 20 ml of *water*, add *5 M sodium hydroxide* until precipitation is complete and extract with two quantities, each of 20 ml, of *chloroform*. Filter the chloroform extracts through *anhydrous sodium sulphate* and evaporate the filtrate to dryness on a water-bath using a stream of nitrogen. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *lignocaine hydrochloride IPRS* treated in the same manner or with the reference spectrum of lignocaine.

B. Dissolve 20 mg in 1 ml of *ethanol (95 per cent)*, add 0.5 ml of a 10 per cent w/v solution of *cobalt chloride* and 0.5 ml of *5 M sodium hydroxide* and shake for 2 minutes; a bluish green precipitate is produced.

C. Dissolve 40 mg in 5 ml of 1 per cent w/v solution of *cetrimide*, add 1 ml of *5 M sodium hydroxide* and 1 ml of *bromine water*; a yellow colour is produced.

Tests

pH (2.4.24). 6.0 to 7.0.

2,6-Dimethylaniline. Mix a quantity of the gel containing 15 mg of anhydrous lignocaine hydrochloride with sufficient *water* to produce 3 ml, using a rotary mixer. To 2 ml of the resulting solution, add 1 ml of a freshly prepared 1 per cent w/v solution of *4-dimethylaminobenzaldehyde* in *methanol*. Mix thoroughly using a rotary mixer. Add 2 ml of *glacial acetic acid* and allow to stand for 10 minutes. Any yellow colour produced is not more intense than that obtained by using a mixture of 2 ml of a solution of *2,6-dimethylaniline* in *methanol* containing 2 µg per ml in place of the solution of the gel (400 ppm).

Sterility (2.2.11). Complies with the test for sterility.

Other tests. Comply with the tests stated under Gels.

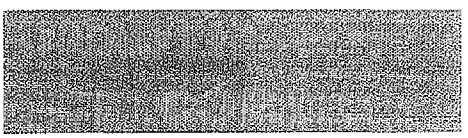
Assay. Weigh accurately a quantity containing about 10 mg of anhydrous lignocaine hydrochloride and disperse in 20 ml of *water*. Add 5 ml of *acetate buffer pH 2.8*, 120 ml of *chloroform* and 5 ml of *dimethyl yellow-oracet blue B solution* and titrate with *0.005 M dioctyl sodium sulphosuccinate* swirling vigorously, until near the end-point, then add the titrant dropwise and, after each addition, swirl vigorously, allow to separate and swirl gently for 5 seconds. The end-point is indicated when the colour of the chloroform layer changes from green to pinkish-grey. Carry out a blank titration.

1 ml of *0.005 M dioctyl sodium sulphosuccinate* is equivalent to 0.001354 g of $C_{14}H_{22}N_2O,HCl$.

Determine the weight per ml of the gel (2.4.29) and calculate the percentage of $C_{14}H_{22}N_2O,HCl$, weight in volume.

Storage. Store in suitable tamper-proof containers holding sufficient of the gel for use on one occasion and at a temperature not exceeding 30°. The gel should not be frozen.

Labelling. The label states (1) that the contents are sterile; (2) the strength in terms of the equivalent amount of anhydrous lignocaine hydrochloride; (3) that any of the gel not used in a single application should be discarded.



Lignocaine Injection

Lignocaine Hydrochloride Injection; Lidocaine Hydrochloride Injection; Lidocaine Injection

Lignocaine Injection is a sterile solution of Lignocaine Hydrochloride in Water for Injections.

Lignocaine Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of lignocaine hydrochloride, $C_{14}H_{22}N_2O,HCl,H_2O$.

Usual strengths. 0.2 per cent w/v; 1.0 per cent w/v; 5.0 per cent w/v.

Description. A clear colourless solution.

Identification

A. To a volume containing 0.1 g of Lignocaine Hydrochloride add sufficient *sodium hydroxide solution* to make alkaline, filter, wash the residue with *water*, dissolve in 1 ml of *ethanol (95 per cent)*, add 0.5 ml of a 10 per cent w/v solution of *cobalt chloride* and shake for 2 minutes; a bluish-green precipitate is formed.

B. To a volume containing 0.1 g of Lignocaine Hydrochloride add 10 ml of *picric acid solution*; the precipitate, after washing with *water* and drying at 105°, melts at about 229° (2.4.21).

C. It gives the reactions of chlorides (2.3.1).

Tests

pH (2.4.24). 5.0 to 7.0.

2,6-Dimethylaniline. To a volume containing 25 mg of Lignocaine Hydrochloride add *water* if necessary to produce 10 ml, add *2 M sodium hydroxide* until the solution is just alkaline and extract with three quantities, each of 5 ml, of *chloroform*. Dry the combined chloroform extracts over *anhydrous sodium sulphate*, filter, wash with a further 5 ml of *chloroform* and evaporate the filtrate to dryness at a pressure of 2 kPa. Dissolve the residue in 2 ml of *methanol*, add 1 ml of a 1 per cent w/v solution of *4-dimethylamino-benzaldehyde* in *methanol* and 2 ml of *glacial acetic acid* and allow to stand at room temperature for 10 minutes. Any yellow colour produced is not more intense than the colour produced by repeating the operation using 10 ml of a solution in *water* containing 1 µg per ml of *2,6-dimethylaniline* in place of the preparation under examination (400 ppm).

Bacterial endotoxins (2.2.3). Not more than 1.1 Endotoxin Units per mg of lignocaine hydrochloride.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Make an accurately measured volume containing about 0.1 g of Lignocaine Hydrochloride alkaline with *2 M sodium hydroxide* and extract with three quantities, each of 20 ml, of *chloroform*, washing each extract with the same 10 ml of *water*. Filter the washed extracts through a filter paper moistened with *chloroform*, wash the filter with 10 ml of *chloroform*, combine the washings with the filtrate. Titrate with *0.02 M perchloric acid*, using *crystal violet solution* as indicator.

1 ml of *0.02 M perchloric acid* is equivalent to 0.005776 g of $C_{14}H_{22}N_2O,HCl,H_2O$.

Lignocaine Hydrochloride Topical Solution

Lidocaine Hydrochloride Topical solution

Lignocaine Hydrochloride Topical Solution contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of lignocaine hydrochloride, $C_{14}H_{22}N_2O,HCl$.

Category. Topical anaesthetic agent.

Usual strengths. 2 per cent w/v; 4 per cent w/v.

Identification

A. Transfer a quantity of topical solution, containing 200 mg of lignocaine hydrochloride, to a separator extract with four 15 ml portions of *chloroform*, discarding the chloroform extracts. Add 2 ml of *2 M sodium hydroxide* to the aqueous solution remaining in the separator and extract with four 15 ml portions of chloroform. Combine the *chloroform* extracts and evaporate the filtrate to dryness on a water-bath using a stream. The residue complies with the following tests.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *lignocaine hydrochloride IPRS* treated in the same mnanner or with the reference spectrum of lignocaine.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution (a).

Tests

pH (2.4.24). 5.0 to 7.0.

Related substances. Determine by liquid chromatography (2.4.14), using solvent mixture and mobile phase as described under Assay.

Test solution. Dissolve 20 mg of lignocaine hydrochloride in 10.0 ml of the mobile phase.

Reference solution (a). A solution containing 0.00026 per cent w/v of *lignocaine IPRS*, 0.00039 per cent w/v of *ropivacaine impurity A IPRS (2,6-dimethylaniline*

hydrochloride) and 0.0003 per cent w/v of *lignocaine impurity H IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.00017 per cent w/v of *lignocaine IPRS*, 0.00026 per cent w/v of *ropivacaine impurity A IPRS* and 0.0002 per cent w/v of *lignocaine impurity H IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 50 µl.

Name	Relative retention time
Lignocaine	1.0
Dimethylaniline	3.2
Lidocaine impurity H[1]	3.8

[1]N-(chloroacetyl)-2,6-xylidide.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to lignocaine impurity H and ropivacaine impurity A is not less than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to lidocaine impurity H is not more than the area of the principal peak in the chromatogram obtained with the reference solution (b) (0.1 per cent) and the area of any peak due to ropivacaine impurity A is not more than 0.8 times the area of the principal peak in the chromatogram obtained with the reference solution (b) (0.1 per cent). The area of any secondary peak is not more than 6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than 23 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 5 volumes of *glacial acetic acid* and 93 volumes of *water,* adjusted the pH to 3.4 with *1 M sodium hydroxide.*

Test solution. Measure a volume containing 20 mg of Lignocaine Hydrochloride to 10.0 ml with the mobile phase.

Reference solution (a). Transfer 20.0 mg of *lignocaine hydrochloride IPRS* to 10.0 ml volumetric flask, add 0.1 ml of *1 M hydrochloric acid* and dilute to volume with mobile phase.

Reference solution (b). A 0.022 per cent w/v solution of *methylparaben IPRS* in the mobile phase.

Reference solution (c). Dilute 2.0 ml of reference solution (b) to 20 ml with the reference solution (a).

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5µm),
- mobile phase: a mixture of 10 volumes of *acetonitrile* and 40 volumes of solvent mixture.
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm
- injection volume: 20 µl.

Inject reference solution (a) and (c). The test is not valid unless the resolution between the peaks due to lignocaine and methylparaben is not less than 3.0 obtained with reference solution (c) and the relative standard deviation for replicate injections is not more than 1.5 per cent obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of the lignocaine hydrochloride, $C_{14}H_{22}N_2O,HCl$.

Storage. Store at a temperature not exceeding 30°.

Lignocaine and Adrenaline Injection

Lidocaine Hydrochloride and Adrenaline Bitartrate Injection; Lidocaine and Adrenaline Injection; Adrenaline Bitartrate and Lidocaine Hydrochloride Injection

Lignocaine and Adrenaline Injection is a sterile solution of Lignocaine Hydrochloride and Adrenaline Bitartrate in Water for Injections.

Lignocaine and Adrenaline Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of lignocaine hydrochloride, $C_{14}H_{22}N_2O,HCl,H_2O$ and not less than 87.5 per cent and not more than 112.5 per cent of the stated amount of adrenaline, $C_9H_{13}NO_3$.

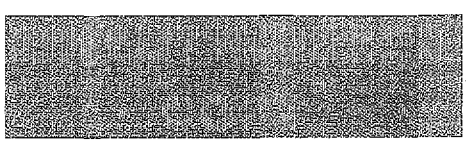
Usual strength. Lignocaine Hydrochloride, 20 mg per ml and adrenaline, 0.01 mg per ml.

Description. A clear colourless solution.

Identification

A. To 5 ml add 1 ml of *hydrochloric acid,* cool to 0°, add 5 ml of a 1 per cent w/v solution of *sodium nitrite* and pour the mixture into 2 ml of *2-naphthol solution* containing 1 g of *sodium acetate*; no red colour is produced.

B. To 10 ml add 4 ml of *disodium hydrogen phosphate solution* and sufficient *0.1 M iodine* to produce a distinct brown colour.



Add *0.01 M sodium thiosulphate* to remove the excess of iodine; a pink colour is produced.

C. To 3 ml add 3 ml of *water* and 6 ml of *picric acid solution*, shake gently and allow to stand until the precipitate becomes crystalline; the precipitate, after washing with *water* and drying at 105°, melts at about 229° (2.4.21).

Tests

pH (2.4.24). 3.0 to 4.5.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. *For lignocaine hydrochloride* — Make an accurately measured volume containing 0.1 g of Lignocaine Hydrochloride alkaline with *2 M sodium hydroxide* and extract with three quantities, each of 20 ml, of *chloroform*, washing each extract with the same 10 ml of *water*. Filter the washed extracts through a filter paper moistened with *chloroform*, wash the filter with 10 ml of *chloroform*, combine the washings with the filtrate. Titrate with *0.02 M perchloric acid*, using *crystal violet solution* as indicator.

1 ml of *0.02 M perchloric acid* is equivalent to 0.005776 g of $C_{14}H_{22}N_2O,HCl,H_2O$.

For adrenaline — Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 8.0 g of *tetramethylammonium hydrogen sulphate*, 2.2 g of *sodium heptanesulphonate*, add 2 ml of *0.1M disodium edetate* to a mixture of 900 ml of *water* and 100 ml of *methanol* , adjusted to pH 3.5 using *1M sodium hydroxide*.

Test solution. Dilute a volume of injection to obtain a solution containing 0.0005 per cent w/v of adrenaline. Dilute 5.0 ml of the resulting solution to 10 ml with the solvent mixture.

Reference solution (a). Dilute 5.0 ml of a 0.01 per cent w/v solution of *adrenaline acid tartrate IPRS* to 100.0 ml with the solvent mixture.

Reference solution (b). A mixture of 5 ml of reference solution (a) with 5 ml of a 0.001 per cent w/v solution of *noradrenaline acid tartrate* in the mobile phase.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a solution prepared by dissolving 4.0 g of *tetramethylammonium hydrogen sulphate*, 1.1 g of *sodium heptanesulphonate*, add 2 ml of *0.1M disodium edetate* to a mixture of 950 ml of *water* and 50 ml of *methanol* and adjusted to pH 3.5 with *1M sodium hydroxide*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 2.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_9H_{13}NO_3$.

Storage. Store protected from light.

Labelling. The label states the strength of Adrenaline Bitartrate in terms of the equivalent amount of adrenaline.

Lignocaine and Dextrose Injection

Lignocaine Hydrochloride and Dextrose Injection; Lidocaine Hydrochloride and Dextrose Injection; Lidocaine and Dextrose Injection

Lignocaine and Dextrose Injection is a sterile solution of Lignocaine Hydrochloride and Dextrose in Water for Injections.

Lignocaine and Dextrose Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amounts of lignocaine hydrochloride, $C_{14}H_{22}N_2O,HCl,H_2O$ and dextrose, $C_6H_{12}O_6,H_2O$.

Usual strength. Lignocaine Hydrochloride 50 mg per ml and Dextrose 75 mg per ml.

Description. A clear colourless or slightly yellow solution.

Identification

A. To a volume containing about 0.5 g of Lignocaine Hydrochloride in a separator add 2 ml of *2 M sodium hydroxide* and extract with four quantities, each of 15 ml, of *chloroform*. Combine the chloroform extracts and evaporate the solution to dryness with the aid of a current of air. Dissolve the residue in 2 ml of *hexane*, evaporate with the aid of warm air and dry the residue over *silica gel* for 24 hours at a pressure not exceeding 0.7 kPa.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *lignocaine hydrochloride IPRS* treated in the same manner or with the reference spectrum of lignocaine.

B. To a volume containing 0.1 g of Dextrose add 10 ml of *water* and 3 ml of *potassium cupri-tartrate solution* and heat; a red precipitate is produced.

Tests

pH (2.4.24). 3.0 to 7.0.

Bacterial endotoxins (2.2.3). Not more than 1.1 Endotoxin Units per mg of lignocaine hydrochloride.

Other tests. Comply with the tests described under Parenteral Preparations (Injections).

Assay. *For lignocaine hydrochloride*—Make an accurately measured volume containing about 0.1 g of Lignocaine Hydrochloride alkaline with *2 M sodium hydroxide* and extract with three quantities, each of 20 ml, of *chloroform*, washing each extract with the same 10 ml of *water*. Filter the washed extracts through a filter paper moistened with *chloroform*, wash the filter with 10 ml of *chloroform*, combine the washings with the filtrate. Titrate with *0.02 M perchloric acid*, using *crystal violet solution* as indicator.

1 ml of *0.02 M perchloric acid* is equivalent to 0.005776 g of $C_{14}H_{22}N_2O,HCl,H_2O$.

For dextrose — To an accurately measured volume containing 2 g to 5 g of Dextrose add sufficient *water* to produce 100.0 ml. Mix well, allow to stand for 30 minutes and determine the optical rotation in a 2-dm tube (2.4.22). The observed rotation in degrees multiplied by 1.0425 represents the weight, in g, of *dextrose*, $C_6H_{12}O_6,H_2O$ in the volume taken for assay.

Storage. Store in single dose containers in a cool place.

Lignocaine and Prilocaine Cream

Lidocaine and Prilocaine Cream

Lignocaine and Prilocaine Cream contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of lignocaine, $C_{14}H_{22}N_2O$ and Prilocaine, $C_{13}H_{20}N_2O$.

Usual strength. Lidocaine 2.5 per cent, Prilocaine 2.5 per cent.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.24). 8.7 to 9.7, determine in 1.0 per cent w/v solution or in the undiluted sample.

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

NOTE — Store the solution at or below 10°.

Reference solution (c). A solution containing 0.0002 per cent w/v of *lignocaine IPRS and prilocaine hydrochloride IPRS* in mobile phase A.

Name	Relative retention time	Correction factor
o-Toluidine[P][2]	0.38	0.43
n-Chloroacetyl-2,6-xylidine[L][3]	0.54	1.0
2,6-Dimethylaniline[L][3]	0.67	0.30
Prilocaine[1]	1.00	—
2-Diethylaminoaceto-2,4-xylidine[L][3]	1.33	1.25
Lignocaine	2.14	—
n-Dichloroacetyl-2,6-xylidine[L][3]	2.98	0.45
Any other individual related compounds [P][2]	—	1.0
Total related compounds, excluding *o*-toluidine	—	—

[1]Relative to the prilocaine peak,

[2]P designates a prilocaine related compound,

[3]L designates a lidocaine related compound.

Inject reference solution (b) and (c).The test is not valid unless the resolution between the peaks due to prilocaine and prilocaine related compound B is not less than 1.4 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (c).

Inject reference solution (c) and the test solution. In the chromatogram obtained with test solution, the area of any peak corresponding to *o*-toluidine is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (2.0 per cent). The area of any peak corresponding to n-chloroacetyl-2,6-xylidine is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent). The area of any peak corresponding to 2,6-dimethylaniline is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent). The area of any peak corresponding to 2-diethylaminoaceto-2,4-xylidine is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent). The area of any peak corresponding to n-dichloroacetyl-2,6-xylidine is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent). The area of any peak corresponding to any other individual related compounds is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent). The sum of all the secondary peaks excluding *o*-toluidine is not more than the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent).

Other tests. Comply with the tests stated under Creams.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Store the solution at or below 10°.

Test solution. Disperse a quantity of the cream containing about 20 mg of Lignocaine in 100.0 ml volumetric flask. Add 5 ml of *5M sodium hydroxide* and mix, Add 5 ml of *5M hydrochloric acid* and dilute to 100.0 ml with the mobile phase A and filter.

Reference solution (a). A solution containing each of 0.02 per cent w/v of *lignocaine IPRS and prilocaine hydrochloride IPRS* in the mobile phase A.

Reference solution (b). Dissolve an accurately weighed quantity of *prilocaine related compound B IPRS* in the reference solution and dilute quantitatively and stepwise if necessary, with the reference preparation to obtain a solution having a known concentration of about 0.008 per cent w/v of prilocaine related compound B.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature: 40°,
- sample temperature: 10°,
- mobile phase: A. a buffer solution prepared by dissolving 2.73 g of *monobasic potassium phosphate* in 630 ml of *water*, adjusted to pH 7.2 with *5M sodium hydroxide* and dilute to 1000 ml with *acetonitrile*.

  B. a buffer solution prepared by dissolving 2.73 g of *monobasic potassium phosphate* in 900 ml of *water*, adjusted to pH 7.2 with *5M sodium hydroxide* and dilute to 1000 ml with *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 232 nm,
- injection volume: 50 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	67	33
11	67	33
22	100	0
32	100	0
32.1	67	33
37	67	33

The relative retention times are 1.0 for prilocaine, 1.09 for prilocaine related compound B and 2.14 for lidocaine.

Inject reference solution (b).The test is not valid unless the resolution between the peaks of prilocaine and prilocaine related compound B is not less than 1.4.

Inject reference solution (a).The test is not valid unless the column efficiency is not less than 5000 theoretical plates and the tailing factor is not more than 1.5 based on the prilocaine peak and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

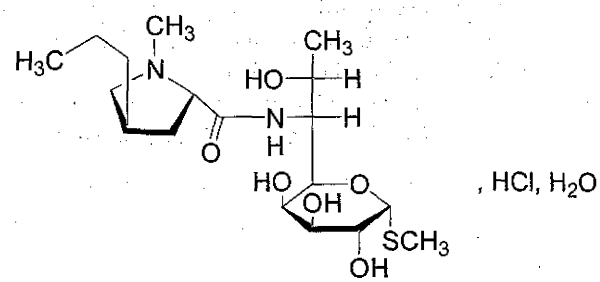
Calculate the contents of $C_{14}H_{22}N_2O$ and $C_{13}H_{20}N_2O$ in the cream.

Storage. Preserve in collapsible tubes or tight containers at a temperature not exceeding 30°. Protect from freezing.

Labelling. The label states the strength of Prilocaine Hydrochloride in terms of the equivalent amount of prilocaine.

Lincomycin Hydrochloride

Lincomycin Hydrochloride Monohydrate



$C_{18}H_{35}ClN_2O_6S, H_2O$ Mol. Wt. 461.0

Lincomycin Hydrochloride consists mainly of methyl6-amino-6,8-dideoxy-6-[[[(2S,4R)-1-methyl-4-propylprrolidin-2-yl]carbonyl]amino]-1-thio-D-erythro-α-D-galacto-octopyranoside(lincomycin)hydrochloridemonohydrate, a mixture of antibiotics producedby *Streptomyces lincolnensis* var. *lincolnensis* or obtained by anyother means.

Lincomycin Hydrochloride contains not less than 96.0 per cent and not more than 102.0 per cent of the sum of Lincomycin Hydrochloride, $C_{18}H_{35}ClN_2O_6S$ and Lincomycin B Hydrochloride, $C_{17}H_{33}ClN_2O_6S$, Lincomycin B Hydrochloride contains not more than 5.0 per cent and calculated on the anhydrous basis.

Category. Antibacterial

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *lincomycin hydrochloride IPRS* or with the reference spectrum of lincomycin hydrochloride.

B. A 1 per cent w/v solution gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *carbondioxide-free water* (Solution A) is clear (2.4.1) and not more intensely coloured than reference solution YS6 (2.4.1).

pH (2.4.24). 3.5 to 5.5 determined in solution A.

Specific optical rotation (2.4.22). + 135° to + 150°, determined in 4.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). A 0.25 per cent w/v solution of *lincomycin hydrochloride IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Reference solution (c). Dissolve 5 mg of *lincomycin hydrochloride for system suitability IPRS* (containing impurities A, B and C) in 2 ml of the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with base-deactivated end capped octylsilane bonded to porous silica (5 µm),
- column temperature: 50°,
- mobile phase: a mixture of 75 volumes of a buffer solution prepared by dissolving 34 g of *ortho-phosphoric acid* in 900 ml of *water,* adjusted to pH 6.1 with *concentrated ammonia,* 17 volumes of *acetonitrile* and 8 volumes of *methanol,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Name	Relative retention time
Lincomycin impurity C[1]	0.4
Lincomycin B	0.5
Lincomycin impurity A[2]	0.7
Lincomycin (Retention time: about 10 minutes)	1.0
Lincomycin impurity B[3]	1.2 and 1.3

[1]methyl6,8-dideoxy-6-[[[(2*S*,4*R*)-4-propylpyrrolidin-2-yl] carbonyl]amino]-1-thio-D-*erythro*-α-D-*galacto*-octopyranoside (*N*-desmethyl *lincomycin*),

[2]methyl6,8-dideoxy-6-[[[(2*R*,4*R*)-1-methyl-4-propylpyrrolidin-2-yl] carbonyl]amino]-1-thio-D-*erythro*-α-D-*galacto*-octopyranoside (α-amide epimer),

[3]methyl 6,8-dideoxy-6-[[[(2*S*,4*EZ*)-1-methyl-4-propylidenepyrrolidin-2-yl]carbonyl]amino]-1-thio-D-*erythro*-α-D-*galacto*-octopyranoside (propylidene analogues).

Inject reference solution (c). The test is not valid unless the resolution between the peak due to lincomycin and 1st peak of lincomycin impurity B is not less than 1.8.

Inject reference solution (b) and the test solution. Run the chromatogram 5.5 times the retention time of the principal peak for the test solution. The area of any peak corresponding to lincomycin impurity A is not more than 0.5 times the area of principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any peak corresponding to lincomycin impurity C is not more than 0.2 times the area of principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the sum of areas of the peaks due to impurity B is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.5 per cent.

Water (2.3.43). 3.1 per cent to 4.6 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modifications.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{18}H_{35}ClN_2O_6S$ (lincomycin) and $C_{17}H_{33}ClN_2O_6S$ (lincomycin B).

Lincomycin Hydrochloride intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unitper mg.

Lincomycin Hydrochloride intended for use in the manufacture of parenteral preparations without a further appropriate sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states whether or not the material is intended for use in the manufacture of parenteral preparations.

Lincomycin Capsules

Lincomycin Hydrochloride Capsules

Lincomycin Capsules contain Lincomycin Hydrochloride equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of lincomycin, $C_{18}H_{34}N_2O_6S$.

Usual strengths. 250 mg, 500 mg.

Identification

A. Extract a quantity of the capsules contents containing the equivalent of 0.2 g of lincomycin with a mixture of 4 volumes of *chloroform* and 1 volume of *methanol*, filter and evaporate the filtrate. Dissolve the oily residue in 1 ml of *water*, add *acetone* until precipitation begins and further add 20 ml of *acetone*. Filter the precipitate, wash with two 10 ml quantities of *acetone*, dissolve the residue in a little of the chloroform–methanol mixture (4:1), evaporate to dryness and dry at 60° at a pressure not exceeding 2 kPa for 4 hours. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *lincomycin hydrochloride IPRS* or with the reference spectrum of lincomycin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Lincomycin B. Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Inject the test solution. The area of any peak corresponding to lincomycin B is not more than 5 per cent of the area of the peak due to lincomycin, calculated by area normalisation method.

Water (2.3.43). Not more than 7.0 per cent, determined on 0.3 g of the contents of capsules.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Mix the content of 20 capsules. Disperse a quantity of the mixed contents containing 50 mg of lincomycin in 50.0 ml of the mobile phase, shake mechanically for a minimum of 5 minutes and filter.

Reference solution. A 0.12 per cent w/v solution of *lincomycin hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: a mixture of 78 volumes of a buffer solution prepared by dissolving 13.5 ml of *orthophosphoric acid* in 1000 ml of *water*, adjusted to pH 6.0 with *ammonium hydroxide*, 15 volumes of *acetonitrile* and 15 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

The relative retention time with reference to lincomycin for lincomycin B is about 0.5.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 4000 theoretical plates, the tailing factor is not more than 1.3 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

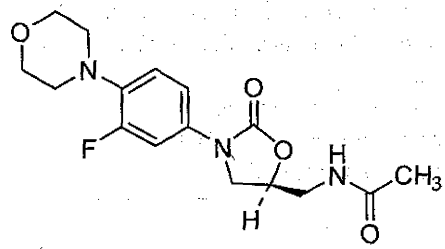
Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{34}N_2O_6S$ in the capsules.

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the equivalent amount of lincomycin.

Linezolid



$C_{16}H_{20}FN_3O_4$ Mol. Wt. 337.4

Linezolid is *N*-[[(5*S*)-3-[3-fluoro-4-(4-morpholinyl)phenyl]-2-oxo-5-oxazolidinyl]methyl]acetamide.

Linezolid contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{16}H_{20}FN_3O_4$, calculated on the dried basis.

Category. Antibacterial.

Description. A white to off-white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *linezolid IPRS* or with the reference spectrum of linezolid.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

Tests

Specific optical rotation (2.4.22). – 14.0° to – 9.0°, determined on 0.9 per cent w/v solution in *chloroform*.

Related substances. Determine by liquid chromatography (2.4.14).

Buffer solution. A solution prepared by diluting 1.0 ml of *triethylamine* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid*.

Solvent mixture. 60 volumes of buffer solution and 40 volumes of *methanol*.

Test solution. Dissolve 50 mg of the substance under examination in 50 ml of the solvent mixture.

Reference solution (a). A 0.1 per cent w/v solution of *linezolid IPRS* in the solvent mixture.

Reference solution (b). Dilute 2 ml of reference solution (a) to 100 ml with the solvent mixture. Further dilute 5.0 ml of the solution to 20.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- column temperature: 40°,
- mobile phase: A. a mixture 90 volumes of buffer solution and 10 volumes of *methanol*,
  B. a mixture 10 volumes of buffer solution and 90 volumes of *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
40	70	30
50	20	80
57	20	80
60	90	10
65	90	10

Inject reference solution (b). The test is not valid unless the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent).

Heavy Metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Buffer solution. A solution prepared by diluting 1.0 ml of *triethylamine* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid*.

Solvent mixture. 60 volumes of buffer solution and 40 volumes of *methanol*.

Test solution. Dissolve about 100 mg of the substance under examination in 100.0 ml of the solvent mixture. Dilute 10.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution (a). A 0.1 per cent w/v solution of *linezolid IPRS* in the solvent mixture.

Reference solution (b). Dilute 10.0 ml of reference solution (a) to 50.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- column temperature: 40°,
- mobile phase: a mixture of 78 volumes of a solution containing 90 volumes of buffer solution and 10 volumes of *methanol* and 22 volumes of a solution containing 10 volumes of buffer solution and 90 volumes of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the theoretical plates is not less than 2000, tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (b) and the test solution.

Calculate content of $C_{16}H_{20}FN_3O_4$.

Storage. Store protected from light and moisture, at a temperature not exceeeding 30°.

Linezolid Tablets

Linezolid Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of linezolid, $C_{16}H_{20}FN_3O_4$.

Usual strength. 600 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* and 0.9 g of *sodium hydroxide* in 1000 ml of *water*, adjusted to pH 6.8 with *sodium hydroxide solution*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the medium if necessary, at the maximum at about 250 nm (2.4.7). Calculate the content of $C_{16}H_{20}FN_3O_4$ in the medium from the absorbance obtained from a solution of known concentration of *linezolid IPRS* in the same medium.

Q. Not less than 70 per cent of the stated amount of $C_{16}H_{20}FN_3O_4$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 75 volumes of buffer solution prepared by diluting 1.0 ml of *triethylamine* to 1000.0 ml with *water*, adjusted to pH 3.0 with *orthophosphoric acid* and 25 volumes of *methanol*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing about 40 mg of linezolid with 35 ml of the solvent mixture, sonicate for 20 minutes and dilute to 50.0 ml with the solvent mixture, filter.

Reference solution. A 0.0008 per cent w/v solution of *linezolid IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- column temperature: 40°,
- mobile phase: A. a mixture of 90 volumes of buffer solution prepared by mixing 1.0 ml of *triethylamine* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and 10 volumes of *methanol*,

B. a mixture of 10 volumes of buffer solution prepared by mixing 1.0 ml of *triethylamine* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and 90 volumes of *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile Phase A (per cent v/v)	Mobile Phase B (per cent v/v)
0	90	10
35	65	35
45	20	80
47	20	80
48	90	10
55	90	10

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with the reference solution (1.0 per cent) and the sum of areas of all the secondary peaks is not more than two times the area of the peak in the chromatogram obtained with the reference solution (2.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of 75 volumes of buffer solution prepared by diluting 1.0 ml of *triethylamine* to 1000 ml with *water*, adjusted pH 3.0 with *orthophosphoric acid* and 25 volumes of *methanol*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing about 40 mg of Linezolid with 35 ml of solvent mixture, sonicate for 20 minutes and dilute to 50 ml with the solvent mixture, filter. Dilute 5 ml of the solution to 50 ml with the solvent mixture.

Reference solution. A 0.08 per cent w/v solution of *linezolid IPRS* in the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- column temperature: 40°,
- mobile phase: a mixture of 70 volumes of a buffer solution prepared by diluting 1.0 ml of *triethylamine* to 1000 ml with *water*, adjusted to pH 3.0 with *orthophosphoric acid* and 30 volumes of *methanol*,

- flow rate: 1.5 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the theoretical plates is not less than 2000, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent

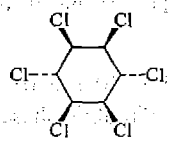
Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{20}FN_3O_4$ in the tablets.

Storage. Store protected from light and moisture.

Lindane

Gamma Benzene Hexachloride



$C_6H_6Cl_6$ Mol.Wt.290.8

Lindane is 1α,2α,3β,4α,5α,6β-hexachlorocyclohexane.

Lindane contains not less 99.0 per cent and not more than 100.5 per cent of $C_6H_6Cl_6$.

Category. Topical parasiticide.

Description. A white or almost white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *lindane IPRS* or with the reference spectrum of lindane.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

C. Dissolve about 5 mg in 4 ml of *ethanol (95 per cent)*. Add 1 ml of *0.5 M ethanolic potassium hydroxide* and allow to stand for 10 minutes. The solution gives reaction (A) of chlorides (2.3.1).

D. Melts at 112° to 115° (2.4.21).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *acetone* is clear (2.4.1) and not more intensely coloured than reference solution YS7 (2.4.1).

Related substances. Determine by thin-layer chromatography (2.4.17) coating the plate with *silica gel G*.

Mobile phase. A mixture of 90 volumes of *cyclohexane* and 10 volumes of *chloroform*.

Test solution (a). Dissolve 1 g of the substance under examination in 10 ml of *chloroform*.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *chloroform*.

Reference solution (a). A 1 per cent w/v solution of *lindane IPRS* in *chloroform*.

Reference solution (b). Dilute 1.0 ml of test solution (b) to 10.0 ml with *chloroform*.

Reference solution (c). Dissolve 10 mg of *α-hexachlorocyclohexane IPRS* in sufficient of the test solution (a) to produce 5 ml.

Apply to the plate 1 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of dry air and irradiate with ultraviolet light at 254 nm for 15 minutes. Spray with a 0.6 per cent w/v solution of *dicarboxidine hydrochloride* in *ethanol (90 per cent)* and examine the spots in daylight. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Chlorides (2.3.12). To 3.75 g, finely powdered, add 15 ml of *water* and boil for 1 minute. Allow to cool, shaking frequently and filter. To 10 ml of the filtrate add 3 ml of *water* and 2 ml of *ethanol (95 per cent)*. The solution complies with the limit test for chlorides (100 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Weigh 0.2 g, add 10 ml of *ethanol (95 per cent)* and warm on a water-bath until dissolved. Cool, add 20 ml of *0.5 M ethanolic potassium hydroxide* and allow to stand for 10 minutes, swirling frequently. Add 50 ml of *water*, 20 ml of *2 M nitric acid*, 25 ml of *0.1 M silver nitrate* and 5 ml of *ferric ammonium sulphate solution*. Titrate with *0.1 M ammonium thiocyanate* until a reddish-yellow colour is obtained. Repeat the procedure without the substance under examination. The difference between the titrations represents the amount of silver nitrate required.

1 ml of *0.1 M silver nitrate* is equivalent to 0.009649 g of $C_6H_6Cl_6$.

Storage. Store protected from light.

Absorbent Lint

Lint; Cotton Lint; Unmedicated Lint

Absorbent Lint is a cotton cloth of plain weave, on one side of which a nep has been raised from either warp or weft yarns. It absorbs water readily but its absorbency may be

considerably reduced by medication, the absorbency of the product depending upon the medicament incorporated.

Category. Surgical dressing.

Description. Cotton cloth of plain weave, reasonably free from weaving defects, readily tearable in both directions and bleached to a good white having on one side a nep raised from either the warp or weft yarns and reasonably free from neps; it is clean and reasonably free from leaf, shell and other foreign substances. It is made of yarn that is reasonably free from slubs, snarls and other defects.

Absorbent Lint has not less than 98.0 per cent of the dimensions stated on the label.

Tests

Threads per cm. Warp not less than 16 and weft not less than 10.

Weight per unit area. 25 g has a superficial area of 1350 to 1370 sq. cm.

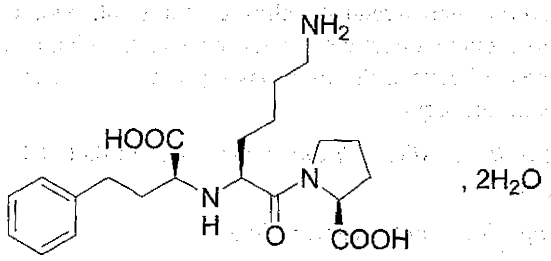
Absorbency. A piece 10 cm square, placed lightly by means of forceps, unraised side downwards, on the surface of water at 20°, becomes saturated within 10 seconds.

Fluorescence. Not more than a few points of fluorescence are visible under screened ultraviolet light.

Storage. Store protected from moisture in well-closed packages in a dry place, free from dust.

Labelling. The label states the dimensions viz. the length and width in cm.

Lisinopril



$C_{21}H_{31}N_3O_5, 2H_2O$ Mol. Wt. 441.5

Lisinopril is (*S*)-1-[*N*^{2}-(1-carboxy-3-phenylpropyl)-L-lysyl]-L-proline dihydrate.

Lisinopril contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{21}H_{31}N_3O_5$, calculated on the anhydrous basis.

Category. Antihypertensive.

Description. A white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *lisinopril IPRS* or with the reference spectrum of lisinopril.

B. In the Assay, the chromatogram obtained with the test solution corresponds to the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). –123.0° to –115.0°, determined on 1.0 per cent w/v solution in *0.25 M zinc acetate* at 405 nm.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in 10.0 ml of mobile phase A.

Reference solution (a). A 0.2 per cent w/v solution of *lisinopril IPRS* in mobile phase A.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with mobile phase A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octylsilane bonded to porous silica (5 µm) (Such as Symmetry C8),
- column temperature: 50°,
- mobile phase: A. a mixture of 3 volumes of *acetonitrile* and 97 volumes of *0.02 M sodium dihydrogen phosphate*, adjusted to pH 5.0 with a 5 per cent w/v solution of *sodium hydroxide* and filter,
  B. a mixture of 20 volumes of *acetonitrile* and 80 volumes of *0.02 M sodium dihydrogen phosphate*, adjusted to pH 5.0 with 5 per cent w/v solution of *sodium hydroxide* and filter,
- a gradient programme using the conditions given below,
- flow rate: 1.8 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
35	70	30
45	70	30
55	0	100
65	100	0
75	100	0

Inject reference solution (b). Test is not valid unless the tailing factor is not more than 3.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than the area of the peak in the chromatogram obtained with the reference solution (b) (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 8.0 to 9.5, determined on 0.1 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 30 mg of the substance under examination in 100.0 ml of *water* and filter.

Reference solution. A 0.03 per cent w/v solution of *lisinopril IPRS* in *water.*

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with dimethyloctylsilane (C8 alkyl chain) fully endcapped stationary phase (5 mm) (Such as Hypersil MOS),
- column temperature: 50°,
- mobile phase: a mixture of 96 volumes of buffer pH 5.0 prepared by dissolving 2.76 g of *monobasic sodium phosphate* in 1000 ml of *water*, adjusted to pH 5.0 with *1 M sodium hydroxide* and 4 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 180 theoretical plates. The tailing factor is not more than 2.0. The relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{31}N_3O_5$.

Storage. Store protected from moisture, at a temperature not exceeding 25°.

Lisinopril Tablets

Lisinopril Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of lisinopril, $C_{21}H_{31}N_3O_5$.

Usual strengths. 2.5 mg; 5 mg; 10 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 50 rpm for 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. The filtrate obtained as given above.

Reference solution. Dissolve an accurately weighed quantity of *lisinopril IPRS* in dissolution medium and dilute with dissolution medium to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octylsilane bonded to porous silica (5 µm) (Such as Symmetry C8),
- column temperature: 50°,
- mobile phase: dissolve 1.0 g of *hexane sulphonic acid sodium salt* in 800 volumes of *phosphate solution* prepared by dissolving 4.1 g of *monobasic potassium phosphate* in 900 ml *water*, adjusted to pH 2.0 with *orthophosphoric acid,* dilute to 1000 ml with *water* and 200 volumes of *acetonitrile*, mix, filter and degas.
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 850 theoretical plates, the tailing factor is not more than 2.0. The relative standard deviation for replicate injections is not more than 2.0 per cent.

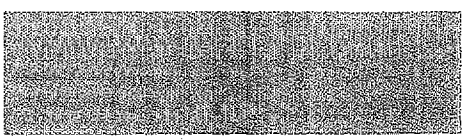
Inject the reference solution and the test solution.

Q. Not less than 75 per cent of the stated amount of $C_{21}H_{31}N_3O_5$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh accurately a powdered tablet containing 100 mg of Lisinopril to a 50-ml volumetric flask. Add about 25 ml of mobile phase A and sonicate for 10 minutes with intermittent shaking. Make up the volume with the mobile phase A and filter.

Reference solution (a). A 0.2 per cent w/v solution of *lisinopril IPRS* in the mobile phase A.



Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with mobile phase A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with packed with dimethyloctylsilane (C8 alkyl chain) fully endcapped stationary phase (5 µm) (Such as Hypersil MOS/ Symmetry C8),
- column temperature: 50°,
- mbile phase: A. a mixture of 3 volumes of *acetonitrile* and 97 volumes of *0.02 M sodium dihydrogen phosphate*, adjusted to pH 5.0 with 5 per cent w/v solution of *sodium hydroxide* and filter,
  B. a mixture of 20 volumes of *acetonitrile* and 80 volumes of *0.02 M sodium dihydrogen phosphate*, adjusted to pH 5.0 with 5 per cent w/v solution of *sodium hydroxide* and filter,
- a gradient programme using the conditions given below,
- flow rate: 1.8 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
35	70	30
45	70	30
50	100	0
60	100	0

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the peak in the chromatogram obtained with the reference solution (b) (2.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of 4 volumes of *water* and 1 volume of *methanol*.

Test solution. Transfer to a suitable size volumertric flask 10 tablets, add the solvent mixture to fill about half of the volumetric flask, shake the flask by mechanical means for 20 minutes and dilute with solvent mixture which will yield a solution having a concentration of about 0.02 per cent w/v and filter.

Reference solution. A 0.02 per cent w/v solution of *lisinopril IPRS* in solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octylsilane bonded to porous silica (5 µm), (Such as Symmetry C8),
- column temperature: 50°,
- mobile phase: dissolve 1.0 g of *hexane sulphonic acid sodium salt* in 800 volumes of *phosphate solution* prepared by dissolving 4.1 g of *monobasic potassium phosphate* in 900 ml *water*, adjusted to pH 2.0 with *orthophosphoric acid*, dilute to 1000 ml with *water* and 200 volumes of *acetonitrile*, mix, filter and degas.
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 850 theoretical plates, the tailing factor is not more than 2.0. The relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{31}N_3O_5$.

Storage. Store protect from moisture, at a temperature between 20° to 25°.

Lithium Carbonate

Li_2CO_3 Mol.Wt.73.9

Lithium Carbonate contains not less than 98.5 per cent and not more than 100.5 per cent of Li_2CO_3.

Category. Antidepressant.

Description. A white, crystalline powder.

Identification

A. When moistened with *hydrochloric acid* and introduced on a platinum wire, it imparts a red colour to a non-luminous flame.

B. Dissolve 0.2 g in 1 ml of *hydrochloric acid* and evaporate to dryness on a water-bath; the residue is soluble in 3 ml of *ethanol (95 per cent)*.

C. It gives reaction (A) of carbonates (2.3.1).

Tests

Appearance of solution. Suspend 10.0 g in 30 ml of *distilled water* and dissolve by adding 22 ml of *nitric acid*. Neutralise with *2 M sodium hydroxide* and dilute to 100.0 ml with *distilled water* (solution A). The solution is clear (2.4.1) and colourless (2.4.1).

Arsenic (2.3.10). Dissolve 5.0 g in 15 ml of *brominated hydrochloric acid*, add 45 ml of *water* and remove the excess of bromine with a few drops of *stannous chloride solution AsT*. The resulting solution complies with the limit test for arsenic (2 ppm).

Calcium and magnesium. Dissolve 1.0 g in 30 ml of *1 M hydrochloric acid* and neutralise with *dilute ammonia solution*, filter, if necessary and divide into two portions; to one portion add 1 ml of *ammonium oxalate solution*; no turbidity or precipitate is produced on standing for 5 minutes. To the other portion add 1 ml of *disodium hydrogen phosphate solution*; no turbidity or precipitate is produced on standing for 5 minutes.

Heavy metals (2.3.13). Mix 1.0 g with 5 ml of *water* and 15 ml of *dilute hydrochloric acid*, heat to boiling and maintain that temperature for 1 minute. Add 1 drop of *phenolphthalein solution* and sufficient *ammonia solution* to give the solution a faint pink colour. Cool and dilute to 25 ml with *water*. The resulting solution complies with the limit test for heavy metals, Method A (20 ppm).

Iron (2.3.14). 20 ml of solution A complies with the limit test for iron (20 ppm).

Potassium. Dissolve 1.0 g in 10 ml of *7 M hydrochloric acid*, add sufficient *water* to produce 50 ml and determine by Method A of flame photometry (2.4.4) or by Method A of Atomic absorption spectrophotometry (2.4.2), measuring at 767 nm, using *potassium solution FP* or *potassium solution AAS* respectively, suitably diluted with *water*, to prepare the standard solution (500 ppm).

Sodium. Dissolve 1.0 g in 10 ml of *7 M hydrochloric acid*, add sufficient *water* to produce 50 ml and determine by Method A for flame photometry (2.4.4) or by Method A of Atomic absorption spectrophotometry (2.4.2), measuring at 589 nm, using *sodium solution FP* or *sodium solution AAS* respectively, suitably diluted with *water*, to prepare the standard solution (500 ppm).

Chlorides (2.3.12). 10 ml of solution A diluted to 15 ml with *water* complies with the limit test for chlorides (250 ppm).

Sulphates (2.3.17). Disperse 0.75 g in 5 ml of *distilled water* and dissolve by adding 5 ml of *7 M hydrochloric acid*. Boil for 2 minutes, cool, neutralise with *2 M sodium hydroxide* and dilute to 25 ml with *distilled water*. The resulting solution complies with the limit test for sulphates (200 ppm).

Assay. Dissolve 0.5 g in 25.0 ml of *1 M hydrochloric acid* and titrate with *1 M sodium hydroxide* using *methyl orange solution* as indicator.

Repeat the operation without the substance under examination. The difference between the titrations represents the amount of hydrochloric acid required.

1 ml of *1 M hydrochloric acid* is equivalent to 0.03695 g of Li_2CO_3.

Storage. Store protected from moisture.

Lithium Carbonate Prolonged-release Tablets

Lithium Carbonate Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Lithium Carbonate Prolonged-release Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of content of lithium carbonate, Li_2CO_3.

Usual strengths. 300 mg; 400 mg; 450 mg.

Identification

A small quantity of the powdered tablets, when moistened with *hydrochloric acid* and introduced on a platinum wire into a flame, imparts a red colour to the flame.

Tests

Dissolution (2.5.2). Complies with the test stated under Tablets.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 1 g of Lithium Carbonate in 100 ml of *water* and 50 ml of *1 M hydrochloric acid* and boil for 1 minute to remove carbon dioxide. Cool and titrate with *1 M sodium hydroxide* using *methyl orange solution* as indicator. Carry out a blank titration.

1 ml of *1 M hydrochloric acid* is equivalent to 0.03695 g of Li_2CO_3.

Lithium Carbonate Tablets

Lithium Carbonate Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of lithium carbonate, Li_2CO_3.

Usual strength. 300 mg.

Identification

A small quantity of the powdered tablets, when moistened with *hydrochloric acid* and introduced on a platinum wire, imparts a red colour to a non-luminous flame.

Tests

Dissolution (2.5.2).
Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 100 rpm and 30 minutes.

Withdraw 90.0 ml of the medium, add a drop of *hydrochloric acid* and dilute to 100.0 ml with *water*. Filter and dilute with *water*, if necessary. Determine by flame photometry Method A (2.4.4), or by atomic absorption spectrophotometry, Method A (2.4.2), measuring at 671 nm and using *lithium solution FP*, or *lithium solution AAS*, as appropriate, suitably diluted with *water*, for the standard solution.

Calculate the content of Li_2CO_3 in the medium.

Q. Not less than 60 per cent of the stated amount of Li_2CO_3.

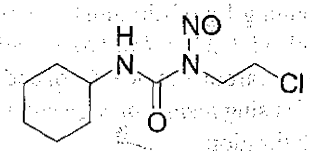
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 1 g of Lithium Carbonate, add 100 ml of *water* and 50.0 ml of *1 M hydrochloric acid* and boil for 1 minute to remove carbon dioxide. Cool and titrate with *1 M sodium hydroxide* using *methyl orange solution* as indicator. Carry out a blank titration.

1 ml of *1 M hydrochloric acid* is equivalent to 0.03695 g of Li_2CO_3.

Storage. Store protected from moisture.

Lomustine



$C_9H_{16}ClN_3O_2$ Mol. Wt. 233.7

Lomustine is 1-(2-chloroethyl)-3-cyclohexyl-1-nitrosourea.

Lomustine contains not less than 98.5 per cent and not more than 100.5 per cent of $C_9H_{16}ClN_3O_2$, calculated on the dried basis.

Category. Anticancer.

Description. A yellow, crystalline powder.

Carry out the tests protected from light and prepare the solutions immediately before use.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *lomustine IPRS* or with the reference spectrum of lomustine.

B. When examined in the range 220 nm to 360 nm (2.4.7), a 0.002 per cent w/v solution in *ethanol (95 per cent)* shows an absorption maximum at about 230 nm, about 0.52.

C. In the test A for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (c).

D. Dissolve about 25 mg in 1 ml of *methanol*, add 0.1 ml of *2 M sodium hydroxide* and 2 ml of *water* and acidify by adding, dropwise, *1 M nitric acid*. The resulting solution gives the reactions of chlorides (2.3.1).

Tests

Related substances. A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 80 volumes of *toluene* and 20 volumes of *glacial acetic acid*.

Test solution (a). Dissolve 0.25 g of the substance under examination in 10.0 ml of *methanol*.

Test solution (b). Dissolve 0.1 g of the substance under examination in 100.0 ml of *methanol*.

Reference solution (a). A 0.01 per cent w/v solution of the substance under examination in *methanol*.

Reference solution (b). A 0.005 per cent w/v solution of the substance under examination in *methanol*.

Reference solution (c). A 0.1 per cent w/v solution of *lomustine IPRS* in *methanol*.

Reference solution (d). A solution containing 0.1 per cent w/v each of *lomustine IPRS* and *1,3-dicyclohexylurea* in *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate, heat it at 110° for 1 hour, exposing the hot plate in a closed tank containing chlorine, produced by adding *dilute hydrochloric acid* to a 5 per cent w/v solution of *potassium permanganate* contained in a beaker placed at the bottom of tank. Allow the plate to stand in contact with the chlorine vapours for 5 minutes. Remove the plate from the tank and dry it in a current of cold air until the excess of chlorine is removed and an area of the plate below the line of application produces at most a very faint blue colour with 0.05 ml of *potassium iodide and starch solution*; avoid prolonged exposure to cold air. Spray the plate with *potassium iodide and starch solution*. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b). The test is not valid unless the chromatogram obtained with reference solution (d) shows two clearly separated principal spots.

B. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.25 g of the substance under examination in 10 ml of *methanol*.

Reference solution. A 0.025 per cent w/v solution of the substance under examination in *methanol*.

Chromatographic system
- a stainless steel column 20 cm × 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: equal volumes of *methanol* and *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject the reference solution. The retention time of lomustine is about 25 minutes. When using a recorder, adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with the reference solution is not less than 50 per cent of the full scale of the recorder.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution the sum of areas of any secondary peaks is not greater than the area of the peak in the chromatogram obtained with the reference solution. Ignore any peak with an area less than one-twentieth of that of the principal peak in the chromatogram obtained with the reference solution.

Chlorides (2.3.12). Dissolve 0.24 g in 4 ml of *methanol*, add 20 ml of *water*, allow to stand for 20 minutes and filter. To 10 ml of the filtrate add 5 ml of *methanol*. The resulting solution complies with the limit test for chlorides, replacing the 5 ml of *water* in the standard solution with 5 ml of *methanol (0.25 per cent)*.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa for 24 hours.

Assay. Weigh 0.2 g, add 20 ml of a 20 per cent w/v solution of *potassium hydroxide* and boil under a reflux condenser for 2 hours. Add 75 ml of *water* and 4 ml of *nitric acid*, cool. Titrate with *0.05 M silver nitrate*, determining the end-point potentiometrically (2.4.25). Repeat the operation without the substance under examination. The difference between the titrations represents the amount of *silver nitrate* required.

1 ml of *0.05 M silver nitrate* is equivalent to 0.01168 g of $C_9H_{16}ClN_3O_2$.

Storage. Store protected from light and moisture.

Lomustine Capsules

Lomustine Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of lomustine, $C_9H_{16}ClN_3O_2$.

Usual strengths. 10 mg; 40 mg.

Carry out the tests protected from light and prepare the solutions immediately before use.

Identification

Shake a quantity of the contents of the capsules containing 0.2 g of Lomustine with 10 ml of *methanol*, filter and evaporate the filtrate to dryness using a rotary evaporator on a water-bath maintained at not more than 60°. The residue, after drying at a pressure not exceeding 0.7 kPa at 60° for 30 minutes, complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *lomustine IPRS* or with the reference spectrum of lomustine.

B. Melting range. 89° to 91° (2.4.21).

Tests

Related substances. A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 80 volumes of *toluene* and 20 volumes of *glacial acetic acid*.

Test solution (a). Shake a quantity of the contents of the capsules containing 0.25 g of Lomustine with 10 ml of *methanol* and filter.

Test solution (b). Dilute 1 volume of test solution (a) to 250 volumes with *methanol*.

Reference solution (a). Dilute 1 volume of test solution (b) to 2 volumes with *methanol*.

Reference solution (b). A 0.005 per cent w/v solution of the substance under examination in *methanol*.

Reference solution (c). A 0.1 per cent w/v solution of *lomustine IPRS* in *methanol*.

Reference solution (d). A solution containing 0.1 per cent w/v each of *lomustine IPRS* and *1,3-dicyclohexylurea* in *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate, heat it at 110° for 1 hour, exposing the hot plate in a closed tank containing chlorine, produced by adding *dilute hydrochloric acid* to a 5 per cent w/v solution of *potassium permanganate* contained in a beaker placed at the bottom of tank. Allow the plate to stand in contact with the chlorine vapours for 5 minutes. Remove the plate and dry it in a current of cold air until the excess of chlorine is removed and an area of the plate below the line of application produces at most a very faint blue colour with 0.05 ml of *potassium iodide and starch solution*; avoid prolonged exposure to cold air. Spray the plate with *potassium iodide and starch solution*. Any secondary spot in the chromatogram obtained with test

solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b). The test is not valid unless the chromatogram obtained with reference solution (d) shows two clearly separated principal spots.

B. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the contents of the capsules containing 0.25 g of Lomustine with 10 ml of *methanol* and filter.

Reference solution. Dilute 1.0 ml of the test solution to 50.0 ml with *methanol*.

Chromatographic system
- a stainless steel column 20 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 mm),
- mobile phase: equal volumes of *methanol* and *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject the reference solution. The retention time of lomustine is about 25 minutes. When using a recorder, adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with the reference solution is not less than 50 per cent of the full scale of the recorder.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution the sum of areas of any secondary peaks is not greater than the area of the peak in the chromatogram obtained with the reference solution. Ignore any peak with an area less than one-twentieth of that of the principal peak in the chromatogram obtained with the reference solution.

Uniformity of content. Complies with the test stated under Capsules.

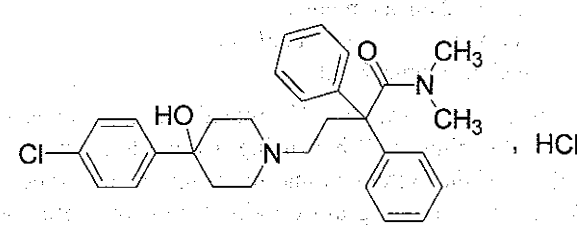
Transfer the contents of a capsule quantitatively to a 100 ml volumetric flask with the aid of 20 ml of *ethanol (95 per cent)*, shake well, make up to the volume with *ethanol (95 per cent)* and filter. Dilute suitably with the same solvent and measure the absorbance of the resulting solution at the maximum at about 230 nm (2.4.7). Calculate the content of $C_9H_{16}ClN_3O_2$ in the capsule taking 260 as the specific absorbance at 230 nm.

Other tests. Comply with the tests stated under Capsules.

Assay. Weigh accurately a quantity of the mixed contents of 20 capsules containing about 40 mg of Lomustine and shake with 70 ml of *ethanol (95 per cent)* for 20 minutes, dilute to 100.0 ml with *ethanol (95 per cent)* and filter. Dilute 5.0 ml of the filtrate to 100.0 ml with *ethanol (95 per cent)* and measure the absorbance of the resulting solution at the maximum at about 230 nm (2.4.7). Calculate the content of $C_9H_{16}ClN_3O_2$ taking 260 as the specific absorbance at 230 nm.

Storage. Store protected from light and moisture.

Loperamide Hydrochloride



$C_{29}H_{33}ClN_2O_2,HCl$ Mol. Wt. 513.5

Loperamide Hydrochloride is 4-(4-chlorophenyl)-4-hydroxy-piperidino]-*N*,*N*-dimethyl-2,2-diphenylbutyramide hydrochloride.

Loperamide Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{29}H_{33}ClN_2O_2,HCl$, calculated on the dried basis.

Category. Antidiarrhoeal.

Description. A white or almost white powder.

Identification

Test B may be omitted if tests A and C are carried out. Test A may be omitted if tests B and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *loperamide hydrochloride IPRS* or with the reference spectrum of loperamide hydrochloride.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *octadecylsilyl silica gel*.

Mobile phase. A mixture of 40 volumes of *dioxan*, 40 volumes of *methanol* and 20 volumes of *ammonium acetate*.

Test solution. Dissolve 0.6 g of the substance under examination in 100 ml of the mobile phase.

Reference solution (a). A 0.6 per cent w/v solution of *loperamide hydrochloride IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.6 per cent w/v each of *loperamide hydrochloride IPRS* and *ketoconazole IPRS* in the mobile phase.

Apply to the plate 5 µl of each solution. After development, dry the plate in air for 15 minutes and expose it to iodine vapours until the spots appear. The principal spot in the

chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

C. Dissolve 50 mg in a mixture of 0.4 ml of *strong ammonia solution* and 2 ml of *water*. Mix, allow to stand for 5 minutes and filter. Acidify the filtrate with *2 M nitric acid*. It gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *methanol* is clear (2.4.1) and not more intensely coloured than reference solution BYS7 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of *methanol*.

Reference solution (a). A solution containing 0.0025 per cent w/v each of *loperamide hydrochloride IPRS* and *haloperidol IPRS* in *methanol*.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol*. Dilute 5.0 ml of the solution to 20.0 ml with *methanol*.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a 1.7 per cent w/v solution of *tetrabutylammoniumhydrogen sulphate*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
10	30	70
15	30	70
20	90	10

Equilibrate the column for at least 30 minutes with *acetonitrile* and then equilibrate at the initial eluent composition for at least 5 minutes.

Adjust the sensitivity of the detector so that the height of the principal peak in the chromatogram obtained with reference solution (b) is 70 per cent to 90 per cent of the full scale of the recorder.

The retention times are: haloperidol, about 3 minutes and loperamide hydrochloride, about 4.5 minutes.

Inject reference solution (a). The test is not valid unless the resolution between the peaks corresponding to haloperidol and loperamide hydrochloride is at least 8.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peaks is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent) and the sum of the areas of any secondary peaks is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.4 g, dissolve in 25 ml of anhydrous *glacial acetic acid*, add 10 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, using *alpha-naphtholbenzein solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.05135 g of $C_{29}H_{33}ClN_2O_2,HCl$.

Storage. Store protected from light and moisture.

Loperamide Capsules

Loperamide Hydrochloride Capsules

Loperamide Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the labeled amount of loperamide hydrochloride $C_{29}H_{33}ClN_2O_2,HCl$.

Usual strength. 2 mg.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 85 volumes of *chloroform*, 10 volumes of *methanol* and 5 volumes of *formic acid*.

Test solution. To a quantity of the contents of the capsules, containing about 10 mg of Loperamide Hydrochloride, add 10 ml of *methanol*, shake for 5 minutes and filter.

Reference solution. A 0.1 per cent w/v solution of *loperamide hydrochloride IPRS* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and expose to iodine vapour. The principal spot in the chromatogram obtained with the test solution

corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2)

Apparatus No. 1 (Basket),
Medium. 500 ml of pH 4.7 acetate buffer, prepared by mixing 200 ml of *1 M acetic acid* with 600 ml of *water*, adjusting with *1 M sodium hydroxide* to a pH of 4.70 ± 0.05, diluting with *water* to 1000 ml and mixing,
Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A solution of *loperamide hydrochloride IPRS* in the dissolution medium containing the same concentration of loperamide hydrochloride as that expected in the dissolution medium in the vessel.

Determine by liquid chromatography (2.4.14) using the chromatographic system described under Assay.

Calculate the content of $C_{29}H_{33}ClN_2O_2$,HCl in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{29}H_{33}ClN_2O_2$, HCl.

Uniformity of content. Complies with the test stated under Capsules.

Transfer the contents of one capsule to a 200-ml volumetric flask. Add 35 ml of *0.5 M hydrochloric acid* and mix with the aid of ultrasound for 15 minutes. Add 35 ml of *acetonitrile* and mix with the aid of ultrasound for another 15 minutes. Dilute to volume with a mixture of equal volumes of *0.5 M hydrochloric acid* and *acetonitrile* mix and filter.

Determine by liquid chromatography (2.4.14) using the chromatographic system and the reference solution described under Assay.

Calculate the content of $C_{29}H_{33}ClN_2O_2$, HCl in the capsule.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Transfer an accurately weighed portion of the mixed contents of 20 capsules containing about 20 mg of Loperamide Hydrochloride, to a 100 ml volumetric flask. Add about 35 ml of *0.5 M hydrochloric acid* and mix with the aid of ultrasound for 15 minutes. Add 35 ml of *acetonitrile* and mix with the aid of ultrasound for an additional 15 minutes. Dilute with a mixture of equal volumes of *acetonitrile* and *0.5 M hydrochloric acid*, mix and filter. Transfer 5.0 ml of the solution to a 100 ml volumetric flask, dilute to volume with the same solvent mixture and mix.

Reference solution. A 0.001 per cent w/v solution of *loperamide hydrochloride IPRS* in a mixture of equal volumes of *acetonitrile* and *0.5 M hydrochloric acid*.

Chromatographic system
- a stainless steel column 25 cm × 4 mm, packed with nitrile groups chemically bonded to porous silica particles (10 µm),
- mobile phase: dilute 500 ml of *acetonitrile* to 1000.0 ml with *water*, add 20 drops of *phosphoric acid*, mix and filter,
- flow rate: 2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 50 µl.

Inject the reference solution. The column efficiency, determined from the analyte peak is not less than 1900 theoretical plates, the capacity factor, is not less than 3.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject alternately the test solution and the reference solution.

Calculate the content of $C_{29}H_{33}ClN_2O_2$,HCl in the capsules.

Loperamide Tablets

Loperamide Hydrochloride Tablets

Loperamide Hydrochloride Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the labeled amount of loperamide hydrochloride $C_{29}H_{33}ClN_2O_2$,HCl.

Usual strength. 2 mg.

Identification

A. Disperse a quantity of powdered tablets containing about 10 mg of Loperamide Hydrochloride, to a test-tube, add 20.0 ml of *isopropyl alcohol*. shake by mechanical means for one minute and allow to settle. Dilute 9.0 ml of the supernatant to 10 ml with *0.1M hydrochloric acid*. The solution so obtained, when examined in the range of 250 nm to 300 nm (2.4.7) shows absorption maxima and minima at the same wavelengths as that of a similar preparation of *loperamide hydrochloride IPRS*.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 of *0.01 M hydrochloric acid*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Test Solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A solution of *loperamide hydrochloride IPRS* in the dissolution medium containing the same concentration of loperamide hydrochloride as that expected in the dissolution medium in the vessel.

Determine by liquid chromatography (2.4.14) using the chromatographic system described under Assay.

Calculate the content of $C_{29}H_{33}ClN_2O_2$, HCl in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{29}H_{33}ClN_2O_2$, HCl.

Uniformity of content. Complies with the test stated under Tablets.

Test solution. Disperse 1 tablet to a 200-ml volumetric flask. Add 4 ml of a 5 per cent w/v solution of *phosphoric acid* and 20 ml of *methanol* shake and dilute to volume with *water*.

Reference solution. Dissolve an accurately weighed quantity of *loperamide hydrochloride IPRS* in *methanol* to obtain a solution having a known concentration of about 2 mg per ml. Quantitatively dilute the solution with *water* to obtain a solution having a known concentration of about 0.2 mg per ml. To 10.0 ml of the solution add 4.0 ml of 5 per cent *phosphoric acid solution* and 20 ml of *methanol*, dilute with *water* to 200.0 ml and mix.

Determine by liquid chromatography (2.4.14) using the chromatographic system described under Assay.

Calculate the content of $C_{29}H_{33}ClN_2O_2$, HCl in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Buffer solution. To 3.0 g of *triethylamine hydrochloride* and 1.0 ml of *phosphoric acid* add 550 ml of *water* and mix.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 16 mg of Loperamide Hydrochloride, to a 200-ml volumetric flask. Add 4 ml of a 5 per cent w/v solution of *phosphoric acid* and 20 ml of *methanol*, dilute with *water* to volume and mix. To 10.0 ml of the solution, add 2.0 ml of 5 per cent w/v solution of *orthophosphoric acid* and 10 ml of *methanol* and dilute to 100.0 ml with *water*.

Reference solution. Dissolve an accurately weighed quantity of *loperamide hydrochloride IPRS* in *methanol* to obtain a solution having a known concentration of about 2 mg per ml. Quantitatively dilute this solution with *water* to obtain a solution having a known concentration of about 0.2 mg per ml. Transfer 10.0 ml of the solution to a 250-ml volumetric flask, add 5.0 ml of 5 per cent *phosphoric acid solution* and 25 ml of *methanol*, dilute with *water* to volume and mix.

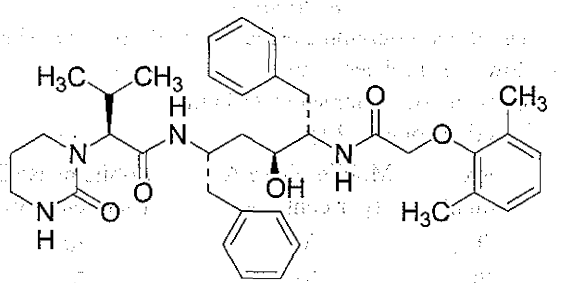
Chromatographic system
- a stainless steel column 8 cm x 4 mm, packed with octylsilane chemically bonded to totally porous silica particles (5 µm),
- mobile phase: a mixture of 45 volumes of *acetonitrile* and 55 volumes of buffer solution,
- flow rate: 2 ml per minute,
- spectrophotometer set at 214 nm,
- injection volume: 20 µl.

Inject the reference solution. The tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject alternately the test solution and the reference solution.

Calculate the content of $C_{29}H_{33}ClN_2O_2$,HCl in the tablets.

Lopinavir



$C_{37}H_{48}N_4O_5$ Mol. Wt. 628.8

Lopinavir is (αS)-*N*-[(1*S*,3*S*,4*S*)-4-[[(2,6-dimethylphenoxy)acetyl]amino-3-hydroxy-5-phenyl-1-(phenylmethyl)pentyl]tetrahydro-α-(1-methylethyl)-2-oxo-1-(2*H*)-pyrimidineacetamide.

Lopinavir contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{37}H_{48}N_4O_5$, calculated on the anhydrous basis.

Category. Antiretroviral.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *lopinavir IPRS* or with the reference spectrum of lopinavir.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to lopinavir in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). –26.0° to –22.0°, determined in a 0.4 per cent w/v solution in *methanol* and calculated on the anhydrous basis.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 70 volumes of a buffer solution prepared by dissolving 2.72 g of *potassium dihydrogen phosphate* in 900 ml of *water*, adjusted to pH 2.5 with *phosphoric acid* and diluting to 1000 ml with *water* and 30 volumes of *acetonitrile*.

Test solution. Dissolve 15 mg of the substance under examination in 100.0 ml of the solvent mixture.

Reference solution. A 0.015 per cent w/v solution of *lopinavir IPRS* in the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: A. buffer solution pH 2.5,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	70	30
30	30	70
40	20	80
50	20	80

Inject the reference solution. The test is not valid unless the column efficiency determined from the lopinavir peak is not less than 5000 theoretical plates and the tailing factor is not more than 1.5.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than 0.3 times the area of the peak in the chromatogram obtained with the reference solution (0.3 per cent) and sum of areas of all the secondary peaks is not more than the area of the peak in the chromatogram obtained with the reference solution (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 4.0 per cent, determined on 0.1 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 70 volumes of a buffer solution prepared by dissolving 2.72 g of *potassium dihydrogen orthophosphate* in 900 ml of *water*, adjusted to pH 2.5 with *orthophosphoric acid* and diluting to 1000 ml with *water* and 30 volumes of *acetonitrile*.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture. Dilute 10.0 ml of the solution to 50.0 with the solvent mixture.

Reference solution. A 0.02 per cent w/v solution of *lopinavir IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 mm),
- mobile phase: 55 volumes of solution B prepared by mixing 80 volumes of *acetonitrile* and 20 volumes of *methanol* and 45 volumes of *0.05 M potassium dihydrogen phosphate*, adjusted to pH 3.0 with *dilute phosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency determined from the lopinavir peak is not less than 1500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{37}H_{48}N_4O_5$.

Storage. Store protected from light and moisture.

Lopinavir and Ritonavir Capsules

Lopinavir and Ritonavir Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of lopinavir, $C_{37}H_{48}N_4O_5$ and ritonavir, $C_{37}H_{48}N_6O_5S_2$.

Usual strength. Lopinavir 200 mg and Ritonavir 50 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of a solution prepared by dissolving 15.7 g of *polyoxyethylene 10-lauryl ether* in 1000 ml of a 0.85 per cent v/v solution of *hydrochloric acid*,

Speed and time. 75 rpm and 120 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14)

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A solution containing 0.15 per cent w/v of *lopinavir IPRS* and 0.04 per cent w/v of *ritonavir IPRS* in *methanol*. Dilute 5.0 ml of the solution to 50.0 ml with the dissolution medium.

Use the chromatographic system given in the Assay.

Inject the reference solution and the test solution.

Calculate the contents of $C_{37}H_{48}N_4O_5$ and $C_{37}H_{48}N_6O_5S_2$ in the medium.

Q. Not less than 75 per cent of the stated amounts of $C_{37}H_{48}N_4O_5$ and $C_{37}H_{48}N_6O_5S_2$.

Related substances. Determine by liquid chromatography (2.4.14).

For Lopinavir —

Solvent mixture. 40 volumes of *buffer solution* and 60 volumes of *acetonitrile*.

Test solution. Weigh accurately a quantity of the contents of the capsules containing 100 mg of Lopinavir, disperse in 100 ml of the solvent mixture and filter.

Reference solution (a). A 0.1 per cent w/v solution of *lopinavir IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 45 volumes of *acetonitrile* and 55 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen orthophosphate dihydrate* in 1000 ml of *water* and adjusted to pH 4.0 with *orthophosphoric acid*,

  B. a mixture of 80 volumes of *acetonitrile* and 20 volumes of the buffer solution,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
80	100	0
90	0	100
120	0	100
130	100	0
140	100	0

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with the reference solution (b) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the peak in the chromatogram obtained with the reference solution (b) (2.0 per cent).

For Ritonavir —

Solvent mixture. 40 volumes of the buffer solution and 60 volumes of *acetonitrile*.

Test solution. Weigh accurately a quantity of the contents of the capsules containing 50 mg of Ritonavir, disperse in 100 ml of the solvent mixture and filter.

Reference solution (a). A 0.05 per cent w/v solution of *ritonavir IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

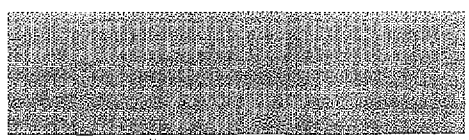
Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with silica gel consisting of porous spherical particles with chemically bonded butyl group (3 µm) (Such as YMC C4),
- column temperature: 60°,
- mobile phase: A. a mixture of 69 volumes of buffer solution prepared by dissolving 4.1 g of *monobasic potassium phosphate* in 1000 ml of *distilled water* and filtering and 18 volumes of *acetonitrile*, 8 volumes of *tetrahydrofuran* and 5 volumes of *n-Butanol*.

  B. a mixture of 40 volumes of the buffer solution, 47 volumes of *acetonitrile*, 8 volumes of *tetrahydrofuran* and 5 volumes of *n-Butanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 50 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
60	100	0
120	0	100
130	100	0
155	100	0

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 5000 theoretical plates and the tailing factor is not more than 2.0.



Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 2.5 times the area of the peak in the chromatogram obtained with the reference solution (b) (2.5 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the peak in the chromatogram obtained with the reference solution (b) (5.0 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Mix the contents of 20 capsules. Weigh accurately a quantity of the mixed contents containing 70 mg of Lopinavir and disperse in 100.0 ml of *methanol* and filter. Dilute 5.0 ml of the filtrate to 50.0 ml with the mobile phase.

Reference solution. A solution containing 0.070 per cent w/v of *lopinavir IPRS* and 0.0175 per cent w/v of *ritonavir IPRS* in *methanol*. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 45 volumes of *buffer solution* prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate dihydrate* in 1000 ml with *water* and adjusted to p*H* 3.0 with *orthophosphoric acid*, 42.5 volumes of *acetonitrile* and 12.5 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the resolution between lopinavir and ritonavir peak is not less than 2.5, the column efficiency for each component is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the contents of $C_{37}H_{48}N_4O_5$ and $C_{37}H_{48}N_6O_5S_2$ in the capsules.

Storage. Store protected from moisture in a refrigerator (2° to 8°).

Lopinavir and Ritonavir Tablets

Lopinavir and Ritonavir Tablets contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of lopinavir, $C_{37}H_{48}N_4O_5$ and ritonavir, $C_{37}H_{48}N_6O_5S_2$.

Usual strength. Lopinavir 200 mg and Ritonavir 50 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with test solution correspond to the peaks in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of a solution prepared by dissolving 15.7 g of *polyoxyethylene 10 lauryl ether* in 1000 ml of a 0.85 per cent v/v solution of *hydrochloric acid*,

Speed and time. 75 rpm and 120 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14)

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A solution containing 0.22 per cent w/v of *lopinavir IPRS* and 0.055 per cent w/v of *ritonavir IPRS* in *methanol*. Dilute 5 ml of the solution to 50 ml with the dissolution medium.

Use the chromatographic system described under Assay.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the contents of $C_{37}H_{48}N_4O_5$ and $C_{37}H_{48}N_6O_5S_2$ in the medium.

Q. Not less than 70 per cent of the stated amounts of $C_{37}H_{48}N_4O_5$ and $C_{37}H_{48}N_6O_5S_2$.

Related substances. Determine by liquid chromatography (2.4.14).

For Lopinavir —

Test solution. Disperse accurately a quantity of the powdered tablets containing 100 mg of Lopinavir in 100 ml of the mobile phase.

Reference solution (a). A 0.1 per cent w/v solution of *lopinavir IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 55 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen orthophosphate in* 1000 ml of *water* and adjusted to pH 4.0 with *orthophosphoric acid* and 45 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,

– spectrophotometer set at 210 nm,
– injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 3000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with the reference solution (b) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the peak in the chromatogram obtained with the reference solution (b) (2.0 per cent).

For Ritonavir —

Solvent mixture. A mixture of 40 volumes of a buffer solution prepared by dissolving 4.1 g of *potassium dihydrogen phosphate* in 1000 ml of *water* and 60 volumes of *acetonitrile*.

Test solution. Disperse an accurately weighed quantity of the powdered tablets containing 100 mg of Ritonavir in 100 ml of the solvent mixture.

Reference solution (a). A 0.1 per cent w/v solution of *ritonavir IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Chromatographic system
– a stainless steel column 15 cm x 4.6 mm, packed with silica gel consisting of porous spherical particles with chemically bonded with butyl group (3 µm) (Such as YMC C4),
– column temperature: 60°,
– mobile phase: A. a mixture of 69 volumes of a buffer solution prepared by dissolving 4.1 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, 18 volumes of *acetonitrile*, 8 volumes of *tetrahydrofuran* and 5 volumes of *n- butanol*,
B. a mixture of 40 volumes of *buffer solution*, 47 volumes of *acetonitrile*, 8 volumes of *tetrahydrofuran* and 5 volumes of *n-butanol*,
– a gradient programme using the conditions given below,
– flow rate: 1 ml per minute,
– spectrophotometer set at 240 nm,
– injection volume: 50 µl.

Time (in min.)	Mobile phase A (per cent w/v)	Mobile phase B (per cent w/v)
0	100	0
60	100	0
120	0	100
121	100	0
135	100	0

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 3000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 2.5 times the area of the peak in the chromatogram obtained with the reference solution (b) (2.5 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the peak in the chromatogram obtained with the reference solution (b) (5.0 per cent).

Water (2.3.43). Not more than 6.0 per cent, determined on 0.5 g.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 200 mg of Lopinovir in 250.0 ml of *methanol*. Dilute 5.0 ml of the resulting solution to 50.0 ml with the mobile phase.

Reference solution. 5.0 ml of each of a 0.08 per cent w/v solution of *lopinavir IPRS* and a 0.02 per cent w/v solution of *ritonavir IPRS* in *methanol*, diluted to 50.0 ml with the mobile phase.

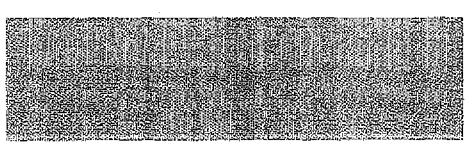
Chromatographic system
– a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
– mobile phase: A. a mixture of 80 volumes of *acetonitrile* and 20 volumes of *methanol*,
B. a mixture of 45 volumes of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate anhydrous* in 1000 ml of *water* and adjusted to pH 3.0 with *orthophosphoric acid* and 55 volumes of mobile phase A.
– flow rate: 1.5 ml per minute,
– spectrophotometer set at 210 nm,
– injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between the peak due to lopinavir (retention time, about 6 minutes) and the peak due to ritonavir (retention time, about 5 minutes) is less than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

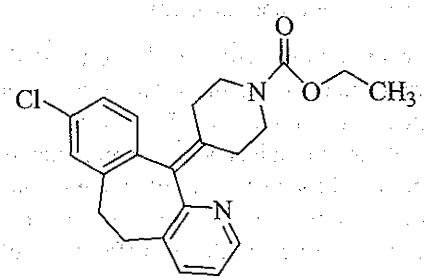
Inject the reference solution and the test solution.

Calculate the contents of $C_{37}H_{48}N_4O_5$ and $C_{37}H_{48}N_6O_5S_2$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.



Loratadine



$C_{22}H_{23}ClN_2O_2$ Mol. Wt. 382.9

Loratadine is ethyl 4-(8-chloro-5,6-dihydro-11*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridin-11-ylidene) piperidine-1-carboxylate.

Loratadine contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{22}H_{23}ClN_2O_2$, calculated on the dried basis.

Category. H_1 receptor antagonist; antihistamine.

Description. A white or almost white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *loratadine IPRS* or with the reference spectrum of loratadine.

Tests

Appearance of solution. A 5.0 per cent w/v solution in *methanol* is clear (2.4.1) and not more intensely coloured than reference solution YS6 (2.4.1).

Impurity H. Determine by gas chromatography (2.4.13).

Internal standard solution. A 0.025 per cent v/v solution of *isoamyl benzoate* in *methylene chloride*. Dilute 5.0 ml of the solution to 50.0 ml with same solvent.

Test solution. Dissolve 25 mg of the substance under examination in *methylene chloride* add 1.0 ml of reference solution (a) and 1.0 ml of the internal standard solution and dilute to 5.0 ml with *methylene chloride*.

Reference solution (a). A 0.0025 per cent w/v solution of *loratadine impurity H IPRS* (ethyl 4-oxopiperidine-1-carboxylate) in *methylene chloride*.

Reference solution (b). To 1.0 ml of reference solution (a) add 1.0 ml of the internal standard solution and dilute to 5.0 ml with *methylene chloride*.

Chromatographic system

- a fused silica capillary column 25 m × 0.32 mm, packed with poly(dimethyl) siloxane (film thickness 0.52 µm),
- temperature:

column	time (min.)	temperature (°)
	0	80
	1	80
	23	300
	33	300

- inlet port 260° and detector at 300°,
- split ratio. 1:30,
- flame ionization detector,
- flow rate: 1.0 ml per minute, using helium/nitrogen as the carrier gas,
- injection volume: 1 µl.

Name	Relative retention time
Loratadine Impurity H[1]	0.33
Isoamyl benzoate	0.37
Loratadine (Retention time is about 32 minutes)	1

[1]timeethyl 4-oxopiperidine-1-carboxylate.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to impurity H and isoamyl benzoate is not less than 2.0, the signal to noise ratio is not less than 10 for impurity H peak.

Inject reference solution (b) and the test solution. Calculate the ratio of the area of the peak due to impurity H to the area of the peak due to isoamyl benzoate from the chromatogram obtained with reference solution (b); from the chromatogram obtained with the test solution, calculate the ratio of the area of the peak due to impurity H to the area of the peak due to isoamyl benzoate this ratio is not more than twice (0.1 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution(a). A 0.002 per cent w/v solution of *loratadine impurity F IPRS* in the mobile phase.

Reference solution (b). Dissolve 5 mg of *loratadine for system suitability IPRS* (containing impurity A and impurity E) in the mobile phase, add 0.5 ml of reference solution (a) and dilute to 5.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with end-capped octadecylsilane bonded to porous silica (5 µm),

- column temperature: 40°,
- mobile phase: a mixture of 30 volumes of *methanol*, 35 volumes of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 2.8 with *orthophosphoric acid* and 40 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Loratadine impurity D[1]	0.2	—
Loratadine impurity B[2]	0.4	—
Loratadine impurity F[3]	0.9	1.6
Loratadine (Retention time is about 12 minutes)	1.0	—
Loratadine impurity E[4]	1.1	1.9
Loratadine impurity A[5]	2.4	1.7
Loratadine impurity C[6]	2.7	—

[1]8-chloro-11-(piperidin-4-ylidene)-6,11-dihydro-5*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridine,

[2]8-chloro-5,6-dihydro-11*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridine-11-one,

[3]ethyl 4-[(11*RS*)-8-chloro-11-fluoro-6,11-dihydro-5*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridin-11-yl]piperidine-1-carboxylate,

[4]ethyl 4-[(11*RS*)-8-chloro-6,11-dihydro-5*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridin-11-yl]-3,6-dihydropyridine-1(2*H*)-carboxylate,

[5]ethyl 4-[(11*RS*)-8-chloro-11-hydroxy-6,11-dihydro-5*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridin-11-yl]piperidine-1-carboxylate,

[6]ethyl 4-(4,8-dichloro-5,6-dihydro-11*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridine-11-ylidene)piperidine-1-carboxylate.

Inject reference solution (b). The test is not valid unless the peak–to–valley ratio is not less than 2.5, where Hp is the height above the baseline of the peak due to impurity E and Hv is the height above the baseline of the lowest point of the curve separating this peak from the peak due to loratadine.

Inject reference solution (c) and the test solution. Run the chromatogram 5 times the retention times of the principal peak for test solution. In the chromatogram obtained with the test solution, the area of any peak due to impurity F is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent), the area of any peak due to impurity A,B,C,D and E for each impurity are not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent) and the sum of the areas of all secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with the reference solution (c) (0.5 per cent). Ignore any peaks with an area 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (c) (0.05 per cent).

Sulphates (2.3.17). Ignite 1.0 g at 800 ± 25° and take up the residue with 20.0 ml of *distilled water*. Filter, if necessary. The filtrate compiles with the limit test for sulphates (150 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on1.0 g by drying in an oven at 105°.

Assay. Weigh about 0.3 g and dissolve in 50 ml of *anhydrous glacial acetic acid* and titrate with *0.1 M perchloric acid*, determining the end point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03829 g of $C_{22}H_{23}ClN_2O_2$.

Loratadine Tablets

Loratadine Tablets contains not less than 95.0 per cent and not more than 105.0 per cent of $C_{22}H_{23}ClN_2O_2$.

Usual strengths. 5 mg; 10 mg.

Identification

Extract a quantity of the powdered tablets containing 50 mg of loratadine with 20 ml of *acetone*, filter and evaporate the filter to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *loratadine IPRS* or with the reference spectrum of loratadine.

Tests

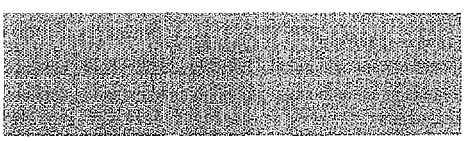
Impurity H. Determine by gas chromatography (2.4.13).

Internal standard solution. A 0.002 per cent w/v solution of *isoamyl benzoate* in *dichloromethane*.

Test solution. Shake a quantity of powdered tablets containing 20 mg of loratadine with 5.0 ml of *dichloromethane* and filter. To the filtrate, add 1.0 ml of the internal standard solution and 1.0 ml of reference solution (a) and dilute to 10.0 ml with *dichloromethane*.

Reference solution (a). A 0.002 per cent w/v solution of *loratadine impurity H IPRS* (ethyl 4-oxopiperidine-1-carboxylate) in *dichloromethane*.

Reference solution (b). To 1.0 ml of internal standard solution add 1.0 ml of reference solution (a) and dilute to 10.0 ml with *dichloromethane*.



Chromatographic system

- a fused silica capillary column 25 m × 0.32 mm, packed with poly(dimethyl) siloxane (film thickness 0.52 µm) (Such as HP1),
- temperature:

column	time (min.)	temperature (°)
	0	80
	1	80
	23	300
	33	300

- inlet port 260° and detector at 300°,
- split ratio. 1:30,
- flame ionization detector,
- flow rate: 1 ml per minute, using helium as the carrier gas,
- injection volume: 1 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to impurity H and isoamyl benzoate is not less than 2.0. Calculate the ratio of the area of the peak due to impurity H to the area of the of the peak due to isoamyl benzoate from the chromatogram obtained with reference solution (b).

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution the ratio of the area of any peak due to impurity H to the area of the peak due to isoamyl benzoate is not more than twice the ratio of the peaks obtained with reference solution (b) (0.1 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution (a). Disperse a quantity of powdered tablets containing 20 mg of loratadine with 10.0 ml of *methanol* and filter. Dilute 1.0 ml of the filtrate to 2.0 ml with the mobile phase.

Test solution (b). Dilute 1.0 ml of test solution (a) to 100.0 ml and further dilute 1.0 ml to 5.0 ml with the mobile phase.

Reference solution. A 0.1 per cent w/v solution of *loratadine impurity standard IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with end-capped octadecylsilane bonded to porous silica (5 µm) (Such as ODS-3V),
- column temperature: 40°,
- mobile phase: a mixture of 30 volumes of *methanol*, 35 volumes of *0.05 M potassium dihydrogen orthophosphate*, adjusted to pH 2.8 with *orthophosphoric acid* and 40 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Loratadine Impurity F[1]	0.9	1.6
Loratadine Impurity E[2]	1.1	1.9
Loratadine Impurity A[3]	2.4	1.7

[1]ethyl 4-[(11*RS*)-8-chloro-11-fluoro-6,11-dihydro-5*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridin-11-yl]piperidine-1-carboxylate,

[2]ethyl 4-[(11*RS*)-8-chloro-6,11-dihydro-5*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridin-11-yl]-3,6-dihydropyridine-1(2*H*)-carboxylate,

[3]ethyl 4-[(11*RS*)-8-chloro-11-hydroxy-6,11-dihydro-5*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridin-11-yl]piperidine-1-carboxylate.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to impurity E and loratadine is not less than 1.5.

Inject test solution (a) and (b). In the chromatogram obtained with test solution (a), the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with test solution (b) (0.2 per cent) and the sum of the areas of all secondary peaks is not more than 2.5 times the area of the peak in the chromatogram obtained with test solution (b) (0.5 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with test solution (b) (0.05 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), using the chromatographic conditions and reference solution (a) as described under Assay.

Test solution. Transfer one tablet in 10-ml volumetric flask, disperse in minimum quantity of *water* and add sufficient quantity of *methanol*, shake for 10 minutes, filter. Dilute the filtrate, with mobile phase to obtain a solution containing 0.01 per cent w/v of loratadine.

Calculate the content of $C_{22}H_{23}ClN_2O_2$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 20 mg of Loratadine with 20.0 ml of *methanol* and filter. Dilute 1.0 ml of the filtrate to 10.0 ml with the mobile phase.

Reference solution(a). A 0.01 per cent w/v solution of *loratadine IPRS* in the mobile phase.

Reference solution (b). A 0.1 per cent w/v solution of *loratadine impurity standard IPRS* in the mobile phase.

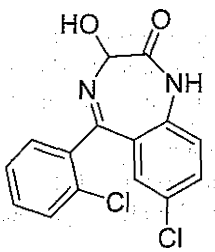
Use chromatographic system as described under Related substances.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to loratadine and impurity E is not less than 1.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{22}H_{23}ClN_2O_2$ in the tablets.

Lorazepam



$C_{15}H_{10}Cl_2N_2O_2$ Mol. Wt. 321.2

Lorazepam is (3*RS*)-7chloro-5-(2-chlorophenyl)-3-hydroxy-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one.

Lorazepam contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{15}H_{10}Cl_2N_2O_2$, calculated on the dried basis.

Category. Antianxiety.

Description. A white or almost white, crystalline powder. It shows polymorphism (2.5.11).

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *lorazepam IPRS* or with the reference spectrum of lorazepam.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 75 volumes of *methanol* and 25 volumes of *water.*

Test solution. Dissolve 32 mg of substance under examination in 100.0 ml of the solvent mixture.

Reference solution (a). A 0.0032 per cent w/v solution of *lorazepam IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.32 per cent w/v of *lorazepam IPRS* and 0.0032 per cent w/v, each of, *lorazepam related compound A IPRS, lorazepam related compound B IPRS, lorazepam related compound C IPRS, lorazepam related compound D IPRS* and *lorazepam related compound E IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as YMC-Pack ODS-A),
- column temperature: 5°,
- sample temperature: 4°,
- mobile phase: a mixture of 50 volumes of *acetonitrile*, 50 volumes of *water* and 1.2 volumes of *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 100 µl.

Name	Relative retention time	Correction factor
Lorazepam	1.0	---
Lorazepam related compound D[1]	1.4	---
Lorazepam related compound A[2]	1.7	---
Lorazepam related compound E[3]	1.9	0.77
Lorazepam related compound C[4]	2.1	---
Lorazepam related compound B[5]	5.5	---

[1]6-chloro-4-(*O*-chlorophenyl)-2-quinazolinecarboxylic acid,

[2]7-chloro-5-(*O*-chlorophenyl)-1,3-dihydro-3-acetoxy-2*H*-1,4-benzodiazepin-2-one,

[3]6-chloro-4-(*O*-chlorophenyl)-2-quinazoline methanol,

[4]6-chloro-4-(*O*-chlorophenyl)-2-quinazolinecarboxaldehyde,

[5]2-amino-2', 5-dichlorobenzophenone.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to lorazepam related compound A and lorazepam related compound E is not less than 1.2 in the chromatogram obtained with reference solution (b), the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. Run the chromatogram 7 times the retention time of the principal peak for the test solution. The area of any peak corresponding to lorazepam related compound D and lorazepam related compound E, each of, is not more than 0.15 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent), the area of any peak corresponding to lorazepam related compound A is not more than 0.1 times the area of the principal peak in the chromatogram obtained

with reference solution (a) (0.1 per cent), the area of any peak corresponding to lorazepam related compound C is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent), the area of any peak corresponding to lorazepam related compound B is not more than 0.01 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.01 per cent), the area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 0.75 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.75 per cent).

Sulphated ash (2.3.18). Not more than 0.3 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g under vacuum at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modifications.

Test solution. Dissolve 100 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution. A 0.01 per cent w/v solution of *lorazepam IPRS* in the solvent mixture.

- injection volume: 5 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{10}Cl_2N_2O_2$.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Lorazepam Injection

Lorazepam Injection is a sterile solution of Lorazepam in a suitable solvent.

Lorazepam Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of lorazepam, $C_{15}H_{10}Cl_2N_2O_2$.

Usual strengths. 2 mg per ml; 4 mg per ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Lorazepam related compound B. Not more than 0.1 per cent.

Determine by liquid chromatography (2.4.14).

Buffer solution. 0.05 M ammonium dihydrogen phosphate, adjusted to pH 6.5 with *ammonium hydroxide*.

Solvent mixture. Equal volumes of *methanol* and buffer solution.

Test solution. Dilute a volume of the injection containing 16 mg of Lorazepam to 100.0 ml with the solvent mixture.

Reference solution. A 0.0016 per cent w/v solution of *lorazepam related compound B IPRS* in the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Luna C18),
- mobile phase: a mixture of 55 volumes of *methanol* and 45 volumes of buffer solution,
- flow rate: 2 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 5.0 per cent and signal-to-noise ratio is not less than 10.

Inject the reference solution and the test solution.

Calculate the content of lorazepam related compound B.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of the injection containing 16 mg of Lorazepam to 100.0 ml with the mobile phase.

Reference solution (a). A 0.1 per cent w/v solution of *lorazepam IPRS* in *methanol*. Dilute a suitable volume with the mobile phase to obtain a solution containing 0.016 per cent w/v of Lorazepam.

Reference solution (b). A solution containing 0.00032 per cent w/v, each of, *lorazepam related compound C IPRS* and *lorazepam related compound D IPRS* in the mobile phase.

Reference solution (c). A solution containing 0.004 per cent w/v of *lorazepam IPRS* and 0.0032 per cent w/v, each of, *lorazepam related compound C IPRS* and *lorazepam related compound D IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 10-15 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm) (Such as Spherisorb ODS),

- mobile phase: a mixture of 50 volumes of *methanol* and 50 volumes of *0.05M ammonium dihydrogen phosphate*, adjusted to pH 6.5 with *ammonium hydroxide*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Name	Relative retention time
Lorazepam related compound D[1]	0.7
Lorazepam	1.0
Lorazepam related compound C[2]	2.7

[1]6-chloro-4-(*o*-chlorophenyl)-2-quinazolinecarboxylic acid,

[2]6-chloro-4-(*o*-chlorophenyl)-2-quinazolinecarboxaldehyde.

Inject reference solution (a) and (c). The test is not valid unless the resolution between the peaks due to lorazepam related compound D and lorazepam is not less than 1.2 and resolution between the peaks due to lorazepam and lorazepam related compound C is not less than 1.2 in the chromatogram obtained with reference solution (c) and the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (b) and the test solution. The sum of all the secondary peaks is not more than 4.0 per cent.

NOTE — Do not include as an impurity any peak from the test solution that has a retention time less than that of the lorazepam related compound D peak from reference solution (b).

Bacterial endotoxins (2.2.3). Not more than 100.0 Endotoxin Units per mg of lorazepam.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{15}H_{10}Cl_2N_2O_2$ in the injection.

Storage. Store in single dose or multiple dose containers, preferably of Type-1 glass, protected from light and in a refrigerator (2° to 8°).

Lorazepam Tablets

Lorazepam Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of lorazepam, $C_{15}H_{10}Cl_2N_2O_2$.

Usual strengths. 1 mg; 2 mg.

Identification

A. Disperse a quantity of the powdered tablets containing 15 mg of Lorazepam with 40 ml of *acetone*, with the aid of ultrasound for 5 minutes and filter. Evaporate the filtrate to dryness on a water-bath in a current of air. Dissolve the residue in 1ml of *acetone* and add 20 ml of 2,2,4-trimethylpentane. Heat the solution on a hot plate and evaporate to a volume of about 10 ml. Remove the solution from hot plate and evaporate to dryness in a current of air. Dry the residue under vacuum at 60° for 1 hour. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *lorazepam IPRS* treated in the same manner or with the reference spectrum of lorazepam.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 500 ml of *water*,
Speed and time. 100 rpm and 30 minutes, 60 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *lorazepam IPRS* in minimum amount of *ethanol* and dilute with the dissolution medium to obtain a solution of known concentration similar to the expected concentration of the test solution.

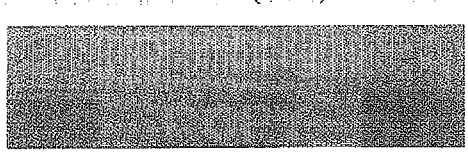
Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Luna C18),
- mobile phase: a mixture of 40 volumes of *acetonitrile*, 60 volumes of *water* and 0.4 volume of *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 50 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{10}Cl_2N_2O_2$ in the medium.

Q. Not less than 60 per cent of the stated amounts of $C_{15}H_{10}Cl_2N_2O_2$ in 30 minutes and not less than 80 per cent of the stated amount of $C_{15}H_{10}Cl_2N_2O_2$ in 60 minutes.

Related substances. Determine by liquid chromatography (2.4.14).



Solvent mixture. 75 volumes of *methanol* and 25 volumes of a buffer solution prepared by dissolving 67.7 g of *sodium acetate trihydrate* in 1000 ml of *water*, adjusted to pH 5.0 with *glacial acetic acid*.

Test solution. Transfer a quantity of powdered tablets containing 20 mg of Lorazepam in 25-ml volumetric flask, add 20 ml of the solvent mixture and stir for 15 minutes. Centrifuge the solution at 2000 rpm for 15 minutes and pass the supernatant through 0.45 µm polyethersulfone membrane filter. Dilute the filtrate with the solvent mixture to obtain a solution containing of 0.016 per cent w/v of lorazepam.

Reference solution (a). A 0.00016 per cent w/v solution of *lorazepam IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.016 per cent w/v of *lorazepam IPRS* and 0.00016 per cent w/v, each of, *lorazepam related compound A IPRS, lorazepam related compound B IPRS, lorazepam related compound C IPRS, lorazepam related compound D IPRS* and *lorazepam related compound E IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as YMC-Pack ODS-A),
- column temperature: 5°,
- sample temperature: 4°,
- mobile phase: a mixture of 50 volumes of *acetonitrile*, 50 volumes of *water* and1.2 volumes of *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Lorazepam	1.0	—
Lorazepam related compound D[1]	1.4	—
Lorazepam related compound A[2,*]	1.7	—
Lorazepam related compound E[3]	1.9	0.77
Lorazepam related compound C[4]	2.1	—
Lorazepam related compound B[5]	5.5	—

*Process impurity included for identification and not be included in the total impurities calculation.

[1]6-chloro-4-(*O*-chlorophenyl)-2-quinazolinecarboxylic acid,

[2]7-chloro-5-(*O*-chlorophenyl)-1,3-dihydro-3-acetoxy-2*H*-1,4-benzodiazepin-2-one,

[3]6-chloro-4-(*O*-chlorophenyl)-2-quinazoline methanol,

[4]6-chloro-4-(*O*-chlorophenyl)-2-quinazolinecarboxaldehyde,

[5]2-amino-2',5-dichlorobenzophenone.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to lorazepam related compound A and lorazepam related compound E is not less than 1.2 in the chromatogram obtained with reference solution (b), the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to lorazepam related compound D and lorazepam related compound E, each of, is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent), the area of any peak corresponding to lorazepam related compound C is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (3.0 per cent), the area of any peak corresponding to lorazepam related compound B is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent), the area of any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (4.0 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Transfer one intact tablet in 10-ml volumetric flask. Add 5 ml of the solvent mixture, disperse with the aid of ultrasound for 10 minutes and shake mechanically for 20 minutes and dilute to volume with the solvent mixture, mix and centrifuge the solution at 2000 rpm for 10 minutes. Dilute the supernatant with the solvent mixture to obtain a solution containing 0.01 per cent w/v of lorazepam.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{10}Cl_2N_2O_2$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 85 volumes of *methanol* and 15 volumes of *water*.

Test solution. Weigh 20 intact tablets and transfer to 100-ml volumetric flask. Add 50 ml of the solvent mixture, disperse with the aid of ultrasound for 10 minutes and shake mechanically for 20 minutes and dilute to volume with the solvent mixture, mix and centrifuge the solution at 2000 rpm for 10 minutes. Dilute the supernatant with the solvent mixture to obtain a solution containing 0.01 per cent w/v of lorazepam.

Reference solution. A 0.01 per cent w/v solution of *lorazepam IPRS* in the solvent mixture.

Chromatographic system as described under Dissolution with the following modifications.

– injection volume: 20 µl.

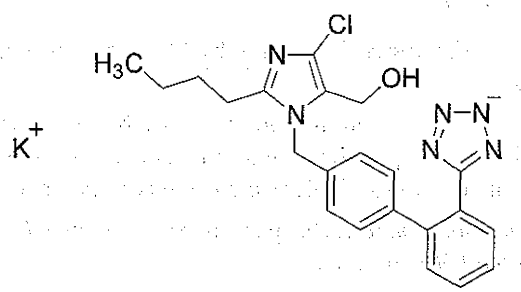
Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{10}Cl_2N_2O_2$ in the tablets.

Storage. Store protected from light and moisture.

Losartan Potassium



$C_{22}H_{22}ClKN_6O$ Mol. Wt. 461.0

Losartan Potassium is monopotassium salt of 2-butyl-4-chloro-1-[[2′-(1*H*-tetrazol-5-yl)[1,1′-biphenyl]-4-yl]methyl]-1*H*-imidazole-5-methanol.

Losartan Potassium contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{22}H_{22}ClKN_6O$, calculated on the anhydrous basis.

Category. Antihypertensive.

Production

As Nitrosamines are classified as probable human carcinogens, their presence in losartan potassium should be avoided or limited as much as possible. For this reason, manufacturers of losartan potassium for human use are expected to perform an assessment of the risk of *N*-nitrosamine formation and contamination during their manufacturing process; if this assessment identifies a potential risk, the manufacturing process should be modified to minimise contamination and a control strategy implemented to detect and control *N*-nitrosamine impurities in losartan potassium. The general chapter 5.11. Nitrosamine Impurities is available to assist manufacturers.

Description. A white to off-white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *losartan potassium IPRS* or with the reference spectrum of losartan potassium.

B. When examined in the range 200 to 400 nm (2.4.7), a 0.001 per cent w/v solution of *methanol* and compares with the absorbance obtained with a solution of *losartan potassium IPRS* prepared in a similar manner.

C. It gives reaction (A) of potassium (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 30 mg of the substance under examination in 100.0 ml of *methanol*.

Reference solution (a). A 0.03 per cent w/v solution of *losartan potassium IPRS* and 0.0002 per cent of *triphenyl-methanol* in *methanol*.

Reference solution (b). A 0.0003 per cent w/v solution of *losartan potassium IPRS* in *methanol*.

Chromatographic system

– a stainless steel column 25 cm x 4.0 mm packed with octadecylsilane bonded to porous silica (5 µm),
– mobile phase: A. 0.1 per cent w/v solution of *orthophosphoric acid* in *water* and filter,
B. *acetonitrile*,
– a gradient programme using the conditions given below,
– flow rate: 1 ml per minute,
– spectrophotometer set at 220 nm,
– injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	75	25
35	10	90
50	75	25
55	75	25

The relative retention times are about 1.0 for losartan and 1.9 for triphenylmethanol.

Inject reference solution (a). The test is not valid unless the tailing factor for losartan is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the peak in the chromatogram obtained with reference solution (b)

(0.5 per cent) and the sum of areas of all the secondary peaks is not more than the area of the peak in the chromatogram obtained with the reference solution (b) (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Water (2.3.43). Not more than 0.5 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 100.0 ml of *methanol*.

Reference solution. A 0.025 per cent w/v solution of *losartan potassium IPRS* in *methanol*.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. 0.1 per cent w/v solution of *orthophosphoric acid* in *water* and filter,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	75	25
35	10	90
50	75	25
60	75	25

Inject the reference solution. The test is not valid unless the column efficiency in not less than 5000 theoretical plates, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{22}ClKN_6O$.

Storage. Store protected from moisture.

Losartan Tablets

Losartan Potassium Tablets

Losartan Tablets contain Losartan Potassium.

Losartan Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of losartan potassium, $C_{22}H_{22}ClKN_6O$.

Usual strength. 50 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *water*,

Speed and time. 50 rpm for 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the medium if necessary, at the maximum at about 250 nm (2.4.7). Calculate the content of $C_{22}H_{22}ClKN_6O$ in the medium from the absorbance obtained from a solution of known concentration of *losartan potassium IPRS* in the same medium.

Q. Not less than 75 per cent of the stated amount of $C_{22}H_{22}ClKN_6O$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 100 mg of Losartan Potassium in *water* and dilute to 100.0 ml of *water* and filter.

Reference solution (a). A 0.1 per cent w/v solution of *losartan potassium IPRS* in *water*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm packed with octylsilane bonded to porous silica (5 µm), (Such as Lichrosphere RP8e),
- mobile phase: a mixture of 75 volumes of buffer solution prepared by mixing 770 mg of *ammonium acetate* in 1000 ml of *water*, add 2.0 ml of *triethylamine*, adjust pH to 6.5 with *glacial acetic acid* and 25 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the column efficiency is not less than 1000 theoretical plates and the tailing factor is not more than 3.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 2 times the area of the peak in the chromatogram obtained with the reference solution (b) (2.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Transfer intact tablets in a suitable volumetric flask, dissolve in mobile phase and disperse completely. Dilute with mobile phase to obtain a final concentration of 0.0125 per cent w/v.

Reference solution. A 0.125 per cent w/v solution of *losartan potassium IPRS* in mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm packed with octylsilane bonded to porous silica (5 µm), (Such as Lichrosphere RP8e)
- mobile phase: a mixture of 65 volumes of *0.005 M ammonium acetate*, 30 volumes of *acetonitrile*, 5 volumes of *methanol* and 0.2 volumes of *triethylamine*, adjusted to pH 6.6 with *glacial acetic acid* and filter,
- flow rate: 1 ml per minute,
- spectrophotometer set at 237 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{22}ClKN_6O$ in the tablets.

Storage. Store protected from light and moisture.

Labelling. The label states the strength of Losartan Potassium.

Losartan Potassium and Amlodipine Tablets

Amlodipine and Losartan Potassium Tablets; Losartan Potassium and Amlodipine Besylate Tablets; Losartan Potassium and Amlodipine Besilate Tablets

Losartan Potassium and Amlodipine Tablets contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of losartan potassium, $C_{22}H_{22}ClKN_6O$ and amlodipine besylate equivalent to amlodipine, $C_{20}H_{25}ClN_2O_5$.

Usual strength. Losartan 50 mg and amlodipine 5 mg.

Identification

In the Assay, the two principle peaks in the chromatogram obtained with the test solution corresponds to the peaks due to losartan potassium and amlodipine in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.01 M sodium acetate solution*, adjusted to pH 4.5 with *glacial acetic acid*,
Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14), using the chromatographic system as described under Assay, except using injection volume: 50 µl.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution (a). A solution containing 0.25 per cent w/v of *losartan potassium IPRS* and 0.035 per cent w/v of *amlodipine besylate IPRS* in *methanol*.

Reference solution (b). Take a suitable quantity of reference solution (a) to obtain a solution having a known concentration similar to expected concentration of the test solution in the dissolution medium.

Inject reference solution (b) and the test solution.

Calculate the contents of $C_{20}H_{25}ClN_2O_5$ and $C_{22}H_{22}ClKN_6O$ in the medium.

Q. Not less than 70.0 per cent of the stated amounts of $C_{22}H_{22}ClKN_6O$ and $C_{20}H_{25}ClN_2O_5$.

Uniformity of content. *For amlodipine* — Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), using the chromatographic system as described under Assay.

Test solution. Transfer 1 tablet to a 100-ml volumetric flask. Add 5 ml of *water* and sonicate for 10 minutes. Add 70 ml of the mobile phase, sonicate for 10 minutes and dilute to the volume with the mobile phase, filter.

Reference solution. A 0.007 per cent w/v solution of *amlodipine besylate IPRS* in the mobile phase.

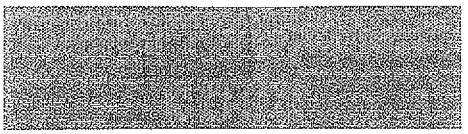
Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{25}ClN_2O_5$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh 10 intact tablets and transfer to 250-ml volumetric flask. Add 20 ml of *water* and sonicate for 10 minutes. Add about 170 ml of the mobile phase and sonicate for 10 minutes. Make up the volume with the mobile phase, mix and centrifuge. Dilute 5 ml of the supernatant to 25 ml with the mobile phase and filter.



Reference solution. A 0.0055 per cent w/v solution of *amlodipine besylate IPRS* and 0.04 per cent w/v solution of *losartan potassium IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 55 volumes of *phosphate buffer pH 5.0*, prepared by dissolving 0.68 g of *potassium dihydrogen orthophosphate* and 4.0 ml of *triethylamine* in 1000 ml of *water*, adjusted to pH 5.0 with *dilute orthophosphoric acid*, 22 volumes of *acetonitrile* and 18 volumes of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 237 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless The tailing factor for both the peaks due to amlodipine and losartan potassium is not more than 2.0, the relative standard deviation for replicate injections for each of the peaks corresponding to losartan potassium (first peak) and amlodipine (second peak) is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content $C_{20}H_{25}ClN_2O_5$ and $C_{22}H_{22}ClKN_6O$ in the tablets.

1 mg of Amlodipine besylate is equivalent to 0.000721 g of Amlodipine.

Storage. Store protected from light and moisture.

Labelling. The quantity of Amlodipine besylate is mentioned in the equivalent terms of Amlodipine.

Losartan Potassium and Hydrochlorothiazide Tablets

Hydrochlorothiazide and Losartan Potassium Tablets

Losartan Potassium and Hydrochlorothiazide Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of losartan potassium, $C_{22}H_{22}ClKN_6O$ and hydrochlorothiazide, $C_7H_8ClN_3O_4S_2$.

Usual strengths. Losartan, 25 mg and hydrochlorothiazide, 5 mg; Losartan, 50 mg and hydrochlorothiazide, 12.5 mg; Losartan, 25 mg and hydrochlorothiazide, 12.5 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution corresponds to the peaks in the chromatogram obtained with reference solution (c) of losartan potassium and hydrochlorothiazide.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water,*
Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution (a). A 0.05 per cent w/v solution of *losartan potassium IPRS* in dissolution medium.

Reference solution (b). Dissolve about 25 mg of *hydrochlorothiazide IPRS* in 10 ml of *acetonitrile* and dilute to 100.0 ml with dissolution medium.

Reference solution (c). Dilute 10.0 ml of reference solution (a) and 5.0 ml of reference solution (b) to 100.0 ml with dissolution medium.

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 60 volumes of buffer solution prepared by dissolving 0.78 g of *sodium dihydrogen orthophosphate* in 500 ml of *water*, adjusted to pH 2.5 with *orthophosphoric acid* and 40 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject reference solution (c).The test is not valid unless the tailing factor of both the principal peaks is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (c) and the test solution.

Calculate the content of $C_{22}H_{22}ClKN_6O$ and $C_7H_8ClN_3O_4S_2$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{22}H_{22}ClKN_6O$ and $C_7H_8ClN_3O_4S_2$.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), using the chromatographic system as described under Dissolution.

For Hydrochlorothiazide —

Test solution. Disperse 1 whole tablet in 100 ml of the mobile phase. Dilute 5 ml of the solution to 50 ml with the mobile phase.

Reference solution. A 0.025 per cent w/v solution of *hydrochlorothiazide IPRS* in the mobile phase. Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_7H_8ClN_3O_4S_2$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing about 50 mg of Losartan Potassium and 12.5 mg of Hydrochlorothiazide in 100.0 ml of the mobile phase, filter. Dilute 5.0 ml of the filtrate to 50.0 ml with the mobile phase.

Reference solution (a). A 0.05 per cent w/v solution of *losartan potassium IPRS* in the mobile phase.

Reference solution (b). A 0.025 per cent w/v solution of *hydrochlorothiazide IPRS* in the mobile phase.

Reference solution (c). Dilute 10.0 ml of reference solution (a) and 5.0 ml of reference solution (b) to 100.0 ml with the mobile phase.

Use chromatographic system as described under Dissolution.

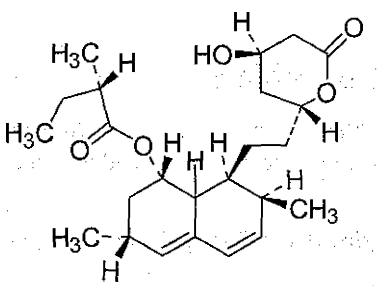
Inject reference solution (c). The test is not valid unless the tailing factor is not more than 2.0 and relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (c) and the test solution.

Calculate the content of $C_{22}H_{22}ClKN_6O$ and $C_7H_8ClN_3O_4S_2$ in the tablets.

Storage. Store protected from light and moisture.

Lovastatin



$C_{24}H_{36}O_5$ Mol. Wt. 404.5

Lovastatin is butanoic acid, 2-methyl-,1,2,3,7,8,8a-hexahydro-3,7-dimethyl-8-[2-(tetrahydro-4-hydroxy-6-oxo-2*H*-pyran-2-yl)-ethyl]-1-naphthalenyl ester, [1S-[1α(R*),3α,7β,8β(2S*,4S*),8aβ]]; (S)-2-methylbutyric acid, 8-ester with (4*R*,6*R*)-6-[2-[(1*S*,2*S*,6*R*,8*S*,8a*R*)-1,2,6,7,8,8a-hexahydro-8-hydroxy-2,6-dimethyl-1-naphthyl] ethyl] tetrahydro-4-hydroxy-2*H*-pyran-2-one.

Lovastatin contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{24}H_{36}O_5$, calculated on the dried basis.

Category. Antihyperlipidemic.

Description. A white to off-white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained from *lovastatin IPRS* or with the reference spectrum of lovastatin.

B. When examined in the range 200 to 400 nm (2.4.7), a 0.001 per cent w/v solution in *acetonitrile* shows an absorption maxima at the same wavelength as shown by the reference solution.

Tests

Specific optical rotation (2.4.22). +324° to +338°, determined in a 0.5 per cent w/v solution in *acetonitrile*.

Limit of lovastatin related compound A. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 25.0 ml of the *acetonitrile*.

Reference solution(a). A solution containing 0.0002 per cent w/v of *lovastatin IPRS* and *lovastatin related compound A IPRS* in *acetonitrile*.

Reference solution(b). A 0.0002 per cent w/v solution of *lovastatin IPRS* in *acetonitrile*.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 65 volumes of *acetonitrile* and 35 volumes of *0.01 M ortho phosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 200 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Lovastatin related compound A	1.3	0.62
Lovastatin	1.0	—

Inject reference solution (a) and (b). The test is not valid unless the resolution between lovastatin and lovastatin related compound A is not less than 6.0 and the relative standard

deviation for replicate injections is not more than 5.0 per cent with reference solution (b).

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of lovastatin related compound A is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent).

Chromatographic purity. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 25.0 ml of the *acetonitrile.*

Reference solution(a). A solution containing 0.0002 per cent w/v of *lovastatin IPRS* and *compactin* in *acetonitrile.*

Reference solution(b). A 0.0002 per cent w/v solution of *lovastatin IPRS* in *acetonitrile.*

Chromatographic system

- a stainless steel column 12.5 cm × 4.0 mm, packed with octadecylsilane bonded to porous silica (4 µm),
- column temperature: 40°,
- mobile phase: A. *0.001 M orthophosphoric acid,* adjusted to pH 4.0 with *1 M sodium hydroxide,*
  B. *acetonitrile,*
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 238 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	60	40
2	60	40
5	45	55
8	45	55
16	10	90
25	10	90
27	60	40
35	60	40

Name	Relative retention time	Correction factor
Compactin	0.85	—
Lovastatin	1.0	—
Unknown impurity	0.73	0.71

Inject reference solution (a) and (b). The test is not valid unless the resolution between lovastatin and compactin is not less than 3.5, the relative standard deviation for replicate injections is not more than 5.0 per cent with reference solution (b).

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.04 per cent).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Loss on drying (2.4.19). Not more than 0.3 per cent, determined on 1.0 g by drying in an vacuum oven at 60° at a pressure not exceeding 0.7 kPa for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 30 mg of the substance under examination in 100.0 ml of *acetonitrile.*

Reference solution. A 0.03 per cent w/v solution of *lovastatin IPRS* in *acetonitrile.*

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of a buffer solution prepared by dissolving 1 ml of *orthophosphoric acid* in 1000 ml of *water* and 65 volumes of *acetonitrile,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 238 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 1.4 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{24}H_{36}O_5$.

Storage. Store protected from moisture, under nitrogen, at a temperature between 2° to 8°.

Lovastatin Tablets

Lovastatin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of lovastatin, $C_{24}H_{36}O_5$.

Usual strengths. 10 mg; 20 mg; 40 mg.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Test solution. Disperse a quantity of powder containing 16 mg of lovastatin, add 0.4 ml of *water* and 1.6 ml of *acetonitrile* with the aid of ultrasound. Centrifuge for 4 minutes and use the clear supernatant.

Reference solution. A 0.8 per cent w/v solution of *lovastatin IPRS* in *acetonitrile*.

Mobile phase. A mixture of 5 volumes of *cyclohexane* 2 volumes of *chloroform* and 1 volume of *isopropyl alcohol*.

Apply to the plate 5 µl of each solution . After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of a solution prepared by dissolving 1.38 g of *monobasic sodium phosphate* and 20 g of *sodium lauryl sulphate* in 900 ml of *water*, adjusted to pH 7.0 with *1M sodium hydroxide* and dilute 1000 ml with *water*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necesssary with the dissolution medium.

Reference solution. Dissolve a quantity of *lovastatin IPRS* in sufficient *methanol* and dilute with the dissolution medium to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Chromatographic system
- a stainless steel column 5 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 30 volumes of a buffer solution prepared by dissolving 3.45 g of *monobasic sodium phosphate* in 900 ml of *water* and adjusting the pH 4.0 with *orthophosphoric acid* and dilute with *water* to 1000 ml, 50 volumes of *acetonitrile* and 10 volumes of *methanol*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{24}H_{36}O_5$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{24}H_{36}O_5$.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modification.

Test solution. Transfer one tablet in 50-ml volumetric flask, disperse in minimum quantity of *water* and add sufficient quantity of solvent mixture, sonicate and filter. Dilute with solvent mixture to obtain a similar concentration as the reference solution.

Calculate the content of $C_{24}H_{36}O_5$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.17).

Solvent mixture. 20 volumes of a buffer solution prepared by dissolving 3 ml of *glacial acetic acid* in 900 ml of *water*, adjust to a pH of 4.0 with *sodium hydroxide solution* dilute to 1000 ml with *water* and 80 volumes of *acetonitrile*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 40 mg of Lovastatin with 150 ml of solvent mixture with the aid of ultrasound for 20 minutes, cool to room temperature and stand for 30 minutes, dilute to 200.0 ml with the solvent mixture, centrifuge a portion of the solution. Dilute 5.0 ml of supernatant liquid to 25.0 ml with the solvent mixture.

Reference solution. A 0.004 per cent w/v solution of *lovastatin IPRS* in the solvent mixture.

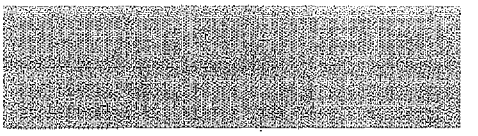
Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: a mixture of 30 volumes of a buffer solution prepared by dissolving 3.45 g of *monobasic sodium phosphate* in 900 ml of *water* and adjusting the pH 4.0 with *orthophosphoric acid* and dilute to 1000 ml with *water*, 50 volumes of *acetonitrile* and 10 volumes of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

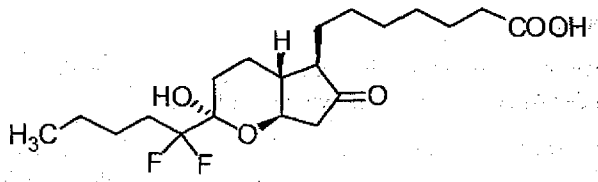
Inject the reference solution and the test solution.

Calculate the content of $C_{24}H_{36}O_5$ in the tablets.

Storage. Store protected from light and moisture.



Lubiprostone



$C_{20}H_{32}F_2O_5$ Mol Wt. 390.5

Lubiprostone is 7-[(1*R*,3*R*,6*R*,7*R*)-3-(1,1-Difluoropentyl)-3-hydroxy-8-oxo-2-oxabicyclo[4.3.0]non-7-yl]heptanoic acid.

Lubiprostone contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{20}H_{32}F_2O_5$, calculated on the dried basis.

Category. Constipation agent ,Gastro intestinal drug.

Description. A white to off white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *lubiprostone IPRS* or with the reference spectrum of lubiprostone.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *water* and *acetonitrile*.

Test solution. Dissolve 25 mg of the substance under examination in the solvent mixture and dilute to 25.0 ml with the solvent mixture.

Reference solution. A 0.001 per cent w/v solution of *lubiprostone IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of 0.01 per cent v/v solution of *triflouroaceticacid* in *water* and 50 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 294 nm,
- injection volume: 100 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any scondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent) and the sum of areas of all the secondary peaks is not more than the two times the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent). Ignore any peak due to lubiprostone tautomer at relative retention time 0.65 with respect to lubiprostone.

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 45° for 30 minutes under vacuum at 0.7 kPa.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *water* and *acetonitrile*.

Test solution. Dissolve 25 mg of the substance under examination in the solvent mixture and dilute to 25.0 ml with the solvent mixture.

Reference solution. A 0.1 per cent w/v solution of *lubiprostone IPRS* in the solvent mixture.

Chromatographic system

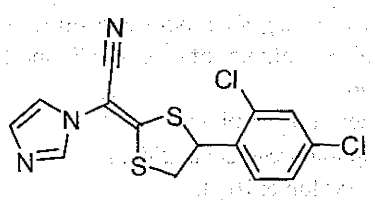
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of 0.01 per cent v/v solution of *triflouroaceticacid* in *water* and 50 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 294 nm,
- injection volume: 100 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates , the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{32}F_2O_5$.

Luliconazole



$C_{14}H_9Cl_2N_3S_2$ Mol Wt. 354.3

Luliconazole is (2E)[4-(2,4-Dichlorophenyl)-1,3-dithiolan-2-ylidene](1H-imidazol-1-yl)acetonitrile.

Luliconazole contains not less than 98.5 per cent and not more than 102.0 per cent of the stated amount of luliconazole, $C_{14}H_9Cl_2N_3S_2$, calculated on the dried basis.

Category. Antifungal.

Description. An off white to pale yellow, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *luliconazole IPRS* or with the reference spectrum of luliconazole.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Appearance of solution. A 5.0 per cent w/v solution in *acetone* is clear (2.4.1) and not more intensely coloured than reference solution BYS5 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light.

A. *For Luliconazole S-E form* —

Test solution. Dissolve 100 mg of the substance under examination in 70 ml of *acetonitrile* with the aid of ultrasound and dilute to 100.0 ml with the same solvent.

Reference solution. A solution containing 0.002 per cent w/v each of *luliconazole IPRS* and *luliconazole S-E form IPRS ((2E)-[(4S)-4-(2,4-dichlorophenyl)-1,3-dithiolan-2-ylidene](1H-imidazol-1-yl)ethanenitrile)* in *acetonitrile.*

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with OD-H (5 µm) (Such as Chiralcel OD-H),
- column temperature: 40°,
- mobile phase. a mixture of 20 volumes of 7.0 per cent w/v solution of *sodium perchlorate monohydrate* and 80 volumes of *methanol*,
- flow rate: 0.6 ml per minute,
- spectrophotometer set at 295 nm,
- injection volume: 10 µl.

The relative retention time with reference to luliconazole for luliconazole S-E form is about 1.18.

Inject the reference solution. The test is not valid unless the resolution between luliconazole peak and luliconazole S-E form peak is not less than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of peak due to luliconazole S-E form is not more than 0.5 times the area of corresponding peak in the chromatogram obtained with the reference solution (1.0 per cent).

B. *For Luliconazole Z form* and other related substances

Test solution. Dissolve 100 mg of the substance under examination in 70 ml of *acetonitrile* with the aid of ultrasound and dilute to 100.0 ml with *acetonitrile.*

Reference solution. A solution containing 0.004 per cent w/v each of *luliconazole IPRS* and *luliconazole Z form IPRS ((2Z)-[4-(2,4-dichlorophenyl)-1,3-dithiolan-2-ylidene](1H-imidazol-1-yl)ethanenitrile)* in *acetonitrile.*

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS-2),
- column temperature: 40°,
- mobile phase:a mixture of 54 volumes of a buffer solution prepared by dissolving 2.4 gm of *sodium 1-undecane sulphonate* in 1000 ml of *water,* 45 volumes of *acetonitrile* and 1 volume of *glacial acetic acid,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 295 nm,
- injection volume: 10 µl.

The relative retention time with reference to luliconazole for luliconazole Z form is about 0.86.

Inject the reference solution.The test is not valid unless the resolution between luliconazole peak and luliconazole Z form peak is not less than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with test solution the area of peak due to luliconazole Z form is not more than 0.025 times the area of corresponding peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of the areas of all other secondary peaks other than Z form is not more than 0.025 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent).

Heavy metals (2.3.13). 2.0 g complies with the test for heavy metals, Method B (10 ppm).

Sulphated ash (2.4.18). Not more than 0.1 per cent.

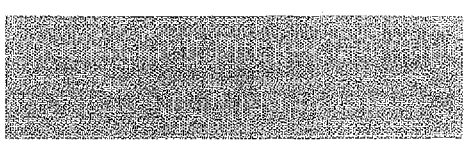
Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in vacuum at 105° for 2 hours.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light.

Internal standard solution. A 0.05 per cent w/v solution of *ethyl 4-aminobenzoate* in *acetonitrile.*

Test solution. Dissolve 100 mg of the substance under examination in 70 ml of *acetonitrile* with the aid of ultrasound



and dilute to 100.0 ml with the same solvent. Transfer 10.0 ml of the solution to 50-ml volumetric flask, add 10.0 ml of the internal standard solution and dilute to volume with *acetonitrile*.

Reference solution. A 0.1 per cent w/v solution of *luliconazole IPRS* in *acetonitrile*. Transfer 10.0 ml of the solution to 50-ml volumetric flask, add 10.0 ml of the internal standard solution and dilute to volume with *acetonitrile*.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with OD-H (5 µm) (Such as Chiralcel OD-H),
- column temperature: 40°,
- mobile phase: a mixture of 60 volumes of *n-hexane*, 40 volumes of *propan-2-ol* and 0.1 volume of *diethylamine*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 295 nm,
- injection volume: 5 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to the internal standard and luliconazole is not less than 10 and the relative standard deviation of the ratio of peak area of luliconazole to that of peak area of the internal standard, for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_9Cl_2N_3S_2$ using ratio of the peak area of luliconazole to that of peak area of the internal standard.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Luliconazole Cream

Luliconazole Cream contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of luliconazole, $C_{14}H_9Cl_2N_3S_2$.

Usual strength. 1.0 per cent w/w.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 3.5 to 7.0, determined in 10 per cent w/v solution of cream.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light.

A. *For Luliconazole S-E form* —

Test solution. Disperse a quantity of cream containing 10 mg of Luliconazole in 70 ml of *acetonitrile*, with the aid of ultrasound, for 10 minutes with intermittent shaking and dilute to 100.0 ml with *acetonitrile*, mix and filter.

Reference solution. A 0.001 per cent w/v solution, each of *luliconazole IPRS and luliconazole S-E form IPRS ((2E)-[(4S)-4-(2,4-dichlorophenyl)-1,3-dithiolan-2-ylidene](1H-imidazol-1-yl)ethanenitrile))* in *acetonitrile*.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with OD-H (5 µm) (Such as Chiralcel OD-H),
- column temperature: 40°,
- mobile phase: a mixture of 20 volumes of 7.0 per cent w/v solution of *sodium perchlorate monohydrate* and 80 volumes of *methanol*,
- flow rate: 0.6 ml per minute,
- spectrophotometer set at 295 nm,
- injection volume: 10 µl.

The relative retention time with reference to luliconazole for luliconazole S-E form is about 1.17.

Inject the reference solution. The test is not valid unless the resolution between luliconazole peak and luliconazole S-E form peak is not less than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of the peak due to luliconazole S-E form is not more than 0.25 times the area of the corresponding peak in the chromatogram obtained with the reference solution (2.5 per cent).

B. *For Luliconazole Z form* and other related substances.

Test solution. Disperse a quantity of cream containing about 10 mg of Luliconazole in 70 ml of *acetonitrile*, with the aid of ultrasound for 10 minutes with intermittent shaking and dilute to 100.0 ml with *acetonitrile*, filter.

Reference solution. A 0.001 per cent w/v solution each of *luliconazole IPRS* and *luliconazole Z form IPRS ((2Z)-[4-(2,4-dichlorophenyl)-1,3-dithiolan-2-ylidene](1H-imidazol-1-yl)ethanenitrile))*in *acetonitrile*.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS-2),
- column temperature: 40°,
- mobile phase: a mixture of 54 volumes of a buffer solution prepared by dissolving 2.4 gm of *sodium 1-undecanesulphonate* in 1000 ml of *water*, 45 volumes of *acetonitrile* and 1 volume of *glacial acetic acid*,
- flow rate: 1 ml per minute,

- spectrophotometer set at 295 nm,
- injection volume: 10 µl.

The relative retention time with reference to luliconazole for luliconazole Z form is about 0.86.

Inject the reference solution. The test is not valid unless the resolution between luliconazole peak and luliconazole Z form peak is not less than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of the peak due to luliconazole Z form is not more than 0.03 times the area of the corresponding peak in the chromatogram obtained with the reference solution (0.3 per cent) and sum of the areas of all other secondary peaks is not more than 0.03 times the area of the luliconazole peak in the chromatogram obtained with the reference solution (0.3 per cent).

Other tests. Comply with the tests stated under Creams.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light.

Internal standard solution. A 0.2 per cent w/v solution of *4-chlorobenzophenone* in *acetonitrile.*

Test solution. Disperse a quantity of cream containing 10 mg of Luliconazole in 50 ml of *acetonitrile,* add 10.0 ml of the internal standard solution and dilute to 100.0 ml with *acetonitrile.*

Reference solution. A 0.1 per cent w/v solution of *luliconazole IPRS* in *acetonitrile.* To 10.0 ml of the solution, add 10.0 ml of the internal standard solution and dilute to 100.0 ml with *acetonitrile.*

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with OD-H (5 µm) (Such as Chiralcel OD-H 5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 20 volumes of 7.0 per cent w/v solution of *sodium perchlorate monohydrate* and 80 volumes of *methanol,*
- flow rate: 0.6 ml per minute,
- spectrophotometer set at 295 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to the internal standard and luliconazole is not less than 9 and the relative standard deviation of the ratio of peak area of luliconazole to that of peak area of the internal standard, for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_9Cl_2N_3S_2$ in the cream using ratio of the peak area of luliconazole to that of peak area of the internal standard.

Storage. Store at a temperature not exceeding 30°.

Luliconazole Lotion

Luliconazole Lotion contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of luliconazole, $C_{14}H_9Cl_2N_3S_2$.

Usual strength. 1.0 per cent w/v.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light.

A. *For Luliconazole S-E form —*

Test solution. Disperse a quantity of lotion containing 10 mg of Luliconazole in 70 ml of *acetonitrile,* with the aid of ultrasound for 10 minutes with intermittent shaking and dilute to 100.0 ml with *acetonitrile,* mix and filter.

Reference solution. A 0.001 per cent w/v solution, each of *luliconazole IPRS and luliconazole S-E form IPRS ((2E)-[(4S)-4-(2,4-dichlorophenyl)-1,3-dithiolan-2-ylidene](1H-imidazol-1-yl)ethanenitrile))* in *acetonitrile.*

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with OD-H (5 µm) (Such as Chiralcel OD-H),
- column temperature: 40°,
- mobile phase: a mixture of 20 volumes of 7.0 per cent w/v solution of *sodium perchlorate monohydrate* and 80 volumes of *methanol,*
- flow rate: 0.6 ml per minute,
- spectrophotometer set at 295 nm,
- injection volume: 10 µl.

The relative retention time with reference to luliconazole for luliconazole S-E form is about 1.17.

Inject the reference solution. The test is not valid unless the resolution between luliconazole peak and luliconazole S-E form peak is not less than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of the peak due to luliconazole S-E form is not more than 0.4 times the area of the corresponding peak in the chromatogram obtained with the reference solution (4.0 per cent).

B. *For Luliconazole Z form* and other related substances

Test solution. Disperse a quantity of lotion containing about 10 mg of Luliconazole in 70 ml of *acetonitrile,* with the aid of ultrasound for 10 minutes with intermittent shaking and dilute to 100.0 ml with *acetonitrile,* mix and filter.

Reference solution. A 0.001 per cent w/v solution each of *luliconazole IPRS* and *luliconazole Z form IPRS ((2Z)-[4-(2,4-dichlorophenyl)-1,3-dithiolan-2-ylidene](1H-imidazol-1-yl)ethanenitrile))* in *acetonitrile.*

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS-2),
- column temperature: 40°,
- mobile phase: a mixture of 54 volumes of a buffer solution prepared by dissolving 2.4 gm of *sodium 1-undecane sulphonate* in 1000 ml of *water*, 45 volumes of *acetonitrile* and 1 volume of *glacial acetic acid,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 295 nm,
- injection volume: 10 µl.

The relative retention time with reference to luliconazole for luliconazole Z form is about 0.86.

Inject the reference solution. The test is not valid unless the resolution between luliconazole peak and luliconazole Z form peak is not less than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of the peak due to luliconazole Z form is not more than 0.05 times the area of the corresponding peak in the chromatogram obtained with the reference solution (0.5 per cent) and sum of the areas of all other secondary peaks is not more than 0.04 times the area of the luliconazole peak in the chromatogram obtained with the reference solution (0.4 per cent).

Other tests. Comply with the tests stated under Lotions.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light.

Internal standard solution. A 0.2 per cent w/v solution of *4- chlorobenzophenone* in *acetonitrile.*

Test solution. Disperse a quantity of lotion containing 10 mg of Luliconazole in 50 ml of *acetonitrile,* add 10.0 ml of the internal standard solution and dilute to 100.0 ml with *acetonitrile.*

Reference solution. A 0.1 per cent w/v solution of *luliconazole IPRS* in *acetonitrile.* To 10.0 ml of the solution, add 10.0 ml of the internal standard solution and dilute to 100.0 ml with *acetonitrile.*

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with OD-H (5 µm) (Such as Chiralcel OD-H),
- column temperature: 40°,
- mobile phase: a mixture of 20 volumes of 7.0 per cent w/v solution of *sodium perchlorate monohydrate* and 80 volumes of *methanol,*
- flow rate: 0.6 ml per minute,
- spectrophotometer set at 295 nm,
- injection volume: 10 µl.

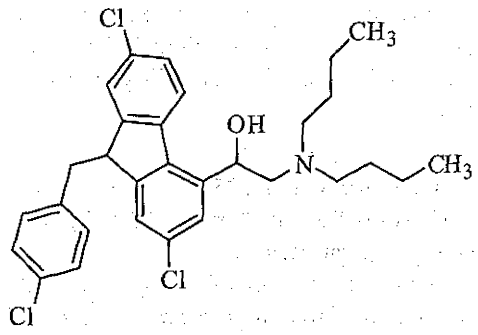
Inject the reference solution. The test is not valid unless the resolution between the peaks due to the internal standard and luliconazole is not less than 9 and the relative standard deviation of the ratio of peak area of luliconazole to that of peak area of the internal standard, replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_9Cl_2N_3S_2$ in the lotion using ratio of the peak area of luliconazole to that of peak area of the internal standard.

Storage. Store at a temperature not exceeding 30°.

Lumefantrine



$C_{30}H_{32}Cl_3NO$ Mol. Wt. 528.9

Lumefantrine is (±)-2,7-Dichloro-9-[(z)-p-chlorobenzylidine]-á[(dibutylamino)methyl]-fluorene-4-methanol.

Lumefantrine contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{30}H_{32}Cl_3NO$.

Category. Antimalarial.

Description. A yellow crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *lumefantrine IPRS* or with the reference spectrum of lumefantrine.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Appearance of solution. A 10 per cent w/v solution in *dichloromethane* is not more opalescent than opalescence standard OS1 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay with the following modification.

Reference solution (d). Dissolve 5 mg of *lumefantrine IPRS* in 10 ml of *dichloromethane* and dilute to 100.0 ml with *acetonitrile*. Dilute 1.0 ml of the solution to 50.0 ml with *acetonitrile*.

Name	Relative retention time	Correction factor
Desbutyl lumefantrine[1]	0.68	0.91
Lumefantrine	1.0	---

[1](z)-2-(Butylamino)-1-(2,7-dichloro-9-(4-chlorobenzylidene)-9H-fluoren-4-yl)ethanol.

Inject reference solution (d) and the test solution. In the chromatogram obtained with the test solution, the area of desbutyl lumefantrine peak is not more than the 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.05 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.3 per cent). Ignore any peak other than desbutyl lumefantrine peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with limit test for heavymetals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 100 mg of the substance under examination in 10 ml of *dichloromethane* and dilute to 100.0 ml with *acetonitrile*.

Reference solution (a). Dissolve 100 mg of *lumefantrine IPRS* in 10 ml of *dichloromethane* and dilute to 100.0 ml with *acetonitrile*.

Reference solution (b). Dissolve 5 mg of *lumefantrine related compound A IPRS* in 10 ml of *dichloromethane* and dilute to 100.0 ml with *acetonitrile*. Dilute 2.0 ml of the solution to 10.0 ml with *acetonitrile*.

Reference solution (c). Dissolve 10 mg of *lumefantrine IPRS* in 1 ml of *dichloromethane*, add 1.0 ml of reference solution (b) and dilute to 10.0 ml with *acetonitrile*.

Chromatographic system

- a stainless steel column 5 cm × 4.6 mm, packed with octadecylsilanebonded to porous silica (1.8 µm),
- column temperature: 50°,
- mobile phase: A. a mixture of 30 volumes of *acetonitrile* and 70 volumes of a buffer solution prepared by dissolving 5.65 g of *sodium 1-hexanesulphonate* and 2.75 g of *monobasic sodium phosphate* in 900 ml of *water*, adjusted to pH 2.3 with *phosphoric acid* and dilute to 1000 ml with *water*,
  B. a mixture of 54 volumes of *acetonitrile* and 46 volumes of *2-propanol*,
- a gradient programme using the conditions given below,
- flow rate: 2.5 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 2.5 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	65	35
1.2	65	35
6.0	50	50
6.4	30	70
10	25	75
15	10	90
15.1	65	35
20	65	35

Name	Relative retention time
Lumefantrine related compound A[1]	0.9
Lumefantrine	1.0

[1](RS, Z)-2-(Dibutylamino)-2-(2,7-dichloro-9-(4-chlorobenzylidene)-9H-fluoren-4-yl) ethanol).

Inject reference solution (a) and (c). The test is not valid unless the resolution between the peaks due to lumefantrine and lumefantrine related compound A is not less than 1.3 in the chromatogram obtained with reference solution (c), the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.0 per cent in the chromatogram obtained with reference solution (a).

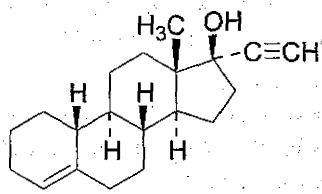
Inject reference solution (a) and the test solution.

Calculate the content of $C_{30}H_{32}Cl_3NO$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Lynoestrenol

Lynestrenol



$C_{20}H_{28}O$ Mol. Wt. 284.4

Lynoestrenol is 19-nor-17α-pregn-4-en-20-yn-17β-ol.

Lynoestrenol contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{20}H_{28}O$, calculated on the dried basis.

Category. Progestogen.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *lynoestrenol IPRS* or with the reference spectrum of lynoestrenol.

B. In the test of Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (b).

C. Melting range. 161° to 165° (2.4.21).

Tests

Appearance of solution. A 2.0 per cent w/v solution in *ethanol (95 per cent)* is clear (2.4.1) and colourless (2.4.1).

Specific optical rotation (2.4.22). – 11.0° to – 9.5°, determined in a 3.6 w/v solution in *ethanol (95 per cent)*.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 80 volumes of *n-heptane* and 20 volumes of *acetone*.

Test solution (a). Dissolve 0.5 g of the substance under examination in 100.0 ml of *chloroform*.

Test solution (b). Dissolve 0.25 g of the substance under examination in 100.0 ml of *chloroform*.

Reference solution (a). A 0.0025 per cent w/v solution of the substance under examination in *chloroform*.

Reference solution (b). A 0.25 per cent w/v solution of *lynoestrenol IPRS* in *chloroform*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and spray with *0.25 M ethanolic sulphuric acid*, heat at 105° for 10 minutes and examine under ultraviolet light at 365 nm. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a).

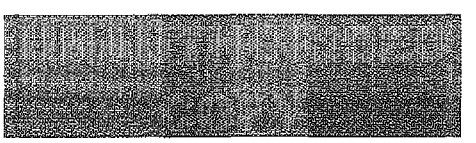
Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 0.5g by drying in an oven at 105°.

Assay. Weigh 0.15 g, dissolve in 40 ml of *tetrahydrofuran*, add 5 ml of a 10 per cent w/v solution of *silver nitrate*. Titrate with *0.1 M sodium hydroxide*, deter-mining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.02844 g of $C_{20}H_{28}O$.

Storage. Store protected from light and moisture.

M



Magaldrate

$Al_5Mg_{10}(OH)_{31}(SO_4)_2,xH_2O$ Mol. Wt. 1097.4 (anhydrous)

Magaldrate is a chemical combination of aluminium and magnesium hydroxides and sulphates corresponding approximately to the formula $Al_5Mg_{10}(OH)_{31}(SO_4)_2,xH_2O$.

Magaldrate contains not less than 90.0 per cent and not more than 105.0 per cent of $Al_5Mg_{10}(OH)_{31}(SO_4)_2$, calculated on the dried basis.

Category. Antacid.

Description. A white or almost white, crystalline powder.

Identification

A. Dissolve 0.8 g in 20 ml of *3 M hydrochloric acid*, dilute with *water* to 50 ml, add 3 drops of *methyl red solution* and heat to boiling. Add *dilute ammonia solution* until the colour changes to just yellow, continue boiling for 2 minutes and filter; the filtrate gives the reactions of magnesium salts (2.3.1).

B. Wash the precipitate obtained in test A with 50 ml of a hot 2 per cent w/v solution of *ammonium chloride*, then dissolve the precipitate in 15 ml of *3 M hydrochloric acid*; the solution gives the reactions of aluminium salts (2.3.1).

Tests

Arsenic (2.3.10). To 1.0 g add 15 ml of *hydrochloric acid*, 0.1 ml of *stannous chloride solution AsT* and 5 ml of *potassium iodide solution* and allow to stand for 15 minutes. The resulting solution complies with the limit test for arsenic (10 ppm).

Heavy metals (2.3.13). Dissolve 0.33 g in 10 ml of *3 M hydrochloric acid*, filtering to get a clear solution and diluting to 25 ml with *water*. The solution complies with the limit test for heavy metals, Method A (60 ppm).

Soluble chloride. Boil 1.0 g, weighed, with 50.0 ml of *water* for 5 minutes, cool, add *water* to the original volume, mix and filter. To 25.0 ml of the filtrate add 0.1 ml of *potassium chromate solution* and titrate with *0.1 M silver nitrate* until a persistent pink colour is obtained; Not more than 5.0 ml of *0.1 M silver nitrate* is required (3.5 per cent).

Soluble sulphate. Dilute 2.5 ml of the filtrate obtained in the test for Soluble chloride to 40 ml with *water* in a Nessler cylinder, add 1 ml of *3 M hydrochloric acid* and 3 ml of *barium chloride solution*, dilute to 50.0 ml, mix and allow to stand for 10 minutes; any turbidity produced is not greater than that produced by treating 1.0 ml of *0.01 M sulphuric acid* in the same manner (1.9 per cent).

Sodium. Transfer 2.0 g, weighed, to a 100-ml volumetric flask, place in an ice-bath, add 5 ml of *nitric acid* and swirl to dissolve. Allow to warm to room temperature, dilute with *water* to volume and mix. Filter, if necessary, to obtain a clear solution. Dilute 10.0 ml of the filtrate with *water* to 100.0 ml. The emission intensity of the solution, determined by flame photometry (2.4.4), at about 589 nm and corrected for background transmission at about 580 nm, is not greater than that produced by treating similarly a standard solution containing 2.2 µg of Sodium per ml.

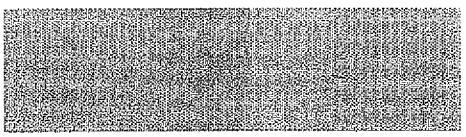
Aluminium hydroxide. 32.1 to 45.9 per cent of $Al(OH)_3$, calculated on the dried basis and determined by the following method. Dissolve about 100 mg, weighed, in 3 ml of *dilute hydrochloric acid* and dilute to 30.0 ml with *water*. Add with stirring 25.0 ml of *0.05 M disodium edetate*, mix and allow to stand for 5 minutes. Add 20 ml of *acetic acid-ammonium acetate buffer*, 60 ml *ethanol (95 per cent)* and 2 ml of *dithizone solution* and titrate with *0.05 M zinc sulphate* to a bright rose-pink colour. Repeat the procedure without the substance under examination. The difference between the titrations represents the amount of *disodium edetate* required.

1 ml of *0.05 M disodium edetate* is equivalent to 0.0039 g of $Al(OH)_3$.

Magnesium hydroxide. 49.2 to 66.6 per cent of $Mg(OH)_2$, calculated on the dried basis and determined by the following method. Dissolve about 100 mg, weighed, in 3 ml of *dilute hydrochloric acid* and dilute with *water* to about 200 ml. Add with stirring 1 g of *ammonium chloride*, 20 ml of *triethanolamine*, 10 ml of *ammonia-ammonium chloride buffer* and 0.1 ml of *eriochrome black T solution* and titrate with *0.05 M disodium edetate* to a blue colour. Repeat the procedure without the substance under examination. The difference between the titrations represents the amount of *disodium edetate* required.

1 ml of *0.05 M disodium edetate* is equivalent to 0.002916 g of $Mg(OH)_2$.

Sulphates. 16.0 to 21.0 per cent, calculated on the dried basis and determined by the following method. Weigh 0.875 g, transfer to a 25-ml volumetric flask, dissolve in 10 ml of *water* and 5 ml of *glacial acetic acid*, dilute to volume with *water* and mix. Transfer 5.0 ml of the solution to a glass chromatographic column, 1 cm in internal diameter, prepared by filling with 15 ml of a strongly acidic styrene-divinylbenzene cation exchange resin (50 to 100 mesh) (such as Dowex 50W-X8 or Amberlite 120) and washing the resin with 30 ml of *water*. Elute the column with 15 ml of *water* and collect the eluate in a 125-ml conical flask. To the eluate add 5 ml of a 5.38 per cent w/v solution of *magnesium acetate* and 32 ml of *methanol*. Titrate with *0.05 M barium chloride* using a 0.2 per cent w/v solution of *sodium alizarin sulphonate* as the indicator and adding about 5 ml of the titrant in the beginning and continuing the titration slowly thereafter until the yellow colour disappears and a pink tinge is visible.



1 ml of *0.05 M barium chloride* is equivalent to 0.004803 g of Sulphates.

Microbial contamination (2.2.9). 1.0 g is free from *Escherichia coli*.

Loss on drying (2.4.19). 10.0 to 20.0 per cent, determined on 0.5 g by drying in an oven at 200° for 4 hours.

Assay. Weigh 3.0 g and transfer to a 250-ml conical flask. Add 100.0 ml of *1 M hydrochloric acid* and stir well until a clear solution is obtained. Titrate the excess acid with *1 M sodium hydroxide* to a pH of 3.0, determined potentiometrically (2.4.25). Repeat the procedure without the substance under examination. The difference between the titrations represents the amount of hydrochloric acid required.

1 ml of *1 M hydrochloric acid* is equivalent to 0.0354 g of $Al_5Mg_{10}(OH)_{31}(SO_4)_2$.

Storage. Store protected from moisture.

Magaldrate Oral Suspension

Magaldrate Suspension

Magaldrate Oral Suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of anhydrous magaldrate, $Al_5Mg_{10}(OH)_{31}(SO_4)_2$.

Usual strength. The equivalent of 800 mg of anhydrous magaldrate per 5 ml.

Identification

A. Dissolve an amount of the suspension containing about 0.8 g of anhydrous magaldrate in 20 ml of *3 M hydrochloric acid*, dilute with *water* to 50 ml, add 3 drops of *methyl red solution* and heat to boiling. Add *dilute ammonia solution* until the colour changes to just yellow, continue boiling for 2 minutes and filter; the filtrate gives the reactions of magnesium salts (2.3.1).

B. Wash the precipitate obtained in test A with 50 ml of a hot 2 per cent w/v solution of *ammonium chloride*, then dissolve the precipitate in 15 ml of *3 M hydrochloric acid*; the solution gives the reactions of aluminium salts (2.3.1).

Tests

Aluminium hydroxide. 32.1 to 45.9 per cent of the stated content of anhydrous magaldrate, determined by the following method. To a quantity containing about 1.0 g of magaldrate add 30 ml of *dilute hydrochloric acid*, shake to dissolve, dilute to 100.0 ml with *water* and mix (solution A). To 10.0 ml of the solution add 20 ml of *water* and Add with stirring 25.0 ml of *0.05 M disodium edetate*, mix and allow to stand for 5 minutes. Add 20 ml of *acetic acid-ammonium acetate buffer*, 60 ml *ethanol (95 per cent)* and 2 ml of *dithizone solution* and titrate with *0.05 M zinc sulphate* to a bright rose-pink colour. Repeat the procedure without the substance under examination. The difference between the titrations represents the amount of disodium edetate required.

1 ml of *0.05 M disodium edetate* is equivalent to 0.0039 g of $Al(OH)_3$.

Magnesium hydroxide. 49.2 to 66.6 per cent of the stated content of anhydrous magaldrate, determined by the following method. Take 10.0 ml of solution A and dilute with *water* to about 200 ml. Add with stirring 1 g of *ammonium chloride*, 20 ml of *triethanolamine*, 10 ml of *ammonia-ammonium chloride buffer* and 0.1 ml of *eriochrome black T solution* and titrate with *0.05 M disodium edetate* to a blue colour. Repeat the procedure without the substance under examination. The difference between the titrations represents the amount of disodium edetate required.

1 ml of *0.05 M disodium edetate* is equivalent to 0.002916 g of $Mg(OH)_2$.

Neutralising capacity. To a weighed quantity of the well-shaken suspension containing 0.8 g of anhydrous magaldrate in a 250-ml beaker add *water* to make a total volume of about 70 ml, heat to 37° and stir continuously, maintaining the temperature at 37°. Add 30.0 ml of *1 M hydrochloric acid* previously heated to 37° and maintain at 37° for 15 minutes, stirring continuously. Titrate the excess acid with *1 M sodium hydroxide* to a pH of 3.5. Not more than 12 ml of *1 M sodium hydroxide* is required.

Microbial contamination (2.2.9). Total microbial count is not more than 10^2 CFU per ml. 1 ml is free from *Escherichia coli*.

Other tests. Comply with the tests stated under Oral Liquids.

Assay. To a measured volume containing about 3.0 g of anhydrous magaldrate in a beaker add 100.0 ml of *1 M hydrochloric acid* and stir well until a solution is obtained. Titrate the excess acid with *1 M sodium hydroxide* to a pH of 3.0, determined potentiometrically (2.4.25). Repeat the procedure without the substance under examination. The difference between the titrations represents the amount of hydrochloric acid required.

1 ml of *1 M hydrochloric acid* is equivalent to 0.0354 g of $Al_5Mg_{10}(OH)_{31}(SO_4)_2$.

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of mg of anhydrous magaldrate per 5 ml.

Magaldrate Tablets

Magaldrate Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of anhydrous magaldrate, $Al_5Mg_{10}(OH)_{31}(SO_4)_2$.

Usual strength. The equivalent of 800 mg of anhydrous magaldrate.

Identification

To a quantity of the powdered tablets containing about 2 g of anhydrous magaldrate, add about 60 ml of *water*, shake for 3 minutes, centrifuge and discard the supernatant solution. Repeat the washing with three more quantities, each of 60 ml, of *water*. Transfer the residue to a beaker and heat on a water-bath to dryness.

A. Dissolve 0.8 g of the residue in 20 ml of *3 M hydrochloric acid*, dilute with *water* to 50 ml, add 3 drops of *methyl red solution* and heat to boiling. Add *dilute ammonia solution* until the colour changes to just yellow, continue boiling for 2 minutes and filter; the filtrate gives the reactions of magnesium salts (2.3.1).

B. Wash the precipitate obtained in test A with 50 ml of a hot 2 per cent w/v solution of *ammonium chloride*, then dissolve the precipitate in 15 ml of *3 M hydrochloric acid*; the solution gives the reactions of aluminium salts (2.3.1).

Tests

Aluminium hydroxide. 32.1 to 45.9 per cent of the stated content of anhydrous magaldrate, determined by the following method. Weigh and finely powder 20 tablets. To a weighed quantity of the powder containing about 1.0 g of anhydrous magaldrate add 30 ml of *dilute hydrochloric acid*, shake well to dissolve, dilute to 100.0 ml with *water* and mix (solution A). To 10.0 ml of the solution add 20 ml of *water* and add with stirring 25.0 ml of *0.05 M disodium edetate*, mix and allow to stand for 5 minutes. Add 20 ml of *acetic acid-ammonium acetate buffer*, 60 ml *ethanol (95 per cent)* and 2 ml of *dithizone solution* and titrate with *0.05 M zinc sulphate* to a bright rose-pink colour. Repeat the procedure without the substance under examination. The difference between the titrations represents the amount of disodium edetate required.

1 ml of *0.05 M disodium edetate* is equivalent to 0.0039 g of $Al(OH)_3$.

Magnesium hydroxide. 49.2 to 66.6 per cent of the stated content of anhydrous magaldrate, determined by the following method. Take 10.0 ml of solution A and dilute with *water* to about 200 ml. Add with stirring 1 g of *ammonium chloride*, 20 ml of *triethanolamine*, 10 ml of *ammonia-ammonium chloride buffer* and 0.1 ml of *eriochrome black T solution* and titrate with *0.05 M disodium edetate* to a blue colour. Repeat the procedure without the substance under examination. The difference between the titrations represents the amount of disodium edetate required.

1 ml of *0.05 M disodium edetate* is equivalent to 0.002916 g of $Mg(OH)_2$.

Neutralising capacity. To a weighed quantity of the powdered tablets containing 0.8 g of anhydrous magaldrate in a 250-ml beaker add about 75 ml of *water* heat to 37° and stir continuously, maintaining the temperature at 37°. Add 30.0 ml of *1 M hydrochloric acid* previously heated to 37° and maintain at 37° for 15 minutes, stirring continuously. Titrate the excess acid with *1 M sodium hydroxide* to a pH of 3.5 determined potentiometrically (2.4.25). Not more than 12 ml of *1 M sodium hydroxide* is required.

Disintegration (2.5.1). 2 minutes for tablets labelled to be swallowed.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and finely powder 20 tablets. Disperse a quantity of the powder containing about 3.0 g of anhydrous magaldrate in a 200-ml volumetric flask add 100.0 ml of *1 M hydrochloric acid*, shake well for 30 minutes. Dilute to volume and filter. Transfer 100.0 ml to a conical flask. Titrate the excess acid with *1 M sodium hydroxide* to a pH of 3.0, determined potentiometrically (2.4.25). Repeat the procedure without the substance under examination. The difference between the titrations represents the amount of hydrochloric acid required.

1 ml of *1 M hydrochloric acid* is equivalent to 0.03540 g of $Al_5Mg_{10}(OH)_{31}(SO_4)_2$.

Storage. Store protected from moisture.

Labelling. The label states (1) the strength in terms of the equivalent amount of anhydrous magaldrate; (2) whether the tablets are to be swallowed or chewed.

Magaldrate and Simethicone Chewable Tablets

Magaldrate and Simethicone Chewable Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of anhydrous magaldrate [$Al_5Mg_{10}(OH)_{31}(SO_4)_2$] and polydimethylsiloxane[$-(CH3)_2SiO-]_n$ not less than 85.0 per cent and not more than 115.0 per cent of the stated amount of simethicone.

Usual strength. Magaldrate 400 mg and Simethicone 60 mg.

Identification

Transfer a quantity of powdered tablets containing 2 g of magaldrate in to a 100 ml centrifuge tube. Add about 60 ml of

water, cap, and shake for 3 minutes. Centrifuge the suspension, and discard the supernatant liquid. Repeat the washing with three more 60-ml portions of *water*. Transfer the residue to a 250-ml beaker, and heat on a water-bath to dryness. The residue complies with the following tests.

A. Dissolve about 0.6 g of magaldrate in 20 ml of *3 M hydrochloric acid*, dilute with *water* to 50.0 ml, add 3 drops of *methyl red solution* and heat to boiling. Add *dilute ammonia solution* until the colour changes to yellow, continue boiling for 2 minutes and filter; the filtrate gives the reactions of magnesium salts (2.3.1).

B. Wash the precipitate obtained in test A with 50.0 ml of hot 0.002 per cent w/v solution of *ammonium chloride*, then dissolve the precipitate in 15 ml of *3 M hydrochloric acid*; the solution gives the reactions of aluminium salts (2.3.1).

C. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *polydimethylsiloxane IPRS* or with the reference spectrum of polydimethylsiloxane by using the test solution as described under Assay.

Tests

Neutralising capacity. To a weighed quantity of the powdered tablets containing 0.8 g of anhydrous magaldrate in a 250-ml beaker add about 75 ml of *water* heat to 37° and stir continuously, maintaining the temperature at 37°. Add 30.0 ml of *1 M hydrochloric acid* previously heated to 37° and maintain at 37° for 15 minutes, stirring continuously. Titrate the excess acid with *1 M sodium hydroxide* to a pH of 3.5 determined potentiometrically (2.4.25). Not more than 12 ml of *1 M sodium hydroxide* is required.

Magnesium hydroxide. 49.2 to 66.6 per cent of $Mg(OH)_2$, of the stated content of anhydrous magaldrate, determined by the following method.

Weigh and powder 20 tablets. Disperse accurately weighed about 1.0 g of powder in 30 ml of *0.01 M hydrochloric acid* and dilute to 100.0 ml with *water* (solution A). Transfer 10.0 ml of solution A to 400-ml beaker, and dilute to about 200 with *water*. Add with stirring 1 g of *ammonium chloride*, 20 ml of *triethanolamine*, 10 ml of *ammonia-ammonium chloride buffer* and 0.1 ml of *eriochrome black T solution* and titrate with *0.05 M disodium edetate* to a blue colour. Repeat the procedure without the substance under examination. The difference between the titrations represents the amount of *disodium edetate* required.

1 ml of *0.05 M disodium edetate* is equivalent to 0.002916 g of $Mg(OH)_2$.

Aluminium hydroxide. 32.1 to 45.9 per cent of $Al(OH)_3$, of the stated content of anhydrous magaldrate, determined by the following method.

To 10.0 ml of the solution prepared for the test of magnesium hydroxide, this solution add 20 ml of *water* and add with stirring 25.0 ml of *0.05 M disodium edetate*, mix and allow to stand for 5 minutes. Add 20 ml of *acetic acid-ammonium acetate buffer*, 60 ml *ethanol (95 per cent)* and 2 ml of *dithizone solution* and titrate with *0.05 M zinc sulphate* to a bright rose-pink colour. Repeat the procedure without the substance under examination. The difference between the titrations represents the amount of *disodium edetate* required.

1 ml of *0.05 M disodium edetate* is equivalent to 0.0039 g of $Al(OH)_3$.

Other tests. Comply with the tests stated under Tablets.

Assay.

Magaldrate — Weigh and powder 20 tablets. Disperse a quantity of the powder containing 6.0 g of Magaldrate with 100 ml of *2 M hydrochloric acid*, sonicate for 30 minutes and dilute 200.0 ml with *water*, filter it. Transfer 100.0 ml of the filtrate to a beaker. Titrate with *1 M sodium hydroxide* to pH of 3.0, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *1 M hydrochloric acid* is equivalent to 0.0354 g of $Al_5Mg_{10}(OH)_{31}(SO_4)_2$.

Polydimethylsiloxane —

Test Solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 20 mg of Simethicone, to a 60-ml separator. Add 10.0 ml of *hexanes* and 25 ml of *6 M hydrochloric acid*, cap the separator, and shake by mechanical means for not less than 2 hours. Allow to stand for about 10 minutes, and drain off as much of the lower, aqueous layer as possible without removing any of the unseparated interphase. Add 25 ml of *4 M sodium hydroxide* to the separator, cap it, and shake by mechanical means for 1 hour. Transfer the mixture from the separator to a 50-ml centrifuge tube, cap, and centrifuge to obtain clear layer. Transfer not less than 5 ml of the clear upper *hexanes* layer to a test tube containing about 0.5 g of *anhydrous sodium sulphate*. Cap the tube, shake vigorously, and allow to stand to obtain a clear supernatant liquid.

Reference solution (a). A solution containing 0.16 per cent w/v of *polydimethylsiloxane IPRS* prepare same as that of test solution.

Reference solution (b). A solution containing 0.2 per cent w/v of *polydimethylsiloxane IPRS* prepare same as that of test solution.

Reference solution (c). A solution containing 0.24 per cent w/v of *polydimethylsiloxane IPRS* prepare same as that of test solution.

NOTE — Between each measurement, rinse the cell with heptane, empty, and dry it.

Measure the absorbance by using 0.5 mm cell at the wavelength of maximum absorbance at about 1260 cm^{-1} with an IR spectrophotometer, using *hexane* as the blank. Prepare a standard curve by plotting the absorbance for the standard preparation and draw the straight line best fitting the three plotted points. From this standard curve, determine concentration in mg per ml of sodium polydimethylsiloxane.

Calculate the quantity in mg of $[-(CH3)_2SiO-]_n$ in the tablets by multiplying concentration by 10.

Storage. Store in tightly-closed containers.

Labelling. The Chewable Tablets to indicate that they are to be chewed before being swallowed. The strength in terms of equivalent amount of anhydrous magaldrate.

Magaldrate and Simethicone Oral Suspension

Magaldrate and Simethicone Oral Suspension is a mixture of Magaldrate and Simethicone. It may contain suitable aqueous flavoured vehicle.

Magaldrate and Simethicone Oral Suspensions contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of anhydrous magaldrate $[Al_5Mg_{10}(OH)_{31}(SO_4)_2]$ and polydimethylsiloxane $[-(CH_3)_2SiO-]_n$ is not less than 85.0 per cent and not more than 115.0 per cent of the stated amount of Simethicone.

Usual strength. Magaldrate 400 mg and Simethicone 60 mg per 5 ml.

Identification

A. Dissolve an amount of Oral Suspension, containing 0.8 g of Magaldrate in 20 ml of *3 M hydrochloric acid*, dilute with *water* to about 50.0 ml, add 3 drops of *methyl red solution*, heat to boiling. Add *6 M ammonium hydroxide* until the colour changes to just yellow, continue boiling for 2 minutes and filter; the filtrate gives the reactions of magnesium salts (2.3.1).

B. Wash the precipitate obtained in test A with 0.002 per cent w/v solution of hot *ammonium chloride* and dissolve the precipitate in *hydrochloric acid*. Divide the resulting solution into two equal portions. The dropwise addition of *6 M ammonium hydroxide* to one portion (Solution 1) yields a gelatinous white precipitate, which does not dissolve in an excess of *6 M ammonium hydroxide*. The dropwise addition of *1 M sodium hydroxide* to the second portion (solution 2) yields a gelatinous white precipitate, which dissolves in an excess of *1 M sodium hydroxide*, leaving some turbidity.

C. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *polydimethylsiloxane IPRS* or with the reference spectrum of polydimethylsiloxane by using the test solution as described in Assay.

Tests

Neutralising capacity. To a weighed quantity of the well-shaken suspension containing 0.8 g of anhydrous magaldrate in a 250-ml beaker add *water* to make a total volume of about 70 ml, heat to 37° and stir continuously, maintaining the temperature at 37°. Add 30.0 ml of *1 M hydrochloric acid* previously heated to 37° and maintain at 37° for 15 minutes, stirring continuously. Titrate the excess acid with *1 M sodium hydroxide* to a pH of 3.5. Not more than 12 ml of *1 M sodium hydroxide* is required.

Magnesium hydroxide. 49.2 to 66.6 per cent of $Mg(OH)_2$, of the stated amount of anhydrous magaldrate determined by the following method.

To a measured volume containing about 1.0 g of the Magaldrate, in 30 ml of *dilute hydrochloric acid* (1 in 10) and dilute with *water* to about 100 ml (solution A). Transfer 10.0 ml of solution A to 400-ml beaker, and dilute to about 200 with *water*. Add with stirring 1 g of *ammonium chloride*, 20 ml of *triethanolamine*, 10 ml of *ammonia-ammonium chloride buffer* and 0.1 ml of *eriochrome black T solution* and titrate with *0.05 M disodium edetate* to a blue colour. Repeat the procedure without the substance under examination. The difference between the titrations represents the amount of *disodium edetate* required.

1 ml of *0.05 M disodium edetate* is equivalent to 0.002916 g of $Mg(OH)_2$.

Aluminium hydroxide. 32.1 to 45.9 per cent of $Al(OH)_3$ per g of the stated amount of anhydrous magaldrate, determined by the following method.

Take 10.0 ml of solution A and 20 ml of *water* to a 250 ml beaker and add with stirring 25.0 ml of *0.05 M disodium edetate*, mix and allow to stand for 5 minutes. Add 20 ml of *acetic acid-ammonium acetate buffer*, 60 ml *ethanol (95 per cent)* and 2 ml of *dithizone solution* and titrate with *0.05 M zinc sulphate* to a bright rose-pink colour. Repeat the procedure without the substance under examination. The difference between the titrations represents the amount of disodium edetate required.

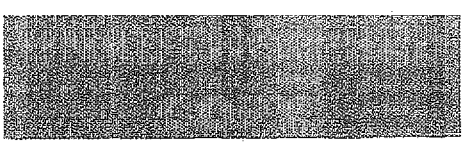
1 ml of *0.05 M disodium edetate* is equivalent to 0.0039 g of $Al(OH)_3$.

Microbial contamination (2.2.9). The total aerobic viable count is not more than 100 CFU per ml. It meets the requirements of the tests for the absence of *Escherichia coli*.

Other tests. Comply with the tests stated under Oral liquids.

Assay

Magaldrate — To a measured volume containing about 3.0 g of Magaldrate in a beaker add 100.0 ml of *1 M hydrochloric*



acid and stir well until a solution is obtained. Titrate the excess acid with *1 M sodium hydroxide* to a pH of 3.0, determined potentiometrically (2.4.25). Repeat the procedure without the substance under examination. The difference between the titrations represents the amount of hydrochloric acid required.

1 ml of *1 M hydrochloric acid* is equivalent to 0.0354 g of $Al_5Mg_{10}(OH)_{31}(SO_4)_2$.

Polydimethylsiloxane —

Test Solution. Transfer an accurately measured quantity of Oral Suspension containing about 250 mg of Simethicone, to a 200-ml centrifuge tube. Add an equal volume of *hydrochloric acid*, swirl to dissolve the Oral Suspension, add 25.0 ml of *hexane*, and immediately close the bottle securely with a cap having an inert liner. Shake the bottle for 30 minutes, and centrifuge the mixture until a clear supernatant layer is obtained.

Reference solution (a). A solution containing 1.0 per cent w/v of *polydimethylsiloxane IPRS* in the hexane.

Measure the absorbance by using 0.1 mm cell at the wavelength of maximum absorbance at about 7.9 µm and at the wavelengths of minimum absorbance at about 7.5 µm and 8.3 µm, with a suitable IR spectrophotometer, using hexane as the blank. Draw a linear baseline between the two minima, and determine the absorbance for the reference preparation and the test preparation with respect to the baseline, making any necessary correction for the blank. Calculate the quantity, in mg, of $[-(CH_3)2SiO-]_n$ in the portion of Oral Suspension taken by the formula:

$$25C \times \frac{AU}{AS}$$

in which C is the concentration, in mg per ml of reference and AU and AS are the absorbance of the test preparation and the reference preparation, respectively.

Storage. Store in tightly-closed containers.

Labelling. The strength in terms of equivalent amount of anhydrous magaldrate.

Magnesium Hydroxide

$Mg(OH)_2$ Mol. Wt. 58.3

Magnesium Hydroxide contains not less than 95.0 per cent and not more than 100.5 per cent of $Mg(OH)_2$, calculated on the dried basis.

Category. Antacid; osmotic laxative.

Description. A bulky white powder.

Identification

Dissolve about 15 mg in 2 ml of *2 M nitric acid* and neutralise with *2 M sodium hydroxide*. The resulting solution gives reaction (A) of magnesium salts (2.3.1).

Tests

Appearance of solution. Dissolve 5.0 g in a mixture 50 ml of *5 M acetic acid* and 50 ml of *distilled water*; not more than a slight effervescence is produced. Boil for 2 minutes, cool and dilute to 100.0 ml with *2 M acetic acid*. Filter, if necessary, through a previously ignited and weighed porcelain or silica crucible of a suitable porosity to give a clear filtrate (solution A). Reserve any residue (residue R) for the test for Substances insoluble in *acetic acid*. Solution A is not more intensely coloured than reference solution BS3 (2.4.1).

Arsenic (2.3.10). Dissolve 2.5 g in 18 ml of *brominated hydrochloric acid* and 42 ml of *water* and remove the excess of bromine with a few drops of *stannous chloride solution AsT*. The resulting solution complies with the limit test for arsenic (4 ppm).

Heavy metals (2.3.13). To 20 ml of solution A add 15 ml of *7 M hydrochloric acid* and shake with 25 ml of *4-methyl-pentan-2-one* for 2 minutes. Separate the layers, evaporate the aqueous layer to dryness, dissolve the residue in 1 ml of *5 M acetic acid* and dilute to 20.0 ml with *water*. 12 ml of the resulting solution complies with the limit test for heavy metals, Method D (40 ppm), using 10 ml of *lead standard solution (2 ppm Pb)*.

Iron (2.3.14). Dissolve 0.2 g in 7 ml of *2 M hydrochloric acid* and dilute to 20.0 ml with *water*. 5 ml of the resulting solution complies with the limit test for iron (0.08 per cent).

Chlorides (2.3.12). 5.0 ml of solution A diluted to 15 ml with *distilled water* complies with the limit test for chlorides (0.1 per cent).

Sulphates (2.3.17). 0.6 ml of solution A diluted to 15 ml with *distilled water* complies with the limit test for sulphates (0.5 per cent).

Calcium. Not more than 1.5 per cent.

Determine by atomic absorption spectrophotometry (2.4.2), measuring at 422.7 nm using nitrous oxide-acetylene flame and calcium hollow-cathode lamp.

Lanthanum solution. Dissolve 58.65 g of lanthanum oxide in 400 ml *water* and add gradually 250 ml *hydrochloricacid*, stir and dilute to 1000.0 ml with *water*.

Blank solution. Dilute 4.0 ml of lanthanum solution and 10.0 ml of *dilute hydrochloric acid* to 200.0 ml with *water*.

Test solution. Dissolve 0.25 g of substance under examination, previously dried, in 30 ml of *dilute Hydrochloric acid*, stir

and heat if necessary. Transfer the solution in a 200-ml volumetric flask containing 4 ml of lanthanum solution, dilute to volume with *water* and mix.

Reference solutions. Dissolve 0.2497 g calcium carbonate, previously dried at 300° for 3 hours and cooled in a desiccator for 2 hours, in a minimum amount of *hydrochloric acid* and dilute to 100.0 ml with *water*. Dilute 1.0 ml, 5.0 ml, 10.0 ml and 15.0 ml of the solution to separate 1000-ml volumetric-flasks, each containing 20.0 ml of lanthanum solution and 40.0 ml of *dilute hydrochloric acid*, dilute with *water* to volume.

Soluble substances. Mix 2.0 g with 100 ml of *water*, boil for 5 minutes, filter whilst hot through a sintered-glass filter (porosity No. 3), allow to cool and dilute to 100.0 ml with *water*. Evaporate 50.0 ml of the filtrate to dryness and dry the residue at 105°; the residue weighs not more than 10 mg (1.0 per cent).

Substances insoluble in acetic acid. Residue R when washed, dried and ignited at 600°, weighs not more than 5.0 mg (0.1 per cent).

Loss on drying (2.4.19). Not more than 2.0 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

Assay. Dissolve 75 mg, previously dried, in 2 ml of 3 *M hydrochloric acid*, and swirl to dissolve. Add 100 ml of *water*, adjust the solution to pH 7 with *1 M sodium hydroxide (using pH indicator paper)*, add 5 ml of *ammonia ammonium chloride buffer* and titrate with *0.05 M disodium edetate* to a blue endpoint, using about 0.15 ml of *eriochrome black T solution* as indicator. Carry out a blank titration.

1 ml of *0.05 M disodium edetate* is equivalent to 0.002916 g of $Mg(OH)_2$.

Storage. Store protected from moisture.

Magnesium Hydroxide Oral Suspension

Magnesium Hydroxide Mixture; Milk of Magnesia; Cream of Magnesia

Magnesium Hydroxide Oral Suspension is an aqueous suspension of hydrated magnesium oxide. It may be prepared from a suitable grade of Light Magnesium Oxide.

Magnesium Hydroxide Oral Suspension contains not less than 7.0 per cent and not more than 8.5 per cent w/w of hydrated magnesium oxide, calculated as $Mg(OH)_2$.

Description. A white, uniform suspension, which does not separate readily on standing.

Identification

A solution of 1 ml of oral suspension in 2 ml of *dilute hydrochloric acid* gives the reactions of magnesium salts (2.3.1).

Tests

Soluble alkalis. Filter about 25 ml and discard the first 10 ml of the filtrate. Dilute 5 ml of the filtrate with 40 ml of *water*, add 0.05 ml of *methyl red solution* and titrate with *0.05 M sulphuric acid* to a persistent pink colour. Not more than 1.0 ml of *0.05 M sulphuric acid* is required.

Soluble salts. To 5 ml of the clear filtrate obtained in the test for Soluble alkalis add 0.15 ml of *sulphuric acid*, evaporate to dryness on a water-bath and then ignite gently to constant weight; the residue does not weigh more than 12 mg.

Heavy metals (2.3.13). Dissolve 12.5 g in 10 ml of *hydrochloric acid* and 20 ml of *water*, add 0.5 ml of *nitric acid*, boil to remove any carbon dioxide and filter. To the cooled filtrate add 2 g of *ammonium chloride* and 2 g of *ammonium thiocyanate* and extract with two successive quantities, each of 10 ml, of *ether*. To the aqueous layer add 2 g of *citric acid* and sufficient *water* to produce 50 ml. 12 ml of the solution complies with the limit test for heavy metals, Method D (4 ppm). Use *lead standard solution (1 ppm Pb)* to prepare the standard.

Sulphates (2.3.17). Dissolve 2.5 ml in 20 ml of *hydrochloric acid* and dilute to 500.0 ml with *water*. 15 ml of the resulting solution, filtered if necessary, complies with the limit test for sulphates (0.2 per cent).

Microbial contamination (2.2.9). Total microbial count is not more than 10^2 CFU per ml. 1 ml is free from *Escherichia coli*.

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Weigh 10.0 g, mix with 50 ml of *water*, add 50.0 ml of *0.5 M sulphuric acid* and titrate the excess of acid with *1 M sodium hydroxide* using *methyl orange solution* as indicator.

1 ml of *0.5 M sulphuric acid* is equivalent to 0.02916 g of hydrated magnesium oxide calculated as $Mg(OH)_2$.

Storage. Store protected from moisture. Do not keep in a refrigerator.

Magnesium Stearate

Magnesium Stearate consists mainly of magnesium stearate $(C_{17}H_{35}CO_2)_2Mg$ with variable proportions of magnesium palmitate, $(C_{15}H_{31}CO_2)_2Mg$ and magnesium oleate, $(C_{17}H_{33}CO_2)_2Mg$.

Magnesium Stearate contains not less than 3.8 per cent and not more than 5.0 per cent of Mg, calculate on the dried basis. The fatty acid fraction contains not less than 40.0 per cent of stearic acid and the sum of stearic acid and palmitic acid is not less than 90.0 per cent.

Category. Pharmaceutical aid (lubricant).

Description. A very fine, light, white powder; unctuous and free from grittiness.

Identification

To 5.0 g add 50 ml of *peroxide-free ether*, 20 ml of *dilute nitric acid* and 20 ml of *water* and heat under a reflux condenser until dissolution is complete. Allow to cool. In a separating funnel, separate the aqueous layer and shake the ether layer with 2 quantities, each of 4 ml, of *water*. Combine the aqueous layers, wash with 15 ml of *peroxide-free ether* and dilute to 50.0 ml with *water* (solution A). Evaporate the organic layer to dryness and dry the residue at 105°.

A. The residue obtained in the preparation of solution A has a freezing point (2.4.11) not less than 53°.

B. The acid value of the fatty acids is 195 to 210, determined on 0.2 g of the residue obtained in the preparation of solution A, dissolved in 25 ml of the prescribed mixture of solvents (2.3.23).

C. In the test for fatty acid composition, the principal peaks in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

D. 1 ml of solution A gives the reaction of magnesium (2.3.1).

Tests

Appearance of solution. Solution A is not more intensely coloured than reference solution YS6 (2.4.1).

Appearance of solution of the fatty acids. Dissolve 0.5 g of the residue obtained in the preparation of solution A in 10 ml of *chloroform*. The solution is clear (2.4.1), and not more intensely coloured than reference solution YS5 (2.4.1).

Acidity or alkalinity. Mix 1.0 g with 20 ml of *carbon dioxide-free water*, boil for 1 minute, shaking continuously, cool and filter. To 10 ml of filtrate add 0.05 ml of *bromothymol blue solution*. Not more than 0.05 ml of *0.1 M hydrochloric acid* or *0.1 M sodium hydroxide* is required to change the colour of the solution.

Acid value of the fatty acids. 195 to 210, determined on 0.2 g of the residue obtained in the preparation of solution A, dissolved in 25 ml of the prescribed mixture of solvents (2.3.23).

Free stearic acid. Not more than 3 per cent, determined by the following method. Weigh 1.0 g into a stoppered flask, add 50 ml of *chloroform*, stopper the flask and shake well. Filter into a beaker through two thicknesses of filter paper taking care to avoid evaporation of the solvent. Wash the filter with 10 ml of *chloroform* and collect the washings in the beaker. Evaporate the chloroform on a water-bath in a current of air. Dissolve the residue in about 10 ml of *ethanol (95 per cent)* previously neutralised to *phenolphthalein solution* and titrate with *0.1 M sodium hydroxide* using *phenolphthalein solution* as indicator.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.0284 g of stearic acid.

Zinc stearate. Heat 5.0 g with shaking in a mixture of 50 ml of *water* and 50 ml of *dilute sulphuric acid* until the fatty acids separate as an oily layer. Cool, filter the aqueous layer and wash the residue with two successive quantities, each of 5 ml, of hot *water*, combine the filtrate and the washings and dilute to 100.0 ml with *water*. To 5 ml of the resulting solution add 0.5 ml of *ammonium mercurithiocyanate solution* and 0.05 ml of *copper sulphate solution*. Scratch the walls of the container with a glass rod and allow to stand for 15 minutes; no violet precipitate is formed.

Heavy metals (2.3.13). Heat 5.0 g with 40 ml of *2 M acetic acid* and allow to cool. Filter, wash the residue with two quantities, each of 5 ml, of warm *water* and dilute to 100.0 ml with *water*. 12 ml of the resulting solution complies with the limit test for heavy metals, Method D (20 ppm). Use 10.0 ml of *lead standard solution (1 ppm Pb)* to prepare the standard.

Chlorides (2.3.12). 10.0 ml of solution A diluted to 15 ml complies with the limit test for chlorides (250 ppm).

Sulphates (2.3.17). Dilute 5.0 ml of solution A to 50.0 ml with *water*. 2.5 ml of the solution diluted to 15 ml with *water* complies with the limit test for sulphates (0.6 per cent)

Loss on drying (2.4.19). Not more than 6.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.75 g, add 50 ml of a mixture of equal volumes of *1-butanol* and *ethanol*, 5 ml of *strong ammonia solution*, 3 ml of *ammonia buffer pH 10.0*, 30.0 ml of *0.1 M disodium edetate* and 15 mg of *mordant black II mixture*, heat to 45° to 50° and titrate with *0.1 M zinc sulphate* until the colour changes from blue to violet. Repeat the operation without the substance under examination. The difference between the titrations represents the amount of disodium edetate required.

1 ml of *0.1 M disodium edetate* is equivalent to 0.002431 g of Mg.

Fatty acid composition. Determine by gas chromatography (2.4.13).

Test solution. Dissolve 100 mg of the substance under examination in 5 ml of *boron trifluoride solution*. Boil under a reflux condenser for 10 minutes, add 4.0 ml of *heptane* through

the condenser, and add 20.0 ml of a *sodium chloride solution*. Shake and allow the layers to separate. Dry the organic layer over 0.1 g of *anhydrous sodium sulphate*. Dilute 1.0 ml of the solution to 10.0 ml with *heptane*.

Reference solution. Dissolve 50 mg each of *palmitic acid IPRS* and *stearic acid IPRS* in 5.0 ml of *boron trifluoride solution*. Boil under a reflux condenser for 10 minutes, add 4.0 ml of *heptane* through the condenser and add 20.0 ml of a *sodium chloride solution*. Shake and allow the layers to separate. Dry the organic layer over 0.1 g of *anhydrous sodium sulphate*. Dilute 1.0 ml of the solution to 10.0 ml with *heptane*.

Chromatographic system

- a capillary column 30 m x 0.32 mm, packed with fused silica coated with macrogol 20000 (film thickness 0.5 µm);
- temperature:

column	time (min)	temperature (°)
	0-2	70
	2-36	70-240
	36-41	240

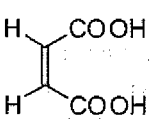
- inlet port at 220° and detector at 260°,
- flame ionization detector,
- flow rate: 2.4 ml per minute, helium or nitrogen as the carrier gas.

Inject 1 µl of the reference solution. The relative retention with reference to methyl stearate for methyl palmitate is about 0.9. The test is not valid unless the resolution between the peaks due to methyl stearate and methyl palmitate is not less than 5.0.

Inject 1 µl of the reference solution and the test solution.

Calculate the percentage content of stearic acid and palmitic acid.

Maleic Acid



$C_4H_4O_4$ Mol. Wt. 116.1

Maleic Acid is (*Z*)-butenedioic acid.

Maleic Acid contains not less than 99.0 per cent and not more than 101.0 per cent of $C_4H_4O_4$, calculated on the anhydrous basis.

Category. Pharmaceutical aid.

Description. A white or almost white, crystalline powder.

Identification

A. In the test for fumaric acid, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

B. Dissolve 0.1 g of the substance under examination in 10 ml of *water*. To 0.3 ml of the solution add a solution of 10 mg of *resorcinol* in 3 ml of *sulphuric acid*. Heat on a water-bath for 15 minutes, no colour develops. Further to 3 ml of the solution, add 1 ml of *bromine water*. Heat on a water-bath for 15 minutes to remove the bromine, heat to boiling and cool. To 0.2 ml of the solution add a solution of 10 mg of *resorcinol* in 3 ml of *sulphuric acid*. Heat on a water-bath for 15 minutes. A violet-pink colour develops.

Tests

Appearance of solution. A 10.0 per cent w/v solution is clear (2.4.1) and not more intensely coloured than reference solution YS7 (2.4.1).

Fumaric acid. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 12 volumes of *anhydrous formic acid*, 16 volumes of *chloroform*, 32 volumes of *butanol* and 44 volumes of *heptane*.

Test solution (a). Dissolve about 0.5 g of the substance under examination in 5.0 ml of *acetone*.

Test solution (b). Dilute 1.0 ml of test solution (a) to 50.0 ml with *acetone*.

Reference solution (a). A 0.2 per cent w/v solution of *maleic acid IPRS* in *acetone*.

Reference solution (b). A 0.15 per cent w/v solution of *fumaric acid IPRS* in *acetone*.

Reference solution (c). A mixture of 5 ml each of reference solution (a) and (b).

Apply to the plate 5 µl of the test solution (a), (b), reference solution (a) and (b) and 10 µl of reference solution (c). Allow the mobile phase to rise 10 cm. Dry the plate at 100° for 15 minutes and examine under ultraviolet light at 254 nm (2.4.7). Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b) (1.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Iron (2.3.14). To 10 ml of a 10 per cent w/v solution in *water*, add 2 ml of *dilute hydrochloric acid* and 0.05 ml of *bromine water*. After 5 minutes, remove the excess of bromine by passing a current of air and add 3 ml of *potassium thiocyanate solution* and shake. Prepare reference solution at the same time and in the same manner, using a mixture of 5 ml of *iron standard solution (1 ppm Fe)*, 1 ml of *dilute hydrochloric*

acid, 6 ml of *water* and 0.05 ml of *bromine water*. Allow both solutions to stand for 5 minutes. Any red colour in the test solution is not more intense than that in the reference solution (5 ppm).

Heavy metals (2.3.13). Weigh in a silica crucible 2 g of the substance under examination, mix with 0.5 g of *magnesium oxide*. Ignite to dull redness until a homogeneous white or greyish-white mass is obtained. After 30 minutes of ignition if mixture remains coloured, allow to cool, mix using a fine glass rod and repeat the ignition. If necessary repeat the operation. Heat at 800° for about 1 hour. Dissolve the residue in 5 ml of a mixture of equal volumes of *hydrochloric acid* and *water*. Add 0.1 ml of *phenolphthalein solution* and then *concentrated ammonia* until a pink colour is obtained. Cool, add *glacial acetic acid* until the solution is decolourised and add 0.5 ml in excess. Filter if necessary and wash the filter. Dilute to 20 ml with *water*, 12 ml of the resulting solution complies with the limit test for heavy metals, Method D (10 ppm), using 10 ml of *lead standard solution (1 ppm pb)* in a mixture of equal volumes of *hydrochloric acid* and *water*.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

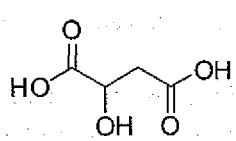
Water (2.3.43). Not more than 2.0 per cent, determined on 1.0 g.

Assay. Dissolve 0.5 g in 50 ml of *water*. Titrate with *1 M sodium hydroxide* using 0.5 ml of *phenolphthalein solution* as indicator.

1 ml of *1 M sodium hydroxide* is equivalent to 0.05804 g of $C_4H_4O_4$.

Storage. Store protected from light.

Malic Acid



$C_4H_6O_5$ Mol. Wt. 134.1

Malic Acid is (*RS*)-hydroxybutanedioic acid.

Malic Acid contains not less than 99.0 per cent and not more than 101.0 per cent of $C_4H_6O_5$, calculated on the anhydrous basis.

Category. Pharmaceutical aid.

Description. A white or almost white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *malic acid IPRS* or with the reference spectrum of malic acid.

Tests

Appearance of solution. A 20.0 per cent w/v solution is clear (2.4.1) and colourless (2.4.1).

Optical rotation (2.4.22). −0.10° to +0.10°, determined on 20.0 per cent w/v solution in *water*.

Water insoluble substances. Not more than 0.1 per cent.

Dissolve 25.0 g of the substance under examination in 100 ml of *water*, filter the solution through a tared sintered-glass filter, wash the filter with hot *water* and dry at 105° to constant weight. The residue weighs a maximum of 25 mg.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 100 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). Dissolve 10 mg of *fumaric acid* and 4 mg of *maleic acid* in 50.0 ml of the mobile phase.

Reference solution (b). Dilute 2.5 ml of reference solution (a) to 100.0 ml with the mobile phase.

Reference solution (c). Dissolve 20 mg of the substance under examination in the mobile phase, add 1.0 ml of reference solution (a) and dilute to 20.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 30 cm x 7.8 mm, packed with ion-exclusion resin (9 µm),
- column temperature: 37°,
- mobile phase: *0.005 M sulphuric acid*,
- flow rate: 0.6 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to malic acid and malic acid impurity B is not less than 2.5. The relative retention time with reference to malic acid for fumaric acid (malic acid impurity A) is about 1.5 and for maleic acid (malic acid impurity B) is about 0.8.

Inject reference solution (b) and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of the peak due to fumaric acid is not more than twice the area of the corresponding peak in the chromatogram obtained with reference solution (b) (1.0 per cent), the area of the peak due to maleic acid is not more than 0.25 times the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.05 per cent), the area of any other secondary peak is not more than 0.5 times the area of the peak due to maleic acid in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the areas of all secondary peaks is not more than 2.5 times the area of the peak due to maleic acid in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an

area less than 0.1 times the area of the peak due to maleic acid in the chromatogram obtained with reference solution (b) (0.02 per cent).

Heavy metals (2.3.13). Not more than 20 ppm, determined by the following method .Weigh 1 g of the substance under examination in a 100-ml long necked combination flask. Clamp the flask at an angle of 45°, add a sufficient volume of a mixture of 8 ml of *sulphuric acid* and 10 ml of *nitric acid* to moisten the substance, warm gently until the reaction starts, allow the reaction to subside and add additional portions of the same acid mixture, heating after each addition. Increase the amount of heat and boil gently until the solution darkens. Cool, add 2 ml of *nitric acid* and heat again until the solution darkens. Continue the heating, followed by the addition of *nitric acid* until no further darkening occur, then heat strongly until dense, white fumes are produced. Cool, add 5 ml of *water*, boil gently until dense, white fumes are produced and continue heating to reduce to 2-3 ml. Cool and add 5 ml of *water* and examine the colour of the solution. If the colour is yellow, cautiously add 1 ml of strong *hydrogen peroxide solution* and again evaporate until dense, white fumes are produced and reduce to a volume of 2 to 3 ml. If the solution is still yellow in colour, repeat the addition of 5 ml of *water* and 1 ml of *strong hydrogen peroxide solution* until the solution is colourless. Cool, and dilute to 25.0 ml with *water* into a 50-ml Nessler cylinder. Adjusted to pH 3.0 with concentrated *ammonia,* dilute with *water* to 40 ml and mix. Add 2 ml of *buffer solution pH 3.5,* mix and add 1.2 ml of *thioacetamide reagent* mix immediately and dilute to 50.0 ml with *water* and. Any colour produced is not more intense than that produced by treating 2 ml of *lead standard solution* (10 ppm).

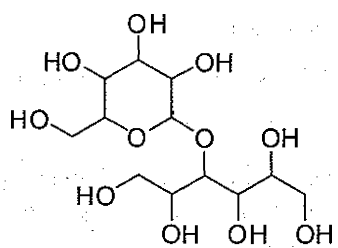
Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 2.0 per cent, determined on 1.0 g.

Assay. Weigh 0.5 g, dissolved in 50 ml of *water.* Titrate with *1 M sodium hydroxide* determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *1 M sodium hydroxide* is equivalent to 0.06705 g of $C_4H_6O_5$.

Maltitol



$C_{12}H_{24}O_{11}$ Mol. Wt. 344.3

Maltitol is α-D-glucopyranosyl-1,4-D-glucitol.

Maltitol contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{12}H_{24}O_{11}$, calculated on the anhydrous basis.

Category. Pharmaceutical aid.

Description. A white or almost white crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *maltitol IPRS* or with the reference spectrum of maltitol.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G.*

Mobile phase. A mixture of 10 volumes of *water*, 20 volumes of *ethyl acetate* and 70 volumes of *propanol.*

Test solution. Dissolve 25 mg of the substance under examination in 10 ml of *water.*

Reference solution (a). A 0.25 per cent w/v solution of *maltitol IPRS* in *water.*

Reference solution (b). A solution containing 0.25 per cent w/v each of *maltitol IPRS* and *sorbitol IPRS* in *water.*

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 17 cm. Dry the plate in air, spray with *4-aminobenzoic acid solution.* Remove the plate and place it in a current of cold air until the acetone is removed. Heat at 105° for 15 minutes and allow to cool, spray with a 0.2 per cent w/v solution of *sodium periodate.* Dry in a current of cold air. Heat at 100° for 15 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated principal spots.

C. Melting point (2.4.21). 148° to 151°.

Tests

Appearance of solution. A 10.0 per cent w/v solution in *water* is clear (2.4.1) and colourless (2.4.1).

Specific optical rotation (2.4.22). + 105.5° to + 108.5°, determined in a 5 per cent w/v solution in *water*, calculated on the anhydrous basis.

Reducing sugars. Not more than 0.2 per cent, expressed as glucose equivalent.

Dissolve 5.0 g in 6 ml of *water* with the aid of gentle heat. Cool and add 20 ml of *cupri-citric solution* and a few glass beads,

boil for 10 minutes. Cool rapidly and add 100 ml of a 2.4 per cent v/v solution of *glacial acetic acid* and 20.0 ml of *0.025 M iodine*. With continuous shaking, add 25 ml of a mixture of 6 volumes of *hydrochloric acid* and 94 volumes of *water* and, when the precipitate has dissolved, titrate the excess of iodine with *0.05 M sodium thiosulphate* using 1 ml of *starch solution*, added towards the end of the titration as indicator. Not less than 12.8 ml of *0.05 M sodium thiosulphate* is required.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 5 g of the substance under examination in 100.0 ml of *water*.

Reference solution (a). A 5.0 per cent w/v solution of *maltitol IPRS* in *water*.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *water*.

Reference solution (c). Dilute 10.0 ml of reference solution (b) to 100.0 ml with *water*.

Reference solution (d). A solution containing 5.0 per cent w/v each of *maltitol IPRS* and *sorbitol IPRS* in *water*.

Chromatographic system

- a stainless steel column 30 cm × 7.8 mm, packed with strong cation exchange resin (calcium form) (9 µm),
- column temperature: 85°,
- mobile phase: *water*,
- flow rate: 0.5 ml per minute,
- refractive index detector,
- injection volume: 20 µl.

The relative retention time with reference to maltitol for sorbitol (maltitol impurity A) is about 1.8, for maltotriitol (maltitol impurity B) is about 0.8.

Inject reference solution (d). The test is not valid unless the resolution between the peaks due to maltitol and maltitol impurity A is not less than 2.0.

Inject reference solution (b), (c) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent). Ignore any peak with the area less than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent).

Lead (2.3.15). Not more than 0.5 ppm.

Nickel. Dissolve 10.0 g in sufficient *water* to produce 20 ml, add 3 ml of *bromine water* and 2 ml of a 20 per cent w/v solution of *citric acid*, mix and 10 ml of *6 M ammonia* and 1 ml of a 1 per cent w/v solution of *dimethylglyoxime* in *ethanol* (*95 per cent*). Mix, dilute 50.0 ml with *water* and allow to stand for 5 minutes; any colour produced is not more intense than that produced by treating in the same manner and at the same time 1.0 ml of *nickel standard solution* (*10 ppm Ni*) diluted to 20.0 ml with *water* (1 ppm).

Water (2.3.43). Not more than 1.0 per cent, determined on 1 g.

Microbial contamination (2.2.9). Total aerobic viable count is not more than 10^2 CFU per g and total fungal count is not more than 10^2 CFU per g determined by plate count. 1 g is free from *Escherichia coli* and 10 g is free from *Salmonella* and *Shigella*.

Bacterial endotoxins (2.2.3). Not more than 4 Endotoxin Unit per g for parenteral dosage forms having a concentration of less than 100 g per litre of maltitol and not more than 2.5 Endotoxin Unit per g for parenteral dosage forms having a concentration of less than 100 g per litre or more of maltitol.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{12}H_{24}O_{11}$.

Labelling. The label states (a) where applicable, the maximum concentration of bacterial endotoxins; (b) where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms.

Liquid Maltitol

Aqueous solution of a hydrogenated, partly hydrolysed starch, composed of a mixture of mainly 4-*O*-α-D-glucopyranosyl-D-glucitol (D-maltitol) with D-glucitol (D-sorbitol) and hydrogenated oligo- and polysaccharides.

Liquid Maltitol contains not less than 50.0 per cent of *D-maltitol*, $C_{12}H_{24}O_{11}$, calculated on the anhydrous basis and 95.0 per cent to 105.0 per cent of the content stated on the label; not more than 8.0 per cent of *D-sorbitol*, $C_6H_{14}O_6$, calculated on the anhydrous basis; not less than 68.0 per cent and not more than 85.0 per cent, calculated on the anhydrous basis.

Category. Pharmaceutical aid.

Description. A clear, colourless and syrupy liquid.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal

peak in the chromatogram obtained with reference solution (a).

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 10 volumes of *water*, 20 volumes of *ethyl acetate* and 70 volumes of *propanol*.

Test solution. Disperse a volume of solution containing about 0.35 g of maltitol to 100.0 ml with *water*.

Reference solution (a). A 0.2 per cent w/v solution of *maltitol IPRS* in *water*.

Reference solution (b). A solution containing 0.2 per cent w/v each of *maltitol IPRS* and *sorbitol IPRS* in *water*.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 17 cm. Dry the plate in air, spray with *4-aminobenzoic acid solution*. Remove the plate and place it in a current of cold air until the acetone is removed. Heat at 105° for 15 minutes and allow to cool, spray with a 0.2 per cent w/v solution of *sodium periodate*. Dry in a current of cold air. Heat at 100° for 15 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated principal spots.

C. To 3 ml of a freshly prepared 10 per cent w/v solution of *pyrocatechol*, add 6 ml of *sulphuric acid* while cooling in iced water. To 3 ml of the cooled mixture, add 0.3 ml of solution A. Heat gently over a naked-flame for about 30 seconds, a pink colour is produced.

Tests

Appearance of solution. A 14.0 per cent w/v solution in *water* is clear (2.4.1) and colourless (2.4.1).

Conductivity (2.4.9). Not more than 10 µS cm^{-1}, measured on undiluted liquid maltitol while gently stirring with a magnetic stirrer.

Reducing sugars. Not more than 0.2 per cent, calculated as glucose equivalent.

To 5.0 g add 6 ml of *water*, 20 ml of *cupri-citric solution* and a few glass beads. Heat so that boiling begins after 4 minutes and maintain boiling for 3 minutes. Cool rapidly and add 100 ml of a 2.4 per cent v/v solution of *glacial acetic acid* and 20.0 ml of *0.025 M iodine*. With continuous shaking, add 25 ml of a mixture of 6 volumes of *hydrochloric acid* and 94 volumes of *water* and when the precipitate has dissolved, titrate the excess of iodine with *0.05 M sodium thiosulphate* using 1 ml of *starch solution*, added towards the end of the titration, as indicator. Not less than 12.8 ml of *0.05 M sodium thiosulphate* is required.

Lead (2.3.15). Not more than 0.5 ppm.

Nickel. Dissolve 10.0 g in sufficient *water* to produce 20 ml, add 3 ml of *bromine water* and 2 ml of a 20 per cent w/v solution of *citric acid*, mix and 10 ml of *6 M ammonia* and 1 ml of a 1 per cent w/v solution of *dimethylglyoxime* in *ethanol* (*95 per cent*). Mix, dilute of 50 ml with *water* and allow to stand for 5 minutes; any colour produced is not more intense than that produced by treating in the same manner and at the same time 1.0 ml of *nickel standard solution* (*10 ppm Ni*) diluted to 20 ml with *water* (1 ppm).

Water (2.3.43). 15.0 per cent to 32.0 per cent, determined on 0.1 g. Use as solvent a mixture of equal volumes of *anhydrous methanol* and *formamide*. Carry out the titration at about 50°.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a volume of solution containing about 1.0 g of Maltitol in 50.0 ml of *water*.

Reference solution (a). A 2.0 per cent w/v solution of *maltitol IPRS* in *water*.

Reference solution (b). A 0.32 per cent w/v solution of *sorbitol IPRS* in *water*.

Reference solution (c). An equal mixture of reference solution (a) and reference solution (b).

Chromatographic system
- a stainless steel column 30 cm × 7.8 mm, packed with strong cation exchange resin (calcium form) (9 µm),
- column temperature: 85°,
- mobile phase: *water*,
- flow rate: 0.5 ml per minute,
- refractive index detector,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to sorbitol and maltitol is not less than 2.0. The relative retention time with reference to maltitol for sorbitol is about 1.8.

Inject reference solution (c) and the test solution. Run the chromatograms 3 times the retention time of maltitol.

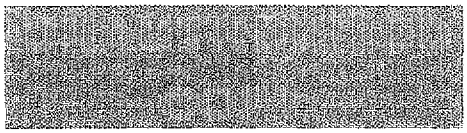
Calculate the content of *D-maltitol*, $C_{12}H_{24}O_{11}$ and *D-sorbitol*, $C_6H_{14}O_6$.

Labelling. The label states the content of D-maltitol.

Maltodextrin

Maltodextrin is a mixture of glucose, disaccharides and polysaccharides, obtained by the partial hydrolysis of starch.

The degree of hydrolysis, expressed as dextrose equivalent (DE), is not more than 20 (nominal value).



Category. Pharmaceutical aid.

Description. A white or almost white, slightly hygroscopic powder or granules.

Identification

A. Dissolve 0.1 g in 2.5 ml of *water* and heat with 2.5 ml of *cupri-tartaric solution*; a red precipitate is produced.

B. Dextrose equivalent (DE) (see Test).

Tests

Solution A. A 25 per cent w/v solution of the substance under examination in *carbon dioxide-free water*.

pH (2.4.24). 4.0 to 7.0, determined in mixture of 1 ml of a 22.36 per cent w/v solution of *potassium chloride* and 30 ml of solution A.

Sulphur dioxide (2.3.40). Not more than 20 ppm.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.5 per cent.

Loss on drying (2.4.19). Not more than 6.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Dextrose equivalent (DE). Within 2 DE units of the nominal value.

Weigh an amount of the substance under examination equivalent to 2.85 to 3.15 g of reducing carbohydrates, calculated as dextrose equivalent, into a 500-ml volumetric flask. Dissolve in *water* and dilute to 500.0 ml with the same solvent. Transfer the solution to a 50 ml burette. Pipette 25.0 ml of *cupri-tartaric solution* into a 250 ml flask and add 18.5 ml of the test solution from the burette, mix and add a few glass beads. Place the flask on a hot plate, previously adjusted so that the solution begins to boil within 2 minutes ± 15 seconds. Allow to boil for exactly 120 seconds, add 1 ml of a 0.1 per cent w/v solution of *methylene blue* and titrate with the test solution (V_1), until the blue colour disappears. Maintain the solution at boiling throughout the titration. Standardize the cupri-tartaric solution using a 0.6 per cent w/v solution of *glucose* (V_0).

$$\frac{300 \times V_0 \times 100}{V_1 \times M \times D}$$

Where, V_0 = total volume of glucose standard solution, in millilitres,

V_1 = total volume of test solution, in millilitres,

M = sample mass, in grams,

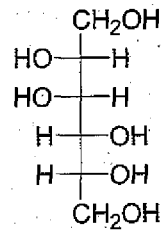
D = percentage content of dry matter in the substance.

Microbial contamination (2.2.9). Total aerobic viable count is not more than 10^3 CFU per g and total fungal count is not more than 10^2 CFU per g determined by plate count. 1 g is free from *Escherichia coli* and 10 g is free from *Salmonella* and *Shigella*.

Labelling. The label states the dextrose equivalent (DE) (nominal value).

Mannitol

D-Mannitol



$C_6H_{14}O_6$ Mol. Wt. 182.2

Mannitol is D-mannitol, a hexahydric alcohol related to mannose.

Mannitol contains not less than 97.0 per cent and not more than 102.0 per cent of $C_6H_{14}O_6$, calculated on the dried basis.

Category. Osmotic diuretic; diagnostic aid (for renal function).

Description. A white, crystalline powder or free-flowing granules.

Identification

A. Determine by infrared absorption spectrophotometery (2.4.6). Compare the spectrum with that obtained with *mannitol IPRS* or with the reference spectrum of mannitol.

B. To 1 ml of a saturated solution add 0.5 ml of *ferric chloride test solution* followed by 0.25 ml of *sodium hydroxide solution* and shake well; a clear solution is obtained which remains clear on the further addition of *sodium hydroxide solution*.

C. Dissolve 5 g in sufficient *carbon dioxide-free water* prepared from *distilled water* to produce 50 ml (solution A). Add 0.3 ml of solution A to 3 ml of a cooled mixture prepared by adding 6 ml of *sulphuric acid* to 3 ml of a freshly prepared 10 per cent w/v solution of *catechol* while cooling in ice. Heat gently over a naked flame for about 30 seconds; a pink colour is produced.

D. Melting range 165° to 170° (2.4.21).

Tests

Appearance of solution. Solution A is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. To 5 ml of solution A add 5 ml of *carbon dioxide-free water* and 0.05 ml of *dilute phenolphthalein solution*; not more than 0.2 ml of *0.01 M sodium hydroxide* is required to change the colour of the solution to pink. To a further 5 ml of solution A add 5 ml of *carbon dioxide-free water* and 0.05 ml of *methyl red solution*. Not more than 0.3 ml of *0.01 M hydrochloric acid* is required to change the colour of the solution to red.

Specific optical rotation (2.4.22). + 23.0° to + 25.0°, determined in a solution prepared by dissolving 2.0 g of the substance under examination and 2.6 g of *sodium tetraborate* in 20 ml of *water* previously heated at 30° and shaking continuously for 15 to 30 minutes without further heating. Dilute the resulting clear solution to 25.0 ml with *water*.

Arsenic (2.3.10). Dissolve 5.0 g in 50 ml of *water* and add 10 ml of *stannated hydrochloric acid*. The resulting solution complies with the limit test for arsenic (2 ppm).

Chlorides (2.3.12). A solution of 5.0 g in 10 ml of *water* complies with the limit test for chlorides (50 ppm).

Sulphates (2.3.17). A solution of 1.5 g in 15 ml of *water* complies with the limit test for sulphates (100 ppm).

Reducing sugars. Dissolve 5.0 g in 25 ml of *water* with the aid of gentle heat. Cool and add 20 ml of *cupri-citric solution* and a few glass beads. Heat so that boiling begins 4 minutes later and continue to boil for 3 minutes. Cool rapidly and add 100 ml of a 2.4 per cent v/v solution of *glacial acetic acid* and 20.0 ml of *0.025 M iodine*. With continuous shaking add 25 ml of a mixture of 6 volumes of *hydrochloric acid* and 94 volumes of *water* and, when the precipitate has dissolved, titrate the excess of iodine with *0.05 M sodium thiosulphate* using 1 ml of *starch solution*, added towards the end of titration, as indicator. Not less than 12.8 ml of *0.05 M sodium thiosulphate* is required.

Sorbitol. Determine by thin-layer chromatography (2.4.17), coating the plate with a uniform 0.75-mm layer of the following mixture. Mix 0.1 g of *carbomer* with 110 ml of *water* and allow to stand, with gentle stirring, for 1 hour. Adjusted to pH 7 by the gradual addition, with continuous shaking, of *2 M sodium hydroxide* and add 30 g of *silica gel H*. Heat the plate at 110° for 1 hour, allow to cool and use immediately.

Mobile phase. A mixture of 85 volumes of *2-propanol* and 15 volumes of a *0.2 per cent w/v solution of boric acid*.

Test solution. Shake 0.5 g of the substance under examination, in fine powder, with 10.0 ml of *ethanol (95 per cent)* for 30 minutes and filter.

Reference solution. A 0.1 per cent w/v solution of *sorbitol IPRS* in *ethanol (95 per cent)*.

Apply to the plate 2 µl of each solution. After development, dry the plate at 100° to 105° for 15 minutes, allow to cool, spray with a 0.5 per cent w/v solution of *potassium permanganate* in *1 M sodium hydroxide* and heat at 100° for 2 minutes. Any spot corresponding to sorbitol in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Sulphated ash (2.3.18). Not more than 0.1 per cent, determined on 2.0 g.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 5.0 g of the substance under examination in 25 ml of *water* and dilute to 100.0 ml with *water*.

Reference solution. Dissolve 0.5 g of *mannitol IPRS* in 2.5 ml of *water* and dilute to 10.0 ml with *water*.

Chromatographic system
- a stainless steel column 30 cm x 7.8 mm packed with strong cation-exchange resin (calcium form) (9 µm),
- column temperature: 85 ± 1°,
- mobile phase: degassed *water*,
- flow rate: 0.5 ml per minute,
- refractometer at constant temperature,
- injection volume: 20 µl.

Inject the reference solution and the test solution. Continue the chromatography for twice the retention time of mannitol.

Calculate the content of $C_6H_{14}O_6$.

Mannitol intended for use in the manufacture of parenteral preparations without a further appropriate procedure for removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 4 Endotoxin Unit per g for parenteral preparation having a concentration of 100 g per litre or less of mannitol, and less than 2.5 Endotoxin Unit per g for parenteral preparations having a concentration of more than 100 g per litre of mannitol.

Labelling. The label states where applicable, the maximum concentration of bacterial endotoxins; whether or not the substance is suitable for use in the manufacture of parenteral preparations.

Storage. Store protected from moisture.

Mannitol Injection

Mannitol Intravenous Infusion

Mannitol Injection is a sterile solution of Mannitol in Water for Injections.

Mannitol Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of mannitol, $C_6H_{14}O_6$.

Usual strengths. 10, 15, 20 and 25 per cent w/v.

Description. A colourless or almost colourless clear solution. Particle, if any, present should dissolve on warming.

Identification

A. Evaporate to dryness on a water-bath a volume containing 2.0 g of Mannitol. The residue melts at 165° to 170° (2.4.21).

B. Determine by thin-layer chromatography (2.4.17), coating the plate with the *silica gel G*

Mobile phase. A mixture of 10 volumes of *water*, 70 volumes of *propan-1-ol* and 20 volumes of *ethyl acetate.*

Test solution. Dilute a volume of injection containing 0.25 g of Mannitol to 100 ml with *water.*

Reference solution. A 0.25 per cent w/v solution of *mannitol IPRS* in *water.*

Apply to the plate 2 µl of each solution. After development, dry the plate in air and spray with the 0.2 per cent w/v solution of *sodium periodate.* Dry the plate in air for 15 minutes and spray with a 2.0 per cent w/v solution of *4,4'-methylenebis-N,N-dimethylanaline* in a mixture of 1 volume of *glacial acetic acid* and 4 volumes of *acetone,* heat at 105° for 30 minutes and examine under ultraviolet light at 365 nm. The principal spot in chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

C. Dissolve 0.5 g of the residue obtained in test A in sufficient *carbon dioxide-free water* prepared from *distilled water* to produce 5 ml (solution A). Add 0.3 ml of solution A to 3 ml of a cooled mixture prepared by adding 6 ml of *sulphuric acid* to 3 ml of a freshly prepared 10 per cent w/v solution of *catechol* while cooling in ice. Heat gently over a naked flame for about 30 seconds; a pink colour is produced.

Tests

pH (2.4.24). 4.5 to 7.0, determined in a solution containing not more than 10.0 per cent w/v solution of Mannitol, diluted if necessary with *water* and to which 0.3 ml of a saturated solution of *potassium chloride* has been added for each 100 ml of solution.

Particulate contamination (2.5.9). When supplied in a container with a nominal content of 100 ml or more, complies with the limit test for particulate contamination.

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml of a solution containing not more than 10 per cent w/v of Mannitol. For solutions of higher strength, dilute the injection under examination with *water BET* so that the final solution contains 10 per cent w/v of Mannitol.

Other tests. Comply with the tests stated under Parenteral Preparations (Intravenous Infusions).

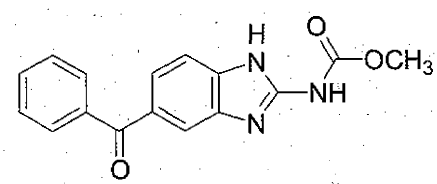
Assay. Dilute a measured volume containing about 0.4 g of Mannitol to 100.0 ml with *water*, transfer 10.0 ml to a stoppered flask, add 20.0 ml of *0.1 M sodium periodate* and 2 ml of *1 M sulphuric acid* and heat on a water-bath for 15 minutes. Cool, add 3 g of *sodium bicarbonate*, in small quantities, and 25.0 ml of *0.1 M sodium arsenite*, mix, add 5 ml of a 20 per cent w/v solution of *potassium iodide* and allow to stand for 15 minutes. Titrate with *0.05 M iodine* until the first trace of yellow colour appears. Repeat the operation without the substance under examination. The difference between the titrations represents the amount of iodine required.

1 ml of *0.05 M iodine* is equivalent to 0.001822 g of $C_6H_{14}O_6$.

Storage. Store at temperatures between 20° and 30°. Exposure to lower temperatures may cause the deposition of crystals, which should be dissolved by warming before use.

Labelling. The label states (1) the strength as a percentage w/v of Mannitol; (2) that the injection should not be used if it contains visible solid particles that do not dissolve on warming.

Mebendazole



$C_{16}H_{13}N_3O_3$ Mol. Wt. 295.3

Mebendazole is Carbamic acid,(5-benzyl-1*H*-binzimidazol-2-yl),methyl ester.

Mebendazole contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{16}H_{13}N_3O_3$, calculated on the dried basis.

Category. Anthelmintic.

Description. A white to slightly yellow, amorphous powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *mebendazole IPRS* or with the reference spectrum of mebendazole.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and *water.*

Test solution. Dissolve 10 mg of the substance under examination in 160 ml of the solvent mixture, with the aid of ultrasound for 10 minutes at about 50°, cool and dilute to 200.0 ml with the solvent mixture.

Reference solution (a). Dissolve 10 mg of *mebendazole IPRS* in 160 ml of the solvent mixture, with the aid of ultrasound for 10 minutes at about 50°, cool and dilute to 200.0 ml with the solvent mixture.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Reference solution (c). A solution containing 0.005 per cent w/v of *mebendazole IPRS* and 0.00025 per cent w/v of *mebendazole related compound D IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature: 40°,
- mobile phase: A. a 0.75 per cent w/v solution of *ammonium acetate,*
  B. *acetonitrile,*
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
15	70	30
20	10	90
25	10	90
26	80	20
30	80	20

Name	Relative retention time	Correction factor
2-Amino mebendazole[1]	0.46	—
2-Hydroxy mebendazole[2]	0.53	—
2-Amino-1-methyl mebendazole[3]	0.67	—
Mebendazole	1.0	—
Mebendazole related compound D	1.1	—
Ethyl mebendazole[4]	1.3	—
Toluoyl mebendazole[5]	1.4	—
Mebendazole dimer[6]	1.6	1.41

[1]2-Amino-5-benzoylbenzimidazole,

[2]5-Benzoyl-2-hydroxybenzimidazole,

[3]2-Amino-5-benzoyl-1-methylbenzimidazole,

[4]Ethyl (5-benzoyl-1H-benzimidazol-2-yl)carbamate,

[5]Methyl 5-(4-toluoyl)-1H-benzimidazol-2-ylcarbamate,

[6]1,3-Bis(5-benzoylbenzimidazol-2-yl)urea.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to mebendazole and mebendazole related compound D is not less than 5.0 and the relative standard deviation for replicate injections is not more than 1.0 per cent for mebendazole peak and not more than 5.0 per cent for mebendazole related compound D.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution the area of any peak corresponding to 2-amino mebendazole, 2-hydroxy mebendazole, 2-amino-1-methyl mebendazole, mebendazole related compound D, ethyl mebendazole and toluoyl mebendazole, each of, is not more than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent), the area of any peak corresponding to mebendazole dimer is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any other secondary peak is not more 0.02 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.01 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

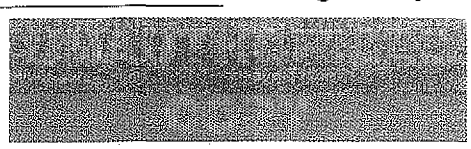
Assay. Determine by liquid chromatography (2.4.14), as described under Related substances.

Inject reference solution (a) and (c). The test is not valid unless the resolution between the peaks due to mebendazole and mebendazole related compound D is not less than 5.0 in the chromatogram obtained with reference solution (c), the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_{16}H_{13}N_3O_3$.

Storage. Store protected from light and moisture.



Mebendazole Tablets

Mebendazole Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of mebendazole, $C_{16}H_{33}N_3O_3$.

Usual strength. 100 mg.

Identification

A. Shake a quantity of the powdered tablets containing 50 mg of Mebendazole with 10 ml of a mixture of 10 volumes of *anhydrous formic acid* and 90 volumes of *chloroform* for 30 minutes, filter, evaporate the filtrate to dryness and dry the residue at a pressure not exceeding 0.7 kPa.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *mebendazole IPRS* or with the reference spectrum of mebendazole.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid* containing 1 per cent w/v of *sodium lauryl sulphate,*
Speed and time. 75 rpm and 2 hours.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve 25 mg of *mebendazole IPRS* in 10 ml of *formic acid* and dilute to 50.0 ml with *methanol*. Dilute a volume of the solution with dissolution medium to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Chromatographic system
- a stainless steel column 3 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of buffer solution prepared by dissolving 4.0 g of *sodium hydroxide* in 1000 ml of *water,* add 1.5 g of *sodium lauryl sulphate* and 10 ml of *orthophosphoric acid*, adjusted to pH 2.5 with *orthophosphoric acid* and 30 volumes of *acetonitrile,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{13}N_3O_3$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{16}H_{13}N_3O_3$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 50 mg of Mebendazole in 20 ml of *dimethylformamide,* with the aid of ultrasound for 30 minutes and dilute to 50.0 ml with *dimethylformamide.*

Reference solution (a). A 0.02 per cent w/v solution of *mebendazole IPRS* in *dimethylformamide*. Dilute 1.0 ml of the solution to 100.0 ml with *dimethylformamide.*

Reference solution (b). Dissolve 100 mg of *mebendazole IPRS* and 2 mg of *mebendazole related compound D IPRS* in 100.0 ml of *dimethylformamide*. Dilute 5.0 ml of the solution to 50.0 ml with *dimethylformamide.*

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature: 40°,
- mobile phase: A. a 0.75 per cent w/v of *ammonium acetate,*
  B. *acetonitrile,*
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
15	70	30
20	10	90
25	10	90
26	80	20
30	80	20

Name	Relative retention time
Mebendazole	1.0
Mebendazole related compound D[1]	1.1

[1]This is a process-related impurity and not included in the total impurities.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to mebendazole and mebendazole related compound D is not less than 1.5 in the

chromatogram obtained with reference solution (b), and the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (a) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances using the following solutions.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg of Mebendazole in *dimethylformamide*, with the aid of ultrasound for 30 minutes and dilute to 100.0 ml with *dimethylformamide*. Dilute 5.0 ml of the solution to 50.0 ml with *dimethylformamide*.

Reference solution. A 0.005 per cent w/v solution of *mebendazole IPRS* in *dimethylformamide*.

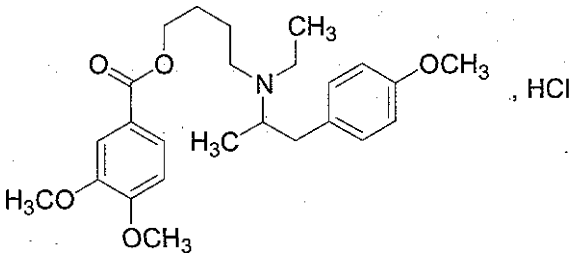
Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{13}N_3O_3$ in the tablets.

Storage. Store protected from light and moisture.

Mebeverine Hydrochloride



$C_{25}H_{35}NO_5,HCl$ Mol. Wt. 466.0

Mebeverine Hydrochloride is (*RS*)-4-[ethyl(4-methoxy-α-methylphenethyl)amino]butyl veratrate hydrochloride.

Mebeverine Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{25}H_{35}NO_5,HCl$, calculated on the dried basis.

Category. Antispasmodic.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *mebeverine hydrochloride IPRS* or with the reference spectrum of mebeverine hydrochloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.003 per cent w/v solution in *0.1 M hydrochloric acid* shows an absorption maximum at about 263 nm and a less well-defined maximum at about 292 nm; absorbance at about 263 nm, about 0.79 and at about 292 nm, about 0.41.

C. Dissolve 25 mg in 2 ml of *water*, acidify with *2 M nitric acid* and centrifuge. The supernatant liquid gives the reactions of chlorides (2.3.1).

Tests

pH (2.4.24). 4.5 to 6.5, determined in a 2.0 per cent w/v solution.

Ether-soluble extractive. Dissolve 40 mg in 25 ml of *2 M hydrochloric acid* and shake with 50 ml of *ether* for 1 minute. Wash the *ether* layer with three quantities, each of 25 ml, of *water*, evaporate the ether to dryness using a rotary evaporator and dissolve the residue in sufficient *methanol* to produce 20 ml; absorbance of the resulting solution at about 260 nm, not more than 0.23 (2.4.7).

Non-tertiary amine. Dissolve 0.5 g in 5 ml of *pyridine*, add 5 ml of *copper chloride-pyridine reagent* and heat at 50° for 30 minutes. Cool, add sufficient *acetone* to produce 50 ml and measure the absorbance of the resulting solution at about 405 nm (2.4.7), using as the blank a solution obtained by treating 5 ml of *pyridine* in the same manner. The absorbance is not more than that obtained by repeating the test using 5 ml of a 0.006 per cent w/v solution of *di-n-butylamine* in *pyridine* and beginning at the words "add 5 ml of *copper chloride-pyridine reagent....*".

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel F254*.

Mobile phase. A mixture of 50 volumes of *ethanol*, 50 volumes of *chloroform* and 1 volume of *18 M ammonia*.

Test solution. Dissolve 0.2 g of the substance under examination in 10.0 ml of *acetone*.

Reference solution (a). Dissolve 10 mg of the substance under examination in 100.0 ml of *acetone*.

Reference solution (b). A 0.002 per cent w/v solution of *veratric acid* in *acetone*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Expose the plate to iodine vapour for 1 hour. When viewed under ultraviolet light, any spot corresponding to veratric acid in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b).Using both methods of visualisation any other secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 1 hour.

Assay. Dissolve 0.4 g in 75 ml of *anhydrous glacial acetic acid* and add 7 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04660 g of $C_{25}H_{35}NO_5$,HCl.

Storage. Store protected from light and moisture at a temperature not exceeding 30°.

Mebeverine Tablets

Mebeverine Hydrochloride Tablets

Mebeverine Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of mebeverine hydrochloride, $C_{25}H_{35}NO_5$,HCl. The tablets are coated.

Usual strength: 135 mg.

Identification

A. Suspend a quantity of the powdered tablets containing 0.2 g of Mebeverine Hydrochloride in 20 ml of *water*, add 5 ml of *5 M sodium hydroxide* and extract with two quantities, each of 25 ml, of *chloroform*. Dry the combined extracts over *anhydrous sodium sulphate* and evaporate to dryness using a rotary evaporator.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *mebeverine hydrochloride IPRS* treated in the same manner or with the reference spectrum of mebeverine.

B. When examined in the range 230 nm to 360 nm (2.4.7), the solution obtained in the Assay shows an absorption maximum at about 263 nm and a less well-defined maximum at about 292 nm.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel F254*.

Mobile phase. A mixture of 50 volumes of *ethanol*, 50 volumes of *chloroform* and 1 volume of *18 M ammonia*.

Test solution. Disperse a quantity of the powdered tablets containing 0.2 g of Mebeverine Hydrochloride with 10.0 ml of *acetone* and filter.

Reference solution (a). Dilute 1 volume of the test solution to 200 volumes with *acetone*.

Reference solution (b). A 0.01 per cent w/v solution of *veratric acid* in *acetone*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Expose the plate to iodine vapour for 1 hour. When viewed under ultraviolet light, any spot corresponding to veratric acid in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b). Using both methods of visualisation any other secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a).

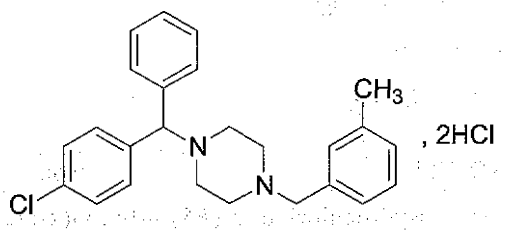
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.5 g of Mebeverine Hydrochloride, dissolve in 100 ml of *0.1 M hydrochloric acid* and heat for 10 minutes on a water-bath, shaking occasionally. Cool, add sufficient *0.1 M hydrochloric acid to* produce 250.0 ml and filter. To 10.0 ml of filtrate add sufficient *0.1 M hydrochloric acid* to produce 100.0 ml and dilute 10.0 ml of the solution to 100.0 ml with the same solvent. Measure the absorbance of the resulting solution at the maximum at about 263 nm (2.4.7). Calculate the content of $C_{25}H_{35}NO_5$,HCl. taking 263 as the specific absorbance at 263 nm.

Storage. Store protected from light and moisture.

Meclizine Hydrochloride

Meclizine Dihydrochloride; Meclozine Hydrochloride; Meclozine Dihydrochloride



$C_{25}H_{27}ClN_2$,2HCl Mol. Wt. 463.9

Meclizine Hydrochloride is (*RS*)-1-(4-chlorobenzhydryl)-4-(3-methylbenzyl)piperazine dihydrochloride.

Meclizine Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{25}H_{27}ClN_2,2HCl$, calculated on the anhydrous basis.

Category. Antiemetic.

Description. A white or yellowish white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *meclizine hydrochloride IPRS* or with the reference spectrum of meclizine hydrochloride.

B. When examined in the range 220 nm to 360 nm (2.4.7), a 0.0015 per cent w/v solution in *0.1 M hydrochloric acid* shows an absorption maximum at about 232 nm and weak absorption without a defined maximum in the range 260 nm to 300 nm; absorbance at the maximum at about 232 nm, 0.51 to 0.57.

C. In the test for Related substances, the principal spot in the chromatogram obtained with the test solution (b) corresponds to that in the chromatogram obtained with reference solution (b).

D. Dissolve about 15 mg in 2 ml of *ethanol (95 per cent)*; the solution gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 2.0 per cent w/v solution in *ethanol (95 per cent)* is clear (2.4.1), and not more intensely coloured than reference solution YS6 (2.4.1).

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. Equal volumes of *dichloromethane* and *methanol*.

Mobile phase. A mixture of 60 volumes of *dichloromethane*, 30 volumes of *toluene*, 5 volumes of *methanol* and 0.5 volume *of strong ammonia solution*.

Test solution (a). Dissolve 0.5 g of the substance under examination in 10.0 ml of the solvent mixture.

Test solution (b). Dissolve 0.5 g of the substance under examination in 100.0 ml of the solvent mixture.

Reference solution (a). Dissolve 25.0 mg of the substance under examination in 100.0 ml of the solvent mixture.

Reference solution (b). A 0.5 per cent w/v solution of *meclizine hydrochloride IPRS* in the solvent mixture.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and spray with *dilute potassium iodobismuthate solution*. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a). Ignore any yellowish white spot on the line of application.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 5.0 per cent, determined on 0.2 g.

Assay. Dissolve 0.35 g in 50 ml of *chloroform*, add 50 ml of *anhydrous glacial acetic acid*, 5 ml of *acetic anhydride* and 12 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, using a 0.1 per cent w/v solution of *quinaldine red* in *anhydrous glacial acetic acid* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02319 g of $C_{25}H_{27}ClN_2,2HCl$.

Storage. Store protected from light and moisture.

Meclizine Tablets

Meclizine Hydrochloride Tablets; Meclozine Tablets; Meclozine Hydrochloride Tablets; Meclizine Dihydrochloride Tablets; Meclozine Dihydrochloride Tablets.

Meclizine Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of meclizine hydrochloride, $C_{25}H_{27}ClN_2,2HCl$.

Usual strength. 25 mg.

Identification

Triturate a quantity of the powdered tablets containing 0.5 g of Meclizine Hydrochloride with three quantities, each of, 15 ml of *chloroform*. Filter the extracts and evaporate the clear filtrate to dryness on a water-bath. The residue complies with test A and C.

A. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *meclizine hydrochloride IPRS* or with the reference spectrum of meclizine hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. Dissolve 15 mg of the residue in 2 ml of *ethanol (95 per cent)*; the solution gives reaction (A) of chlorides (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *0.01 M hydrochloric acid,*
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of the mobile phase and dissolution medium.

Test solution. Use the filtrate, dilute if necessary with the mobile phase.

Reference solution. Dissolve a quantity of *meclizine hydrochloride IPRS* in *ethanol* (not more than 1 per cent of volume of flask) and dilute with the solvent mixture to obtain a solution of known concentration similar to the expected concentration of the test solution.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with irregular or spherical, totally porous silica gel, bonded with strongly acidic cation-exchange coating (3 to 10 µm),
- mobile phase: a mixture of 55 volumes of *water* and 45 volumes of *methanol*, containing 0.69 g of *monobasic sodium phosphate*, adjusted to pH 4.0 with *orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 100 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{25}H_{27}ClN_2,2HCl$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{25}H_{27}ClN_2,2HCl$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 0.25 g Meclizine Hydrochloride in the mobile phase, with the aid of mechanical shaker for 30 minutes and dilute to 100.0 ml with the mobile phase, filter.

Reference solution (a). A 0.0025 per cent w/v solution of *meclizine hydrochloride IPRS* in the mobile phase.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with phenyl groups bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of a buffer solution prepared by dissolving 1.32 g of *dibasic ammonium phosphate* in 1000 ml of *water*, adjusted to pH 7.5 with *orthophosphoric acid*, 32.5 volumes of *methanol* and 32.5 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 232 nm,
- injection volume: 20 µl.

The relative retention time with reference to meclizine hydrochloride for 4- chlorobenzophenone is about 0.23.

Inject reference solution (a) and (b). The test is not valid unless the column efficiency is not less than 1200 theoretical plate, the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (a) and the signal-to-noise ratio is not less than 10 for the principal peak in the chromatogram obtained with reference solution (b).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to 4-chlorobenzophenone, multiplied with correction factor of 1.39, is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent), and the sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a)) (0.1 per cent).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 12.5 mg of Meclizine Hydrochloride in the mobile phase, with the aid of mechanical shaker for 30 minutes and dilute to 100.0 ml with the mobile phase, filter.

Reference solution. A 0.0125 per cent w/v solution of *meclizine hydrochloride IPRS* in the mobile phase.

Use the chromatographic system as described under Related substances

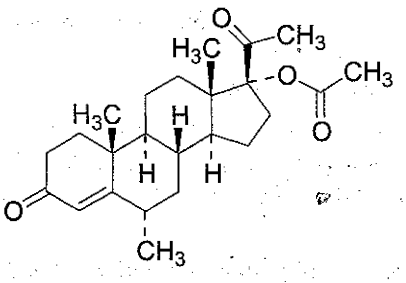
Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{27}ClN_2,2HCl$ in the tablets.

Storage. Store protected from light and moisture.

Medroxyprogesterone Acetate



$C_{24}H_{34}O_4$ Mol. wt. 386.5

Medroxyprogesterone Acetate is 6α-methyl-3,20-dioxo-pregn-4-en-17α-yl acetate.

Medroxyprogesterone Acetate contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{24}H_{34}O_4$, calculated on the dried basis.

Category. Progestogen.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried. Test B may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *medroxyprogesterone acetate IPRS* or with the reference spectrum of medroxyprogesterone acetate.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Solvent mixture. 90 volumes of *chloroform* and 10 volumes of *methanol*

Mobile phase. A mixture of 70 volumes of *toluene*, 40 volumes of *ethyl acetate* and 10 volumes of *light petroleum (50° to 70°)*.

Test solution. Dissolve 0.1 g of the substance under examination in 100.0 ml of the solvent mixture.

Reference solution (a). A 0.1 per cent w/v solution of *medroxyprogesterone acetate IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.05 per cent w/v each of *progesterone IPRS* and *medroxyprogesterone acetate IPRS* in the solvent mixture.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

Spray with *ethanolic sulphuric acid (20 per cent)*, heat at 120° for 10 minutes or until spots appear and allow to cool. Examine the plate under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

C. Melting range 205° to 209° (2.4.21).

Tests

Specific optical rotation (2.4.22). +45.0° to +51.0°, determined in a 1.0 per cent w/v solution in *dioxan*.

Related substances. Determine by liquid chromatography (2.4.17).

Test solution (a). Dissolve 5 mg of the substance under examination in 100.0 ml of the mobile phase.

Test solution (b). Dissolve 0.25 g of the substance under examination in 100.0 ml of the mobile phase.

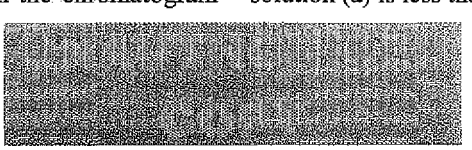
Reference solution. Evaporate 1 ml of a solution containing 0.1 per cent w/v each of *medroxyprogesterone acetate IPRS* and *megestrol acetate IPRS* in *ethanol*, to dryness in a water-bath at 45° and dissolve the residue in sufficient mobile phase to produce 25 ml.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 mm),
- mobile phase: a mixture of 60 volumes of *acetonitrile* and 40 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Equilibrate the column with the mobile phase at a flow rate of 1 ml per minute for about 45 minutes. When the chromatograms are recorded under the conditions described above, the retention times are 12.5 minutes for megestrol acetate and 13.5 minutes for medroxyprogesterone acetate.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to megestrol acetate and medroxyprogesterone acetate is at least 2.0. If this resolution is not achieved, adjust the concentration of *acetonitrile* in the mobile phase. Verify the repeatability by making five separate injections of test solution (a). The system is not suitable unless the relative standard deviation for the area of the principal peak in the chromatogram obtained with test solution (a) is less than 2.0 per cent.



Inject test solution (a) and (b). Record the chromatograms for 1.5 times the retention time of the principal peak. In the chromatogram obtained with test solution (b) the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with test solution (a) (1.0 per cent) and the sum of the areas of all the secondary peaks is not more than 0.75 times the area of the principal peak in the chromatogram obtained with test solution (a) (1.5 per cent). Ignore any peak with an area less than 0.025 times the area of the principal peak in the chromatogram obtained with test solution (a) (0.05 per cent).

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 0.5 g by drying in an oven at 105° for 3 hours.

Assay. Dissolve 25 mg in sufficient *ethanol (95 per cent)* to produce 100.0 ml, dilute 5.0 ml to 100.0 ml with *ethanol (95 per cent)* and measure the absorbance of the resulting solution at the maximum at about 241 nm (2.4.7). Calculate the content of $C_{24}H_{34}O_4$ taking 426 as the specific absorbance at 241 nm.

Storage. Store protected from light and moisture.

Medroxyprogesterone Injection

Medroxyprogesterone Acetate Injection

Medroxyprogesterone Injection is a sterile suspension of Medroxyprogesterone Acetate in a suitable vehicle.

Medroxyprogesterone Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of medroxyprogesterone acetate, $C_{24}H_{34}O_4$.

Usual strength. 150 mg per ml.

Identification

Dissolve a volume of the injection containing about 50 mg of Medroxyprogesterone Acetate in 8 ml of *light petroleum (Boiling range 40° to 60°)* and extract with three 8 ml of a mixture of 7 volumes of *glacial acetic acid* and 3 volumes of *water*. Wash the combined extracts with 10 ml of *light petroleum (Boiling range 40° to 60°)*, dilute with *water* until the solution becomes turbid. Allow to stand in ice for two hours and filter. Wash the precipitate with *water* and dry at 105°. Determine by infrared absorption spectrophotometry (2.4.6), on the residue. Compare the spectrum with that obtained with *medroxyprogesterone acetate IPRS* or with the reference spectrum of medroxyprogesterone acetate.

Tests

Impurity F (6α-methyl-3,20-dioxo-5β-pregnan-17-yl acetate). Determine by thin layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 10 volumes of *tetrahydrofuran*, 45 volumes of *1,1-dimethylethyl methyl ether* and 45 volumes of *hexane*.

Test solution. Dilute the injection with *dichloromethane*, if necessary, to obtain a 2.0 per cent w/v solution of Medroxyprogesterone Acetate.

Reference solution. A 0.01 per cent w/v solution of *medroxyprogesterone acetate impurity F IPRS* in 2.0 per cent w/v solution of *medroxyprogesterone acetate IPRS* in *dichloromethane*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and carry out a second development in the same direction, using a freshly prepared mobile phase. Dry the plate at 105° and allow to cool, spray with a 20.0 per cent w/v solution of *toluenesulphonic acid* in *ethanol (95 per cent)*. Heat at 120° for 10 minutes. Allow to cool and examine the plate in the ultraviolet light at 365 nm. In the chromatogram obtained with the test solution, any blue fluorescent spot with an R_f value higher than the principal spot is not more intense than the corresponding blue fluorescent spot due to medroxyprogesterone impurity F in the chromatogram obtained with the reference solution (0.5 per cent). The test is not valid unless the chromatogram obtained with the reference solution shows two clearly separated spots.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a quantity of the injection containing about 40 mg Medroxyprogesterone Acetate in 100.0 ml of the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.002 per cent w/v of *medroxyprogesterone acetate IPRS* and 0.005 per cent w/v of *megestrol acetate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with base-deactivated endcapped octadecylsilane bonded to porous silica (5 µm) (Such as Phenomenex Prodigy ODS3),
- column temperature: 40°,
- mobile phase: a mixture of 10 volumes of *tetrahydrofuran*, 35 volumes of *acetonitrile*, 50 volumes of *water* and diluted to 100 volumes with *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 241 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 3.3 and the tailing factor of the peak due to medroxyprogesterone acetate is not more than 1.3.

Inject reference solution (a) and the test solution. In the chromatogram obtained with test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent) and the sum of areas of all other secondary peaks is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute the injection with mobile phase to obtain 0.004 per cent w/v solution of Medroxyprogesterone Acetate.

Reference solution (a). A 0.004 per cent w/v solution of *medroxyprogesterone acetate IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.002 per cent w/v of *medroxyprogesterone acetate IPRS* and 0.005 per cent w/v of *megestrol acetate IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 3.3 and the tailing factor of the peak due to medroxyprogesterone acetate is not more than 1.3.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{24}H_{34}O_4$ in the injection.

Storage. Store protected from light.

Medroxyprogesterone Tablets

Medroxyprogesterone Acetate Tablets

Medroxyprogesterone Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of medroxyprogesterone acetate, $C_{24}H_{34}O_4$.

Usual strengths. 2.5 mg; 5 mg; 10 mg.

Identification

Disperse a quantity of the powdered tablets containing about 50 mg of Medroxyprogesterone Acetate in 8 ml of *petroleum spirit (boiling range, 40° to 60°)* and extract with three 8 ml quantities of a mixture of 7 volumes of *glacial acetic acid* and 3 volumes of *water*. Wash the combined extracts with 10 ml of *petroleum spirit (boiling range, 40° to 60°)*, dilute with *water* until the solution becomes turbid, allow to stand in ice for 2 hours and filter. Wash the precipitate with *water* and dry at 105°. Determine by infrared absorption spectrphotometry (2.4.6), on the residue. Compare the spectrum with that obtained with *medroxyprogesterone acetate IPRS* or with the reference spectrum of medroxyprogesterone acetate.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of 0.5 per cent w/v solution of *sodium lauryl sulphate,*
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium to produce a 0.00028 per cent w/v solution of Medroxyprogesterone Acetate.

Reference solution. A 0.00028 per cent w/v solution of *medroxyprogesterone acetate IPRS* in the dissolution medium.

Chromatographic system
- a stainless steel column 8 cm x 4 mm, packed with octylsilane bonded to porous silica (10 µm) (Such as Zorbax C8),
- mobile phase: a mixture of 40 volumes of *water* and 60 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{24}H_{34}O_4$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{24}H_{34}O_4$.

Impurity F (6α-methyl-3,20-dioxo-5β-pregnan-17-yl acetate). Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 10 volumes of *tetrahydrofuran*, 45 volumes of *1,1-dimethylethyl methyl ether* and 45 volumes of *hexane.*

Test solution. Shake a quantity of powdered tablets containing about 0.2 g of Medroxyprogesterone Acetate with *dichloromethane* and dilute to 10.0 ml with the same solvent. Centrifuge and use the supernatant liquid.

Reference solution. A 0.01 per cent w/v solution of *medroxyprogesterone acetate impurity F IPRS* in 2.0 per cent w/v solution of *medroxyprogesterone acetate IPRS* in *dichloromethane.*

Apply to the plate 10 µl of each solution. After removal of the plate, dry the plate in air and carry out a second development

in the same direction using a freshly prepared mobile phase. Dry the plate at 105° and allow to cool, spray with a 20 per cent w/v solution of *toluenesulphonic acid* in *ethanol (95 per cent)*. Heat at 120° for 10 minutes, allow to cool and examine the plate under ultraviolet light at 365 nm. In the chromatogram obtained with the test solution, any blue fluorescent spot with an R_f value higher than that of the principal spot is not more intense than the corresponding blue fluorescent spot due to medroxyprogesterone impurity F in the chromatogram obtained with the reference solution (0.5 per cent). The test is not valid unless the chromatogram obtained with the reference solution shows two clearly separated spots.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing about 40 mg of Medroxyprogesterone Acetate in 50 ml of the mobile phase and dilute to 100 ml with the mobile phase and filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.002 per cent w/v of *medroxyprogesterone acetate IPRS* and 0.005 per cent w/v of *megestrol acetate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with base-deactivated end-capped octadecylsilane bonded to porous silica (5 µm) (Such as Phenomenex Prodigy ODS3),
- column temperature: 40°,
- mobile phase: a mixture of 10 volumes of *tetrahydrofuran*, 35 volumes of *acetonitrile*, 50 volumes of *water* and dilute to 100 volumes with *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 241 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 3.3 and the tailing factor of the peak due to medroxyprogesterone acetate is not more than 1.3.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent). Ignore any peak with an area less than that 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the powdered tablets containing 40 mg of Medroxyprogesterone Acetate with 50 ml of the mobile phase for 15 minutes, add sufficient mobile phase to produce 100 ml, mix and filter. To 5ml of the filtrate add sufficient mobile phase to produce 50.0 ml.

Reference solution (a). A 0.004 per cent w/v solution of *medroxyprogesterone acetate IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.002 per cent w/v of *medroxyprogesterone acetate IPRS* and 0.005 per cent w/v of *megestrol acetate IPRS* in the mobile phase.

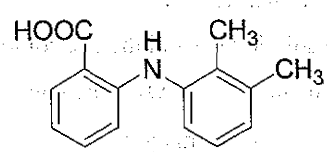
Use chromatographic system as described in the test for Related substances.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 3.3 and the tailing factor of the peak due to medroxyprogesterone acetate is not more than 1.3.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{24}H_{34}O_4$ in the tablets.

Mefenamic Acid



$C_{15}H_{15}NO_2$ Mol. Wt. 241.3

Mefenamic Acid is *N*-(2,3-xylyl)anthranilic acid.

Mefenamic Acid contains not less than 99.0 per cent and not more than 100.5 per cent of $C_{15}H_{15}NO_2$, calculated on the dried basis.

Category. Antiinflammatory; analgesic.

Description. A white to greyish-white, microcrystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *mefenamic acid IPRS* or with the reference spectrum of mefenamic acid.

B. Dissolve 25 mg in 15 ml of *chloroform* and examine under ultraviolet light at 365 nm; the solution exhibits a strong greenish-yellow fluorescence. Carefully add 0.5 ml of a saturated solution of *trichloroacetic acid* drop wise and

examine again under ultraviolet light at 365 nm; the solution does not exhibit fluorescence.

C. Dissolve 5 mg in 2 ml of *sulphuric acid* and add 0.05 ml of *0.0167 M potassium dichromate*; an intense blue colour is produced immediately which fades rapidly to brownish-green.

Tests

Light absorption (2.4.7). Absorbance of a 0.002 per cent w/v solution in a mixture of 99 volumes of *methanol* and 1 volume of *1 M hydrochloric acid* at the maximum at about 279 nm, 0.69 to 0.74 and at the maximum at about 350 nm, 0.56 to 0.60.

Copper. Moisten 1.0 g with *sulphuric acid* and ignite until all the carbon is removed. Add 10 ml of *1 M sulphuric acid* to the residue and allow to stand for 10 minutes. Transfer to a separating funnel using 20 ml of *water* and add 10 ml of a solution containing 20 per cent w/v *diammonium hydrogen citrate* and 5 per cent w/v solution of *disodium edetate*. Add 0.2 ml of *thymol blue solution* and neutralise with *5 M ammonia*. Add 10 ml of *sodium diethyldithiocarbamate solution* and 15 ml of *carbon tetrachloride*, shake and allow to separate. The yellow colour of the *carbon tetrachloride* layer is not more intense than that produced by treating 2 ml of *copper standard solution (10 ppm Cu)* in the same manner beginning at the words "Transfer to a separating funnel using....." (20 ppm).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Further dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.0005 per cent w/v each of *mefenamic acid impurity C* and *mefenamic acid impurity D* in the mobile phase.

Reference solution (c). A 0.001 per cent w/v solution of *mefenamic acid impurity A IPRS* in the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (d). A 0.002 per cent w/v solution of *benzoic acid* in the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 14 volumes of *tetrahydrofuran*, 40 volumes of a 0.58 per cent w/v solution of *ammonium dihydrogen phosphate*, adjusted to pH 5.0 with *dilute ammonia* and 46 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Mefenamic acid impurity C[1]	0.3	5.9
Mefenamic acid impurity D[2]	0.35	4.0
Mefenamic acid impurity A[3]	0.5	—
Mefenamic acid (Retention time: about 8 minutes)	1.0	—

[1]2-chlorobenzoic acid,

[2]benzoic acid,

[3]2,3-dimethylaniline.

Inject reference solution (b) and (d). The test is not valid unless the resolution between the peaks due to mefenamic acid impurities C and D is not less than 3.0 in the chromatogram obtained with reference solution (b) and the signal-to-noise ratio is not less than 10 for the principal peak in the chromatogram obtained with reference solution (d).

Inject reference solution (a), (c) and the test solution. Run the chromatogram 4 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak due to mefenamic acid impurities C and D is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). The area of any peak due to mefenamic acid impurity A is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (100 ppm), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

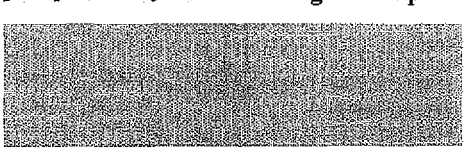
Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.5 g and dissolve in 100 ml of warm *ethanol (95 per cent)* previously neutralised to *phenol red solution* and titrate with *0.1 M sodium hydroxide* using *phenol red solution* as indicator.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.02413 g of $C_{15}H_{15}NO_2$.

Storage. Store protected from light and moisture.



Mefenamic Acid Capsules

Mefenamic Acid Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of mefenamic acid, $C_{15}H_{15}NO_2$.

Usual strength. 250 mg; 500 mg.

Identification

Extract a quantity of the contents of the capsules containing 0.25 g of Mefenamic Acid with two quantities, each of 30 ml, of *ether*. Wash the combined extracts with *water* and evaporate to dryness on a water-bath. The residue, after drying at 105°, complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *mefenamic acid IPRS* or with the reference spectrum of mefenamic acid.

B. Dissolve 25 mg in 15 ml of *chloroform* and examine under ultraviolet light at 365 nm; the solution exhibits a strong greenish-yellow fluorescence. Carefully add 0.5 ml of a saturated solution of *trichloroacetic acid* drop wise and examine again under ultraviolet light at 365 nm; the solution does not exhibit fluorescence.

C. Dissolve 5 mg in 2 ml of *sulphuric acid* and add 0.05 ml of *0.0167 M potassium dichromate*; an intense blue colour is produced immediately which fades rapidly to brownish-green.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *0.05 M tris buffer* prepared by dissolving 60.5 g *tris(hydroxymethyl) aminomethane* in 6000 ml *water*, diluting to 10,000 ml with *water* and adjusted to pH 9.0 ± 0.05 with *phosphoric acid*. 100 g of *sodium lauryl sulphate* is dissolved in 6000 ml of the above solution and further mixed with the remaining quantity of the solution,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary.

Reference solution. A 0.02 per cent w/v solution of *mefenamic acid IPRS* in the dissolution medium.

Use the chromatographic system described under Assay.

Calculate the content of $C_{15}H_{15}NO_2$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{15}H_{15}NO_2$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 90 volumes of *toluene*, 25 volumes of *dioxan* and 1 volume of *glacial acetic acid*.

Test solution. The supernatant liquid obtained by shaking a quantity of the contents of the capsules containing 0.25 g of Mefenamic Acid with a mixture of 7.5 ml of *chloroform* and 2.5 ml of *methanol*.

Reference solution. Dissolve 5.0 mg of the substance under examination in 100 ml of a mixture of 3 volumes of *chloroform* and 1 volume of *methanol*.

Apply to the plate 20 µl of each solution. After development, dry the plate in air, expose to iodine vapour for 5 minutes and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

2,3-Dimethylaniline. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 90 volumes of *toluene*, 25 volumes of *dioxan* and 1 volume of *18 M ammonia*.

Test solution. The supernatant liquid obtained in the test for Related substances.

Reference solution. A 0.00025 per cent w/v solution of *2, 3-dimethylaniline* in a mixture of 3 volumes of *chloroform* and 1 volume of *methanol*.

Apply to the plate 40 µl of each solution. After development, dry the plate in a current of warm air. Spray the plate with *ethanolic sulphuric acid (20 per cent)*, heat at 105° for 30 minutes and immediately expose to nitrous fumes in a closed glass chamber for 15 minutes (the nitrous fumes may be generated by adding *dilute sulphuric acid* dropwise to a solution containing 10 per cent w/v of *sodium nitrite* and 3 per cent w/v of *potassium iodide*). Place the plate in a current of warm air for 15 minutes and spray with a 0.5 per cent w/v solution of *N-(1-naphthyl)ethylenediamine dihydrochloride* in *ethanol (95 per cent)*. If necessary, allow to dry and repeat the spraying. Any spot corresponding to 2,3-dimethylaniline in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the mixed contents of 20 capsules containing about 50 mg of Mefenamic acid in a 250.0-ml volumetric flask, add 5 ml of *tetrahydrofuran*, shake for 10 minutes with the aid of ultrasound, dilute to volume with the mobile phase and filter.

Reference solution. A solution containing 0.02 per cent w/v of *mefenamic acid IPRS* in the mobile phase.

NOTE—Protect the solutions from light.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 23 volumes of *acetonitrile*, 20 volumes of *0.05 M of monobasic ammonium phosphate* adjusted to a pH of 5.0 with *3 M ammonia* and 7 volumes of *tetrahydrofuran*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency determined from the mefenamic acid peak is not less than 8200 theoretical plates, the tailing factor is not more than 1.6 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_5NO_2$ in the capsules.

Mefenamic Acid and Dicyclomine Hydrochloride Tablets

Mefenamic Acid and Dicyclomine Hydrochloride Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of mefenamic acid, $C_{15}H_{15}NO_2$ and dicyclomine hydrochloride, $C_{19}H_{35}NO_2,HCl$.

Usual strengths. Mefenamic acid, 250 mg and Dicyclomine hydrochloride, 10 mg; Mefenamic acid, 250 mg and Dicyclomine hydrochloride, 20 mg; Mefenamic acid, 500 mg and Dicyclomine hydrochloride, 20 mg.

Identification

A. In the Assay for mefenamic acid, the test solution shows an absorption maxima and minima at the same wavelength as that of reference solution of mefenamic acid.

B. In the Assay for dicyclomine hydrochloride, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution of dicyclomine hydrochloride.

Tests

Dissolution (2.5.2).

For Mefenamic acid —

Apparatus No. 2 (Paddle),
Medium. 900 ml of a *tris buffer* prepared by dissolving 36.5 g of *tris(hydroxymethyl) aminomethane* in 6000 ml *water* and adjusted to pH 9.0 with *orthophosphoric acid*. Add 60.0 g of *sodium lauryl sulphate* in the above solution,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Test solution. Dilute 2.0 ml of the filtrate to 25.0 ml with the dissolution medium.

Reference solution. Weigh accurately 25.0 mg of *mefenamic acid IPRS* and transfer to a 50-ml volumetric flask, add 30.0 ml of *methanol* and sonicate to dissolve. Make up the volume with *methanol* and mix. Dilute further 2.0 ml of the solution to 50.0 ml with dissolution medium.

Measure the absorbance of the reference solution and test solution at the maximum at about 254 nm (2.4.7). Calculate the content of $C_{15}H_{15}NO_2$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{15}H_{15}NO_2$.

For Dicyclomine hydrochloride —

Apparatus No. 2 (Paddle),
Medium. 500 ml of *0.01M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Solvent mixture. A mixture of 70 volumes of *acetonitrile* and 30 volumes of *water*.

Test solution. Dilute 5.0 ml of the filtrate to 10.0 ml with the mobile phase.

Reference solution. Weigh accurately 25 mg of *dicyclomine hydrochloride IPRS* and transfer to a 25-ml volumetric flask and dilute with solvent mixture and sonicate. Dilute further 1.0 ml of the solution to 100.0 ml with mobile phase

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 25 volumes of a buffer solution prepared by dissolving 2.72 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 7.5 with *sodium hydroxide* solution, 75 volumes of *acetonitrile* and filter,
- flow rate: 2 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency is not less than 2000 theoretical plates and the relative standard deviation for replicate injection is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{35}NO_2,HCl$.

Q. Not less than 70 per cent of the stated amounts of $C_{19}H_{35}NO_2,HCl$.

Uniformity of content. Complies with the test stated under Tablets.

For Dicyclomine Hydrochloride — Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Disperse one tablet in 80.0 ml of solvent mixture with the aid of ultrasound and dilute to 100.0 ml with the same solvent. Further dilute 4.0 ml of the solution to 10.0 ml with mobile phase.

Reference solution. Dissolve 25.0 mg of *dicyclomine hydrochloride IPRS* in 20 ml of solvent mixture and dilute to 25.0 ml with the same solvent. Dilute 1.0 ml of the solution to 25.0 ml with mobile phase and mix.

Inject the reference solution and test solution.

Calculate the content of $C_{19}H_{35}NO_2$,HCl in the tablet.

Other tests. Comply with the tests stated under tablets.

Assay.

For Mefenamic Acid —

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg Mefenamic acid in 70 ml of *methanol* with the aid of ultrasound and dilute to 100.0 ml with *methanol*. Dilute 2.0 ml of the solution to 50.0 ml with *methanol*.

Reference solution. A 0.002 per cent w/v solution of *mefenamic acid IPRS* in *methanol*.

Measure the absorbance of the reference solution and the test solution at 254 nm (2.4.7). Calculate the content of $C_{15}H_{15}NO_2$.

For Dicyclomine Hydrochloride — Determine by liquid chromatography (2.4.14).

Solvent mixture. 70 volumes of *acetonitrile* and 30 volumes of *water*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 20 mg Dicyclomine Hydrochloride in to 50-ml volumetric flask add 40 ml of solvent mixture and sonicate to dissolve. Make up the volume with solvent mixture and mix. Further dilute 1.0 ml of the solution to 10.0 ml with mobile phase.

Reference solution. Weigh accurately 25 mg of *dicyclomine hydrochloride IPRS* and transfer to a 25-ml volumetric flask, add 20.0 ml of solvent mixture and sonicate to dissolve. Make up the volume with solvent mixture and mix. Dilute 1.0 ml of the solution to 25.0 ml with mobile phase and mix.

Chromatographic system

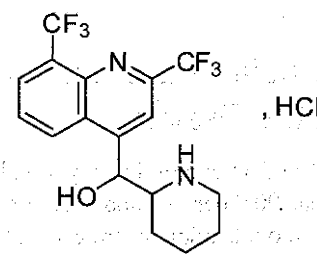
- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 25 volumes of a buffer solution prepared by dissolving 2.72 g of *potassium dihydrogen orthophosphate* into 1000 ml of *water*, adjusted to pH 7.5 with *sodium hydroxide* solution, 75 volumes of *acetonitrile* and filter.
- flow rate: 2 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injection is not more than 2.0 per cent.

Inject the reference solution and test solution.

Calculate the content of $C_{19}H_{35}NO_2$,HCl in the tablets.

Mefloquine Hydrochloride



$C_{17}H_{17}ClF_6N_2O$ Mol. Wt. 414.8

Mefloquine Hydrochloride is (*RS*)-[2,8-bis(trifluoromethyl) quinolin-4-yl][(2*SR*)-piperidin-2-yl]methanol hydrochloride.

Mefloquine Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{17}H_{17}ClF_6N_2O$ calculated on the anhydrous basis.

Category. Antimalarial.

Description. A white or slightly yellow crystalline powder.

Identification

Tests A and E may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if tests A and E are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *mefloquine hydrochloride IPRS* or with the reference spectrum of mefloquine hydrochloride.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 10 volumes of *anhydrous acetic acid*, 10 volumes of *methanol*, and 80 volumes of *dichloromethane*.

Test solution. Dissolve 8.0 mg of the substance under examination in 5.0 ml of *methanol*.

Reference solution (a). Dissolve 8.0 mg of *mefloquine hydrochloride IPRS* in 5.0 ml of *methanol*.

Reference solution (b). Dilute 2.5 ml of the test solution to 100 ml with *methanol*.

Reference solution (c). To 1 ml of reference solution (b), add 1 ml of a 0.0016 per cent w/v solution of *quinidine sulphate* in *methanol*.

Apply to the plate 20 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate in a current of warm air for 15 minutes and examine under ultraviolet light at 254 nm; lightly spray with a mixture, prepared immediately before use, of 1 volume of *sulphuric acid* and 40 volumes of *iodoplatinate reagent*; spray with *strong hydrogen peroxide solution*. In reference solution (c) the chromatogram shows two clearly separated spots. The principal spot in the chromatogram obtained with the test solution corresponds to the spot in the chromatogram obtained with reference solution (a).

C. Mix about 10 mg of the substance under examination with 45 mg of *heavy magnesium oxide* and ignite in a crucible until a practically white residue is obtained. Allow to cool, then add 2 ml of *water*, 0.05 ml of *phenolphthalein solution* and about 1 ml of *dilute hydrochloric acid* to make the solution colourless. Filter. To the filtrate add a freshly prepared mixture of 0.1 ml of *alizarin S solution* and 0.1 ml of *zirconyl nitrate solution*. Mix, allow to stand for 5 minutes and compare the colour of the solution with a blank prepared in the same manner. The test solution is yellow and the blank is red.

D. To about 20 mg of the substance under examination, add 0.2 ml of *sulphuric acid*. Blue fluorescence appears under ultraviolet light at 365 nm.

E. It gives reaction (B) of chlorides (2.3.1).

Tests

Appearance of solution. A 5.0 per cent solution in *methanol* is clear (2.4.1) and not more intensely coloured than reference solution BYS7 (2.4.1).

Optical rotation (2.4.22). – 0.2° to + 0.2°, determined in a 5.0 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 100 mg of the substance under examination in 25.0 ml of the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.016 per cent w/v each of *mefloquine hydrochloride IPRS* and *quinidine sulphate* in the mobile phase. Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 100 mg of *tetraheptylammonium bromide* in a mixture of 20 volumes of *methanol*, 40 volumes of a 0.15 per cent w/v solution of *sodium hydrogen sulphate* and 40 volumes of *acetonitrile*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to quinidine and mefloquine is not less than 8.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of secondary peak with a relative retention time with reference to mefloquine is about 0.7 is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of secondary peaks other than the peak with a relative retention time with reference to mefloquine is about 0.7 is not more than five times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 3.0 per cent, determined on 1.0 g.

Assay. Dissolve 0.35 g in 15 ml of *anhydrous formic acid* and add 40 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04148 g of $C_{17}H_{17}ClF_6N_2O$.

Storage. Store protected from light.

Mefloquine Tablets

Mefloquine Hydrochloride Tablets

Mefloquine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of mefloquine, $C_{17}H_{16}F_6N_2O$.

Usual strength. 250 mg.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF 254*.

Mobile phase. A mixture of 70 volumes of *toluene*, 30 volumes of *ethanol* and 2 volumes of *strong ammonia solution*.

Test solution. Disperse a quantity of powder containing about 0.1 g of Mefloquine in 10.0 ml of *methanol*.

Reference solution. A 1.0 per cent w/v solution of *mefloquine IPRS* in *methanol*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 8.0 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to the spot in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. It gives reaction (A) of chlorides (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.1 M hydrochloric acid*,

Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted if necessary with the medium, at the maximum at about 283 nm (2.4.7). Calculate the content of $C_{17}H_{16}F_6N_2O$ in the medium from the absorbance obtained from a solution of known concentration of *mefloquine hydrochloride IPRS*, prepared by dissolving in minimum quantity of *methanol* and diluting with the dissolution medium.

Q. Not less than 80 per cent of the stated amount of $C_{17}H_{16}F_6N_2O$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the powdered tablets containing about 200 mg of Mefloquine, disperse in 100.0 ml of the mobile phase.

Reference solution (a). A solution containing 0.022 per cent w/v of *mefloquine hydrochloride IPRS* and 0.004 per cent w/v of *sulphadoxine* with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 2.0 ml of the solution to 20.0 ml with mobile phase.

Use chromatographic system as described in the Assay.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to mefloquine and sulphadoxine is not less than 5.0.The relative retention time with reference to mefloquine for (*RS*)-[2,8-bis(trifluoromethyl) quinolin-4-yl][(2*RS*)-piperidin-2-yl]methanol(threo-mefloquine impurity A) is about 0.9, for (*RS*)-[2,8-bis(trifluoromethyl) quinolin-4-yl](pyridin-2-yl]methanol (mefloquine impurity C) is about 3.6, for (*RS*)-[2,8-bis(trifluoromethyl)quinolin-4-yl](pyridin-2-yl]methanone (mefloquine impurity B) is about 7.4.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution (a). Disperse a quantity of the powdered tablets containing about 200 mg of mefloquine, disperse in 100.0 ml of the mobile phase.

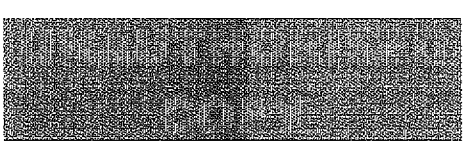
Test solution (b). Dilute 5.0 ml of test solution (a) to 50.0 ml with the mobile phase.

Reference solution (a). A 0.022 per cent w/v solution of *mefloquine hydrochloride IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.022 per cent w/v of *mefloquine hydrochloride IPRS* and 0.004 per cent w/v of *sulphadoxine* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 22 volumes of *methanol*, 38 volumes of *acetonitrile* and 40 volumes of a buffer solution prepared by dissolving 13.6 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 3.5 with *orthophoshphoric acid*,
- flow rate: 1.5 ml per minute,



– spectrophotometer set at 283 nm,
– injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to mefloquine and sulphadoxine is not less than 5.0.

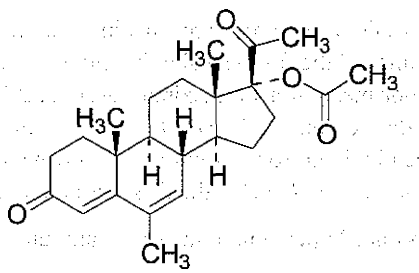
Inject reference solution (a) and test solution (b).

Calculate the content of $C_{17}H_{16}F_6N_2O$ in the tablets.

Each mg of mefloquine hydrochloride, $C_{17}H_{16}F_6N_2O,HCl$ is equivalent to 0.912 mg of mefloquine $C_{17}H_{16}F_6N_2O$.

Storage. Store protected from light and moisture.

Megestrol Acetate



$C_{24}H_{32}O_4$ Mol.Wt. 384.5

Megestrol Acetate is 6-methyl-3,20-dioxopregna-4,6-dien-17-yl acetate.

Megestrol Acetate contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{24}H_{32}O_4$, calculated on the dried basis.

Category. Progestogen.

Description. A white to creamy-white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *megestrol acetate IPRS* or with the reference spectrum of megestrol acetate.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. 90 volumes of *acetone* and *1,2-propanediol*.

Mobile phase. A mixture of 40 volumes of *cyclohexane* and 10 volumes of *toluene*.

Test solution. Dissolve 25 mg of the substance under examination in 10.0 ml of the solvent mixture.

Reference solution (a). Dissolve 25 mg of *megestrol acetate IPRS* in 10.0 ml of the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 1µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

C. It gives the reaction of acetyl groups (2.3.1).

Tests

Specific optical rotation (2.4.22). +9.0° to +12.0°, determined at 20° in a 5.0 per cent w/v solution in *chloroform*.

Light absorption. When examined in the range 230 nm to 360 nm (2.4.7), the solution obtained in the Assay shows an absorption maximum only at about 287 nm; ratio of the absorbance at about 240 nm to that at the maximum at about 287 nm, not more than 0.17.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 145 volumes of *tetrahydrofuran* and 255 volumes of *acetonitrile*.

Test solution. Dissolve 25 mg of the substance under examination in 20 ml of the solvent mixture, dilute to 50.0 ml with *water*.

Reference solution (a). Dissolve 25 mg of *medroxyprogesterone acetate IPRS (megestrol acetate impurity A IPRS)* in 20 ml of the solvent mixture, dilute to 50.0 ml with *water*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 200.0 ml with the mobile phase.

Reference solution (c). To 3.0 ml of the test solution, add 1 ml of reference solution (a) and dilute to 50.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 14.5 volumes of *tetrahydrofuran*, 22.5 volumes of *acetonitrile* and 60 volumes of *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to megestrol acetate and megestrol acetate impurity A is not less than 4.0.

Inject reference solution (b) and the test solution. Run the chromatogram 1.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of the peak corresponding to megestrol acetate impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks other than megestrol acetate impurity A is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principle peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 20 mg in sufficient *ethanol (95 per cent)* to produce 100.0 ml, dilute 5.0 ml to 100.0 ml with *ethanol (95 per cent)* and measure the absorbance of the resulting solution at the maximum at about 287 nm (2.4.7). Calculate the content of $C_{24}H_{32}O_4$ taking 630 as the specific absorbance at 287 nm.

Storage. Store protected from light and moisture.

Megestrol Tablets

Megestrol AcetateTablets

Megestrol Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of megestrol acetate, $C_{24}H_{32}O_4$.

Usual strengths. 20 mg; 160 mg.

Identification

A. Extract a quantity of the powdered tablets containing 40 mg of Megestrol Acetate with 10 ml of *chloroform*, filter and evaporate the filtrate to dryness in a current of air. Dry the residue at 60° at a pressure not exceeding 0.7 kPa for 1 hour.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *megestrol acetate IPRS* or with the reference spectrum of megestrol acetate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of 1 per cent w/v solution of *sodium lauryl sulphate*,
Speed and time. 75 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably dilute if necessary with the dissolution medium, at the maximum at about 292 nm (2.4.7). Calculate the content of $C_{24}H_{32}O_4$ in the medium from the absorbance obtained from a solution of known concentration of *megestrol acetate IPRS* in the dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_{24}H_{32}O_4$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 40 volumes of *acetonitrile* and 60 volumes of *water*

Internal standard solution. A 0.08 per cent w/v solution of *propylparaben* in *acetonitrile*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 80 mg of Megestrol Acetate in 10 ml of *water*, shake for 10 minutes, add 75 ml of *acetonitrile*, shake for 30 minutes and dilute to 100.0 ml with *acetonitrile* and centrifuge. Dilute 5.0 ml of the solution and 5.0 ml of the internal standard solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.1 per cent w/v solution of *megestrol acetate IPRS* in *acetonitrile*. Dilute 4.0 ml of the solution and 5.0 ml of the internal standard solution to 50.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 55 volumes of *acetonitrile* and 45 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 25 µl.

The relative retention time with reference to megestrol acetate for propylparaben is about 0.4.

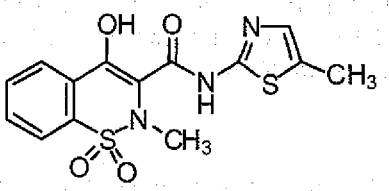
Inject the reference solution. The test is not valid unless the resolution between the peaks due to propylparaben and megestrol acetate is not less than 8.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent for the peak response ratio of megestrol acetate and propyl paraben.

Inject the reference solution and the test solution.

Calculate the content of $C_{24}H_{32}O_4$ in the tablets.

Storage. Store protected from light and moisture.

Meloxicam



$C_{14}H_{13}N_3O_4S_2$ Mol. Wt. 351.4

Meloxicam is 4-Hydroxy-2-methyl-*N*-(5-methyl-2-thiazolyl)-2*H*-1,2-benzothiazine-3-carboxamide-1,1-dioxide.

Meloxicam contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{14}H_{13}N_3O_4S_2$, calculated on the dried basis.

Category. Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

Description. A pale yellow powder. It shows polymorphism (2.5.11).

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *meloxicam IPRS* or with the reference spectrum of meloxicam.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 40 mg of the substance under examination in a mixture of 5 ml of *methanol* and 0.3 ml of *1 M sodium hydroxide*. Dilute to 20.0 ml with *methanol*.

Reference solution (a). Dilute 2.0 ml of the test solution to 100.0 ml with *methanol*. Dilute 5.0 ml of the solution to 100.0 ml with the same solvent.

Reference solution (b). Dissolve 2 mg of the substance under examination, 2 mg of *meloxicam impurity A IPRS*, 2 mg of *meloxicam impurity B IPRS*, 2 mg of *meloxicam impurity C IPRS* and 2 mg of *meloxicam impurity D IPRS* in a mixture of 5 ml of *methanol* and 0.3 ml of *1 M sodium hydroxide*. Dilute to 25.0 ml with *methanol*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: A. a 0.1 per cent w/v solution of *potassium dihydrogen phosphate*, adjusted to pH 6.0 with *1 M sodium hydroxide*,
  B. *methanol*,
- flow rate: 1 ml per minute,
- a gradient programme using the conditions given below,
- spectrophotometer set at 260 nm and 350 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	60	40
2	60	40
10	30	70
15	30	70

Name	Relative retention time	Correction factor
Meloxicam impurity B[1]	0.5	---
Meloxicam (retention time is about 7 minutes)	1.0	---
Meloxicam impurity A[2]	1.4	2.0
Meloxicam impurity C[3]	1.7	---
Meloxicam impurity D[4]	1.9	---

[1]5-methylthiazol-2-amine.

[2]ethyl 4-hydroxy-2-methyl-2*H*-1,2-benzothiazine-3-carboxylate 1,1-dioxide.

[3]*N*-[(2*Z*)-3,5-dimethylthiazol-2(3*H*)-ylidene]-4-hydroxy-2-methyl-2*H*-1,2-benzothiazine-3-carboxamide 1,1-dioxide.

[4]*N*-[(2*Z*)-3-ethyl-5-methylthiazol-2(3*H*)-ylidene]-4-hydroxy-2-methyl-2*H*-1,2-benzothiazine-3-carboxamide 1,1-dioxide.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to meloxicam and meloxicam impurity A at 350 nm is not less than 3.0 and between the peaks due to meloxicam impurity B and meloxicam at 260 nm is not less than 3.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to meloxicam impurity A at 350 nm is not

more than the area of the principal peak in the chromatogram obtained with reference solution (a) at 350 nm (0.1 per cent), the area of any peak corresponding to meloxicam impurity B at 260 nm is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) at 350 nm (0.1 per cent), the area of any peak corresponding to meloxicam impurities C and D at 350 nm is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) at 350 nm (0.05 per cent), the area of any other secondary peak at 350 nm is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent). Ignore any peak at 350 nm with an area less than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.03 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

Assay. *To avoid overheating, mix thoroughly throughout the titration and stop the titration immediately after the end-point has been reached.*

Dissolve 0.25 g in a mixture of 5 ml of *anhydrous formic acid* and 50 ml of *anhydrous acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03514 g of $C_{14}H_{13}N_3O_4S_2$.

Storage. Store protected from light

Meloxicam Oral Suspension

Meloxicam Oral Suspension is a suspension of Meloxicam in a suitable vehicle.

Meloxicam Oral Suspension contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of meloxicam, $C_{14}H_{13}N_3O_4S_2$.

Usual strengths. 7.5 mg; 15 mg.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel F254*.

Mobile phase. A mixture of 1 volume of *13.5 M ammonia*, 20 volumes of *methanol* and 80 volumes of *dichloromethane*.

Test solution. Dilute a quantity of the oral suspension containing 3 mg of Meloxicam to 10 ml with *acetone*, stir for 10 minutes, filter and use the filtrate.

Reference solution. Dissolve 3 mg of *meloxicam IPRS* in about 5 ml of *acetone*, add 0.5 ml of *water* and dilute to 10 ml with *acetone*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 8 cm. Dry the plate in air and examine under ultraviolet light at 254 and 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. Disperse a quantity of the substance under examination containing 1.5 mg of Meloxicam in 5 ml of *0.1M sodium hydroxide*, dilute to 100 ml with *methanol* and filter. The light absorption of the filtrate (2.4.7), in the range 340 to 450 nm exhibits a maximum at 362 nm.

Tests

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the oral suspension containing 15 mg of Meloxicam with sufficient of the mobile phase to produce 50 ml, stir for 30 minutes and filter.

Reference solution. A 0.03 per cent w/v solution of *meloxicam IPRS* in the mobile phase.

Chromatographic system

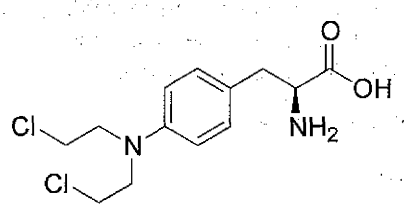
- a stainless steel column 10 cm x 4 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- column temperature: 40°,
- mobile phase: a mixture of 35 volumes of a solution containing 10 volumes of *propan-2-ol* and 65 volumes of *methanol* and 65 volumes of a 0.2 per cent w/v solution of *diammonium hydrogen orthophosphate* previously adjusted to pH 7.0 with *orthophosphoric acid*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Determine the weight per ml of the suspension (2.4.29) and calculate the content of $C_{14}H_{13}N_3O_4S_2$.

Melphalan



$C_{13}H_{18}Cl_2N_2O_2$ Mol. Wt. 305.2

Melphalan is 4-bis(2-chloroethyl)amino-L-phenylalanine.

Melphalan contains not less than 93.0 per cent and not more than 100.5 per cent of $C_{13}H_{18}Cl_2N_2O_2$, calculated on the dried basis.

Category. Anticancer.

Description. A white or almost white powder.

Identification

A. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* shows an absorption maximum at about 260 nm and a less well-defined maximum at about 301 nm.

B. Dissolve 20 mg in 50 ml of *methanol* with the aid of gentle heat, add 1 ml of a 5 per cent w/v solution of *4-(4-nitrobenzyl)pyridine* in *acetone* and evaporate to dryness. Dissolve the residue in 1 ml of hot *methanol* and add 0.1 ml of *strong ammonia solution*; a red colour is produced.

C. Heat 0.1 g with 10 ml of *0.1 M sodium hydroxide* for 10 minutes on a water-bath. The resulting solution, after acidification with *2 M nitric acid*, gives reaction (A) of chlorides (2.3.1).

Tests

Specific optical rotation (2.4.22). –36.0° to –30.0°, determined in a 0.7 per cent w/v solution in *methanol* prepared with the aid of gentle heat.

Ionisable chlorine. Dissolve 0.4 g in a mixture of 75 ml of *water* and 2 ml of *nitric acid*. Allow to stand for 2 minutes and titrate with *0.1 M silver nitrate*, determining the end-point potentiometrically (2.4.25); not more than 0.8 ml is required.

Sulphated Ash (2.3.18). Not more than 0.3 per cent.

Loss on drying (2.4.19). Not more than 7.0 per cent, determined on 0.5 g by drying in an oven at 105° at a pressure not exceeding 0.7 kPa for 2 hours.

Assay. Weigh 0.4 g, add 20 ml of a 20 per cent w/v solution of *potassium hydroxide*, heat on a water-bath for 2 hours, replacing the *water* lost by evaporation. Cool, add 75 ml of *water* and 4 ml of *nitric acid*, cool. Titrate with *0.1 M silver nitrate*, determining the end-point potentiometrically (2.4.25). Subtract the equivalent volume of *0.1 M silver nitrate* used in the test for Ionisable chlorine. The difference between the volumes represents the amount of *0.1 M silver nitrate* required by melphalan.

1 ml of *0.1 M silver nitrate* is equivalent to 0.01526 g of $C_{13}H_{18}Cl_2N_2O_2$.

Storage. Store protected from light and moisture.

Melphalan Injection

Melphalan Injection is a sterile material consisting of Melphalan with or without auxiliary substances. It is filled in a sealed container.

Usual strength. 50 mg per vial

The inection is prepared immediately before use by dissolving the contents of the sealed container which contains Melphalan Hydrochloride with or without auxillary substances in a suitable solvent and then diluting with the requisite volume of a suitable diluent in accordance with the manufacturer's instructions.

The constituted solution complies with the requirement for Particulate matter stated under Parenteral Preparations (Injections) and with the following tests.

Tests

Solution A. Dissolve the contents of one container in a suitable solvent, dilute the requisite volume of a suitable diluent in accordance with the manufacturer's instruction to produce a final solution containing 0.5 per cent w/v of anhydrous melphalan and allow to stand for 30 minutes.

Appearance of solution. Solution A is not more opalescent than opalescence standard OS2 (2.4.1).

pH (2.4.24). 6.0 to 7.0, determined in solution A.

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Melphalan Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of anhydrous melphalan, $C_{13}H_{18}Cl_2N_2O_2$.

Usual strength. 50 mg.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements:

Identification

A. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* shows an absorption maxima at about 260 nm and a less well-defined maxima at about 301 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. Dissolve a quantity containing 20 mg of anhydrous melphalan in 50 ml of *methanol* with the aid of gentle heat, add 1 ml of a 5 per cent w/v solution of *4-(4-nitrobenzyl)pyridine* in *acetone* and evaporate to dryness. Dissolve the residue in 1 ml of hot *methanol* and add 0.1 ml of *strong ammonia solution*; a red colour is produced.

D. Heat a quantity of the powder containing 0.1 g of anhydrous melphalan with 10 ml of *0.1 M sodium hydroxide* for 10 minutes on a water-bath. The resulting solution, after acidification with *2 M nitric acid*, gives reaction (A) of chlorides (2.3.1).

Tests

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 4 volumes of *acetonitrile* and 1 volume of *0.1 M hydrochloric acid*.

Test solution. Weigh a quantity of the mixed contents of 10 containers containing about 50 mg of Melphalan, dissolve in solvent mixture and dilute with sufficient of the solvent mixture to produce a final solution containing the equivalent of 0.01 per cent w/v of anhydrous melphalan.

Reference solution. A 0.01 per cent w/v solution of *melphalan IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane chemically bonded to porous silica (10 µm),
- mobile phase: 200 volumes of a 0.375 per cent w/v solution of *ammonium carbonate*, 180 volumes of *methanol* and 2.7 volumes of *glacial acetic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{13}H_{18}Cl_2N_2O_2$ in the injection.

Storage. Store protected from light and moisture at a temperature not exceeding 30°.

Labelling. The label on the sealed container states (1) the equivalent amount of anhydrous melphalan contained in it; (2) that it should be used immediately after preparation.

Melphalan Tablets

Melphalan Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of melphalan, $C_{13}H_{18}Cl_2N_2O_2$. The tablets are coated.

Usual strengths. 2 mg; 4 mg.

Identification

A. Shake a quantity of the powdered tablets containing about 5 mg of Melphalan with 100 ml of hot *methanol*. Filter and dilute 10 ml of the filtrate to 50 ml with *methanol*.

When examined in the range 230 nm to 360 nm (2.4.7), the filtrate shows an absorption maxima at about 260 nm and a less well-defined maxima at about 301 nm.

B. To the remainder of the filtrate obtained in test A add 1 ml of a 5 per cent w/v solution of *4-(4-nitrobenzyl)pyridine* in *acetone* and evaporate to dryness. Dissolve the residue in 1 ml of hot *methanol* and 0.1 ml of *strong ammonia solution*; a red colour is produced.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with *0.1 M hydrochloric acid*.

Reference solution. Dilute a suitable volume of 0.1 per cent w/v solution of *melphalan IPRS* in a mixture of 4 volumes of *acetonitrile* and 1 volume of *0.1 M hydrochloric acid*, with sufficient *0.1 M hydrochloric acid* to produce a solution containing 0.0002 per cent w/v.

Chromatographic system
- a stainless steel column 20 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm) (Such as spherisorb ODS 1),
- mobile phase: a mixture of 200 volumes of 0.375 per cent w/v solution of *ammonium carbonate*, 180 volumes of *methanol* and 2.7 volumes of *glacial acetic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 100 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{13}H_{18}Cl_2N_2O_2$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{13}H_{18}Cl_2N_2O_2$.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14)

Test solution. Add 20 ml of a mixture of 4 volumes of *acetonitrile* and 1 volume of *0.1 M hydrochloric acid* to one tablet, mix with the aid of ultrasound for 10 minutes or until the tablet disintegrates, filter, discarding the first 5 ml of filtrate, and use the filtrate.

Reference solution. A 0.01 per cent w/v solution of *melphalan IPRS* in the same solvent.

Chromatographic system

- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 200 volumes of a 0.375 per cent w/v solution of *ammonium carbonate*, 180 volumes of *methanol* and 2.7 volumes of *glacial acetic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{13}H_{18}Cl_2N_2O_2$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets and add about 150 ml of a mixture of 4 volumes of *acetonitrile* and 1 volume of *0.1 M hydrochloric acid* to a weighed quantity of the powdered tablets containing about 25 mg of Melphalan, shake and mix with the aid of ultrasound for 5 minutes, dilute to 250 ml with the same solvent. Filter, discarding the first 20 ml of filtrate, and use the filtrate.

Reference solution. A 0.01 per cent w/v solution of *melphalan IPRS* in the same solvent.

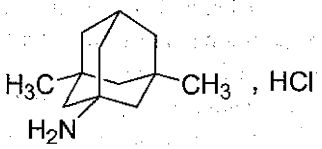
Use the chromatographic system described under Uniformity of content.

Calculate the content of $C_{13}H_{18}Cl_2N_2O_2$ in the tablets (for tablets containing more than 2 mg of Melphalan).

For tablets containing 2 mg or less of Melphalan, use the average of 10 individual results obtained in the test for Uniformity of content.

Storage. Store protected from light and moisture in a cool place.

Memantine Hydrochloride



$C_{12}H_{21}N,HCl$ Mol. Wt. 215.8

Memantine Hydrochloride is tricyclo [3.3.1.1^{3,7}] decan-1-amine, 3,5-dimethyl-hydrochloride;1-amino-3,5-dimethyl-adamantane hydrochloride.

Memantine Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{12}H_{21}N,HCl$, calculated on the anhydrous basis.

Category. Antialzheimer.

Description. A white to off white, coloured powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *memantine hydrochloride IPRS* or with the reference spectrum of memantine hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. It gives reaction (A) of chlorides (2.3.1).

Tests

Related substances. Determine by gas chromatography (2.4.13).

Test solution. Transfer 250 mg of the substance under examination to a 50-ml volumetric flask. Add about 7.5 ml of *5 M sodium hydroxide* and 10.0 ml of *n-hexane*. Shake for 10 minutes. Transfer this solution to a separator. Allow the layers to separate, filter the upper layer, dry over *anhydrous sodium sulphate*. Allow to stand for few minutes. Use the clear filtrate.

Reference solution (a). A solution containing 0.025 per cent w/v each of *memantine impurity A IPRS*, *memantine impurity B IPRS*, *memantine impurity C IPRS*, *memantine impurity D IPRS* and *memantine impurity E IPRS* in *n-hexane*.

Reference solution (b). To a 100-ml volumetric flask containing 0.5 g of *memantine hydrochloride IPRS*. Add 20 ml of *5 M sodium hydroxide* and 20.0 ml of *n-hexane*. Shake for 10 minutes. Transfer this solution to a separator. Allow the layers to separate, filter the upper layer, dry over *anhydrous*

sodium sulphate. Allow to stand for few minutes. Use the clear filtrate.

Reference solution (c). Dilute 1.0 ml each of reference solution (a) and reference solution (b) to 10.0 ml with *n-hexane*. This solution contains 0.0025 per cent w/v each of *memantine impurity A IPRS, memantine impurity B IPRS, memantine impurity C IPRS, memantine impurity D IPRS, memantine impurity E IPRS and 0.25 per cent w/v of memantine hydrochloride IPRS*. (*Memantine impurity D IPRS* and E are used for identification purpose only).

Reference solution (d). Dilute 1.0 ml of reference solution (b) to 10.0 ml with *n-hexane*. Further dilute 1.0 ml of the solution and 10.0 ml of reference solution (a) to 100.0 ml with *n-hexane*. This solution contains 0.0025 per cent w/v each of *memantine impurity A IPRS, memantine impurity B IPRS, memantine impurity C IPRS, memantine impurity D IPRS, memantine impurity E IPRS* and *memantine IPRS* in *n-hexane*.

Chromatographic system as described under Assay.

Name	Relative retention time
Memantine impurity A[1]	0.77
Memantine	1.0
Memantine impurity B[2]	1.03
Memantine impurity C[3]	1.07
Memantine impurity D[4]	1.19
Memantine impurity E[5]	1.44

[1]1,3-dimethyladamantane,

[2]3,5-dimethyladamantane-1-ol,

[3]1-chloro-3,5-dimethyladamantane,

[4]1-bromo-3,5-dimethyladamantane,

[5]3,5-dimethyladamantan-1-yl.

Ignore any peak with a relative retention time of 0.11, 0.12, 0.13, 0.18 and 0.26 with respect to memantine peak.

Inject reference solution (c) and (d). The test is not valid unless the resolution between peaks due to memantine and memantine impurity B is not less than 6 and the resolution between the peaks due memantine impurity B and memantine impurity C is not less than 2.0 obtained with reference solution (c). The tailing factor is not more than 2.0 for memantine peak obtained with reference solution (d).

Inject reference solution (d) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to memantine impurity A, B, C, D and E are not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.15 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.5 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Water (2.3.43). Not more than 1.0 per cent.

Assay. Determine by gas chromatography (2. 4.13).

Internal standard solution. A 0.4 per cent v/v solution of *adamantane* in *n-hexane*.

Test solution. Weigh and transfer 100 mg of the substance under examination, to a 60-ml separator. Add 15 ml of *1 M sodium hydroxide* and mix. Add 25.0 ml of internal standard solution, and shake for 15 minutes. Allow the layers to separate, and filter upper hexane layer through *anhydrous sodium sulphate*. Use the clear filtrate.

Reference solution. Weigh 100 mg of *memantine hydrochloride IPRS*, transfer to a 60-ml separator and dissolve in 15.0 ml of *1 M sodium hydroxide* and mix. Add 25.0 ml of internal standard solution, and shake for 15 minutes. Allow the layers to separate, and filter upper hexane layer through *anhydrous sodium sulphate*. Use the clear filtrate.

Chromatographic system

- a capillary column 50 m x 0.32 mm, coated with 5 per cent phenyl and 95 per cent methylpolysiloxane (film thickness 0.52 µm),
- temperature:
  column. 50°, then raised at the rate of 5° per minute upto 145° and then raised at the rate of 10° per minute up to 250° hold for 20 minutes,
- inlet port at 220° and detector at 300°,
- split ratio. 1:50,
- flame ionization detector,
- flow rate: 4.0 ml per minute, using helium as carrier gas,
- injection volume: 1 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 for memantine and adamantane peaks. The relative standard deviation of the peak response ratio replicate injections due to memantine and adamantane is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{12}H_{21}N,HCl$ from the peak response ratios of memantine to the internal standard obtained with the reference solution and the test solution respectively.

Storage: Store protected from light and moisture, at a temperature below 30°.

Memantine Tablets

Memantine Hydrochloride Tablets

Memantine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of memantine hydrochloride, $C_{12}H_{21}N,HCl$.

Usual strengths. 5 mg; 10 mg.

Identification

A. Extract a quantity of the powdered tablet containing 70 mg of memantine hydrochloride with 10 ml of *dichloromethane* and shaking for 10 minutes. Centrifuge for 10 minutes and use the supernatant liquid. Evaporate the solvent at room temperature. Collect the residue and dry at 60° for 15 minutes. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with 67 mg of *memantine hydrochloride IPRS* treated in the same manner or with the reference spectrum of memantine.

B. In the Assay, the principal peak in the chromatogram obtained with test solution (b) corresponds to the peak in the chromatogram obtained with reference solution (b).

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),

Medium. 900 ml of *0.2 per cent w/v solution of sodium chloride* in *water*, adjusted to pH 1.2 with *hydrochloric acid*,

Speed and time. 100 rpm and 30 minutes.

Determine by gas chromatography (2.4.13).

Internal standard solution (a). 0.0028 per cent w/v solution of *amantadine hydrochloride IPRS* in medium.

Test solution. Withdraw a suitable volume of medium and filter. Transfer a volume of the filtrate, expected to contain 28 µg of memantine hydrochloride to a stoppered test tube, add 1.0 ml of the internal standard solution and 2 ml of *5 M sodium hydroxide*, and mix for 1 minute. Add 3.0 ml of *toluene*, and mix for 2 minutes. Use the toluene layer.

Reference solution (a). A solution containing 0.00056 per cent w/v solution of *memantine hydrochloride IPRS* in dissolution medium.

Reference solution (b). Transfer 5.0 ml of the reference solution (a) to a stoppered test tube, add 1.0 ml of the Internal standard solution and 2 ml of *5 M sodium hydroxide*, and mix for 1 minute. Add 3.0 ml of toluene, and mix for 2 minutes. Use the *toluene* layer.

Chromatographic system

- a capillary column 30 m x 0.32 mm, coated with 5 per cent phenyl and 95 per cent methylpolysiloxane (film thickness 0.25 µm),
- temperature:
  column. 50° for 2 minutes, then raised at the rate of 20° per minute upto at 140° and then raised at the rate of 30° per minute upto 200° and hold for 5 minutes,
- injection port at 210° and detector at 300°,
- flame ionization detector,
- flow rate: 7.0 ml per minute, using helium or nitrogen as carrier gas,
- injection volume: 4 µl,
- injection type: splitless.

Inject reference solution (b). The test in not valid unless the resolution between the peaks due to amantadine and memantine is not less than 2.0, the tailing factor due to amantadine and memantine peaks is not more than 2.0.

Inject reference solution (b) and the test solution.

Calculate the content of $C_{12}H_{21}N,HCl$ the tablets from the peak response ratios of memantine to the amantadine obtained with reference solution (b) and the test solution respectively.

Q. Not less than 80 per cent of the stated amount of $C_{12}H_{21}N,HCl$.

Related substances. A. Determine by gas chromatography (2.4.13).

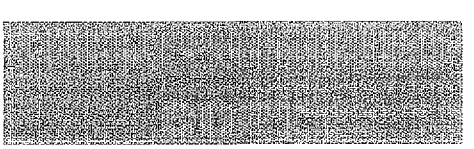
Test solution. Transfer a quantity of the powdered tablets containing 100 mg of Memantine Hydrochloride to a 100-ml volumetric flask. Add 15 ml of *1 M sodium hydroxide solution*. Shake for 5 minutes, mix with the aid of ultrasound for 5 minutes. Add 20.0 ml of *n-hexane* and shake for 10 minutes. Transfer the contents into a separator. Allow the layers to separate, and filter a portion of the top hexane layer through *anhydrous sodium sulphate*.

Reference solution (a). A solution containing 0.05 per cent w/v each of *memantine impurity A IPRS*, *memantine impurity B IPRS*, *memantine impurity C IPRS*, *memantine impurity D IPRS* and *memantine impurity E IPRS* in *n-hexane*.

Reference solution (b). Weigh and transfer 75 mg of *memantine hydrochloride IPRS* to a suitable volumetric flask, add 9 ml of *1 M sodium hydroxide solution* and 6 ml of the *n-hexane*, and mix for 10 minutes. Transfer the contents to a separator. Allow the layers to separate, and filter a portion of the top hexane layer through *anhydrous sodium sulphate*.

Reference solution (c). Pipette 4.0 ml of the n-hexane layer from reference solution (b) in to a 10-ml volumetric flask. Add 0.5 ml of reference solution (a) and dilute to volume with *n-hexane*.

Reference solution (d). Weigh and transfer 25 mg of *memantine hydrochloride IPRS* to a 50-ml volumetric flask. Add 15.0 ml of *1 M sodium hydroxide solution* mix for 5 minutes. Add 20.0 ml of *n-hexane* and shake for 10 minutes.



Transfer the contents into a separator. Allow the layers to separate, and filter a portion of the top *n-hexane* layer through *anhydrous sodium sulphate*.

Reference solution (e). Dilute 2.0 ml of the reference solution (d) to 100.0 ml with *n-hexane*.

Chromatographic system

- a capillary column 50 m x 0.32 mm, coated with 5 per cent phenyl and 95 per cent methylpolysiloxane (film thickness 0.52 µm),
- temperature:
  column. 50° for 2 minutes, then raised @ of 5° per minute to hold at 145° and then raised the temperature @ of 10° per minute to 250° and hold for 20 minutes,
- injection port at 220° and detector at 300°,
- split ratio: 1:20,
- flame ionization detector,
- flow rate: 4 ml per minute, using helium or nitrogen as carrier gas,
- injection volume: 3µl.

Name	Relative retention time
Memantine impurity A[1]	0.77
Memantine	1.0
Memantine impurity B[2]	1.03
Memantine impurity C[3]	1.1
Memantine impurity D[4]	1.2
Memantine impurity E[5]	1.4

[1]1,3-dimethyladamantane,this is a process impurity,

[2]3,5-dimethyladamantane-1-ol,this is a process impurity,

[3]1-chloro-3,5-dimethyladamantane,this is a process impurity,

[4]1-bromo-3,5-dimethyladamantane,this is a process impurity,

[5]3,5-dimethyladamantan-1-yl.

Inject reference solution (c) and (e) . The test is not valid unless the resolution between the peaks due to memantine and memantine impurity B and between memantine impurity B and memantine impurity C is not less than 2.0 obtained with reference solution (c) and the tailing factor is not more than 2.0 obtained with reference solution (e).

Inject reference solution (e) and the test solution. In the chromatogram obtained with the test solution, the area of peak corresponding to memantine impurity E is not more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (e) (0.3 per cent). The area of any other secondary peak is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (e) (0.2 per cent) and the sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (e) (0.5 per cent) excluding memantine lactose adduct.

B. Determine by Liquid chromatography (2.4.14).

NOTE — Perform this test if lactose is present in the formulation.

Test solution. Weigh a quantity of powdered tablets containing 100 mg of Memantine Hydrochloride into a 20-ml volumetric flask. Add 10.0 ml of mobile phase, and sonicate for 30 minutes. Centrifuge, and pass a portion of the solution through a suitable filter of 0.45µm.

Reference solution. A 0.02 per cent w/v solution of *memantine hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 70 volumes of a buffer solution prepared by dissolving 3.3 g of *monobasic potassium phosphate* and 2.3 g of *sodium 1-octane sulphonate* in 1000 ml of *water*, adjusted to pH 6.1 by 4 per cent w/v solution of *sodium hydroxide*, and 4 volumes of *methanol* and 26 volumes of *acetonitrile*,
- flow rate: 1.3 ml per minute,
- refractive index detector,
- injection volume: 50 µl.

Name	Relative retention time	Correction factor
Memantine lactose adduct	0.41	1.89
Memantine	1.0	---

Inject the reference solution. The test is not valid unless the tailing factor is not more than 3.5.

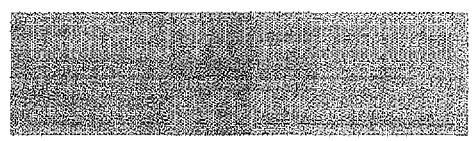
Inject the reference solution and the test solution. Run the chromatogram 1.3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to memantine lactose adduct is not more than 0.7 times the area of the principal peak in the chromatogram obtained with reference solution (1.4 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by gas chromatography (2.4.13), as described under Assay using the following solution

Test solution (a). Transfer one tablet to a 100-ml volumetric flask, add 40 ml of *water*; disperse with the aid of ultrasound for 30 minutes, further add 40 ml of *methanol* and shake for 10 minutes. Dilute to volume with *methanol* and centrifuge. Dilute a suitable volume of supernatant liquid with *water* to obtain a solution containing 0.002 per cent w/v of memantine hydrochloride.

Other tests. Comply with the tests stated under Tablets.



Assay. Determine by gas chromatography (2.4.13).

Internal standard solution. A solution containing 0.0025 per cent w/v of *amantadine hydrochloride IPRS* in *water*.

Test solution (a). Weigh and powder 20 tablets. Disperse a quantity of the powder containing 10 mg of Memantine Hydrochloride in 40 ml of *methanol* and sonicate for 30 minutes, further add 40 ml of *water* and sonicate for 30 minutes with intermittent shaking. Dilute to 100.0 ml with *water*, and centrifuge a portion for 10 minutes. Dilute 2.0 ml of the clear, supernatant liquid to 10.0 ml with *water* and mix.

Test solution (b). Pipette 5.0 ml of the test solution (a) in to a stoppered test tube, add 4.0 ml of internal standard solution and add 2 ml of *20 per cent w/v solution of sodium hydroxide*, mix on a vortex mixer for 1 minute. Add 4.0 ml of *toluene*, and mix on a vortex mixer for 5 minutes. Allow the two layers to separate.

Reference solution (a). Dissolve 100 mg of *memantine hydrochloride IPRS* in *methanol* with the aid of ultrasound and dilute to 100.0 ml with *methanol*. Pipette 10.0 ml of the solution into a 100-ml volumetric flask, add 40 ml of *methanol* and dilute to volume with *water*. Dilute 2.0 ml of the solution to 10.0 ml with *water* and mix.

Reference solution (b). Pipette 5.0 ml of the reference solution (a) in to a stoppered test tube, add 4.0 ml of internal standard solution stoppered test tube, add 2 ml of 20 per cent w/v solution of *sodium hydroxide* and mix for 1 minute. Add 4.0 ml of *toluene*, and mix on a vortex mixer for 3 minutes. Allow the two layers to separate.

Blank. To 5.0 ml of 8.0 per cent v/v solution of *methanol* in *water* add 2 ml of 20 per cent w/v solution of *sodium hydroxide*, and mix for 1 minute. Add 4.0 ml of *toluene*, and mix on vortex for 3 minutes. Allow the two layers to separate. Inject the toluene layer.

Chromatographic system

- a capillary column 30 m x 0.32 mm, packed with 5 per cent phenyl and 95 per cent methylpolysiloxane (film thickness 0.25 µm),
- temperature:
  column. 50° for 2 minutes, then raised at the rate of 20° per minute to hold at 140° and then raised the rate of 30° per minute to 200° and hold for 5 minutes,
- injection port at 210° and detector at 300°,
- split ratio: 1:20,
- flame ionization detector,
- flow rate: 7 ml per minute, using helium or nitrogen as carrier gas,
- injection volume: 4 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to amantadine and memantine is not less than 2.0. The tailing factor is not more than 2.5 for amantadine and not more than 2.0 for memantine obtained from reference solution (b).

Inject the blank solution, reference solution (b) and test solution (b).

Calculate the content of $C_{12}H_{21}N$,HCl in the tablets from the peak response ratios of memantine to the amantadine obtained with reference solution (b) and test solution (b) respectively.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Menotropin

Human Menopausal Gonadotropin; Menotrophin

Menotropin is a sterile preparation containing glycoprotein gonadotropins possessing follicle stimulating and luteinizing activities. The preparation is exclusively or predominantly of pituitary origin and is extracted from the urine of post-menopausal women. Menotropin may be prepared by suitable fractionation procedure followed by ion-exchange chromatography. It is prepared in conditions designed to minimise microbial contaminations and to be in compliance with the requirements of viral safety.

Menotropin has the property in females of stimulating growth and maturation of ovarian follicles and in males of maintaining and stimulating testicular interstitial cells (Leydig tissue) related to testosterone production and of being responsible for full development and maturation of spermatozoa in seminiferous tubules.

Menotropin contains not less than 40 IU of Follicle Stimulating hormone (FSH) activity per mg. The ratio of IU of luteinizing hormone (LH) activity to IU of follicle stimulating hormone (FSH) is approximately 1. For each component the estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency.

Category. Gonadotropic hormone.

Description. An almost white or slightly yellow powder, soluble in *water*.

Identification

It causes enlargement of the ovaries of immature female rats and increases the weight of the seminal vesicles and prostate gland of immature male rats when administered as described under assay.

Tests

NOTE — Menotropin is prepared by suitable collection and extraction procedures followed by purification steps. The method of preparation includes steps that have been shown

to remove and / or inactivate extraneous agents including viral agents as determined by a suitable risk based approach as approved by the regulatory authority. The drug substance is negative for HIV, HCV and HBV using validated NAT (Nucleic Acid Test) based assays.

Hepatitis B surface antigen. Examine by a suitably sensitive immunochemical method (2.2.14). Hepatitis B surface antigens are not detected.

HCV antibodies. Examine by a suitably sensitive immunochemical method, (2.2.14) Hepatitis C antibodies are not detected.

HIV antibodies. Examine by a suitably sensitive immunochemical method, (2.2.14) HIV antibodies are not detected.

Water (2.3.43). Not more than 5.0 per cent w/w, by using 4 mg (Method 3).

Assay

Potency. The potency of menotropin with respect to its follicle stimulating hormone activity is estimated by comparing its effect in enlarging the ovaries of immature female rats with that of the standard preparation of human urinary FSH and human urinary LH under the conditions of suitable method of assay.

The potency of menotropin with respect to its luteinizing hormone activity is estimated by comparing its effect in increasing the weight of the seminal vesicles or the prostate gland of immature male rats with that of the standard preparation of urinary FSH and urinary LH under the conditions of suitable method of assay.

Standard preparation. The standard preparation is the International standard preparation of human urinary Follicle Stimulating Hormone (FSH) and Luteinizing Hormone (LH), consisting of freeze-dried extract from urine of post-menopausal together with lactose or any other suitable preparation, the potency of which has been determined in relation to the International reference standard.

a) Assay for Follicle stimulating hormone activity

Select female rats of the same strain, 19 to 28 days old and differing in age by not more than 3 days, and having weights such that the difference between the heaviest rat and the lightest rat is not more than 10 g. House the animals under uniform conditions of temperature, light, food and water. Mark the animals for identification, and divide them at random into seven equal groups of at least six animals per group. If sets of six litter mates are available, allot one litter mate from each set to each group and mark according to litter. Assign one group to each standard preparation one group to each assay preparation and one group to the control. Keep the control group during dose determination trail only.

Choose three doses of the standard preparation and three doses of the preparation being examined such that the smallest dose produces a positive response in some of the rats and the largest dose does not produce a maximum response in all of the rats. Use doses in geometric progression. As an initial approximation total doses of 1.5, 3.0, 6.0 IU may be tried although the dose will depend on the sensitivity of the animals used which may vary widely.

Standard solution. Dissolve a sufficient quantity of the standard preparation corresponding to the daily doses to be used in sufficient albumin-phosphate buffer pH 7.2 containing not less than 70 IU of Chorionic Gonadotropin per ml so that the daily dose is about 0.2 ml. Add a suitable antimicrobial preservative such as 0.4 per cent w/v of *phenol* or 0.002 per cent w/v of *thiomersal*. Store the solution at a temperature of 2° to 8°.

Test solution. Prepare test solution similar to that of standard solution by dissolve a sufficient quantity of the preparation under examination instead of standard preparation.

Inject subcutaneously into each rat the daily dose allocated to its group. Repeat the procedure after 24 and 48 hours. About 24 hours after the last injection, euthanize the rats and remove the ovaries. Remove any extraneous fluid and tissue and immediately weigh the ovaries from each animal. Record the combined weight of both ovaries from each rat. Calculate the result of the assay by standard statistical methods using the weight of the ovaries as the response. (The precision of the assay may be improved by a suitable correction of the organ weight with reference to the weight of the animal from which it was taken; an analysis of covariance may be used). The fiducial limits of error are not less than 64 per cent and not more than 156 per cent of stated potency.

b) Assay for Luteinizing hormone activity

Standard solution. Dissolve a sufficient quantity of standard preparation corresponding to the daily doses to be used in sufficient albumin-phosphate buffer pH 7.2 so that the daily dose is about 0.2 ml. Add a suitable antimicrobial preservative such as 0.4 per cent w/v of *phenol* or 0.002 per cent w/v of *thiomersal*. Store the solution at a temperature of 2° to 8°.

Test solution. Prepare test solution similar to that of standard solution by dissolve a sufficient quantity of the preparation under examination instead of standard preparation.

Select male rats of the same strain, approximately 19 to 28 days old and differing in age by not more than 3 days, and having weights such that the difference between the heaviest rat and the lightest rat is not more than 10 g. House the animals under uniform conditions of temperature, light, food and water. Mark the animals for identification, and divide them at random into seven equal groups of at least six animals per group. If

sets of six litter mates are available, allot one litter mate from each set to each group and mark according to litter. Assign one group to each standard preparation one group to each assay preparation and one group to the control. Keep the control group during dose determination trail only.

Choose three doses of the Standard preparation and three doses of the preparation being examined such that the smallest dose is sufficient to produce a positive response in some of the rats and the largest dose does not produce a maximum response in all of the rats. Use doses in geometric progression. As an initial approximation, total doses of 7, 14 and 28 IU may be tried although the dose will depend on the sensitivity of the animals used, which may vary widely. Dissolve separately the total quantities of the preparation being examined and of the standard Preparation corresponding to the daily doses to be used in sufficient albumin phosphate buffer pH 7.2 so that the daily dose is about 0.2 ml. Add a suitable antimicrobial preservative such as 0.4 per cent w/v of *phenol* or 0.002 per cent w/v of *thiomersal*. Store the solutions at a temperature of 2° to 8°, Inject subcutaneously into each rat the daily dose allocated to its group on 4 consecutive days at the same time each day. On the fifth day, about 24 hours after the last injection, euthanize the rats and remove the seminal vesicles or the prostate gland. Remove any extraneous fluid and tissue and weigh immediately the seminal vesicles or the prostate gland. Calculate the result of the assay by standard statistical methods, using the weight of the vesicles or the prostate gland as the response. (The precision of the assay may be improved by a suitable correction of the organ weight with reference to the weight of the animal from which it was taken; an analysis of covariance may be used). The fiducial limits of error are not less than 64 per cent and not more than 156 per cent of stated potency.

Bacterial endotoxins (2.2.3). Not more than 0.78 IU per IU of Follicle-Stimulating Hormone.

Sterility (2.2.11). Complies with the test for sterility, if the menotropin intended for use in the manufacture of parenteral preparations without a further appropriate sterilisation procedure.

Abnormal toxicity (2.2.1). Complies with the test for abnormal toxicity (2.2.1) using a quantity equivalent to 75 IU follicle stimulating hormone.

Storage. Menotropin should be kept in an airtight, tamper-evident container and protected from light. Store in a refrigerator at 2° to 8°.

Labelling. The label of the sealed container states (1) the number of IU (Units) of follicle-stimulating hormone activity, the number of IU (Units) of luteinizing hormone activity in the container; (2) The number of IU (Units) of follicle stimulating hormone activity per mg and the number of IU (units) of luteinizing hormone activity per mg; (3) where applicable, the number of IU (Units) of chorionic gonadotropin activity per mg; (4) the date after which the material is not intended to be used; (5) the condition under which it should be stored; (6) where applicable, that it is sterile.

Menotropin for Injection

Menotrophin for Injection

Menotropin for Injection is a sterile material consisting of menotropin with or without excipients. It may also contain an antimicrobial agent. It is supplied in a sealed container. Menotropin injection contains not less than 80 per cent and not more than 125 per cent of the stated potency.

The injection is reconstituted by dissolving the contents of the sealed container in the requisite amount of *Sterile Water for Injection* or a suitable diluent supplied by the manufacturer, immediately before use. The reconstituted solution should be used immediately after preparation but, in any case, within the period as recommended by the manufacturer.

The reconstituted solution complies with the requirements for Clarity of solution and Particulate matter stated under parenteral preparations (Injections).

Usual strengths. 75 IU per container, 150 IU per container.

Description. A white or almost white, slightly yellow powder, lyophilized powder

Identification

It causes enlargement of the ovaries of immature female rats and increases in the weight of the seminal vesicles and prostate gland of immature male rats when administered as described under the Assay.

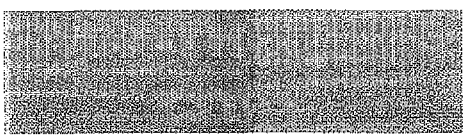
Tests

NOTE — Tests for Hepatitis B Surface antigen, HCV antibodies and HIV antibodies may be omitted if the menotropin for injection is prepared from menotropin complied as per monograph in current edition of IP. If any excipient of human origin isused, the injection must be free from HIV, HCV and HBV, confirmed by using validated NAT (Nucleic Acid Test) based assays.

pH (2.4.24). 6.0 to 8.0, dissolve the vial contents in 3ml of *water*.

Hepatitis B surface antigen. Examine by a suitably sensitive immunochemical method, (2.2.14) Hepatitis B surface antigens are not detected.

HCV antibodies. Examine by a suitably sensitive immunochemical method, (2.2.14) Hepatitis C antibodies are not detected.



HIV antibodies. Examine by a suitably sensitive immunochemical method, (2.2.14) HIV antibodies are not detected.

Water (2.3.43). Not more than 5.0 per cent (Method 3).

Other tests. Comply with the requirements stated under Powders for injections with the following requirements.

Bacterial endotoxins (2.2.3). Not more than 0.78 IU per IU of follicle stimulating hormone.

Assay

Potency. The potency of menotropin with respect to its follicle stimulating hormone activity is estimated by comparing its effect in enlarging the ovaries of immature female rats with that of the standard preparation of human urinary FSH and human urinary LH under the conditions of suitable method of assay.

The potency of menotropin with respect to its luteinizing hormone activity is estimated by comparing its effect in increasing the weight of the seminal vesicles or the prostate gland of immature male rats with that of the standard preparation of urinary FSH and urinary LH under the conditions of suitable method of assay.

Standard preparation. The standard preparation is the International standard preparation of human urinary Follicle Stimulating Hormone (FSH) and Luteinizing Hormone (LH), consisting of freeze-dried extract from urine of post-menopausal together with lactose or any other suitable preparation, the potency of which has been determined in relation to the International reference standard.

a) Assay for Follicle stimulating hormone activity

Select female rats of the same strain, 19 to 28 days old and differing in age by not more than 3 days, and having weights such that the difference between the heaviest rat and the lightest rat is not more than 10 g. House the animals under uniform conditions of temperature, light, food and water. Mark the animals for identification, and divide them at random into seven equal groups of at least six animals per group. If sets of six litter mates are available, allot one litter mate from each set to each group and mark according to litter. Assign one group to each standard preparation one group to each assay preparation and one group to the control. Keep the control group during dose determination trail only.

Choose three doses of the standard preparation and three doses of the preparation being examined such that the smallest dose produces a positive response in some of the rats and the largest dose does not produce a maximum response in all of the rats. Use doses in geometric progression. As an initial approximation total doses of 1.5, 3.0, 6.0 IU may be tried although the dose will depend on the sensitivity of the animals used which may vary widely.

Standard solution. Dissolve a sufficient quantity of the standard preparation corresponding to the daily doses to be used in sufficient albumin-phosphate buffer pH 7.2 containing not less than 70 IU of Chorionic Gonadotropin per ml so that the daily dose is about 0.2 ml.. Add a suitable antimicrobial preservative such as 0.4 per cent w/v of *phenol* or 0.002 per cent w/v of *thiomersal*. Store the solution at a temperature of 2° to 8°.

Test solution. Prepare test solution similar to that of standard solution by dissolve a sufficient quantity of the preparation under examination instead of standard preparation.

Inject subcutaneously into each rat the daily dose allocated to its group. Repeat the procedure after 24 and 48 hours. About 24 hours after the last injection, euthanize the rats and remove the ovaries. Remove any extraneous fluid and tissue and immediately weigh the ovaries from each animal. Record the combined weight of both ovaries from each rat. Calculate the result of the assay by standard statistical methods using the weight of the ovaries as the response. (The precision of the assay may be improved by a suitable correction of the organ weight with reference to the weight of the animal from which it was taken; an analysis of covariance may be used). The fiducial limits of error are not less than 64 per cent and not more than 156 per cent of stated potency.

b) Assay for Luteinizing hormone activity

Standard solution. Dissolve a sufficient quantity of standard preparation corresponding to the daily doses to be used in sufficient albumin-phosphate buffer pH 7.2 so that the daily dose is about 0.2 ml. Add a suitable antimicrobial preservative such as 0.4 per cent w/v of *phenol* or 0.002 per cent w/v of *thiomersal*. Store the solution at a temperature of 2° to 8°.

Test solution. Prepare test solution similar to that of standard solution by dissolve a sufficient quantity of the preparation under examination instead of standard preparation.

Select male rats of the same strain, approximately 19 to 28 days old and differing in age by not more than 3 days, and having weights such that the difference between the heaviest rat and the lightest rat is not more than 10 g. House the animals under uniform conditions of temperature, light, food and water. Mark the animals for identification, and divide them at random into seven equal groups of at least six animals per group. If sets of six litter mates are available, allot one litter mate from each set to each group and mark according to litter. Assign one group to each standard preparation one group to each assay preparation and one group to the control. Keep the control group during dose determination trail only.

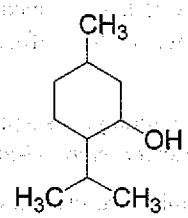
Choose three doses of the Standard preparation and three doses of the preparation being examined such that the smallest dose is sufficient to produce a positive response in some of the rats and the largest dose does not produce a maximum

response in all of the rats. Use doses in geometric progression. As an initial approximation, total doses of 7, 14 and 28 IU may be tried although the dose will depend on the sensitivity of the animals used, which may vary widely. Dissolve separately the total quantities of the preparation being examined and of the standard Preparation corresponding to the daily doses to be used in sufficient albumin phosphate buffer pH 7.2 so that the daily dose is about 0.2 ml. Add a suitable antimicrobial preservative such as 0.4 per cent w/v of *phenol* or 0.002 per cent w/v of *thiomersal*. Store the solutions at a temperature of 2° to 8°, Inject subcutaneously into each rat the daily dose allocated to its group on 4 consecutive days at the same time each day. On the fifth day, about 24 hours after the last injection, euthanize the rats and remove the seminal vesicles or the prostate gland. Remove any extraneous fluid and tissue and weigh immediately the seminal vesicles or the prostate gland. Calculate the result of the assay by standard statistical methods, using the weight of the vesicles or the prostate gland as the response. (The precision of the assay may be improved by a suitable correction of the organ weight with reference to the weight of the animal from which it was taken; an analysis of covariance may be used). The fiducial limits of error are not less than 64 per cent and not more than 156 per cent of stated potency.

Storage. Sealed container, store protected from light in containers at a temperature not exceeding 20°.

Labelling. The label states (1) the number of IU (units) of follicle stimulating hormone activity; (2) the number of IU (units) of luteinizing hormone activity and (3) where applicable, the number of IU (units) of chorionic gonadotrophin activity contained in it.

Menthol



$C_{10}H_{20}O$ Mol. Wt.156.3

Menthol is 2-isopropyl-5-methylcyclohexanol. It is obtained from the volatile oils of various species of *Mentha* or prepared synthetically. It may be levo-rotatory [(–)-menthol] or racemic [(±)-menthol].

Category. Topical antipruritic.

Description. Colourless, hexagonal or needle-like crystals, or infused masses or a crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *menthol IPRS* or with the reference spectrum of menthol.

B. Dissolve 10 mg in 1 ml of *sulphuric acid* and add 1 ml of a 1 per cent w/v solution of *vanillin* in *sulphuric acid*; an orange-yellow colour is produced. Add 1 ml of *water*; the colour changes to violet (distinction from thymol).

C. When triturated with about an equal weight of *camphor* or *chloral hydrate* or *phenol*, the mixture liquefies.

Tests

Appearance of solution. Dissolve 1.0 g in 10 ml of *ethanol (95 per cent)*. The solution is not more opalescent than opalescence standard OS4 (2.4.1), and not more intensely coloured than reference solution RS6 (2.4.1).

Acidity. To 1.0 g in a 100-ml glass-stoppered conical flask add 20 ml of *water*, boil until dissolution is complete, cool, stopper the flask and shake vigorously for 1 minute. Add a few crystals of the substance under examination to initiate crystallisation, shake vigorously for 1 minute and filter. To 5 ml of the filtrate add 0.05 ml of *methyl red solution* and 0.05 ml of *0.01M sodium hydroxide*; the solution is yellow.

Specific optical rotation (2.4.22). (for (–)-menthol) –51.0° to –49.0°; (for (±)-menthol) –2.0 ° to +2.0°, determined in a 10.0 per cent w/v solution in *ethanol (95 per cent)*.

Congealing range (2.4.10). (for (±)-menthol) 27.0° to 28.0°; on prolonged stirring, the temperature rises 30° to 32°.

Related substances. Determine by gas chromatography (2.4.13).

Test solution. Dissolve 0.1 g in sufficient *ethanol (95 per cent)* to produce 10 ml.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with *ethanol (95 per cent)*.

Reference solution (b). Dilute 1 ml of reference solution (a) to 20 ml with *ethanol (95 per cent)*.

Chromatographic system

- a glass or stainless steel column 4 m x 2 mm, packed with diatomaceous support (125 to 180 mesh) impregnated with 5 per cent carbowax 20 M (Polyethylene glycol compund 20 M),
- temperature :
  column 80°, after 2 minutes, increase the temperature of the column to 240° at a rate of 8° per minute and maintain at this temperature for 15 minutes,
  injection port at 250° and the detector at 240°,
- flow rate: 30 ml per minute of the carrier gas.

Inject 1 µl of each solution. Run the chromatogram obtained with the test solution for 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution the sum of the areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Residue on evaporation. Evaporate 2.0 g on a water-bath and heat at 105° for 1 hour. The residue weighs not more than 1.0 mg (0.05 per cent).

Storage. Store protected from light and moisture at a temperature not exceeding 30°.

Labelling. The label states whether the contents are levo-rotatory or racemic menthol.

Menthol and Benzoin Inhalation

Menthol and Benzoin Inhalation is an inhalation vapour, solution of racementhol or levomenthol 20 g in sufficient benzoin inhalation to produce 1000 ml.

Menthol and Benzoin Inhalation contains not less than 2.8 per cent w/v of total balsamic acids, calculated as cinnamic acid, $C_9H_8O_2$.

Tests

Total solids (2.6.5). 9.0 per cent to 12.0 per cent w/v, determined on 2 ml of the solution by drying at 105° for 4 hours.

Other tests. Comply with the tests stated under Inhalation Preparations.

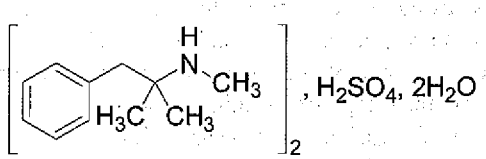
Follow the procedure described under Assay with suitable dilution of the reference solution wherever the amount of active substance is to be determined in any test.

Assay. Boil 10 ml with 25 ml of *ethanolic potassium hydroxide solution* under a reflux condenser for 1 hour. Evaporate the *ethanol (95 per cent)*, disperse the residue in 50 ml of hot *water*, cool, add 80 ml of *water* and 1.5 g of *magnesium sulphate* dissolved in 50 ml of *water*. Mix thoroughly and allow to stand for 10 minutes. Filter, wash the residue on the filter with 20 ml of *water*, acidify the combined filtrate and washings with *hydrochloric acid* and extract with four 40 ml quantities of *ether*. Discard the aqueous solution, combine the ether extracts and extract with successive quantities of 20, 20, 10, 10 and 10 ml of *sodium hydrogen carbonate solution*, washing each aqueous extract with the same 20 ml of *ether*. Discard the ether layers, carefully acidify the combined aqueous extracts with *hydrochloric acid* and extract with successive quantities of 30, 20, 20 and 10 ml of *chloroform*, filtering each extract through *anhydrous sodium sulphate* supported on absorbent cotton. Distil the *chloroform* from the combined filtrates until 10 ml remains and remove the remainder in a current of air. Dissolve the residue, with the aid of gentle heat, in 10 ml of *ethanol (95 per cent)*, previously neutralised to *phenol red solution*, cool and titrate with *0.1 M sodium hydroxide* using *phenol red solution* as indicator.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01482 g of total balsamic acids, calculated as cinnamic acid, $C_9H_8O_2$.

Labelling. The label states the amount of active ingredient delivered per inhalation.

Mephentermine Sulphate



$(C_{11}H_{17}N)_2,H_2SO_4,2H_2O$ Mol. Wt.460.6

Mephentermine Sulphate is *N*,α,α-trimethylphenethylamine sulphate dihydrate.

Mephentermine Sulphate contains not less than 98.0 per cent and not more than 102.0 per cent of $(C_{11}H_{17}N)_2,H_2SO_4$, calculated on the dried basis.

Category. Sympathomimetic.

Description. A white crystals or a white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *mephentermine sulphate IPRS* or with the reference spectrum of mephentermine sulphate.

B. A 0.2 per cent w/v solution yields a precipitate with *iodine solution* and with *potassium mercuri-iodide solution*.

C. Dissolve 0.1 g in 5 ml of *water*, add with stirring 10 ml of *picric acid solution*. Allow to stand for 30 minutes, filter and wash the precipitate with small quantities of cold *water* until the last washing is colourless; the precipitate, after drying at 105° melts at 154° to 158° (2.4.21).

D. It gives the reactions of sulphates (2.3.1).

Tests

pH (2.4.24). 4.0 to 6.5, determined in a 2.0 per cent w/v solution in *carbon dioxide-free water*.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). 5.0 to 8.0 per cent, determined on 0.5 g by drying in an oven at 105° for 3 hours.

Assay. Weigh 0.4 g, dissolve in 250 ml of *water*, add 5 g of *sodium chloride*, shake well and add 5 ml of *5 M sodium hydroxide*. Extract with 30 ml and then with further quantities, each of 20 ml, of *ether* until the base is completely extracted. Combine the ether extracts, wash with two quantities, each of 10 ml, of *water* and extract the aqueous washings with 10 ml of *ether*, adding this ether to the main ether extract. Add to the ether solution 30.0 ml of *0.05 M sulphuric acid*, stir thoroughly and warm gently until the ether is evaporated. Cool and titrate with *0.1 M sodium hydroxide* using *methyl red solution* as indicator. Repeat the operation without the substance under examination. The difference between the titrations represents the amount of sulphuric acid required.

1 ml of *0.05 M sulphuric acid* is equivalent to 0.02123 g of $(C_{11}H_{17}N)_2,H_2SO_4$.

Storage. Store protected from light and moisture.

Mephentermine Injection

Mephentermine Sulphate Injection

Mephentermine Injection is a sterile solution of Mephentermine Sulphate in Water for Injections.

Mephentermine Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of mephentermine, $C_{11}H_{17}N$.

Usual strength. The equivalent of 15 mg of mephentermine per ml (21 mg of mephentermine sulphate is approximately equivalent to 15 mg of mephentermine).

Identification

A. A 0.2 per cent w/v solution yields a precipitate with *iodine solution* and with *potassium mercuri-iodide solution*.

B. Dissolve 0.1 g in 5 ml of *water*, add with stirring 10 ml of *picric acid solution*. Allow to stand for 30 minutes, filter and wash the precipitate with small quantities of cold *water* until the last washing is colourless; the precipitate, after drying at 105° melts at 154° to 158° (2.4.21).

C. It gives the reactions of sulphates (2.3.1).

Tests

pH (2.4.24). 4.0 to 6.5.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Measure a volume containing about 0.2 g of mephentermine, add *water* if necessary to produce 20 ml add 5 g of *sodium chloride*, shake well and add 5 ml of *5 M sodium hydroxide*. Extract with 30 ml and then with further quantities, each of 20 ml, of *ether* until the base is completely extracted. Combine the ether extracts, wash with two quantities, each of 10 ml, of *water* and extract the aqueous washings with 10 ml of *ether*, adding this ether to the main ether extract. Add to the ether solution 30.0 ml of *0.05 M sulphuric acid*, stir thoroughly and warm gently until the ether is evaporated. Cool and titrate with *0.1 M sodium hydroxide* using *methyl red solution* as indicator. Repeat the operation without the substance under examination. The difference between the titrations represents the amount of sulphuric acid required.

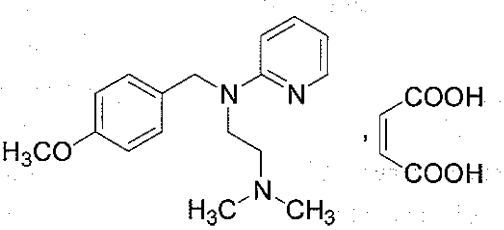
1 ml of *0.05 M sulphuric acid* is equivalent to 0.0163 g of $C_{11}H_{17}N$.

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of the equivalent amount of mephentermine in a suitable dose-volume.

Mepyramine Maleate

Pyrilamine Maleate



$C_{17}H_{23}N_3O,C_4H_4O_4$ Mol. Wt. 401.5

Mepyramine Maleate is 2-(*N*-4-methoxybenzyl-*N*-2-pyridylamino)ethyldimethylamine hydrogen maleate.

Mepyramine Maleate contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{17}H_{23}N_3O,C_4H_4O_4$, calculated on the dried basis.

Category. Histamine H_1-receptor antagonist.

Description. A white or slightly yellowish, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *mepyramine maleate IPRS* or with the reference spectrum of mepyramine maleate.

Tests

Appearance of solution. A 4.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and not more intensely coloured than reference solution YS6 (2.4.1).

pH (2.4.24). 4.9 to 5.2, determined in a 2.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). A solution containing 0.0001 per cent w/v each of *anisaldehyde*, *mepyramine impurity A IPRS* and *mepyramine impurity C IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Further dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with phenylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 0.1 volume of *triethylamine*, 40 volumes of a 0.08 per cent w/v solution of *ammonium acetate* and 60 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Name	Relative retention time
Maleic acid	0.2
Mepyramine impurity C[1]	0.3
Mepyramine impurity B[2]	0.4
Mepyramine impurity A[3]	0.5
Mepyramine (Retention time: about13 minutes)	1.0

[1]pyridin-2-amine,

[2]anisaldehyde,

[3]*N*-(4-methoxybenzyl)pyridin-2-amine.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to mepyramine impurities C and B is not less than 3.0.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to mepyramine impurities A and C is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.2 per cent). The area of any peak corresponding to mepyramine impurity B is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent) and the peak due to maleic acid.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method A (20 ppm).

Chlorides (2.3.12). 2.5 g dissolved in 15 ml of *water* complies with the limit test for chlorides (100 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.25 per cent, determined on 2.0 g by drying in an oven at 80°.

Assay. Weigh 0.15 g, dissolve in 40 ml of *anhydrous glacial acetic acid.* Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02007 g of $C_{17}H_{23}N_3O,C_4H_4O_4$.

Storage. Store protected from light and moisture.

Mepyramine Tablets

Mepyramine MaleateTablets; Pyrilamine Maleate Tablets; Pyrilamine Tablets

Mepyramine Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of mepyramine maleate, $C_{17}H_{23}N_3O,C_4H_4O_4$.

Usual strength. 50 mg.

Identification

A. Shake a quantity of the powdered tablets containing 0.1 g of Mepyramine Maleate with 10 ml of *dichloromethane*, filter and evaporate the filtrate to dryness.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *mepyramine maleate IPRS* or with the reference spectrum of mepyramine maleate.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (b).

C. Dissolve a quantity of the powdered tablets containing 0.2 g of Mepyramine Maleate, freed as far as possible from any sugar coating, in 3 ml of *water*, add 2 ml of *5 M sodium hydroxide* and shake with three quantities, each of 3 ml, of *ether*. Warm the aqueous layer in a water-bath for 10 minutes with 2 ml of *bromine solution*, heat to boiling, cool and add 0.2 ml to a solution of 10 mg of *resorcinol* in 3 ml of *sulphuric acid*; a bluish black colour is produced on heating for 15 minutes in a water-bath.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 100 volumes of *ethyl acetate* and 2 volumes of *diethylamine*.

NOTE—Prepare the following solutions immediately before use.

Test solution (a). Shake a quantity of the powdered tablets containing 0.4 g of Mepyramine Maleate with 10 ml of *chloroform* and filter.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *chloroform*.

Reference solution (a). A 4.0 per cent w/v solution of *mepyramine maleate IPRS* in *chloroform*.

Reference solution (b). A 0.4 per cent w/v solution of *mepyramine maleate IPRS* in *chloroform*.

Reference solution (c). A 0.008 per cent w/v solution of *mepyramine maleate IPRS* in *chloroform*.

Reference solution (d). A 0.004 per cent w/v solution of *mepyramine maleate IPRS* in *chloroform*.

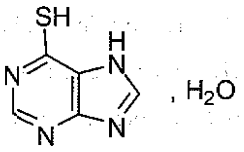
Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (c). The test is not valid unless the R_f values of the principal spots in the chromatograms obtained with test solution (a) and reference solution (a) are at least 0.2 and unless the spot in the chromatogram obtained with reference solution (d) is clearly visible. Ignore the spot due to maleic acid on the line of application.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.1 g of Mepyramine Maleate, add 75 ml of *water* and 5 ml of *2 M hydrochloric acid*, shake vigorously for 15 minutes and dilute to 100.0 ml with *water*. Centrifuge and dilute 10.0 ml of the clear, supernatant liquid to 100.0 ml with *water*. To 10.0 ml add 10 ml of *0.1 M hydrochloric acid* and dilute to 50.0 ml with *water*. Measure the absorbance of the resulting solution at the maximum at about 316 nm (2.4.7). Calculate the content of $C_{17}H_{23}N_3O,C_4H_4O_4$ taking 206 as the specific absorbance at 316 nm.

Storage. Store protected from light and moisture.

Mercaptopurine



$C_5H_4N_4S,H_2O$ Mol. Wt. 170.2

Mercaptopurine is purine-6-thiol monohydrate.

Mercaptopurine contains not less than 98.5 per cent and not more than 101.0 per cent of $C_5H_4N_4S$, calculated on the anhydrous basis.

Category. Anticancer.

Description. A yellow, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *mercaptopurine IPRS* or with the reference spectrum of mercaptopurine.

B. Dissolve 20 mg in 5 ml of *dimethyl sulphoxide* and add sufficient *0.1 M hydrochloric acid* to produce 100 ml. Dilute 5 ml to 200 ml with *0.1 M hydrochloric acid*.

When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows an absorption maximum only at about 325 nm.

C. Dissolve 20 mg in 20 ml of *ethanol (95 per cent)* heated to 60° and add 1 ml of a saturated solution of *mercuric acetate* in *ethanol (95 per cent)*; a white precipitate is produced.

D. Dissolve 20 mg in 20 ml of *ethanol (95 per cent)* heated at 60° and add 1 ml of a 1 per cent w/v solution of *lead acetate* in *ethanol (95 per cent)*; a yellow precipitate is produced.

Tests

Hypoxanthine. Determine by thin layer chromatography (2.4.17), coating the plate with the *silica gel GF254*.

Mobile phase. A mixture of 3 volumes of *concentrated ammonia*, 7 volumes of *water* and 90 volumes of *acetone*.

Test solution. Dissolve 50 mg of the substance under examination in 1 ml of *dimethyl sulphoxide* and dilute to 10 ml with *methanol.*

Reference solution. Dilute 10 mg of *hypoxanthine* in 10 ml of *dimethyl sulphoxide* and diluted to 100 ml with *methanol.*

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 10 cm. After development, dry the plate in air and examine at 254 nm. Any secondary spot corresponding to hypoxanthine in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (2.0 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 10.0 to 12.0 per cent, determined on 0.25 g.

Assay. Weigh 0.15 g, dissolve in 50 ml of *dimethylformamide.* Titrate with *0.1 M tetrabutylammonium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.01522 g of $C_5H_4N_4S$.

Storage. Store protected from light and moisture.

Mercaptopurine Tablets

Mercaptopurine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of mercaptopurine, $C_5H_4N_4S,H_2O$.

Usual strength. 50 mg.

Identification

Shake a quantity of the powdered tablets containing 50 mg of Mercaptopurine with a mixture of 20 ml of *water* and 0.5 ml of *5 M sodium hydroxide* for about 3 minutes, add sufficient *water* to produce 100 ml, mix and filter. Dilute a suitable aliquot of the filtrate with sufficient *0.1 M hydrochloric acid* to give a solution containing 5 µg of Mercaptopurine per ml. The resulting solution shows an absorption maximum at about 325 nm (2.4.7).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 50 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate as the test solution.

Reference solution. A solution containing 0.0055 per cent w/v of *mercaptopurine IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 3.9 mm, packed with octadecylsilane chemically bonded to porous silica (5 µm),
- mobile phase: 0.1 per cent v/v solution of *acetic acid* in *water*,
- flow rate: 2.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the retention time for mercaptopurine is not less than 4 minutes and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_5H_4N_4S,H_2O$ in the medium.

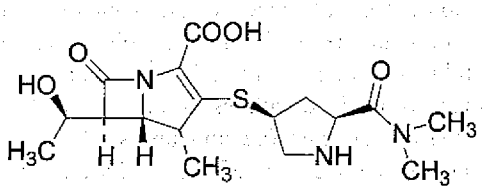
Q. Not less than 75 per cent of the stated amount of $C_5H_4N_4S,H_2O$.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 50 mg of Mercaptopurine, dissolve as completely as possible in 5 ml of *dimethyl sulphoxide* and add sufficient *0.1 M hydrochloric acid* to produce 500.0 ml. Dilute 5.0 ml to 100.0 ml with *0.1 M hydrochloric acid*, filter if necessary and measure the absorbance of the resulting solution at the maximum at about 325 nm (2.4.7). Calculate the content of $C_5H_4N_4S,H_2O$ taking 1165 as the specific absorbance at 325 nm.

Storage. Store protected from light and moisture.

Meropenem



$C_{17}H_{25}N_3O_5S,3H_2O$ Mol. Wt. 437.5 (hydrated)
$C_{17}H_{25}N_3O_5S$ 383.5 (anhydrous)

Meropenam is (1*R*,5*S*,6*S*)-2-[(3*S*,5*S*)-5-(dimethylaminocarbonyl)pyrrolidin-3-ylthio-6-[(*R*)-1-hydroxyethyl]-1-methylcarbapen-2-en-3-carboxylic acid.

Meropenem contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{17}H_{25}N_3O_5S$, calculated on the anhydrous basis.

Category. Antibiotic.

Description. A white to off-white crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *meropenem IPRS* or with the reference spectrum of meropenem.

Tests

pH (2.4.24). 4.0 to 6.0, determined in 1.0 per cent w/v solution in *water*.

Specific optical rotation (2.4.22). –21.0° to–17.0°, determined in a 0.5 per cent w/v solution.

Acetone (5.4). Not more than 0.05 per cent.

Determine by gas chromatography (2.4.13).

Internal standard solution. A 0.005 per cent w/v solution of *ethyl acetate* in *dimethylformamide*.

Test solution. Dissolve 100 mg of the substance under examination in 0.2 ml of *dimethylformamide* and 2.0 ml of internal standard solution.

Reference solution. Weigh 50 mg of *acetone*, dissolve in a small quantity of *dimethylformamide*, dilute to 100.0 ml with *dimethylformamide* and mix. To 1.0 ml of the solution, add 10.0 ml of the internal standard solution, and mix.

Chromatographic system
- a glass column 2 m × 3 mm, packed with styrenedivinylbenzene copolymer (Such as Chromosorb 101),
- temperature:
  column. 150°,
  inlet port and detector 170°,
- flow rate adjusted so that the retention time for acetone is about 3 minutes of the carrier gas.

Inject 1 µl of the test solution and the reference solution.

Calculate the percentage of acetone.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. To 900 ml of *water* add 1.0 ml of *triethylamine*, adjusted to pH 5.0 with *dilute phosphoric acid*, dilute to 1000 ml with *water* and mix.

NOTE — Prepare the solutions immediately before use.

Test solution. Dissolve 0.5 g of the substance under examination in the solvent mixture and dilute to 100 ml of the solvent mixture.

Reference solution. A 0.0025 per cent w/v solution of *meropenem IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: mix 1.0 ml of *triethylamine* and 900 ml of *water*, adjusted to pH 5.0 with *dilute orthophosphoric acid*, dilute with *water* to 1000 ml, add 70 ml of *acetonitrile*,
- flow rate: 1.6 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.5, the column efficiency in not less than 2500 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution. Any individual impurity is not more than 0.5 per cent and the sum of all impurities found is not more than 2.0 per cent.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1per cent, igniting at 500 ± 50°, instead of at 800 ± 25°. Use a desiccator containing *silica gel*.

Water (2.3.43). 11.4 per cent to 13.4 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. To 900 ml of *water* add 1.0 ml of *triethylamine*, adjusted to pH 5.0 with *dilute orthophosphoric acid*, dilute to 1000 ml with *water* and mix.

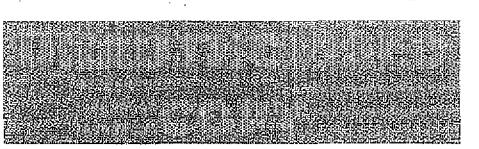
NOTE — Prepare the solutions immediately before use.

Test solution. Dissolve 50.0 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution. A 0.05 per cent w/v solution of *meropenem IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 30°,
- mobile phase: a mixture of 50 volumes of the solvent mixture and 10 volumes of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 300 nm,
- injection volume: 5 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.5, the column efficiency is not less than 2500 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.



Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{25}N_3O_5S$.

Meropenem intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.125 Endotoxin Unit per mg of meropenem.

Meropenem intended for use in the manufacture of parenteral preparations without a further appropriate sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store in airtight containers, at a temperature not exceeding 25°.

Labelling. The label states whether or not the contents are intended for use in the manufacture of parenteral preparations.

Meropenem Injection

Meropenem Injection is a sterile material consisting of Meropenem and Sodium Carbonate.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Meropenem Injection contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of meropenem, $C_{17}H_{25}N_3O_5S$.

Usual strengths. 125 mg; 250 mg; 500 mg; 1 g.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 7.3 to 8.3, determined in 5.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 1.0 ml of *triethylamine* in 900 ml of *water*. Adjusted to pH 5.0 with *dilute phosphoric acid* and dilute to 1000 ml with *water*.

NOTE — Prepare the solutions immediately before use.

Test solution. Determine the weight of the contents of 10 containers. Dissolve a weighed quantity of the mixed contents of the 10 containers containing about 50 mg of Meropenem in 10 ml of the solvent mixture, and mix.

Reference solution. A 0.0025 per cent w/v solution of *meropenem IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm × 4.0 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature 40°,
- mobile phase: mix 1.0 ml of *triethylamine* and 900 ml of *water*, adjusted to pH 5.0 with *dilute phosphoric acid*, dilute to 1000 ml with *water*; filter and mix with 60 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.5 and the column efficiency is not less than 2500 theoretical plates.

Inject the reference solution and the test solution. Any individual impurity is not more than 0.8 per cent and the sum of all impurities found is not more than 2.0 per cent.

Content of Sodium. 80 to 120 per cent of the labelled amount of sodium.

Weigh a quantity of the injection containing 50 mg of anhydrous meropenem and dissolve in sufficient *water* to produce 100.0 ml. Dilute the resulting solution appropriately with *water* and determine by Method A for flame photometry (2.4.4), measuring at 589 nm or by Method A for atomic absorption spectrophotometry (2.4.2), using *sodium solution FP*, suitably diluted with *water* for the reference solutions.

Bacterial endotoxins (2.2.3). Not more than 0.125 Endotoxin Unit per mg of meropenem.

Sterility (2.2.11). Complies with the test for sterility.

Loss on drying (2.4.19). 9.0 per cent to 12.0 per cent, determined on 1.0 g by drying it in vacuum oven at 65° for 6 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Determine the weight of the contents of 10 containers. Dissolve a weighed quantity of the mixed contents of the 10 containers containing about 10 mg of

Meropenem in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *meropenem IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 153 volumes of buffer solution prepared by dissolving 20 ml of 25 per cent w/v of *tetrabutylammonium hydroxide* to 1000 ml with *water*, adjusted to pH 7.5 with *dilute phosphoric acid*, 30 volumes of *acetonitrile* and 20 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 300 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.5, the column efficiency in not less than 2500 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

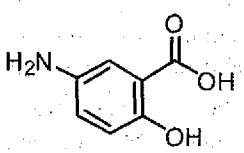
Calculate the content of $C_{17}H_{25}N_3O_5S$ in the injection.

Storage. Store protected from moisture.

Labelling. The label states the quantity in mg, of meropenem and sodium in a suitable dose-volume.

Mesalazine

Mesalamine



$C_7H_7NO_3$ Mol. Wt. 153.1

Mesalazine is 5-amino-2-hydroxybenzoic acid.

Mesalazine contains not less than 98.5 per cent and not more than 101.5 per cent of $C_7H_7NO_3$, calculated on the dried basis.

Category. Antiulcer.

Description. An almost white or light grey or light pink powder or crystals.

Identification

Tests A and C may be omitted if test B is carried out. Test B may be omitted if tests A and C are carried out.

A. Dissolve 50 mg in 10 ml of a 1.03 per cent w/v solution of *hydrochloric acid* and dilute to 100.0 ml with the same acid. Dilute 5.0 ml to 200.0 ml with a 1.03 per cent w/v solution of *hydrochloric acid*. When examined in the range 210 nm to 250 nm (2.4.7), the solution shows an absorption maximum at about 230 nm. The specific absorbance at the maximum is 430 to 450.

B. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *mesalazine IPRS* or with the reference spectrum of mesalazine.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 10 volumes of *glacial acetic acid*, 40 volumes of *methanol* and 50 volumes of *methyl isobutyl ketone*.

Solvent mixture. Equal volumes of *glacial acetic acid* and *water*.

Test solution. Dissolve 50 mg of the substance under examination in 10 ml of the solvent mixture and dilute to 20.0 ml with *methanol*.

Reference solution. Dissolve 50 mg of *mesalazine IPRS* in 10 ml of the solvent mixture and dilute to 20.0 ml with *methanol*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate in air and examine under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Light absorption. *Maintain the solutions at 40° during preparation and measurements.*

Dissolve 0.5 g in *1 M hydrochloric acid* and dilute to 20 ml with the same acid. The solution is clear (2.4.1). Immediately measure the absorbance (2.4.7) of the solution at 440 nm and 650 nm. The absorbance is not more than 0.15 at 440 nm and 0.10 at 650 nm.

Reducing substances. Dissolve 0.1 g in *dilute hydrochloric acid* and dilute to 25 ml with the same acid. Add 0.2 ml of *starch solution* and 0.25 ml of *0.01 M iodine*. Allow to stand for 2 minutes. The solution is blue or violet-brown.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Use freshly prepared solutions and mobile phases.

Test solution. Dissolve 50 mg of the substance under examination in mobile phase A and dilute to 50.0 ml with mobile phase A.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A.

Reference solution (b). A 0.005 per cent w/v solution of *3-aminobenzoic acid* in mobile phase A. Dilute 1.0 ml to 25.0 ml with the test solution.

Reference solution (c). A 0.0001 per cent w/v solution of *3-aminobenzoic acid* in mobile phase A.

Reference solution (d). A 0.0002 per cent w/v solution of *3-aminophenol* in mobile phase A.

Reference solution (e). A 0.0001 per cent w/v solution of *2,5-dihydroxybenzoic acid* in mobile phase A.

Reference solution (f). A 0.0003 per cent w/v solution of *salicylic acid* in mobile phase A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with base deactivated octylsilane bonded to porous silica (5 µm),
- mobile phase: A. dissolve 2.2 g of *perchloric acid* and 1.0 g of *orthophosphoric acid* in *water* and dilute to 1000.0 ml with the same solvent,

  B. dissolve 1.7 g of *perchloric acid* and 1.0 g of *orthophosphoric acid* in *acetonitrile* and dilute to 1000.0 ml with the same solvent,
- a gradient programme using the conditions given below,
- flow rate: 1.25 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
7	100	0
25	40	60
30	100	0
40	100	0

Name	Relative retention time
Mesalazine impurity B[1]	0.8
Mesalazine (Retention time: about 5 minutes)	1.0
Mesalazine impurity D[2]	1.2
Mesalazine impurity G[3]	3.1
Mesalazine impurity H[4]	3.9

[1] 3-aminophenol,

[2] 3-aminobenzoic acid,

[3] 2,5-dihydroxybenzoic acid,

[4] salicylic acid.

Inject reference solution (b). The test is not valid unless the peak-to-valley ratio is not less than 1.5, where H_p is the height above the baseline of the peak due to impurity D and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to mesalazine.

Inject reference solution (a), (c), (d), (f) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to mesalazine impurity B is not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.2 per cent). The area of any peak corresponding to mesalazine impurity D is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent). The area of any peak corresponding to mesalazine impurity G is not more than the area of the principal peak in the chromatogram obtained with reference solution (e) (0.1 per cent). The area of any peak corresponding to mesalazine impurity H not more than the area of the principal peak in the chromatogram obtained with reference solution (f) (0.3 per cent), the area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Impurities A and C. Determine by liquid chromatography (2.4.14).

NOTE — Use freshly prepared mobile phases.

Test solution. Dissolve 50 mg of the substance under examination in mobile phase A and dilute to 50.0 ml with mobile phase A.

Reference solution (a). Dissolve 5 mg of *2-aminophenol* in mobile phase A and dilute to 100.0 ml with mobile phase A. Dilute 10.0 ml to 100.0 ml with mobile phase A.

Reference solution (b). Dissolve 5 mg of *4-aminophenol* in mobile phase A and dilute to 250.0 ml with mobile phase A. To 1.0 ml of the solution, add 1.0 ml of reference solution (a) and dilute to 100.0 ml with mobile phase A.

Reference solution (c). Dilute 1.0 ml of the test solution to 200.0 ml with mobile phase A. To 5.0 ml of the solution add 5.0 ml of reference solution (a).

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (3 µm),
- mobile phase: A. dissolve 2.2 g of *perchloric acid* and 1.0 g of *orthophosphoric acid* in *water* and dilute to 1000.0 ml with *water*,

  B. dissolve 1.7 g of *perchloric acid* and 1.0 g of *orthophosphoric acid* in *acetonitrile* and dilute to 1000.0 ml with the same solvent,

– a gradient programme using the conditions given below,
– flow rate: 1 ml per minute,
– spectrophotometer set at 220 nm,
– injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
8	100	0
25	40	60
30	100	0
40	100	0

Name	Relative retention time
Mesalazine impurity A[1]	0.5
Mesalazine impurity C[2]	0.9
Mesalazine (Retention time: about 9 minutes)	1.0

[1]4-aminophenol,

[2]2-aminophenol.

Inject reference solution (c). The test is not valid unless the resolution between the peaks corresponding to mesalazine impurity C and mesalazine is not less than 3.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak corresponding to mesalazine impurity A is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (200 ppm) and the area of any secondary peak corresponding to mesalazine impurity C is not more than 4 times the area of the corresponding peak in the chromatogram obtained with reference solution (b) (200 ppm).

Impurity K. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 40 mg of the substance under examination in the mobile phase and dilute to 20.0 ml with the mobile phase.

Reference solution. Dissolve 27.8 mg of *aniline hydrochloride* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 0.2 ml of the solution to 20.0 ml with the mobile phase. Further dilute 0.2 ml of the solution to 20.0 ml with the mobile phase.

Chromatographic system
– a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
– column temperature: 40°,
– mobile phase: a mixture of 15 volumes of *methanol* and 85 volumes of a solution containing 0.141 per cent w/v of *potassium dihydrogen phosphate* and 0.047 per cent w/v of *disodium hydrogen phosphate dihydrate* previously adjusted to pH 8.0 with a 4.2 per cent solution of *sodium hydroxide*,
– flow rate: 1 ml per minute,
– spectrophotometer set at 205 nm,
– injection volume. 50 µl.

Inject the reference solution. The test is not valid unless the signal-to-noise ratio is not less than 10 for the principal peak.

Inject the reference solution and the test solution. The retention time of mesalazine impurity K (aniline) peak is about 15 minutes. In the chromatogram obtained with the test solution, the area of any peak corresponding to mesalazine impurity K is not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (10 ppm).

Chlorides. Not more than 0.1 per cent.

Dissolve 1.5 g in 50 ml of *anhydrous formic acid.* Add 100 ml of *water* and 5 ml of *2 M nitric acid.* Titrate with *0.005 M silver nitrate* determining the end-point potentiometrically (2.4.25).

1 ml of *0.005 M silver nitrate* is equivalent to 0.1773 mg of Cl.

Sulphates (2.3.17). Disperse 1.0 g with 20 ml of *water* for 1 minute and filter. 15 ml of the filtrate complies with the limit test for sulphates (200 ppm).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 50 mg in 100 ml of boiling *water.* Cool rapidly to room temperature and titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01531 g of $C_7H_7NO_3$.

Storage. Store protected from light and moisture.

Mesalazine Prolonged-release Tablets

Mesalamine Prolonged-release Tablets

Mesalazine Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Mesalazine Prolonged-release Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of mesalazine, $C_7H_7NO_3$.

Usual strengths. 500 mg; 1000 mg; 1200 mg.

Identification

Boil a quantity of the powdered tablets containing 1.0 g of Mesalazine with 50 ml of *water* for 1 minute and filter the hot supernatant fluid. Cool the solution to room temperature, allow to stand, filter and dry the crystals at 110°. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *mesalazine IPRS* or with the reference spectrum of mesalazine.

Tests

Dissolution (2.5.2). Complies the test stated under tablets.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 50 mg of Mesalazine in 30 ml of *0.01 M hydrochloric acid* with the aid of ultrasound for 10 minutes and dilute to 50.0 ml with *0.01 M hydrochloric acid*, filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *0.01 M hydrochloric acid*. Dilute 1.0 ml of the solution to 10.0 ml with *0.01 M hydrochloric acid*.

Reference solution (b). Dilute 1.0 ml of a 0.01 per cent w/v solution of *3-aminosalicylic acid* in *0.01 M hydrochloric acid* to 100.0 ml with the test solution.

Reference solution (c). Dilute 3.0 ml of reference solution (a) to 10.0 ml with *0.01 M hydrochloric acid*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. a 0.69 per cent w/v solution of *sodium dihydrogen phosphate monohydrate*, adjusted to pH 6.2 with *sodium hydroxide*,
  B. a mixture of 40 volumes of *acetonitrile* and 60 volumes of mobile phase A,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)

[1]unknown,

[2]diaminosalicylic acid,

[3]4-aminosalicylic acid,

[4]3-aminosalicylic acid,

[5]2,5-dihydroxybenzoic acid,

[6]unknown,

[7]2-chlorobenzoic acid,

[8]2-chloro-5-nitrobenzoic acid,

[9]salicylic acid,

[10]unknown,

[11]5-nitrosalicylic acid.

Inject reference solution (b). The test is not valid unless the peak-to-valley ratio is not less than 3.0, where H_p is the height above the baseline of the peak due to 3-aminosalicylic acid and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to mesalazine.

Inject reference solution (a), (c) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to mesalazine impurity H is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent). The area of any peak corresponding to mesalazine impurities E, F, G, J, L, M, P is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.03 per cent).

Impurities A and C. Determine by liquid chromatography (2.4.14).

NOTE — Use freshly prepared mobile phases.

Test solution. Disperse a quantity of the powdered tablets containing 50 mg of Mesalazine in 30 ml of mobile phase A with the aid of ultrasound for 10 minutes and dilute to 50.0 ml with mobile phase A, filter.

Reference solution (a). Dilute 1.0 ml of a 0.002 per cent w/v solution of *4-aminophenol* in mobile phase A with 1.0 ml of 0.002 per cent w/v of *2-aminophenol* in mobile phase A and dilute to 100.0 ml with mobile phase A.

Reference solution (b). Dilute 1.0 ml of the test solution to 200.0 ml with mobile phase A. To 1.0 ml of the solution, add 1.0 ml of 0.0005 per cent w/v of *2-aminophenol* in mobile phase A.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (3 µm),
- mobile phase: A. a 0.22 per cent w/v of *perchloric acid* and 0.1 per cent w/v of *orthophosphoric acid*,
  B. a 0.17 per cent w/v of *perchloric acid* and 0.1 per cent w/v of *orthophosphoric acid* in *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
8	100	0
25	40	60

Name	Relative retention time
Mesalazine impurity A[1]	0.5
Mesalazine impurity C[2]	0.9
Mesalazine (Retention time: about 9 minutes)	1.0

[1]4-aminophenol,

[2]2-aminophenol.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 3.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to 4-aminophenol is not more than the area of corresponding peak in the chromatogram obtained with reference solution (a) (200 ppm) and the area of any peak corresponding to 2-aminophenol is not more than the area of corresponding peak in the chromatogram obtained with reference solution (a) (200 ppm).

Impurity K. Determine by liquid chromatography (2.4.14).

Test solution. Add 2 ml of *0.01 M sodium hydroxide* and 5 drops of *1 M sodium hydroxide* to a quantity of the powdered tablets containing 50 mg of Mesalazine, add 15 ml of the mobile phase and mix for 20 minutes with the aid of ultrasound and dilute to 25.0 ml with the mobile phase.

Reference solution. A 0.00000278 per cent w/v solution of *aniline hydrochloride* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 15 volumes of *methanol* and 85 volumes of a solution containing 0.141 per cent w/v of *potassium dihydrogen orthophosphate* and 0.047 per cent w/v of *disodium hydrogen orthophosphate dihydrate*, previously adjusted to pH 8.0 with 4.2 per cent w/v of *sodium hydroxide*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 50 µl.

The retention time of aniline is about 15 minutes.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to aniline is not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (10 ppm).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 25 mg of Mesalazine in 15 ml of *0.1 M hydrochloric acid* with the aid of ultrasound for 50 minutes with additional vortex mixing at 10 minute intervals and dilute to 25.0 ml with *0.1 M hydrochloric acid*, filter. Dilute 1.0 ml of the solution to 50.0 ml with *0.1 M hydrochloric acid.*

Reference solution (a). A 0.002 per cent w/v solution of *mesalazine IPRS* in *0.1 M hydrochloric acid.*

Reference solution (b). A 0.01 per cent w/v solution of *3-aminosalicylic acid* in *0.1 M hydrochloric acid.* Dilute

1.0 ml of the solution to 100.0 ml with 0.1 per cent w/v solution of *mesalazine IPRS* in *0.01 M hydrochloric acid.*

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a 0.69 per cent w/v solution of *sodium dihydrogen phosphate monohydrate,* adjusted to pH 6.2 with *dilute sodium hydroxide solution*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the peak-to-valley ratio is not less than 3.0, where H_p is the height above the baseline of the peak due to 3-aminosalicylic acid and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to mesalazine.

Inject reference solution (a) and the test solution.

Calculate the content of $C_7H_7NO_3$ in the tablets.

Mesna

$C_2H_5NaO_3S_2$ Mol Wt.164.2

Mesna is sodium 2-sulfanylethanesulfonate.

Mesna contains not less than 96.0 per cent and not more than 102.0 per cent of $C_2H_5NaO_3S_2$, calculated on the dried basis.

Category. It works as a chemotherapeutic adjuvant. It helps in detoxifying the metabolic products of cyclophosphamide.

Description. A white to off-white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare th.e spectrum with that obtained with *mesna IPRS* or with reference spectrum of mesna.

B. It gives the reactions of sodium salts (2.3.1).

Tests

Solution A. A 20.0 per cent w/v solution in *carbon dioxide-free water.*

Appearance of solution. Solution A is clear (2.4.1) and not more intensely coloured than reference solution YS7 (2.4.1).

pH (2.4.24). 4.5 to 6.0, determined in a 2.0 per cent w/v solution in *carbon dioxide-free water.*

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). A 0.0008 per cent w/v solution of *mesna impurity C IPRS [2-(acetylsulfanyl)ethanesulphonic acid]* in *the mobile phase.*

Reference solution (b). A 0.012 per cent w/v solution of *mesna impurity D IPRS (2,2'-(disulfanediyl)bis(ethanesulphonic acid)* in *the mobile phase.*

Reference solution (c). Dilute the test solution in mobile phase to obtain a solution containing 0.12 per cent w/v of mesna.

Reference solution (d). Dilute reference solution (c) in the mobile phase to obtain a solution containing 0.0012 per cent w/v of mesna.

Reference solution (e). Dilute 6.0 ml of reference solution (c) to 20.0 ml with the mobile phase. To 10 ml of the solution add 10 ml of reference solution (a).

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a buffer solution prepared by dissolving 2.94 g of *potassium dihydrogen phosphate*, 2.94 g of *dipotassium hydrogen phosphate* and 2.6 g of *tetrabutylammonium hydrogen sulphate* in about 600.0 ml of *water*, adjusted to pH 2.3 with *orthophosphoric acid*, add 335 ml of *methanol* and dilute to 1000 ml with *water.*
- flow rate: 1 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 20 µl.

The relative retention time with reference to mesna (retention time about 4.8 minutes) for *mesna impurity A IPRS (2-(carbamimidoylsulfanyl) ethanesulphonic acid)* and *mesna impurity B IPRS (2-[[(guanidino)(imino)methyl]sulfanyl] ethanesulphonic acid) are about 0.6, for mesna impurity E IPRS (2-(4,6-diamino-1,3,5-triazin-2-yl)sulfanylethane sulphonic acid)* is about 0.8, for *mesna impurity C IPRS (2-(acetylsulfanyl) ethanesulfonic acid)* is about 1.4 and for *mesna impurity D IPRS (2,2'-(disulfanediyl)bis (ethanesulfonic acid)*, is about 2.3.

Inject reference solution (e). The test is not valid unless the resolution between the peaks due to mesna and mesna impurity C is not less than 3.0.

Inject reference solution (a),(b),(d) and the test solution. In the chromatogram obtained with the test solution, the area of

the peak due to mesna impurity C is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of the peak due to mesna impurity D is not more than the area of the peak in the chromatogram obtained with reference solution (b) (3.0 per cent),the area of the peak due to mesna impurity A, B and E multiplied with correction factor 0.01 is not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (d) (0.3 per cent), the area of any other secondary peak is not more than 0.33 times the area of the peak obtained with reference solution (d) (0.1 per cent) and the sum of areas all the secondary peaks is not more than the area of the peak obtained with reference solution (d) (0.3 per cent). Ignore any peak with an area less than 0.15 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.045 per cent).

Chlorides (2.3.12). Dilute 5.0 ml of solution A to 15 ml with *water*. The solution complies with the limit test for chlorides (250 ppm).

Sulphates (2.3.17). Dilute 5.0 ml of solution A to 30 ml with *water*. 15 ml of the solution complies with the limit for sulphates (300 ppm).

Disodium edetate. Not more than 500 ppm.

Dissolve 4.0 g in 90 ml of *water* and adjusted to pH 4.5 using *0.1 M hydrochloric acid*. Add 10 ml of *acetate buffer solution pH 4.5* and 50 ml of *2-propanol*. Add 2 ml of 0.025 per cent w/v solution of *dithizone* in *2-propanol*. Titrate with *0.01 M zinc sulphate* until the colour changes from bluish-grey to pink.

1 ml of *0.01 M zinc sulphate* is equivalent to 0.00372 g of $C_{10}H_{14}N_2Na_2O_8,2H_2O$.

Heavy metals (2.3.13). Not more than 10 ppm.

Dilute 10 ml of solution A to 20.0 ml with *water*. 12 ml of the solution complies with limit test for heavy metals, Method D (10 ppm). Use 10 ml of *lead standard solution (1 ppm Pb)* to prepare the standard.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in vacuum oven at 60° for 2 hours.

Assay. Dissolve 0.120 g in 10 ml of *water*. Add 10 ml of *1 M sulphuric acid* and 20.0 ml of *0.05 M iodine*. Titrate with *0.1 M sodium thiosulphate*, using 1 ml of *starch solution*, added towards the end of the titration as an indicator. Carry out a blank titration.

1 ml of *0.1 M sodium thiosulphate* is equivalent to 0.01642 g of $C_2H_5NaO_3S_2$.

Storage. Store in tight containers.

Mesna Tablets

Mesna Tablets contain not less than 90.0 per cent and not more than 105.0 per cent of the stated amount of mesna, $C_2H_5NaO_3S_2$.

Usual strengths. 400 mg and 600 mg.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *mesna IPRS* or with reference spectrum of mesna.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 500 ml of *0.06 M hydrochloric acid,*
Speed and time. 50 rpm for 15 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution (a). A 0.08 per cent w/v solution of *mesna IPRS* in the dissolution medium.

Reference solution (b). A solution containing 0.4 per cent w/v of *mesna IPRS* and 0.002 per cent w/v of *mesna related compound A IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 20 cm x 2.1 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 70 volumes of a buffer solution prepared by dissolving 2.72 g of *monobasic potassium phosphate* and 6.79 g of *tetrabutyl ammonium hydrogen sulphate* in 700 ml of *water* and 30 volumes of *methanol*, adjusted to pH 2.8,
- flow rate: 0.325 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 5 µl.

Inject reference solution (a) and (b). The test is not valid unless the resolution between mesna and mesna related compound A is not less than 1.5 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_2H_5NaO_3S_2$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_2H_5NaO_3S_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 0.4 g of Mesna in 70 ml of the mobile phase, with the aid of ultrasound for 20 minutes and dilute to 100.0 ml with the mobile phase.

Reference solution (a). A solution containing 0.002 per cent w/v of *mesna IPRS* and 0.01 per cent w/v of *mesna related compound B IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.4 per cent w/v of *mesna IPRS* and 0.002 per cent w/v of *mesna related compound A IPRS* in the mobile phase.

Use chromatographic system as described under Dissolution with the following modification.

- spectrophotometer set at 230 nm (for reference solution (b)),
- spectrophotometer set at 202 nm (for reference solution (a) and test solution),

Name	Relative retention time
Thiouronium ethanesulphonic acid[1,2]	0.6
Guanidinethiouronium ethanesulphonic acid[1,3]	0.6
Mesna	1.0
Mesna related compound A[4]	1.3
Mesna related compound B[5]	2.5

[1]Process related impurity not included in total impurities;

[2]2-(Carbamimidoylthio)ethane-1-sulphonic acid;

[3]2-[(*N*-Carbamimidoylcarbamimidoyl)thio]ethane-1-sulphonic acid;

[4]2-(Acetylthio)ethane-1-sulphonic acid;

[5]2,2-Disulfanediylbis(ethane-1-sulphonic acid).

Inject reference solution (a) and (b). The test is not valid unless the resolution between the mesna and mesna related compound A is not less than 1.5 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections for mesna and mesna related compound B is not more than 2.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to mesna related compound B is not more than 1.2 times the area of the corresponding peak in the chromatogram obtained with reference solution (a) (3.0 per cent), the area of any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks other than mesna related compound B is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 0.4 g of Mesna in 70 ml of the mobile phase, with the aid of ultrasound for 20 minutes and dilute to 100.0 ml with the mobile phase.

Reference solution (a). A 0.4 per cent w/v solution of *mesna IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.4 per cent w/v of *mesna IPRS* and 0.002 per cent w/v of *mesna related compound A IPRS* in the mobile phase.

Use chromatographic system as described under Dissolution.

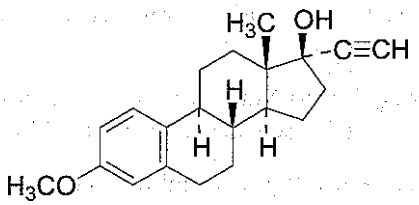
Inject reference solution (a) and (b). The test is not valid unless the resolution between the mesna and mesna related compound A is not less than 1.5 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_2H_5NaO_3S_2$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Mestranol



$C_{21}H_{26}O_2$ Mol. Wt. 310.4

Mestranol is 3-methoxy-19-nor-17α-pregna-1,3,5(10)-trien-20-yn-17β–ol.

Mestranol contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{21}H_{26}O_2$, calculated on the dried basis.

Category. Estrogen.

Description. A white or almost white, crystalline powder.

Identification

Test B may be omitted if tests A and C are carried out. Test A may be omitted if tests B and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *mestranol IPRS* or with the reference spectrum of mestranol.

B. In the test for Related substances the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (c).

C. Dissolve about 5 mg in 1 ml of *sulphuric acid*; a red colour is produced which appears greenish-yellow under ultraviolet light at 365 nm. On adding the solution to 10 ml of *water* and mixing, the solution becomes pink and on standing a pink to violet precipitate is produced.

Tests

Specific optical rotation (2.4.22). –24.0° to –20.0°, determined in a 1.0 per cent w/v solution in *anhydrous pyridine*.

Light absorption (2.4.7). Dissolve about 25 mg in sufficient *ethanol (95 per cent)* to produce 25 ml and dilute 10 ml of the solution to 100 ml with *ethanol (95 per cent)*. When examined in the range 230 nm to 360 nm, the resulting solution shows absorption maxima at about 279 nm and 288 nm and a minimum at about 286 nm. Absorbance at about 279 nm is 0.062 to 0.068 and at about 288 nm is 0.059 to 0.064, both calculated on the dried basis.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 90 volumes of *toluene* and 10 volumes of *ethanol (95 per cent)*.

Test solution (a). Dissolve 0.1 g of the substance under examination in 10 ml of *chloroform*.

Test solution (b). Dissolve 0.1 g of the substance under examination in 100 ml of *chloroform*.

Reference solution (a). A 0.01 per cent w/v solution of the substance under examination in *chloroform*.

Reference solution (b). A 0.005 per cent w/v solution of the substance under examination in *chloroform*.

Reference solution (c). A 0.1 per cent w/v solution of *mestranol IPRS* in *chloroform*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air until the odour of the solvent is no longer detectable, heat it at 110° for 10 minutes and spray the hot plate with *ethanolic sulphuric acid* (20 per cent). Heat again at 110° for 10 minutes and examine in daylight and under ultraviolet light at 365 nm. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a), and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

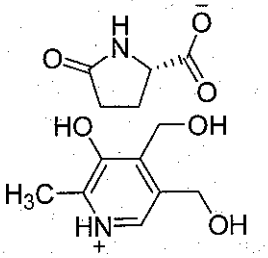
Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 0.5 g by drying in an oven at 105° for 3 hours.

Assay. Weigh 0.2 g, dissolve in 40 ml of *tetrahydrofuran* and add 5 ml of 10 per cent w/v solution of *silver nitrate*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25).

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.03104 g of $C_{21}H_{25}O_2$.

Storage. Store protected from light and moisture.

Metadoxine



$C_{13}H_{18}N_2O_6$ Mol. Wt. 298.3

Metadoxine is 5-oxo-L-proline- 4, 5-bis (hydroxymethyl)-2-methylpyridin-3-ol.

Metadoxine contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{13}H_{18}N_2O_6$, calculated on the dried basis.

Category. Hepatoprotective.

Description. A white to off white, powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *metadoxine IPRS* or with the reference spectrum of metadoxine.

Tests

pH (2.4.24).3.8 to 4.2, determined in a 1.0 per cent w/v solution.

Specific optical rotation (2.4.22). – 8.5° to – 6.5°, determined in a 5.0 per cent w/v solution in *0.1 M hydrochloric acid*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination and dilute to 50.0 ml with the *water*.

Reference solution. A 0.01 per cent w/v solution of *metadoxine IPRS* in *water*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5µm) (Such as Hypersil BDS),
- mobile phase: Dissolve 8.6 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 7.0 with *potassium hydroxide solution*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

The retention time of Metadoxine is about 15 minutes.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates and the tailing factor is not more than 3.

Inject the reference solution and the test solution. Run the chromatogram twice the retention time of the principal peak. The area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram with the reference solution (1.0 per cent). Ignore the peak due to pyroglutamic acid at the relative retention time of about 0.24.

Chlorides (2.3.12). Dissolve 0.25 g in *water* and dilute to 25 ml with *water*. The solution complies with the limit test for chlorides (1000 ppm).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.3 per cent.

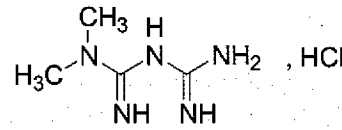
Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in oven at 60° for 5 hours.

Assay. Weigh accurately about 0.24 g and dissolve in 50 ml of *anhydrous acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of 0.1 M perchloric acid is equivalent to 0.02983 g of $C_{13}H_{18}N_2O_6$.

Storage. Store protected from light and moisture.

Metformin Hydrochloride



$C_4H_{11}N_5,HCl$ Mol. Wt. 165.6

Metformin Hydrochloride is 1,1-dimethylbiguanide hydrochloride.

Metformin Hydrochloride contains not less than 98.5 per cent and not more than 101.0 per cent of $C_4H_{11}N_5,HCl$, calculated on the dried basis.

Category. Hypoglycaemic.

Description. A white or almost white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *metformin hydrochloride IPRS* or with the reference spectrum of metformin hydrochloride.

B. Dissolve 25 mg in 5 ml of *water*, add 1.5 ml of *5 M sodium hydroxide*, 1 ml of *1-naphthol solution* and, dropwise with shaking, 0.5 ml of *sodium hypochlorite solution (3 per cent Cl)*; an orange-red colour is produced which darkens on keeping.

C. Dissolve 10 mg in 10 ml of *water* and add 10 ml of a solution prepared by mixing equal volumes of a 10 per cent w/v solution of *sodium nitroprusside*, a 10 per cent w/v solution of *potassium ferricyanide* and a 10 per cent w/v solution of *sodium hydroxide* and allowing to stand for 20 minutes; a wine red colour develops within 3 minutes.

D. It gives reaction (A) of chlorides (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 10 ml of *water*.

Reference solution (a). A 0.0005 per cent w/v solution of the substance under examination in *water*.

Reference solution (b). A 0.0001 per cent w/v solution of *dicyandiamide* in *water*.

Chromatographic system
- a stainless steel column 30 cm x 4 mm, packed with octadecylsilane bonded to porous silica (10 µm),

- mobile phase: a solution containing 0.087 per cent w/v of *sodium pentanesulphonate* and 0.12 per cent w/v of *sodium chloride*, adjusted to pH 3.5 using 1 per cent v/v solution of *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 218 nm,
- injection volume: 20 µl.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to dicyandiamide is not more than the area of the peak in the chromatogram obtained with reference solution (b) (0.02 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay Dissolve 0.1 g in 4 ml of *anhydrous formic acid*. Add 80 ml of *acetonitrile* and titrate with *0.1M perchloric acid* immediately. Determine the end point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01656 g of $C_4H_{12}ClN_5$.

Storage. Store protected from light and moisture.

Metformin Oral Solution

Metformin Hydrochloride Oral Solution

Metformin Oral Solution is a solution of Metformin Hydrochloride in a suitable flavoured vehicle.

Metformin Oral Solution contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of metformin hydrochloride, $C_4H_{11}N_5,HCl$.

Usual strength. 100 mg per 5ml.

Identification

In the Assay, the retention time of the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.24). 6.0 to 7.5.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of oral solution with the mobile phase to obtain a solution containing 0.5 per cent w/v of Metformin Hydrochloride and filter, if necessary.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Further dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 20 mg of *dicyandiamide* in *water*, dilute to 100 ml with *water*. Dilute 1.0 ml of the solution to 200.0 ml with the mobile phase.

Reference solution (c). A solution containing 0.00025 per cent w/v of *melamine* and 0.0001 per cent w/v of *metformin hydrochloride IPRS* in the mobile phase.

Reference solution (d). Dilute 1 volume of reference solution (a) to 2 volumes with the mobile phase.

Chromatographic system

- a stainless steel column 12.5 cm x 4.6 mm, packed with benzenesulphonic acid groups bonded to porous silica (5 µm) (Such as Partisphere SCX),
- mobile phase: a 1.7 per cent w/v solution of *ammonium dihydrogen orthophosphate*, adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 218 nm,
- injection volume: 20 µl.

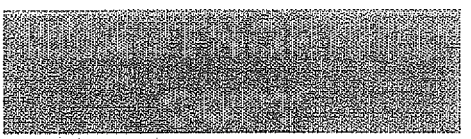
Inject reference solution (c). The test is not valid unless the resolution between the peaks due to melamine and metformin hydrochloride is not less than 10.0.

Inject reference solution (a), (b), (d) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to dicyandiamide is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.02 per cent), the area of any other secondary peak is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent) and the sum of the areas of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent). Ignore any peak, except that of dicyandiamide, with an area less than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.05 per cent).

Other tests. Comply with the tests stated under Oral liquids.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of oral solution with the mobile phase to obtain a solution containing 0.05 per cent w/v of Metformin Hydrochloride and filter, if necessary.



Reference solution (a). A 0.05 per cent w/v solution of *metformin hydrochloride IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.00025 per cent w/v of *melamine* and 0.0001 per cent w/v of *metformin hydrochloride IPRS* in the mobile phase.

Use chromatographic system as described in the Related substances.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to melamine and metformin hydrochloride is not less than 10.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_4H_{11}N_5,HCl$, weight in volume.

Metformin Hydrochloride Prolonged-release Tablets

Metformin Hydrochloride Sustained-release Tablets; Metformin Hydrochloride Extended-release Tablets

Metformin Hydrochloride Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Metformin Hydrochloride Prolonged-release Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of metformin hydrochloride, $C_4H_{11}N_5,HCl$.

Usual strengths. 100 mg; 500 mg; 850 mg; 1 g.

Identification

A. Shake a quantity of the powdered tablets containing about 20 mg of Metformin Hydrochloride with 20 ml of *dehydrated alcohol* and filter, evaporate the filtrate to dryness on a water-bath and dry the residue at 105° for 1 hour. The residue complies with the following test. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *metformin hydrochloride IPRS* or with the reference spectrum of metformin hydrochloride.

B. Triturate a quantity of the powdered tablets containing about 50 mg of Metformin Hydrochloride with 10 ml of *water* and filter. To 5 ml of the filtrate, add 1.5 ml of *5 M sodium hydroxide*, 1 ml of *1-naphthol solution* and, dropwise with shaking, 0.5 ml of *dilute sodium hypochlorite solution;* an orange-red colour is produced which darkens on keeping.

Tests

Dissolution (2.5.2). Complies with the test stated under Tablets.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. A 2.5 per cent v/v solution of *acetonitrile* in *water*.

Test solution. Disperse a quantity of the powdered tablets containing about 0.5 g of Metformin Hydrochloride in 100 ml of the solvent mixture. Take 10 ml of the solution and centrifuge at 3500 rpm for 15 minutes. Dilute 5 ml of this supernatant to 100 ml with the solvent mixture.

Reference solution (a). A 0.0005 per cent w/v solution of *dicyandiamide* in the solvent mixture.

Reference solution (b). A 0.0025 per cent w/v solution of *metformin hydrochloride IPRS* in the solvent mixture.

Reference solution (c). Dilute 1 ml each of reference solution (a) and reference solution (b), to 100 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 90 volumes of buffer solution prepared by dissolving 1 g each of *sodium heptane sulphonate* and *sodium chloride* to 1800 ml of *water,* adjusted to pH 3.85 with *0.06 M orthophosphoric acid* and dilute to 2000 ml with *water* and 10 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 218 nm,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless the tailing factor of the peak due to metformin hydrochloride is not more than 2.0. The resolution between the peaks due to dicyandiamide and metformin hydrochloride is not less than 2.0. The relative standard deviation for replicate injections is not more than 2.0 per cent for metformin hydrochloride and not more than 10 per cent for dicyandiamide.

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution the area of peak corresponding to dicyandiamide is not more than the area of the peak due to dicyandiamide in the chromatogram obtained with reference solution (c) (0.02 per cent) and the area of any other secondary peak is not more than the area of peak due to metformin hydrochloride in the chromatogarm obtained with reference solution (c) (0.1 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.1 g of Metformin Hydrochloride with 70 ml of *water* until complete dispersion, dilute to 100.0 ml with *water* and filter. Dilute 5 ml of the filtrate to 50.0 ml with *water*. Further dilute 5.0 ml to 50.0 ml with *water*. Measure the

absorbance of the resulting solution at the maximum at about 232 nm (2.4.7).

Calculate the content of $C_4H_{11}N_5HCl$ from the absorbance obtained by carrying out the Assay simultaneously using *metformin hydrochloride IPRS*.

Metformin Hydrochloride Prolonged-release and Glimepiride Tablets

Metformin Hydrochloride Prolonged-release and Glimepiride Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Metformin Hydrochloride prolonged-release and Glimepiride Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of metformin hydrochloride, $C_4H_{11}N_5,HCl$ and glimepiride, $C_{24}H_{34}N_4O_5S$.

Usual strengths. Glimepiride, 1.0 mg and Metformin Hydrochloride, 500 mg; Glimepiride, 2.0 mg and Metformin Hydrochloride, 500 mg.

Identification

A. When examined in the range of 200 nm to 300 nm, a 0.001 per cent w/v solution of *metformin hydrochloride IPRS* and test solution, as obtained in the Assay, shows absorption maxima, at about 232 nm (2.4.7).

B. In the Assay of Glimepiride, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

For Metformin hydrochloride — Complies with the test stated under Tablets.

For Glimepiride —

Apparatus No. 2 (Paddle),
Medium. 900 ml of a buffer solution prepared by dissolving 0.58 g of *monobasic potassium phosphate* and 8.86 g of anhydrous *dibasic sodium phosphate* in 1000 ml of *water* and adjusted to pH 7.8 with *orthophosphoric acid* or *1M sodium hydroxide*, add 10 g of *sodium lauryl sulphate* and mix.
Speed and time. 100 rpm and 90 minutes.

Withdraw a suitable volume of the medium and filter. Dilute further, if necessary, with the dissolution medium.

Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of 90 volumes of *acetonitrile* and 10 volumes of *water*.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Weigh accurately 10 mg of *glimepiride IPRS* in 10-ml volumetric flask and dilute with solvent mixture and sonicate. Dilute further with dissolution medium to obtain a solution containing 0.0001 per cent w/v solution of glimepiride.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of a buffer solution prepared by dissolving 0.5 g *sodium dihydrogen phosphate* in 500 ml of *water*, adjusted to pH 2.1 to 2.7 with *orthophosphoric acid*, and 65 volumes of *acetonitrile*.
- flow rate: 1 ml per minute,
- spectrophotometer set at 228 nm,
- injection volume: 50 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{24}H_{34}N_4O_5S$.

Q. Not less than 70 per cent of the stated amounts of $C_{24}H_{34}N_4O_5S$.

Uniformity of content. Complies with the test stated under Tablets.

For Glimepiride — Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Disperse 1 tablet in 20.0 ml of solvent mixture with the aid of ultrasound and dilute to 25.0 ml with the same solvent. Dilute further, if necessary with the solvent mixture.

Reference solution. Weigh accurately 10 mg *glimepiride IPRS* in 10-ml volumetric flask, shake to dissolve and dilute to volume with solvent mixture. Further dilute 1.0 ml of the solution to 25.0 ml with the same solvent. Dilute further, if necessary with the solvent mixture.

Inject the reference solution and test solution.

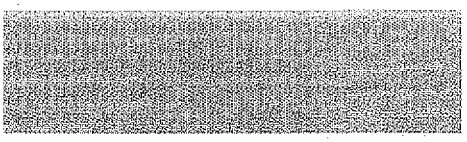
Calculate the content of $C_{24}H_{34}N_4O_5S$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay

For Metformin hydrochloride —

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg Metformin Hydrochloride in 70 ml of *water* with the aid of ultrasound and dilute to 100.0 ml with *water*. Dilute 1.0 ml of the solution to 50.0 ml with *water*.



Reference solution. A 0.001 per cent w/v solution of *metformin hydrochloride IPRS* in *water*.

Measure the absorbance of the reference solution and the test solution at 232 nm (2.4.7) using *water* as blank. Calculate the content of $C_4H_{11}N_5$,HCl in tablets.

For Glimepiride — Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of 90 volumes of *acetonitrile* and 10 volumes of *water*.

Test solution. Disperse intact tablets in solvent mixture with the aid of ultrasound to produce a solution containing 0.004 per cent w/v of Glimepiride.

Reference solution. Weigh accurately 10 mg *glimepiride IPRS* in 10-ml volumetric flask and dilute with solvent mixture. Transfer 1.0 ml of the solution in a 25-ml volumetric flask and dilute with solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of a buffer solution prepared by dissolving 0.5 g *monobasic sodium phosphate* in 500 ml of *water*, adjusted to pH 2.1 to 2.7 with *orthophosphoric acid*, and 65 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 228 nm,
- injection volume: 20 µl.

Inject the reference solution and test solution.

Calculate the content of $C_{24}H_{34}N_4O_5S$ in tablets.

Metformin Tablets

Metformin Hydrochloride Tablets

Metformin Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of metformin hydrochloride, $C_4H_{11}N_5$,HCl.

Usual strengths. 500 mg; 850 mg.

Identification

A. Shake a quantity of the powdered tablets containing 20 mg of Metformin Hydrochloride with 20 ml of *ethanol*, filter, evaporate the filtrate to dryness on a water-bath and dry the residue at 105° for 1 hour.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *metformin hydrochloride IPRS* or with the reference spectrum of metformin hydrochloride.

B. Triturate a quantity of the powdered tablets containing 50 mg of Metformin Hydrochloride with 10 ml of *water* and filter. To 5 ml of the filtrate, add 1.5 ml of *5 M sodium hydroxide*, 1 ml of *1-naphthol solution* and, dropwise with shaking, 0.5 ml of *sodium hypochlorite solution (3 per cent)*; an orange-red colour is produced which darkens on keeping.

C. The filtrate obtained in test B gives reaction (A) of chlorides (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),

Medium. 900 ml of a 0.68 per cent w/v solution of *potassium dihydrogen phosphate*, adjusted to pH 6.8 by the addition of *1 M sodium hydroxide*,

Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter, dilute suitably with *water* and measure the absorbance of the resulting solution at the maximum at about 233 nm (2.4.7). Calculate the content of $C_4H_{11}N_5$,HCl, in the medium taking 806 as the specific absorbance at 233 nm.

Q. Not less than 70 per cent of the stated amount of $C_4H_{11}N_5$, HCl.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the powdered tablets containing 0.5 g of Metformin Hydrochloride with 100 ml of *water* and filter.

Reference solution (a). Dilute 0.1 ml of the test solution to 100 ml with *water*.

Reference solution (b). A 0.0001 per cent w/v solution of *dicyandiamide* in *water*.

Chromatographic system
- a stainless steel column 30 cm x 4 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a solution containing 0.087 per cent w/v of *sodium pentanesulphonate* and 0.12 per cent w/v of *sodium chloride*, adjusted to pH 3.5 using 1 per cent v/v solution of *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 218 nm,
- injection volume: 20 µl.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to dicyandiamide is not more than the area of the peak in the chromatogram obtained with reference solution (b) (0.02 per cent), the area of any other secondary peak is not more than the area of the principal peak

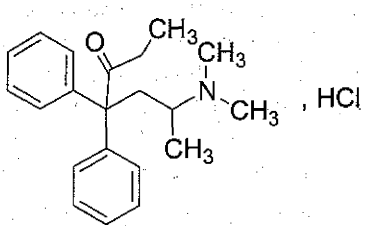
in the chromatogram obtained with reference solution (a) (0.1 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.1 g of Metformin Hydrochloride, shake with 70 ml of *water* for 15 minutes, dilute to 100.0 ml with *water* and filter. Dilute 10.0 ml of the filtrate to 100.0 ml with *water*. Further dilute 10.0 ml to 100.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 232 nm (2.4.7). Calculate the content of $C_4H_{11}N_5$, HCl taking 798 as the specific absorbance at 232 nm.

Methadone Hydrochloride

Amidone Hydrochloride



$C_{21}H_{27}NO,HCl$ Mol. Wt. 345.9

Methadone Hydrochloride is (*RS*)-dimethyl-(1-methyl-4-oxo-3,3-diphenylhexyl)amine hydrochloride.

Methadone Hydrochloride contains not less than 98.5 per cent and not more than 100.5 per cent of $C_{21}H_{27}NO,HCl$, calculated on the dried basis.

Category. Narcotic analgesic.

Description. A white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *methadone hydrochloride IPRS* or with the reference spectrum of methadone hydrochloride.

B. To 2 ml of a 5 per cent w/v solution in *carbon dioxide-free water* add 1 ml of *0.1 M hydrochloric acid* and 6 ml of *ammonium thiocyanate solution*; a white precipitate is produced which becomes crystalline on stirring for a few minutes. The precipitate, after drying at 105° melts at 143° to 148° (2.4.21).

C. Dissolve 50 mg in 5 ml of *carbon dioxide-free water*, add 1 ml of *6 M ammonia*, mix, allow to stand for 5 minutes and filter; the filtrate gives reaction (A) of chlorides (2.3.1).

D. Optical rotation of a 2-dm layer of a 5 per cent w/v solution in *carbon dioxide-free water*, is −0.05° to +0.05° (2.4.22).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. To 10 ml of a 2.0 per cent w/v solution in *carbon dioxide-free water* add 0.2 ml of *methyl red solution* and 0.2 ml of *0.01 M sodium hydroxide*; the solution is yellow. Add 0.4 ml of *0.01 M hydrochloric acid*; the solution is red.

Related substances. Determine by gas chromatography (2.4.13).

Test solution. Dissolve 0.1 g of the substance under examination in *methanol* and dilute to 10.0 ml with *methanol*.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with *methanol*. Further dilute 1.0 ml of the solution to 100.0 ml with *methanol*.

Reference solution (b). A solution containing 0.005 per cent w/v each of *imipramine hydrochloride IPRS* and *cyclobenzaprine hydrochloride IPRS* in *methanol*.

Chromatographic system

- a fused silica column 50 m x 0.32 mm, packed with poly(dimethyl)(diphenyl)siloxane (film thickness 1.05 µm),
- temperature:

column	time (min.)	temperature (°)
	0-4	150→250
	4-35	250

- inlet port at 200° and detector at 250°,
- split ratio. 1:100,
- flame ionization detector,
- flow rate: 1.2 ml per minute, using nitrogen as the carrier gas.

Name	Relative retention time
Methadone impurity E[1]	0.44
Methadone impurity C[2]	0.81
Methadone impurity B[3]	0.89
Methadone impurity D[4]	0.98
Methadone (Retention time: about 25 minutes)	1.0
Methadone impurity A[5]	1.14
Imipramine	1.19
Cyclobenzaprine	1.24

[1]diphenylacetonitrile,
[2](3*RS*)-4-(dimethylamino)-3-methyl-2,2- diphenylbutanenitrile,
[3](4*RS*)-4-(dimethylamino)-2,2- diphenylpentanenitrile,
[4]isomethadone,
[5]isomethadone ketimine.

Inject 2 µl of reference solution (b). The test is not valid unless the resolution between the peaks due to imipramine and cyclobenzaprine is not less than 3.0.

Inject 2 µl of reference solution (a) and the test solution. Run the chromatogram 1.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.5 g, dissolve in 50 ml of *anhydrous glacial acetic acid*, add 5 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator and continuing the titration until the colour changes from violet-blue to green. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03459 g of $C_{21}H_{27}NO,HCl$.

Storage. Store protected from light and moisture.

Methadone Injection

Methadone Hydrochloride Injection; Amidone Hydrochloride Injection; Amidone Injection

Methadone Injection is a sterile solution of Methadone Hydrochloride in Water for Injections.

Methadone Injection contains not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of methadone hydrochloride, $C_{21}H_{27}NO,HCl$.

Usual strengths. 5 mg per ml; 10 mg per ml.

Identification

Make a volume containing 0.1 g of Methadone Hydrochloride alkaline with *5 M sodium hydroxide*, stir with a glass rod until the precipitate solidifies, filter, wash with *water* and dry over *phosphorus pentoxide* at room temperature at a pressure of 2 kPa. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *methadone hydrochloride IPRS* treated in the same manner or with the reference spectrum of methadone.

B. To 5 mg add 0.05 ml of *dinitrobenzene solution* and 0.05 ml of a 50 per cent w/v solution of *sodium hydroxide*; a purple colour is produced which changes slowly to dark brown.

Tests

pH (2.4.24). 5.0 to 6.5.

Bacterial endotoxins (2.2.3). Not more than 8.8 Endotoxin Units per mg of methadone hydrochloride.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. To a measured volume containing 10 mg of Methadone Hydrochloride add 1 ml of *glacial acetic acid* and dilute to 100.0 ml with *water*. To 10.0 ml of the solution add 10 ml of a 0.4 per cent w/v solution of *picric acid* and 10 ml of *phosphate buffer pH 4.9*, extract with three quantities, each of 15 ml, of *chloroform*, dilute the combined chloroform extracts to 50.0 ml with *chloroform*. To 10.0 ml add sufficient *chloroform* to produce 20.0 ml and measure the absorbance of the resulting solution at the maximum at about 350 nm (2.4.7), using as the blank a solution prepared in the same manner but omitting the substance under examination. Calculate the content of $C_{21}H_{27}NO,HCl$ taking 448 as the specific absorbance at 350 nm.

Storage. Store protected from light, in single dose container.

Methadone Linctus

Methadone Hydrochloride Linctus; Amidone HydrochlorideLinctus; Amidone Linctus

Methadone Linctus is a solution containing 0.04 per cent w/v of Methadone Hydrochloride in a suitable vehicle with a tolu flavour.

Methadone Linctus contains not less than 0.036 per cent and not more than 0.044 per cent w/v of stated amount of methadone hydrochloride, $C_{21}H_{27}NO,HCl$.

Category. Opioid analgesic.

Identification

To 50 ml, add 30 ml of *water* and *1 M sulphuric acid* until the solution is acidic to *litmus paper*. Extract with two 20 ml quantities of *petroleum spirit (boiling range, 40° to 60°)*, discarding the extracts, add *5 M sodium hydroxide* until the solution is alkaline to *litmus paper*. Add 4 g of *sodium chloride*, shake to dissolve, extract with two 25 ml quantities of *ether* and wash the combined ether extracts with five 20 ml quantities of *water*. Dry with *anhydrous sodium sulphate*, filter, evaporate to dryness and dry the residue over *phosphorus pentoxide* at a pressure of 2 kPa. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *methadone hydrochloride IPRS* treated in the same manner or with the reference spectrum of methadone.

B. To 5 mg add 0.05 ml of *dinitrobenzene solution* and 0.05 ml of a 50 per cent w/v solution of *sodium hydroxide*. A purple colour is produced which changes slowly to dark brown.

Tests

Other tests. Comply with the tests stated under Oral Liquids.

Assay. To 30 g add 1 ml of *glacial acetic acid* and dilute to 100 ml with *water*. To 10 ml of the resulting solution add 10 ml of a 0.4 per cent w/v solution of *picric acid* and 10 ml of *phosphate buffer pH 4.9*, extract with three 15 ml quantities of *chloroform* and dilute the combined chloroform extracts to 50 ml with *chloroform*. To 10 ml add sufficient *chloroform* to produce 20 ml and measure the absorbance of the resulting solution (2.4.7), at the maximum at about 350 nm using as the blank a solution prepared in the same manner but using 10 ml of a 1 per cent v/v solution of *glacial acetic acid* and beginning at the words 'add 10 ml of a 0.4 per cent w/v .....'. Calculate the content of $C_{21}H_{27}NO$, HCl taking 448 as the specific absorbance at 350 nm.

Determine the weight per ml (2.4.29) of the linctus, and calculate the content of $C_{21}H_{27}NO$,HCl, weight in volume.

Storage. Store protected from light.

Labelling. The label states the strength in terms of the equivalent amount of methadone.

Methadone Oral Solution

Methadone Hydrochloride Oral Solution; Amidone Hydrochloride Oral Solution; Amidone Oral Solution

Methadone Oral Solution contains 0.1 per cent w/v of Methadone Hydrochloride in a suitable aqueous vehicle. It is supplied as a ready-to-use solution or it is prepared from Methadone Hydrochloride Oral Concentrate in accordance with the manufacturer's instructions.

Methadone Oral Solution contains not less than 0.09 per cent w/v and not more than 0.11 per cent w/v of methadone hydrochloride, $C_{21}H_{27}NO$,HCl.

Usual strength. 0.1 per cent w/v.

Identification

In the Assay, the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Other tests. Comply with the tests stated under Oral liquids.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute 1 volume of the oral solution to 10 volumes with the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *methadone hydrochloride IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Lichrosorb RP18),
- mobile phase: a mixture of 50 volumes of *acetonitrile* and 50 volumes of *0.02 M potassium dihydrogen orthophosphate*, adjusted to pH 5.5 with *2 M orthophosphoric acid* or *2 M sodium hydroxide*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{27}NO$,HCl in the oral solution.

Methadone Hydrochloride Oral Concentrate

Methadone Hydrochloride Oral Concentrate is a solution of Methadone Hydrochloride in a suitable aqueous vehicle.

Metformin Hydrochloride Oral Concentrate contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of methadone hydrochloride, $C_{21}H_{27}NO$,HCl.

Identification

In the Assay, the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

Other tests. Comply with the tests stated under Oral liquids.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute the concentrate to produce a solution containing 0.01 per cent w/v of Methadone Hydrochloride in the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *methadone hydrochloride IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm) (Such as Lichrosorb RP18),

- mobile phase: a mixture of 50 volumes of *acetonitrile* and 50 volumes of *0.02 M potassium dihydrogen orthophosphate*, adjusted to pH 5.5 with *2 M orthophosphoric acid* or *2 M sodium hydroxide*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{27}NO,HCl$ in the concentrate.

Labelling. At the specific request of the prescriber, the concentrate may be diluted to a concentration other than 0.1 per cent w/v in accordance with the manufacturer's instructions.

Methadone Tablets

Methadone Hydrochloride Tablets; Amidone Hydrochloride Tablets; Amidone Tablets

Methadone Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of methadone hydrochloride, $C_{21}H_{27}NO,HCl$.

Usual strengths. 5 mg; 10 mg.

Identification

A. Shake a quantity of the powdered tablets containing 0.1 g of Methadone Hydrochloride with 20 ml of *water* and centrifuge. Make the supernatant liquid alkaline with *5 M sodium hydroxide*, stir with a glass rod until the precipitate solidifies, filter, wash with *water* and dry over *phosphorus pentoxide* at room temperature at a pressure of 2 kPa.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *methadone hydrochloride IPRS* treated in the same manner or with the reference spectrum of methadone.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 500 ml of *water*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and transfer equivalent to 0.4 mg of Methadone Hydrochloride into a separating funnel. Add 1 ml of *glacial acetic acid* and 20 ml of 0.02 per cent w/v solution of *bromocresol purple* in 2 per cent v/v solution of *glacial acetic acid*. Add 20.0 ml of *chloroform*, mix and extract. Measure the absorbance of the chloroform at the maximum at 405 nm. (2.4.7). Calculate the content of $C_{21}H_{27}NO,HCl$ in the medium from the absorbance obtained from the chloroform extract similarly prepared of known concentration of *methadone hydrochloride IPRS*.

Q. Not less than 75 per cent of the stated amount of $C_{21}H_{27}NO,HCl$.

Uniformity of content. Determine by liquid chromatography (2.4.14).

Test solution. Disperse 1 intact tablet in the mobile phase, with the aid of ultrasound with intermittent shaking and dilute with the mobile phase to obtain a solution containing 0.5 per cent w/v of Methadone Hydrochloride.

Reference solution. A 0.5 per cent w/v solution of *methadone hydrochloride IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with phenyl groups bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolving 4.08 g of *potassium dihydrogen phosphate* in 1000 ml of *water* and 40 volumes of *acetonitrile*, adjusted to pH 3.2 with *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{27}NO,HCl$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14), as described under Uniformity of content using the following solution.

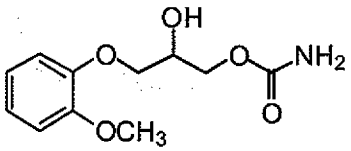
Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 10 mg of Methadone Hydrochloride in mobile phase, with the aid of ultrasound and dilute to 20.0 ml with the mobile phase.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{27}NO,HCl$ in the tablets.

Storage. Store protected from light and moisture.

Methocarbamol



$C_{11}H_{15}NO_5$ Mol. Wt. 241.2

Methocarbamol is (*RS*)-2-Hydroxy-3-(2-methoxyphenoxy) propyl carbamate.

Methocarbamol contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{11}H_{15}NO_5$, calculated on the dried basis.

Category. Muscle relaxant.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *methocarbamol IPRS* or with the reference spectrum of methocarbamol.

B. When examined in the range 200 nm to 350 nm (2.4.7), a 0.004 per cent w/v solution in *methanol* shows absorption maxima at about 274 nm.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Use freshly prepared solutions.

Test solution. Dissolve 100 mg of substance to under examination in 13 ml of *methanol* with the aid of ultrasound and dilute to 50.0 ml with buffer solution.

Reference solution (a). A 0.04 per cent w/v solution of *guaifenesin IPRS* in *methanol*.

Reference solution (b) .Dissolve 20.0 mg of *methocarbamol IPRS* in 2 ml of *methanol*, add 1.0 ml of reference solution (a) and dilute to 10.0 ml with buffer solution.

Reference solution (c). Dilute 1.0 ml of test solution to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 75 volumes of buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 4.5 with *6 M ortho phosphoric acid* or *10 M* of *potassium hydroxide* and 25 volumes of *methanol*,
- flow rate: 1.0 ml per minute,
- spectrophotometer set at 274 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless resolution between the peaks due to guaifenesin and methocarbamol is not less than 2.0.

The relative retention time of guaifenesin with reference to methocarbamol is about 0.8.

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution, the sum of areas of all the secondary peak is not more than the area of principal peak in the chromatogram obtained with reference solution (c) (2.0 per cent).

Heavy metals (2.3.13). Dissolve 1.0 g of substance under examination in 7 ml of *methanol* and 3 ml of *1 M acetic acid*, and dilute to 25 ml with *water*. The resulting solution complies with the limit test for heavy metals, Method A (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 60° for 2 hours.

Assay. Weigh 100 mg of the substance under examination in 100 ml of *methanol* with the aid of ultrasound, filter. Dilute 4.0 ml of the solution to 100.0 ml with *methanol* and measure the absorbance of the resulting solution at the maximum at about 274 nm (2.4.7), using *methanol* as blank Calculate the content of $C_{11}H_{15}NO_5$ from the absorbance obtained by repeating the operation using *methocarbamol IPRS* in place of the substance under examination.

Storage. Store protected from moisture.

Methocarbamol Tablets

Methocarbamol Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of methocarbamol, $C_{11}H_{15}NO_5$.

Usual strengths. 500 mg; 750 mg.

Identification

Mix a quantity of the powdered tablets containing 1g of methocarbamol with 25 ml of *water* in a separator, and extract with 25 ml of *chloroform*, filter the chloroform layer through anhydrous sodium sulphate and evaporate the filtrate to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *methocarbamol IPRS* or with the reference spectrum of methocarbamol.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water,*
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate.

Reference solution. A solution of *methocarbamol IPRS* in the dissolution medium suitably diluted to obtain a solution having the similar concentration as that of the test solution.

Use the chromatographic system as described in the Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{11}H_{15}NO_5$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{11}H_{15}NO_5$.

Other tests. Complies with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Buffer solution pH 4.5. Dissolve 6.8 g of *monobasic potassium phosphate* in *water* and dilute to 1000.0 ml with *water.* Adjust to pH 4.5 with *orthophosphoric acid.*

Internal standard solution. A 0.3 per cent w/v solution of *caffeine* in *methanol.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 100 mg of methocarbamol in 50 ml of buffer solution, add 25 ml of *methanol,* 5.0 ml of internal standard solution, mix with the aid of ultrasound for 10 minutes and dilute to 100.0 ml with the buffer solution, mix and filter.

Reference solution. Dissolve 100 mg of *methocarbamol IPRS* in 50 ml of buffer solution, add 25 ml of *methanol,* 5.0 ml of internal standard solution, mix with the aid of ultrasound for 10 minutes, dilute to 100.0 ml with buffer solution, mix.

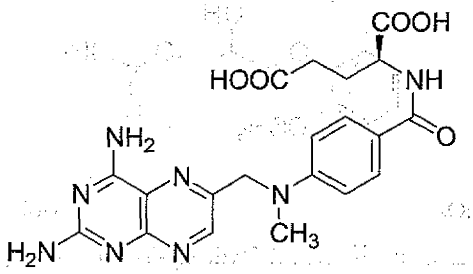
Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 30 volumes of *methanol* and 70 volumes of buffer solution,
- flow rate: 1 ml per minute,
- spectrophotometer set at 274 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{11}H_{15}NO_5$ in the tablets.

Storage. Store protected from moisture.

Methotrexate



$C_{20}H_{22}N_8O_5$ Mol. Wt. 454.4

Methotrexate is 4-amino-4-deoxy-10-methylpteroyl-L-glutamic acid.

Methotrexate contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{20}H_{22}N_8O_5$, calculated on the anhydrous basis.

Category. Anticancer.

Description. A yellow to orange-brown, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *methotrexate IPRS* or with the reference spectrum of methotrexate.

B. When examined in the range 230 nm to 380 nm (2.4.7), a 0.001 per cent w/v solution in *0.1 M sodium hydroxide* shows absorption maxima at about 258 nm, 303 nm and 371 nm; ratio of the absorbance at the maximum at about 303 nm to that at the maximum at about 371 nm, 2.8 to 3.3.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 0.5 ml of *dilute ammonia* and 5 ml of mobile phase A.

Test solution. Dissolve 40 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with mobile phase A.

Reference solution (a). Dilute 5.0 ml of the test solution to 100.0 ml with mobile phase A. Further dilute 5.0 ml of the solution to 50.0 ml with mobile phase A.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 25.0 ml with mobile phase A.

Reference solution (c). A solution containing 0.005 per cent w/v each of the substance under examination, *methotrexate impurity B IPRS, methotrexate impurity C IPRS, methotrexate impurity D IPRS* and *methotrexate impurity E IPRS* prepared

by dissolving in the solvent mixture and diluted with mobile phase A.

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 5 volumes of *acetonitrile* and 95 volumes of a 0.34 per cent w/v solution of *anhydrous sodium dihydrogen phosphate* previously adjusted to pH 6.0 with a 4.2 per cent w/v solution of *sodium hydroxide*,

  B. a mixture of 50 volumes of *acetonitrile* and 50 volumes of a 0.34 per cent w/v solution of *anhydrous sodium dihydrogen phosphate* previously adjusted to pH 6.0 with a 4.2 per cent w/v solution of *sodium hydroxide*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
10	100	0
20	95	5
28	50	50
37	50	50
40	100	0

Name	Relative retention time	Correction factor
Methotrexate impurity B[1]	0.3	---
Methotrexate impurity C[2]	0.4	---
Methotrexate (Retention time: about 18 minutes)	1.0	—
Methotrexate impurity E[3]	1.4	0.8
Methotrexate impurity I[4]	1.5	1.4
Methotrexate impurity H[5]	1.6	---

[1]4-aminofolic acid,

[2]*N*-methylfolic acid,

[3]4-[[(2,4-diaminopteridin-6-yl)methyl]methylamino]benzoic acid,

[4]methotrexate 1-methyl ester,

[5]methotrexate 5-methyl ester.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to methotrexate impurities B and C and is not less than 2.0 and between the peaks due to methotrexate impurity D and methotrexate is not less than 1.5.

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to methotrexate impurity C is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). The area of any peak corresponding to methotrexate impurities B and E is not more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent). The area of any peak corresponding to methotrexate impurities H and I is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent) and the sum of areas of all the secondary peaks other than methotrexate impurities B, C and E is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.03 per cent).

Enantiomeric purity. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 4.0 mg of *methotrexate for system suitability IPRS* (containing impurity F) in the mobile phase and dilute to 20.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.0 mm packed with *bovine albumin* bound to *silica gel for chromatography* (7 µm) with a pore size of 30 nm
- mobile phase: add 500 ml of 0.71 per cent w/v solution of *anhydrous disodium hydrogen phosphate* to 600 ml of a 0.69 per cent w/v solution of *sodium dihydrogen phosphate monohydrate*, mix, adjusted to pH 6.9 with dilute *sodium hydroxide* solution, to 920 ml of this mixture add 80 ml of *propanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 302 nm,
- injection volume: 20 µl.

The relative retention time with reference to methotrexate (retention time is about 4 minutes) for impurity F is about 1.6.

Inject reference solution (b). The resolution between methotrexate and impurity F should not be less than 2.0.

Inject reference solution (a). The area of peak due to impurity F not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (3.0 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 12.0 per cent, determined on 0.25 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 250.0 ml of the mobile phase.

Reference solution (a). Dissolve 25 mg of *methotrexate IPRS* in 250.0 ml of the mobile phase.

Reference solution (b). Dissolve 25 mg of *methotrexate IPRS* and 25 mg of *folic acid* in 250.0 ml of the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 92 volumes of *phosphate buffer pH 6.0* and 8 volumes of *acetonitrile*,
- flow rate: 1.4 ml per minute,
- spectrophotometer set at 302 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (b). The resolution between the peaks due to methotrexate and folic acid is not less than 5.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{20}H_{22}N_8O_5$.

Storage. Store protected from light and moisture.

CAUTION — Great care should be taken to prevent inhaling particles of Methotrexate and exposing the skin to it.

Methotrexate Injection

Methotrexate Injection is a sterile solution of Methotrexate in Water for Injections containing Sodium Hydroxide.

Methotrexate Injection contains not less than 95.0 per cent and not more than 110.0 per cent of the stated amount of methotrexate, $C_{20}H_{22}N_8O_5$.

Usual strengths. 2.5 mg per ml; 25 mg per ml.

Description. A clear, yellowish solution.

Identification

When examined in the range of 200 nm to 400 nm (2.4.7), a 0.001 per cent w/v solution in *0.1 M sodium hydroxide* shows absorption maxima at 258, 303 and 371 nm.

Tests

pH (2.4.24). 7.5 to 9.0.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of injection to obtain a solution containing 0.01 per cent w/v of Methotrexate in the mobile phase.

Reference solution (a). A 0.00002 per cent w/v solution of *methotrexate IPRS* in the mobile phase.

Reference solution (b). A 0.0003 per cent w/v solution of *methotrexate impurity C IPRS* in the mobile phase.

Reference solution (c). A solution containing 0.0003 per cent w/v each of *methotrexate IPRS* and *methotrexate impurity D IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with base deactivated octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil BDS),
- mobile phase: a mixture of 7 volumes of *acetonitrile* and 93 volumes of a citro-phosphate buffer solution prepared by dissolving 7.8 g of *citric acid* and 17.9 g of *disodium hydrogen orthophosphate* in *water* and dilute to 1000 ml with *water*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 20 µl.

Name	Relative retention time
Methotrexate impurity A[1]	0.2
Methotrexate impurity B[2]	0.3
Methotrexate impurity C[3]	0.4
Methotrexate impurity D[4]	0.8
Methotrexate	1.0
Methotrexate impurity E[5]	2.3

[1](2,4-diaminopteridin-6-yl)methanol,

[2] 4-aminofolic acid,

[3] *N*-methylfolic acid,

[4]4-[[(2-amino-4-oxo-1,4-dihydropteridin-6-yl)methyl]methylamino] benzoic acid,

[5]4-[[(2,4-diaminopteridin-6-yl)methyl]methylamino]benzoic acid.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to methotrexate and methotrexate impurity D is not less than 2.0.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to methotrexate impurity C is not more that the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent). The area of

any peak corresponding to methotrexate impurity B is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent). The area of any peak corresponding to methotrexate impurity E is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of areas of any other secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

Bacterial endotoxins (2.2.3). Not more than 0.4 Endotoxin Unit per mg of methotrexate.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of the injection with the mobile phase to produce a solution containing 0.0025 per cent w/v of Methotrexate.

Reference solution (a). A 0.0025 per cent w/v solution of *methotrexate IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.0025 per cent w/v each of *methotrexate IPRS* and *folic acid in* the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: 92 volumes of *phosphate buffer pH 6.0* and 8 volumes of *acetonitrile*,
- flow rate: 1.4 ml per minute,
- spectrophotometer set at 302 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the relative standard deviation for the replicate injections is not more than 2.0 per cent.

Inject reference solution (b). The resolution between the peaks due to methotrexate and folic acid is not less than 5.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{20}H_{22}N_8O_5$ in the injection.

Storage. Store protected from light.

Labelling. The label states that the injection is not intended for intrathecal injection when an antimicrobial preservative is present.

Methotrexate Tablets

Methotrexate Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of methotrexate, $C_{20}H_{22}N_8O_5$.

Usual strength. 2.5 mg.

Identification

Extract a quantity of the powdered tablets containing 10 mg of Methotrexate with sufficient *0.1 M sodium hydroxide* to produce 100 ml, filter and dilute 10 ml of the filtrate to 100 ml with *0.1 M sodium hydroxide*.

When examined in the range 230 nm to 380 nm (2.4.7), the resulting solution shows absorption maxima at about 258 nm, 303 nm and 371 nm.

Tests

Dissolution (2.5.2).
Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Dilute a suitable volume of the filtrate with the same solvent and measure the absorbance of the resulting solution at the maximum at about 306 nm (2.4.7). Calculate the content of $C_{20}H_{22}N_8O_5$ in the medium from the absorbance obtained from a solution of known concentration of *methotrexate IPRS*.

Q. Not less than 75 per cent of the stated amount of $C_{20}H_{22}N_8O_5$.

Related substances. Determine by liquid chromatography (2.4.14).

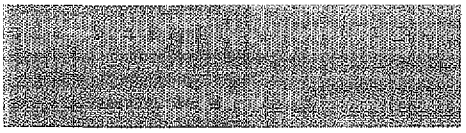
Test solution. Disperse a quantity of the powdered tablets containing about 10 mg of Methotrexate in 70 ml of the mobile phase with the aid of ultrasound for 5 minutes and dilute to 100.0 ml with the mobile phase, filter.

Reference solution (a). A 0.00002 per cent w/v solution of *methotrexate IPRS* in the mobile phase.

Reference solution (b). A 0.0003 per cent w/v solution of *methotrexate impurity C IPRS* in the mobile phase.

Reference solution (c). A solution containing 0.0003 per cent w/v each of *methotrexate IPRS* and *methotrexate impurity D IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with base deactivated octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil BDS),
- mobile phase: a mixture of 7 volumes of *acetonitrile* and 93 volumes of a citro-phosphate buffer solution



prepared by dissolving 7.8 g of *citric acid* and 17.9 g of *disodium hydrogen orthophosphate*, dilute to 1000 ml with *water*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 20 µl.

Name	Relative retention time
Methotrexate impurity A[1]	0.2
Methotrexate impurity B[2]	0.3
Methotrexate impurity C[3]	0.4
Methotrexate impurity D[4]	0.8
Methotrexate	1.0
Methotrexate impurity E[5]	2.3

[1](2,4-diaminopteridin-6-yl)methanol,

[2]4-aminofolic acid,

[3]*N*-methylfolic acid,

[4]4-[[(2-amino-4-oxo-1,4-dihydropteridin-6-yl)methyl]methylamino] benzoic acid,

[5] 4-[[(2,4-diaminopteridin-6-yl)methyl]methylamino]benzoic acid.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to methotrexate and methotrexate impurity D is not less than 2.0.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to methotrexate impurity C is not more than the area of the principal peak in the chromatogram obtained with solution (b) (3.0 per cent). The area of any peak corresponding to methotrexate impurity B is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). The area of any peak corresponding to methotrexate impurity E is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of any other secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Carry out the test as described in the Assay, using the following solutions.

Test solution. Crush one tablet and mix with 100 ml of the mobile phase with the aid of ultrasound, centrifuge and use the supernatant liquid.

Reference solution (a). A 0.0025 per cent w/v solution of *methotrexate IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.0025 per cent w/v each of *methotrexate IPRS* and *folic acid* in the mobile phase.

Calculate the content of $C_{20}H_{22}N_8O_5$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 2.5 mg of Methotrexate and mix with 100.0 ml of the mobile phase with the aid of ultrasound, centrifuge and use the supernatant liquid.

Reference solution (a). A solution containing 0.0025 per cent w/v each of *methotrexate IPRS* and *folic acid* in the mobile phase.

Reference solution (b). A 0.0025 per cent w/v solution of *methotrexate IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 92 volumes of *phosphate buffer pH 6.0* and 8 volumes of *acetonitrile*,
- flow rate: 1.4 ml per minute,
- spectrophotometer set at 302 nm,
- injection volume: 20 µl.

Inject reference solution (a). The resolution between the peaks due to methotrexate and folic acid is not less than 5.0.

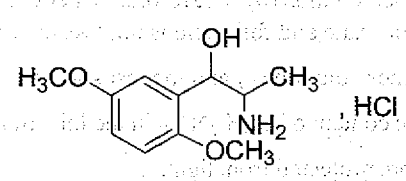
Inject reference solution (b). The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (b) and the test solution.

Calculate the content of $C_{20}H_{22}N_8O_5$ in the tablets.

Storage. Store protected from light and moisture.

Methoxamine Hydrochloride



$C_{11}H_{17}NO_3,HCl$ Mol. Wt. 247.7

Methoxamine Hydrochloride is *all-rac*-2-amino-1-(2,5-dimethoxyphenyl)propan-1-ol hydrochloride.

Methoxamine Hydrochloride contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{11}H_{17}NO_3$,HCl, calculated on the dried basis.

Category. Sympathomimetic.

Description. Colourless crystals or white, plate-like crystals or a white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *methoxamine hydrochloride IPRS* or with the reference spectrum of methoxamone hydrochloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.005 per cent w/v solution shows an absorption maximum only at about 290 nm; absorbance at about 290 nm, about 0.69.

C. Dissolve 20 mg in 2 ml of *water*, add 5 ml of *diazotised nitroaniline solution* and 1 ml of *dilute sodium carbonate solution*. Allow to stand for 2 minutes and add 1 ml of *1 M sodium hydroxide*; a deep red colour is produced which is extractable with *1-butanol*.

D. A 5 per cent w/v solution gives the reactions of chlorides (2.3.1).

Tests

pH (2.4.24). 4.0 to 6.0, determined in a 2.0 per cent w/v solution.

Related substances. Determine by thin-layer chromatography (2.4.14), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 86 volumes of *chloroform*, 12 volumes of *methanol* and 2 volumes of *strong ammonia solution*.

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of *methanol*.

Reference solution (a). A 0.02 per cent w/v solution of the substance under examination in *methanol*.

Reference solution (b). A 0.01 per cent w/v solution of *2,5-dimethoxybenzaldehyde* in *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 365 nm. Any spot corresponding to 2,5 dimethoxybenzaldehyde in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b). Spray the plate with a 0.3 per cent w/v solution of *ninhydrin* in *1-butanol* containing 3 per cent v/v of *glacial acetic acid* and heat at 105° for 5 minutes. Any other secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

Assay. Dissolve 0.5 g in 30 ml of *anhydrous glacial acetic acid*, 15 ml of *mercuric acetate solution*, warming if necessary. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02477 g of $C_{11}H_{17}NO_3$,HCl.

Storage. Store protected from light and moisture.

Methoxamine Injection

Methoxamine Hydrochloride Injection

Methoxamine Injection is a sterile solution containing 2 per cent w/v of Methoxamine Hydrochloride in Water for Injections.

Methoxamine Injection contains not less than 1.90 per cent and not more than 2.10 per cent w/v of methoxamine hydrochloride, $C_{11}H_{17}NO_3$, HCl.

Identification

A. When examined in the range 230 nm to 360 nm (2.4.7), the solution obtained in the Assay shows an absorption maximum only at about 290 nm.

B. Dilute 1 ml with 1 ml of *water*, add 5 ml of *diazotised nitroaniline solution* and 1 ml of *dilute sodium carbonate solution*. Allow to stand for 2 minutes and add 1 ml of *1 M sodium hydroxide*; a deep red colour is produced which is extractable with *1-butanol*.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 86 volumes of *chloroform*, 12 volumes of *methanol* and 2 volumes of *strong ammonia solution*.

Test solution. Dilute the injection, if necessary, with *water* to contain 2.0 per cent w/v of Methoxamine Hydrochloride.

Reference solution (a). Dilute 1 volume of the test solution to 100 ml with *water*.

Reference solution (b). A 0.01 per cent w/v solution of *2,5-dimethoxybenzaldehyde* in *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 365 nm. Any spot corresponding to 2,5-dimethoxybenzaldehyde in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram

obtained with reference solution (b). Spray the plate with a 0.3 per cent w/v solution of *ninhydrin* in *1-butanol* containing 3 per cent v/v of *glacial acetic acid* and heat at 105° for 5 minutes. Any other secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a).

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. To a measured volume containing about 100 mg of Methoxamine Hydrochloride add sufficient *water* to produce 100.0 ml. Dilute 5.0 ml of the solution to 100.0 ml with *water*. Measure the absorbance of the resulting solution at the maximum at about 290 nm (2.4.7). Calculate the content of $C_{11}H_{17}NO_3$,HCl taking 137 as the specific absorbance at 290 nm.

Storage. Store protected from light.

Industrial Methylated Spirit

IMS

Industrial Methylated Spirit is a mixture of nineteen volumes of Ethanol of an appropriate strength and one volume of approved wood naphtha.

Category. Pharmaceutical aid (solvent).

Description. Clear, colourless, mobile, volatile liquid.

Identification

Mix 0.1 ml with 0.05 ml of an 11 per cent w/w solution of *phosphoric acid* and 0.25 ml of *dilute potassium permanganate solution*. After 1 minute add a few mg of *sodium metabisulphite* and shake until the mixture is decolorised. Add 1.5 ml of a 50 per cent v/v solution of *sulphuric acid* and a few mg of finely powdered *chromotropic acid sodium salt*, shake well and heat on a water-bath for 5 minutes; a deep violet colour is produced.

Tests

Relative density (2.4.29). Not greater than 0.815.

Acidity or alkalinity. 25 ml requires not more than 0.2 ml of *0.1 M sodium hydroxide* to produce a pink colour with *phenolphthalein solution* and not more than 1.0 ml of *0.1 M hydrochloric acid* is required to produce a red colour with *methyl red solution*.

Appearance of solution. Dilute 5.0 ml to 100 ml with *water*; the solution is clear (2.4.1).

Aldehydes. Not more than 50 ppm, determined by the following method. To 5.0 ml add 5 ml of *water* and 1 ml of *decolourised fuchsin solution* and allow to stand for 30 minutes. Any colour produced is not more intense than that obtained by treating in the same manner 5 ml of a 0.005 per cent w/v solution of redistilled *acetaldehyde* in *aldehyde-free ethanol (95 per cent)*.

Non-volatile matter. When evaporated and dried at 105°, leave not more than 0.01 per cent w/v of residue.

Storage. Store in tightly-closed containers at a temperature not exceeding 30°.

Labelling. The label states that it is inflammable.

Methylcellulose

Cellulose Methyl Ether

Methylcellulose is a cellulose having some of the hydroxyl groups in the form of the methyl ether. Various grades are available and are distinguished by a number indicative of the apparent viscosity in millipascal seconds of a 2 per cent w/w solution measured at 20°.

Methylcellulose contains not less than 27.5 per cent and not more than 31.5 per cent of methoxyl (-OCH_3) groups, calculated on the dried basis.

Category. Bulk laxative; pharmaceutical aid (tablet excipient; suspending agent).

Description. A white or yellowish white or greyish white powder or granules; hygroscopic after drying.

Identification

A. With constant stirring add a quantity containing 1.0 g of the dried substance into 50 ml of *carbon dioxide-free water* previously heated to 90°. Allow to cool, dilute to 100 ml with *carbon dioxide-free water* and continue stirring until solution is complete (solution A). Heat 10 ml of solution A on a water-bath with stirring. At temperatures above 40° the solution becomes cloudy or a flocculent precipitate is formed. On cooling, the solution becomes clear.

B. To 10 ml of solution A add 0.3 ml of *2 M acetic acid* and 2.5 ml of a 10.0 per cent w/v solution of *tannic acid*; a yellowish white, flocculent precipitate is produced which dissolves in *6 M ammonia*.

C. Without heating completely dissolve 0.2 g in 15 ml of a 70 per cent w/w solution of *sulphuric acid*, pour the solution with stirring into 100 ml of iced *water*. In a test-tube kept in ice, mix thoroughly 1 ml of the solution with 8 ml of *sulphuric acid*, added dropwise. Heat in a water-bath for exactly 3 minutes and cool immediately in ice. When the mixture is cool, carefully add 0.6 ml of a solution containing 3 g of *ninhydrin* in 100 ml of a 4.55 per cent w/v solution of *sodium metabisulphite*, mix well and allow to stand at 25°; a pink colour is produced immediately which becomes violet within 100 minutes.

D. Place 1 ml of solution A on a glass plate. After evaporation of the *water* a thin film is produced.

Tests

Appearance of solution. Whilst stirring, introduce a quantity containing 1.0 g of the dried substance into 50 g of *carbon dioxide-free water* heated to 90°. Allow to cool, dilute to 100 g with the same solvent and continue stirring until solution is complete. Allow to stand at 2° to 8° for 1 hour. The resulting solution is not more opalescent than opalescence standard OS3 (2.4.1), and is not more intensely coloured than reference solution YS6 (2.4.1).

pH (2.4.24). 5.0 to 8.5, determined in solution A.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Chlorides (2.3.12). Dilute 5.0 ml of solution A to 15 ml with *water*. The resulting solution complies with the limit test for chlorides (0.5 per cent).

Apparent viscosity. Not less than 75 per cent and not more than 140 per cent of the declared value, determined by the following method. To 150 g of *water* heated to 90° add, with stirring, a quantity containing 6.0 g of the dried substance. Stir with a propeller-type stirrer for 10 minutes, place the flask in a bath of iced *water*, continue the stirring and allow to remain in the bath of iced *water* for 40 minutes to ensure that solution is complete. Adjust the weight of the solution to 300 g and centrifuge the solution to expel any trapped air. Determine the viscosity at 20° by Method C (2.4.28), using a shear rate of 10 s^{-1}.

Sulphated ash (2.3.18). Not more than 1.0 per cent.

Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 1.0 g by drying in an oven at 105°.

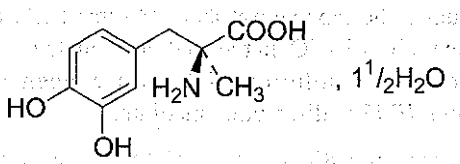
Assay. Weigh 50 mg in a hard gelatin capsule shell place the capsule and the contents in a 50-ml boiling flask and carry out the determination of methoxyl (2.3.29).

1 ml of *0.1 M sodium thiosulphate* is equivalent to 0.0005172 g of methoxyl ($-OCH_3$) groups.

Storage. Store protected from light and moisture.

Labelling. The label states the apparent viscosity in millipascal seconds of a 2 per cent w/w solution.

Methyldopa



$C_{10}H_{13}NO_4$, 1½ H_2O Mol. Wt. 238.2

Methyldopa is 3-(3,4-dihydroxyphenyl)-2-methyl-L-alanine sesquihydrate.

Methyldopa contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{10}H_{13}NO_4$, calculated on the anhydrous basis.

Category. Antihypertensive.

Description. A white to yellowish white, fine powder which may contain friable lumps.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *methyldopa IPRS* or with the reference spectrum of methyldopa.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.004 per cent w/v solution in *0.1 M hydrochloric acid* shows an absorption maximum only at about 280 nm; absorbance at about 280 nm, about 0.46.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *microcrystalline cellulose*.

Mobile phase. A mixture of 50 volumes of *1-butanol*, 25 volumes of *glacial acetic acid* and 25 volumes of *water*.

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of *1 M hydrochloric acid*.

Reference solution. A 1 per cent w/v solution of *methyldopa IPRS* in *1 M hydrochloric acid*.

Apply to the plate 5 µl of each solution. After development, dry the plate in a current of warm air, and spray with a solution freshly prepared by mixing equal volumes of a 10 per cent w/v solution of *ferric chloride* and a 5 per cent w/v solution of *potassium ferricyanide*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

D. To 10 mg add 3 drops of a 0.4 per cent w/v solution of *ninhydrin* in *sulphuric acid*; a dark purple colour is produced within 5 to 10 minutes. Add 0.15 ml of *water*; the colour changes to pale brownish yellow.

Tests

Appearance of solution. A 4.0 per cent w/v solution in *1 M hydrochloric acid* is not more intensely coloured than reference solution BYS6 or BS6 (2.4.1).

Acidity. Dissolve 1.0 g in 100 ml of *carbon dioxide-free water* with the aid of heat, add 0.15 ml of *methyl red solution* and titrate with *0.1 M sodium hydroxide*; not more than 0.5 ml is required to produce a pure yellow colour.

Optical rotation (2.4.22). −1.10° to −1.23°, determined in a solution prepared by dissolving a quantity containing 2.2 g of the anhydrous substance in 50.0 ml of *aluminium chloride solution*.

3-Methoxy compound and related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *microcrystalline cellulose*.

Mobile phase. A mixture of 65 volumes of *1-butanol*, 25 volumes of *water* and 15 volumes of *glacial acetic acid*.

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of a mixture of 96 volumes of *methanol* and 4 volumes of *7 M hydrochloric acid*.

Reference solution (a). A 0.005 per cent w/v solution of *3-methoxymethyldopa IPRS* in *methanol*.

Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

Apply to the plate 10 µl of each of the test solution and reference solution (a) and 20 µl of reference solution (b). After development, dry the plate immediately in a current of warm air and spray with a mixture of 5 volumes of a 5 per cent w/v solution of *sodium nitrite* and 45 volumes of a 0.3 per cent w/v solution of *4-nitroaniline* in a mixture of 80 volumes of *hydrochloric acid* and 20 volumes of *water*. Dry it in a current of warm air and spray with a 20 per cent w/v solution of *sodium carbonate* and examine immediately. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

Heavy metals (2.3.13). Dissolve 2.0 g in 10 ml of *water*, add 2 ml of *dilute acetic acid* and dilute to 25 ml with *water*. The solution complies with the limit test for heavy metals, Method A (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 10.0 to 13.0 per cent, determined on 0.4 g.

Assay. Weigh 0.4 g and dissolve in 15 ml of *anhydrous formic acid*, 30 ml of *anhydrous glacial acetic acid* and 30 ml of *dioxan*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02112 g of $C_{10}H_{13}NO_4$.

Storage. Store protected from light and moisture.

Methyldopa Tablets

Methyldopa Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of anhydrous methyldopa, $C_{10}H_{13}NO_4$. The tablets are coated.

Usual strengths. The equivalent of 125 mg, 250 mg and 500 mg of anhydrous methyldopa.

Identification

Remove the coating from a suitable quantity of the tablets by washing with *chloroform*. To a quantity of the powdered tablet cores containing 5 g of anhydrous methyldopa add 35 ml of a mixture of equal volumes of *chloroform* and *methanol* and shake for 3 minutes. Centrifuge and discard the supernatant liquid. Repeat the operation with a further 35 ml of a mixture of equal volumes of *chloroform* and *methanol*. Dry the residue in a current of nitrogen, add 20 ml of *methanol* and 15 ml of *2 M hydrochloric acid*, shake for 2 minutes and filter. Adjust the pH of the filtrate to 4.9 with *5 M ammonia*, allow to stand for several hours at 2° to 8° and filter. Wash the precipitate with 15 ml of *water* and dry it at 50° at a pressure not exceeding 0.7 kPa for 3 hours. Reserve a portion of the residue for the test for Specific optical rotation. The remainder of the residue complies with tests A and B.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *methyldopa IPRS* or with the reference spectrum of methyldopa.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.004 per cent w/v solution in *0.1 M hydrochloric acid* shows an absorption maximum only at about 280 nm; absorbance at about 280 nm, about 0.46.

C. To a quantity of the powdered tablets containing 10 mg of anhydrous methyldopa, add 3 drops of a 0.4 per cent w/v solution of *ninhydrin* in *sulphuric acid*; a dark purple colour is produced within 5 to 10 minutes. Add 0.15 ml of *water*; the colour changes to pale brownish yellow.

D. To 10 mg of the powdered tablets add 2 ml of *0.1 M sulphuric acid*, 2 ml of *ferrous sulphate-citrate solution* and 0.5 ml of *dilute ammonia solution*; a dark purple colour is immediately produced.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 20 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, dilute suitably if necessary with the medium, at the maximum at about 280 nm (2.4.7). Calculate the content of $C_{10}H_{13}NO_4$ in the medium from the absorbance obtained from a solution of known concentration of *methyldopa IPRS* in dissolution medium.

Q. Not less than 80 per cent of the stated amount of $C_{10}H_{13}NO_4$.

Optical rotation (2.4.22). – 0.98° to –1.09°, determined on a solution prepared by dissolving a weighed quantity of the residue obtained in the Identification test containing 0.39 g of $C_{10}H_{13}NO_4$ in sufficient *aluminium chloride solution* to produce 10.0 ml. The content of $C_{10}H_{13}NO_4$ in the residue used for the test may be determined by titrating with *0.1 M perchloric acid*, using 0.2 g of the residue, *crystal violet solution* as indicator.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02112 g of $C_{10}H_{13}NO_4$.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.1 g of anhydrous methyldopa dissolve as completely as possible in sufficient *0.05M sulphuric acid* to produce 100 ml and filter. To 5 ml of the filtrate add 2 ml of *ferrous sulphate-citrate solution*, 8 ml of *glycine buffer solution* and sufficient *water* to produce 100 ml. Carry out the test simultaneously using 5 ml of a 0.11 per cent w/v solution of *methyldopa IPRS* in *0.05 M sulphuric acid*, instead of 5 ml of the filtrate, beginning with the words, " add 2 ml of *ferrous sulphate - citrate solution....*" Measure the absorbance of the test solution and the reference solution at about 545 nm (2.4.7) using as a blank solution, prepared by diluting 2 ml of *ferrous sulphate-citrate solution*, 8 ml of *glycine buffer solution* and sufficient *water* to produce 100 ml. Calculate the content of $C_{10}H_{13}NO_4$ in the tablets.

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of the equivalent amount of anhydrous methyldopa.

Methyldopa and Hydrochlorothiazide Tablets

Methyldopa and Hydrochlorothiazide Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of methyldopa, $C_{10}H_{13}NO_4$ and hydrochlorothiazide, $C_7H_8ClN_3O_4S_2$.

Usual strength. 250 mg methyldopa and 15 mg hydrochlorothiazide.

Identification

A. In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the principal peaks in the chromatogram obtained with the reference solution.

B. Shake a quantity of the powdered tablets containing 10 mg of methyldopa add 0.15 ml of solution of *ninhydrin* in *sulphuric acid* (1 volume in 250 volume). A dark purple colour is produced within 5 to 10 minutes. The colour changes to pale brownish yellow on adding of 0.15 ml of *water*.

Tests

Dissolution (2.5.2).

For Methyldopa —

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 30 minutes.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium. Reject the first few ml of the filtrate.

Reference solution. A 0.0275 per cent w/v solution of *methyldopa IPRS* in dissolution medium.

Solution A. A solution containing each of 1.0 per cent w/v solution of *ferrous sulphate*, 2.0 per cent w/v solution of *potassium sodium tartrate*, and 0.1 per cent w/v solution of *sodium bisulphite* in *water*.

Solution B. 5.0 per cent w/v solution of *ammonium acetate* in 20 per cent v/v *ethanol* and adjusted to pH 8.5 with *6 M ammonium hydroxide*.

Transfer an aliquot of the test solution containing 2-3 mg of methyldopa to a 100-ml volumetric flask. Adjust the final volume, if necessary, with medium to 100.0 ml. To a second 100-ml volumetric flask add 10.0 ml of reference solution, and to a third 100-ml volumetric flask add 10.0 ml of medium use as a blank. Pipette 5.0 ml of solution A into each flask, dilute with solution B to volume, and mix. measure the absorbance of the reference solution and the test solution at the wavelength of maximum at about 520 nm (2.4.7). Using the blank.

Q. Not less than 80 per cent of the stated amount of $C_{10}H_{13}NO_4$.

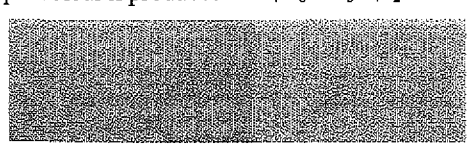
For Hydrochlorthiazide —

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter. Reject the first few ml of the filtrate and dilute a suitable volume of the filtrate with dissolution medium. Measure the absorbance of the resulting solution at the maximum at about 317 nm (2.4.7).

Calculate the content of hydrochlorothiazide, $C_7H_8ClN_3O_4S_2$ in the medium from the absorbance obtained from a solution of known concentration of *hydrochlorothiazide IPRS* in dissolution medium.

Q. Not less than 80 per cent of the stated amount of $C_7H_8ClN_3O_4S_2$.



Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14)

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 250 mg of Methyldopa add 50.0 ml of *water,* 25.0 ml of *acetonitrile* and 13.0 ml of *1 M hydrochloric acid* and disperse with the aid of ultrasound for 5 minutes, cool, dilute to 250.0 ml with *water* and filter.

Reference solution. Dissolve suitable quantity of *methyldopa IPRS* to a volumetric flask to prepare 1 mg per ml solution and add a quantity of *hydrochlorthiazide IPRS* corresponds to the ratio of *hydrochlorthiazide* to *methyldopa* in a mixture of 1 volume of *water*, 1 volume of *acetonitrile*, and 0.5 volume of *1 M hydrochloric acid.* Dilute with *water* to volume.

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 5 volumes of *methanol* and 95 volumes of a buffer solution prepared by dissolving 11.04 g of *monobasic sodium phosphate* in 1000 ml of *water*, adjusted to pH 2.8 with *orthophosphoric acid.*
- flow rate: 2 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the resolution between methyldopa and hydrochlorothiazide is not less than 6.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

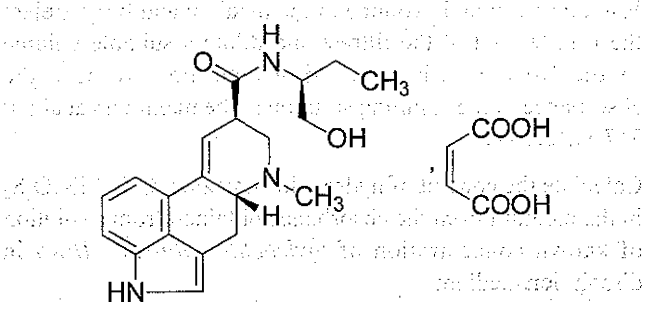
Inject the reference solution and the test solution.

Calculate the contents of $C_{10}H_{13}NO_4$ and $C_7H_8ClN_3O_4S_2$ in the tablets.

Storage. Store protected from moisture.

Methylergometrine Maleate

Methylergonovine Maleate



$C_{20}H_{25}N_3O_2,C_4H_4O_4$ Mol. Wt. 455.5

Methylergometrine Maleate is 9,10-didehydro-*N*-[(*S*)-1-(hydroxymethyl)propyl]-6-methylergoline-8β-carboxamide hydrogen maleate.

Methylergometrine Maleate contains not less than 95.0 per cent and not more than 105.0 per cent of $C_{20}H_{25}N_3O_2,C_4H_4O_4$, calculated on the dried basis.

Category. Uterine stimulant.

Description. A white or faintly yellow, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *methylergometrine maleate IPRS* or with the reference spectrum of methylergometrine maleate.

B. A 1.0 per cent w/v solution shows a blue fluorescence.

C. Dissolve 0.25 mg in 1 ml of *glacial acetic acid* containing a trace of *ferric chloride solution* and add carefully 1 ml of *sulphuric acid* and shake well; a deep blue colour is produced.

Tests

pH (2.4.24). 4.4 to 5.2, determined in a 0.02 per cent w/v solution.

Specific optical rotation (2.4.22). +44.0° to +50°, determined at 20° in a 0.5 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Carry out the test protected from light.

Test solution. Dissolve 25 mg of the substance under examination in 15 ml of mobile phase B and dilute to 50.0 ml with *water*.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with *water*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with *water*.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (3.5 µm),
- mobile phase: A. a 0.2 per cent w/v solution of *ammonium carbamate*,
  B. a mixture of equal volumes of *acetonitrile* and *water*,
- a gradient programme using the conditions given below,
- flow rate: 2 ml per minute,
- spectrophotometer set at 310 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	85	15
2	85	15
7	65	35
12	65	35
17	20	80
19	20	80

Name	Relative retention time
Methylergometrine impurity A[1]	0.2
Methylergometrine impurity B[2]	0.5
Methylergometrine impurity C[3]	0.6
Methylergometrine impurity D[4]	0.7

[4]ergometrine,

[5]1¢-*epi*-methylergometrine,

[6](6a*R*,9*S*)-7-methyl-4,6,6a,7,8,9-hexahydroindolo[4,3-*fg*]quinoline-9-carboxamide,

[7]ergometrinine,

[8]methysergide,

[9]methylergometrinine.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to methylergometrine impurity I is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent). The area of any peak corresponding to methylergometrine impurity C is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent). The area of any peak corresponding to methylergometrine impurities A, B, D, E, F, G and H is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.6 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 2.0 per cent, determined on 1.0 g by drying at 80° at a pressure not exceeding 2.7 kPa for 3 hours.

Assay. Weigh 20 mg and dissolve in sufficient *water* to produce 100.0 ml; dilute 20.0 ml of the solution to 100.0 ml with *water*. To 3.0 ml add 6.0 ml of *dimethylamino-benzaldehyde reagent*, mix, cool in running water for 5 minutes and add sufficient reagent to produce 10.0 ml. Measure the absorbance of the resulting solution at the maximum at about 550 nm (2.4.7), using as the blank a solution prepared in the same manner omitting the substance under examination. Calculate the content of $C_{20}H_{25}N_3O_2$, $C_4H_4O_4$ from the absorbance obtained by repeating the Assay using *methylergometrine maleate IPRS* in place of the substance under examination.

Storage. Store protected from light, in an atmosphere of nitrogen, at a temperature between 2° to 8°.

Methylergometrine Injection

Methylergometrine Maleate Injection; Methylergonovine Maleate Injection; Methylergonovine Injection

Methylergometrine Injection is a sterile solution of Methylergometrine Maleate in Water for Injections free from dissolved air.

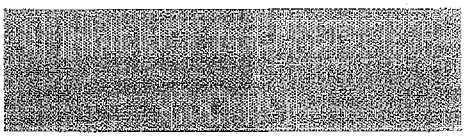
Methylergometrine Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of methylergometrine maleate, $C_{20}H_{25}N_3O_2,C_4H_4O_4$.

Usual strength. 200 µg per ml.

Identification

A. In the test for Related substances, the principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

B. It exhibits a blue fluorescence.



C. To a volume containing 0.1 mg of Methylergometrine Maleate add 0.5 ml of *water* and 2 ml of *4-dimethylaminobenzaldehyde reagent*; after a few minutes a deep blue colour is produced.

Tests

pH (2.4.24). 2.7 to 3.5.

Related substances. *Protect the solutions from light throughout the test.*

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 10 volumes of *chloroform* and 1 volume of *methanol*.

Test solution. Transfer a volume containing 1 mg of Methylergometrine Maleate to a separating funnel, add 1 ml of *sodium bicarbonate solution* and extract with three quantities, each of 5 ml, of *chloroform*. Evaporate the combined extracts to dryness at room temperature at a pressure not exceeding 0.7 kPa. Dissolve the residue in 0.25 ml of *methanol* and centrifuge, if necessary.

Reference solution (a). A 0.4 per cent w/v solution of *methylergometrine maleate IPRS* in *methanol*.

Reference solution (b). A 0.012 per cent w/v solution of *methylergometrine maleate IPRS* in *methanol*.

Place a beaker containing 25 ml of *strong ammonia solution* in the developing chamber, cover the chamber and allow to equilibrate for 30 minutes. Apply to the plate 25 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Spray the plate with a solution containing 0.8 g of *4-dimethylaminobenzaldehyde* in a mixture of 90 ml of *ethanol* and 10 ml of *sulphuric acid*. Dry in a current of warm air for about 2 minutes. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b).

Bacterial endotoxins (2.2.3). Not more than 1.7 Endotoxin Units per µg of methylergometrine maleate.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. *Protect the solutions from light throughout the Assay.*

To 1.0 ml add sufficient *water* to produce a solution containing 0.04 mg of Methylergometrine Maleate per ml. To 3.0 ml add 6.0 ml of *dimethylaminobenzaldehyde reagent*, mix, cool in running water for 5 minutes and add sufficient reagent to produce 10.0 ml. Measure the absorbance of the resulting solution at the maximum at about 550 nm (2.4.7), using as the blank a solution prepared in the same manner omitting the substance under examination. Calculate the content of $C_{20}H_{25}N_3O_2,C_4H_4O_4$ from the absorbance obtained by repeating the Assay using *methylergometrine maleate IPRS* in place of the substance under examination.

Storage. Store protected from light, at a temperature between 2° to 8°.

Methylergometrine Tablets

Methylergometrine Maleate Tablets; Methylergonovine Maleate Tablets; Methylergonovine Tablets

Methylergometrine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of methylergometrine maleate, $C_{20}H_{25}N_3O_2,C_4H_4O_4$.

Usual strength. 125 µg.

Identification

A. In the test for Related substances, the principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

B. Extract a quantity of the powdered tablets containing 1 mg of Methylergometrine Maleate with 10 ml of *water*, filter and wash the residue with sufficient *water* to produce 10 ml; the solution has a blue fluorescence.

C. To 2 ml of the solution obtained in test B add 4 ml of *4-dimethylaminobenzaldehyde reagent*; a deep blue colour is produced after a few minutes.

Tests

Related substances. *Protect the solutions from light throughout the test.*

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 10 volumes of *chloroform* and 1 volume of *methanol*.

Test solution. To a quantity of the powdered tablets containing 1 mg of Methylergometrine Maleate add 5 ml of *water*, 1 ml of *sodium bicarbonate solution* and 2 ml of *chloroform*. Shake, allow to separate and filter the chloroform layer through a plug of cotton moistened with *chloroform*. Repeat the extraction with a further 2 ml of *chloroform* and filter. Evaporate the combined extracts to dryness at room temperature at a pressure not exceeding 0.7 kPa, dissolve the residue in 0.25 ml of *methanol* and centrifuge, if necessary.

Reference solution (a). A 0.4 per cent w/v solution of *methylergometrine maleate IPRS* in *methanol*.

Reference solution (b). A 0.012 per cent w/v solution of *methylergometrine maleate IPRS* in *methanol*.

Place a beaker containing 25 ml of *strong ammonia solution* in the developing chamber, cover the chamber and allow to equilibrate for 30 minutes. Apply to the plate 25 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Spray the plate with a solution containing 0.8 g of *4-dimethylaminobenzaldehyde* in a mixture of 90 ml of *ethanol* and 10 ml of *sulphuric acid*. Dry in a current of warm air for about 2 minutes. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b).

Uniformity of content. Complies with the test stated under Tablets.

Crush one tablet and transfer to a separating funnel with the aid of not more than 5 ml of *water* and add 3 ml of a 5 per cent w/v solution of *sodium carbonate*. Extract with four quantities, each of 5 ml, of *chloroform*. Filter the extracts through a plug of cotton moistened with *chloroform* into a 100-ml separating funnel. Add 2.0 ml of *water* and 10.0 ml of *4-dimethylamino-benzaldehyde reagent*.and shake vigorously for at least 90 seconds. Allow to stand for 30 minutes and discard the chloroform layer. Transfer the aqueous layer to a stoppered-tube and allow to stand for 60 minutes. Measure the absorbance of the resulting solution at the maximum at about 550 nm (2.4.7), using as the blank a mixture of 2.0 ml of *water* and 10.0 ml of *4-dimethylaminobenzaldehyde reagent*. Calculate the content of $C_{19}H_{23}N_3O_2,C_4H_4O_4$ in the tablet from the absorbance obtained by carrying out the following operation simul-taneously. Weigh 12 mg of *methylergometrine maleate IPRS* and dissolve in sufficient *water* to produce 200.0 ml. To 2.0 ml add 10.0 ml of *4-dimethylaminobenzaldehyde reagent*, mix and cool in running water for 5 minutes. Measure the absorbance of the resulting solution at the maximum at about 550 nm, using as the blank a mixture of 2.0 ml of *water* and 10.0 ml of *4-dimethylamino-benzaldehyde reagent*.

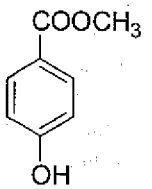
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 2 mg of Methylergo-metrine Maleate, dissolve in 50 ml of a 1 per cent w/v solution of *tartaric acid*. To 3.0 ml add 6.0 ml of *dimethylaminobenz-aldehyde reagent*, mix, cool in running water for 5 minutes and add sufficient reagent to produce 10.0 ml. Measure the absorbance of the resulting solution at the maximum at about 550 nm (2.4.7), using as the blank a solution prepared in the same manner omitting the substance under examination. Calculate the content of $C_{20}H_{25}N_3O_2,C_4H_4O_4$ from the absorbance obtained by repeating the Assay using *methylergometrine maleate IPRS* in place of the substance under examination.

Storage. Store protected from light and moisture.

Methylparaben

Methyl Hydroxybenzoate



$C_8H_8O_3$ Mol. Wt. 152.2

Methylparaben is methyl 4-hydroxybenzoate.

Methylparaben contains not less than 98.0 per cent and not more than 102.0 per cent of $C_8H_8O_3$.

Category. Pharmaceutical aid (antimicrobial preservative).

Description. A white or almost white, crystalline powder or colourless crystals.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *methylparaben IPRS* or with the reference spectrum of methylparaben.

B. Melting point (2.4.21). 125° to 128°.

Tests

Appearance of solution. A 10.0 per cent w/v solution in *ethanol (95 per cent)* is clear (2.4.1), and not more intensely coloured than reference solution BYS6 (2.4.1).

Acidity. Dissolve 1.0 g in sufficient *ethanol (95 per cent)* to produce 10 ml. To 2 ml of the solution add 3 ml of *ethanol (95 per cent)*, 5 ml of *carbon dioxide-free water* and 0.1 ml of *bromocresol green solution*. Not more than 0.1 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 2.5 ml of *methanol* and dilute to 50.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 5 mg of *4-hydroxybenzoic acid* (methylparaben impurity A), and 5 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 50 mg of *methylparaben IPRS* in 2.5 ml of *methanol* and dilute to 50.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of the test solution to 20.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of 0.68 per cent w/v solution of *potassium dihydrogen phosphate*, and 65 volumes of *methanol*,
- flow rate: 1.3 ml per minute,
- spectrophotometer set at 272 nm,
- injection volume: 10 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to methylparaben and methyl paraben impurity A is not less than 2.0. The relative retention time with reference to methyparaben for 4-hydroxybenzoic acid (methyparaben impurity A) is about 0.6.

Inject reference solution (c) and the test solution. Run the chromatogram 5 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any peak due to methylparaben impurity A multiplied by 1.4 is not more than the area the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent). Ignore the peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

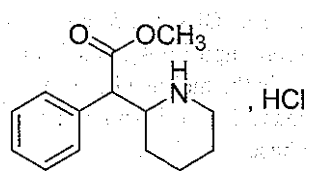
Assay. Determine by liquid chromatography (2.4.14), as described in the Related substances.

Inject reference solution (b) and the test solution.

Calculate the content of $C_8H_8O_3$.

Storage. Store protected from moisture.

Methylphenidate Hydrochloride



$C_{14}H_{19}NO_2,HCl$ Mol.Wt.269.8

Methylphenidate Hydrochloride is methyl α-phenyl-2-piperidineacetate hydrochloride.

Methylphenidate Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{14}H_{19}NO_2,HCl$, calculated on the dried basis.

Category. CNS stimulant.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *methylphenidate hydrochloride IPRS* or with the reference spectrum of methylphenidate hydrochloride.

B. It gives reaction (A) of chlorides (2.3.1).

Tests

Related substances. *NOTE — If ethylphenidate or bis-methylphenidate is a known process impurity, Procedure 2 is recommended.*

Method A

Determine by liquid chromatography (2.4.14) as described in the Assay with the following modifications.

Reference solution (a). A 0.0005 per cent w/v solution of *methylphenidate hydrochloride IPRS* in the mobile phase.

Name	Relative retention time
Erythro(R,S) isomer[1]	0.58
Methylphenidate impurity A[2]	0.85
Methylphenidate	1.0

[1]methyl (RS,SR)-2-phenyl-2-(piperidin-2-yl)acetate,

[2](RS,RS)2-Phenyl-2-(piperidin-2-yl)acetic acid.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to methylphenidate impurity A and methylphenidate is not less than 2.5 and the tailing factor is not more than 3.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to erythro(R,S) isomer is not more than the 0.15 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent). The area of any peak due to methylphenidate impurity A is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent), the area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent).

Method B

NOTE — Perform this test only if ethylphenidate or bis-1,2-(-carboxymethylbenzyl) piperidine is a known process impurity.

Test solution. Dissolve 5 mg of the substance under examination in mobile phase A and dilute to 10.0 ml with mobile phase A.

Reference solution (a). A 0.0005 per cent w/v solution of *methylphenidate hydrochloride IPRS* in mobile phase A.

Reference solution (b). A solution containing 0.05 per cent w/v of *methylphenidate hydrochloride IPRS*, 0.0003 per cent w/v each of *methylphenidate impurity A IPRS, phenylacetic acid IPRS, methylphenidate hydrochloride erythro isomer solution IPRS* in mobile phase A.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with octcylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. a mixture of 7 volumes of *acetonitrile* and 43 volumes of solution prepared by adding 4 ml of *triethylamine* to 1000 ml of buffer solution prepared by dissolving 5.7 g of *monobasic ammonium phosphate* and 1.6 g of *1-octanesulphonate sodium* in 1000 ml of *water*, adjusted to pH 2.9 with *orthophosphoric acid*, B. a mixture of 4 volumes of *acetonitrile* and 1 volume of buffer solution,
- a gradient programme using the conditions given below,
- flow rate: 2.8 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
7	65	35
10	50	50
12	50	50
13	90	10
16	90	10

Name	Relative retention time	Relative response factor
Methylphenidate impurity A[1]	0.55	1.1
Phenylacetic acid	0.67	1.0
Erythro(R,S) isomer[2]	0.8	1.0
Methylphenidate	1.0	—
Ethylphenidate[3]	1.22	0.9
Bis-methylphenidate[4]	1.8	2.6

[1](RS,SR)2-Phenyl-2-(piperidin-2-yl)acetic acid,

[2]methyl (RS,SR)-2-phenyl-2-(piperidin-2-yl)acetate,

[3]ethyl (RR,SS)-2-phenyl-2-(piperidin-2-yl)acetate,

[4]1,2-Bis(carboxymethylbenzyl)piperidine.

Inject reference solution (b). The test is not valid unless the resolution between methylphenidate impurity A and phenylacetic acid is not less than 2.7 and between phenylacetic acid and erythro isomer is not less than 3.6; the tailing factor for the methylphenidate peak is not more than 2.0 and the relative standard deviation for replicate injections for methylphenidate peak is not more than 2.0 per cent and not more than 5.0 per cent for methylphenidate impurity A , phenylacetic acid and methylphenidate hydrochloride erythroisomer.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to methylphenidate impurity A and erythro(R,S) isomer is not more than the 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent).

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1 g by drying in a vacuum at 60° for 4 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 5 mg of the substance under examination in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). A 0.05 per cent w/v solution of *methylphenidate hydrochloride IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.0005 per cent w/v of *methylphenidate impurity A IPRS* and 0.05 per cent w/v of *methylphenidate hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 1 volume of *methanol* and 2 volumes of 0.27 per cent w/v solution of *monobasic potassium phosphate*, adjusted to pH 4.6 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 209 nm,
- injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to methylphenidate impurity A and methylphenidate is not less than 2.5, the tailing factor is not more than 3.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent for the methylphenidate peak.

Inject reference solution (a) and the test solution. Run the chromatogram twice the retention time of the principal peak.

Calculate the content of $C_{14}H_{19}NO_2$,HCl.

Storage. Store protected from moisture.

Methylphenidate Hydrochloride Prolonged-release Tablets

Methylphenidate Hydrochloride Extended-release Tablets; Methylphenidate Hydrochloride Sustained-release Tablets

"*Methylphenidate Hydrochloride Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the product for the different manufacturer may not be the same.*"

Methylphenidate Hydrochloride Prolonged-release Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of methylphenidate hydrochloride, $C_{14}H_{19}NO_2$,HCl.

Usual strengths. 10 mg; 20 mg; 18 mg; 36 mg.

Identification

A. Place a portion of powdered tablets containing 100 mg of methylphenidate hydrochloride in a 100-ml beaker. Add 20 ml of *chloroform*, stir for 5 minutes, and filter, collecting the filtrate. Evaporate the filtrate to about 5 ml. Add *ethyl ether* slowly, with stirring, until crystals form. Filter the crystals, wash with *ethyl ether*, and dry at 80° for 30 minutes. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *methylphenidate hydrochloride IPRS* or with the reference spectrum of methylphenidate hydrochloride.

B. In the Related substances, methylphenidate hydrochloride peak in the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2). Complies with the test stated under Tablets.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture A. 10 volumes of *acetonitrile* and 30 volumes of acidified *water*, adjusted to pH 3.0 with *orthophosphoric acid*.

Solvent mixture B. 10 volumes of *acetonitrile* and 10 volumes of *methanol*.

Test solution. Disperse a quantity of powdered tablets containing 10 mg of Methylphenidate Hydrochloride in solvent mixture B with the aid of ultrasound and dilute to 10.0 ml with solvent mixture B. Dilute 1.0 ml of the solution to 10.0 ml with solvent mixture A and centrifuge it.

Reference solution. A solution containing 0.00002 per cent w/v of *methylphenidate hydrochloride IPRS*, 0.00005 per cent w/v of methylphenidate hydrochloride erythro isomer from *methylphenidate hydrochloride erythro isomer solution IPRS* (this solution contains 0.5 mg of methylphenidate hydrochloride erythro isomer per ml in *methanol*) and 0.00015 per cent w/v of *methylphenidate impurity A IPRS* in solvent mixture A.

Chromatographic system
- a stainless steel column 15 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 2 g of *1-octanesulphonic acid sodium* in 730 ml of *water*, adjusted to pH 2.7 with *orthophosphoric acid*, mix with 270 ml of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 25 µl.

Name	Relative retention time
Methylphenidate impurity A[1]	0.47
Erythroisomer[2]	0.65
Methylphenidate hydrochloride	1.0

[1]α-phenyl-2-piperidineacetic acid,

[2]methyl (RS,SR)-2-phenyl-2-(piperidin-2-yl) acetate.

Inject the reference solution. The test is not valid unless the resolution between the methylphenidate and erythro isomer peaks is not less than 6.0 and the tailing factor for the methylphenidate peak is not more than 2.0.

Inject the refrence solution and the test solution. Run the chromatogram twice the retention time of the principal peak.

In the chromatogram obtained with the test solution, the area of any peak corresponding to Methylphenidate impurity A is not more than the area of the Methylphenidate impurity A peak in the chromatogram obtained with the reference solution (1.5 per cent). The area of any peak corresponding to erythroisomer is not more than the area of the methylphenidate

hydrochloride erythro isomer in the chromatogram obtained with the reference solution (0.5 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent) and the sum of areas of all the secondary peaks is not more than 12.5 times the area of the principal peak in the chromatogram obtained with the reference solution (2.5 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Internal standard solution. A 0.04 per cent w/v solution of *phenylephrine hydrochloride* in the mobile phase.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 20 mg of Methylphenidate Hydrochloride with 70 ml of the mobile phase with the aid of ultrasound for 15 minutes. Cool and dilute to 100.0 ml with the mobile phase, filter. To 10.0 ml of the solution, add 5.0 ml of the internal standard solution.

Reference solution. A 0.02 per cent w/v solution of *methylphenidate hydrochloride IPRS* in the mobile phase. To 10.0 ml of the solution, add 5.0 ml of the internal standard solution.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with nitrile groups chemically bonded to porous silica (3 to 10 µm),
- mobile phase: a mixture of 40 volumes of *methanol*, 30 volumes of *acetonitrile* and 30 volumes of buffer solution prepared by dissolving 1.64 g of *anhydrous sodium acetate* in 900 ml of *water*, adjusted to pH 4.0 with *acetic acid* and dilute to 1000 ml with *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 50 µl.

The relative retention time with reference to methylphenidate hydrochloride for phenylephrine hydrochloride is about 0.8.

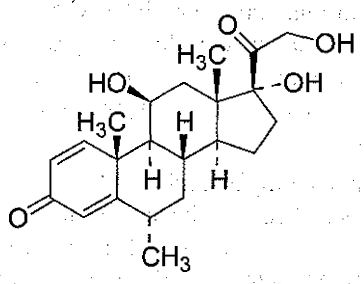
Inject the reference solution. The test is not valid unless the resolution between methylphenidate hydrochloride and internal standard peaks is not less than 2.0, the relative standard deviation from the peak response ratios of the methylphenidate hydrochloride to the internal standard is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_{19}NO_2$,HCl in the tablets from the peak response ratios of methylphenidate hydrochloride to the internal standard obtained with the reference solution and the test solution respectively.

Storage. Store protected from moisture.

Methylprednisolone



$C_{22}H_{30}O_5$ Mol. Wt. 374.5

Methylprednisolone is 11β,17α,21-trihydroxy-6α-methylpregna-1,4-diene-3,20-dione.

Methylprednisolone contains not less than 96.0 per cent and not more than 104.0 per cent of $C_{22}H_{30}O_5$, calculated on the dried basis.

Category. Adrenocortical steroid.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Test C may be omitted if tests A and B are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *methylprednisolone IPRS* or with the reference spectrum of methylprednisolone.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. A mixture of 90 volumes of *acetone* and 10 volumes of *formamide*.

Mobile phase. *Chloroform*.

Test solution. Dissolve 25 mg of the substance under examination in 10 ml of the solvent mixture.

Reference solution (a). Dissolve 25 mg of *methylprednisolone IPRS* in 10 ml of the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*.

Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

C. Dissolve about 2 mg in 2 ml of *sulphuric acid* by shaking and allow to stand for 5 minutes; an intense red colour is produced and the solution exhibits a reddish brown fluorescence when examined under ultraviolet light at 365 nm. Add the solution to 10 ml of *water* and mix; the colour fades and the solution exhibits a yellowish green fluorescence under ultraviolet light at 365 nm.

Tests

Specific optical rotation (2.4.22). +79.0° to +86.0°, determined in a 1.0 per cent w/v solution in *dioxan*.

Light absorption (2.4.7). Absorbance of a 0.001 per cent w/v solution in *ethanol (95 per cent)* at the maximum at about 243 nm, 0.38 to 0.40.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in a mixture of equal volumes of *acetonitrile* and *methanol* and dilute to 10 ml with the solvent mixture.

Reference solution (a). Dissolve 2.0 mg of *methylprednisolone IPRS* and 2.0 mg of *betamethasone IPRS* in mobile phase A and dilute to 200 ml with mobile phase A.

Reference solution (b). Dilute 1 ml of the test solution to 100 ml with mobile phase A

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane chemically bonded to silica gel (5 µm),
- column temperature: 45°,
- mobile phase A. a mixture of 250 volumes of *acetonitrile* and 700 volumes of *water* mixed, allowed to equilibrate and diluted to 1000 volumes with *water*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 2.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Time (min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
15	100	0
40	0	100
41	100	0
46	100	0

Equilibrate the column for at least 30 minutes with mobile phase B and then with mobile phase A for 5 minutes. For subsequent operations use the conditions described from 40 to 46 minutes.

Inject reference solution (a). When the chromatograms are recorded, the retention times are; methylprednisolone about 11.5 minutes, and betamethasone about 12.5 minutes. The test is not valid unless the resolution between the peaks corresponding to methylprednisolone and betamethasone is at least 1.5; if necessary, adjust the concentration of acetonitrile in mobile phase A.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak other than the principal peak, is not more than 0.5 the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent). Ignore any peak due to the blank and any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Weigh 0.1 g and dissolve in sufficient *ethanol (95 per cent)* to produce 100.0 ml and mix. Dilute 2.0 ml of the solution to 100.0 ml with *ethanol (95 per cent)* and mix well. Determine the absorbance of the resulting solution (2.4.7) at the maximum at about 243 nm. Calculate the content of $C_{22}H_{30}O_5$ taking 395 as the specific absorbance at 243 nm.

Storage. Store protected from light and moisture.

Methylprednisolone Tablets

Methylprednisolone Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of methylprednisolone, $C_{22}H_{30}O_5$.

Usual strengths. 2 mg; 4 mg; 16 mg.

Identification

Extract a quantity of the powdered tablets containing 50 mg of Methylprednisolone with 100 ml of *chloroform*, filter and evaporate the filtrate to dryness. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *methylprednisolone IPRS* or with the reference spectrum of methylprednisolone.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. A mixture of 90 volumes of *acetone* and 10 volumes of *formamide*.

Mobile phase. A mixture of 30 volumes of *toluene* and 10 volumes of *chloroform*.

Test solution. Dissolve 25 mg of the residue in 10 ml of the solvent mixture.

Reference solution (a). Dissolve 25 mg of *methylprednisolone acetate IPRS* in 10 ml of the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *water*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of a layer of suitable thickness of the filtered solution at the maximum at about 246 nm (2.4.7). Calculate the content of $C_{22}H_{30}O_5$ in the medium taking 400 as the specific absorbance at 246 nm.

Q. Not less than 70 per cent of the stated amount of $C_{22}H_{30}O_5$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. A filtered mixture of 72 volumes of *water*, 25 volumes of *tetrahydrofuran* and 3 volumes of *glacial acetic acid*.

Test solution. Extract a quantity of the powdered tablets containing 25 mg of Methylprednisolone with the solvent mixture and dilute to 25 ml with the solvent mixture. Filter and centrifuge, if necessary.

Reference solution. A 0.001 per cent w/v solution of *methylprednisolone IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 20 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (3 to 10 µm),
- mobile phase: a mixture of 149 volumes of *water*, 40 volumes of *tetrahydrofuran*, 10 volumes of *dimethylsulfoxide* and 1 volume of *butanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject the reference solution. The column efficiency is not less than 800 theoretical plates and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent).

Uniformity of content. Complies with the test stated under Tablets.

To one tablet add 0.5 ml of *water* (in the case of tablets containing 10 mg or less) or 1.0 ml of *water* (in the case of tablets containing more than 10 mg). Allow the tablet to stand for about 2 minutes, then swirl to disperse the tablet. Add 5.0 ml of the internal standard used in the assay for each mg of methylprednisolone, shake for 15 minutes, filter and centrifuge. Use the filtrate as the test solution.

Determine by liquid chromatography (2.4.14) using the chromatographic system and the reference solution described in the Assay.

Calculate the content of $C_{22}H_{30}O_5$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Internal standard solution. Weigh a suitable quantity of prednisone in a 3 per cent v/v solution of *glacial acetic acid* in *chloroform* to obtain a solution having a known concentration of about 0.2 mg per ml of prednisone.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 10 mg of Methylprednisolone transfer to a suitable container and add 2.5 ml of *water*. Swirl to form a slurry. Add 50.0 ml of the internal standard solution, and shake for 15 minutes. Filter and centrifuge a portion of the filtrate if necessary and use this as the test solution.

Reference solution. Weigh a suitable quantity of *methylprednisolone IPRS* in the internal standard solution to obtain a solution having a known concentration of about 0.2 mg per ml of methylprednisolone.

Chromatographic system
- stainless steel column 25 cm x 4 mm, packed with porous silica particles (3 to 10 µm),
- mobile phase: a mixture of 475 volumes of *butyl chloride*, 475 volumes of *water-saturated butyl chloride*, 70 volumes of *tetrahydrofuran*, 35 volumes of *methanol*, and 30 volumes of *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

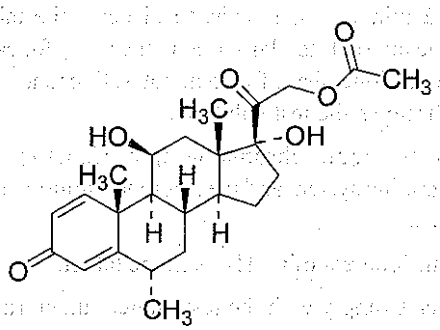
Inject the reference solution. The resolution between methylprednisolone and prednisone is not less than 4.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution. The relative retention time with reference to methylprednisolone for prednisone is about 0.7.

Calculate the content of $C_{22}H_{30}O_5$ in the tablets.

Storage. Store protected from light and moisture.

Methylprednisolone Acetate



$C_{24}H_{32}O_6$ Mol. Wt. 416.5

Methylprednisolone Acetate is 11β,17α-dihydroxy-6α-methyl-3, 20-dioxopregna-1,4-dien-21-yl acetate.

Methylprednisolone Acetate contains not less than 96.0 per cent and not more than 104.0 per cent of $C_{24}H_{32}O_6$, calculated on the dried basis.

Category. Adrenocortical steroid.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *methylprednisolone acetate IPRS* or with the reference spectrum of methylprednisolone acetate.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. 90 volumes of *acetone* and 10 volumes of *formamide*.

Mobile phase. A mixture of 30 volumes of *toluene* and 10 volumes of *chloroform*.

Test solution. Dissolve 25 mg of the substance under examination in 10.0 ml of the solvent mixture.

Reference solution (a). Dissolve 25 mg of *methylprednisolone acetate IPRS* in 10.0 ml of the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

Tests

Specific optical rotation (2.4.22). +97.0° to +105°, determined in a 1.0 per cent w/v solution in *dioxan*.

Light absorption (2.4.7). Absorbance of a 0.001 per cent w/v solution in *ethanol (95 per cent)* at the maximum at about 240 nm, 0.34 to 0.37. The ratio of the absorbance at the maximum at about 240 nm to that at about 263 nm is 1.50 to 1.70.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in 5 ml of *tetrahydrofuran* and dilute to 10.0 ml with *water*.

Reference solution (a). Dissolve 4.0 mg of *methylprednisolone acetate IPRS* and 4.0 mg of *dexamethasone acetate IPRS* in the mobile phase and dilute to 20.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane chemically bonded to porous silica (5 µm),
- mobile phase: a mixture of 255 volumes of *tetrahydrofuran* and 745 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Equilibrate the column with the mobile phase for about 45 minutes.

Inject reference solution (a). The retention times are: methylprednisolone acetate, about 43 minutes and dexamethasone acetate about 57 minutes. The test is not valid unless the resolution between the peaks corresponding to methylprednisolone acetate and dexamethasone acetate is not less than 6.5. If necessary, adjust the concentration of *water* in the mobile phase.

Inject reference solution (b) and the test solution. Continue the chromatography for 1.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the sum of areas of all the secondary peaks is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak due to the solvent and any peak with an area less than 0.025 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Weigh 0.1 g and dissolve in sufficient *ethanol* to produce 100.0 ml and mix. Dilute 1.0 ml of the solution to 100.0 ml with *ethanol* and mix well. Determine the absorbance of the resulting solution at the maximum at about 243 nm (2.4.7). Calculate the content of $C_{24}H_{32}O_6$, taking 355 as the specific absorbance at 243 nm.

Storage. Store protected from light and moisture.

Methylprednisolone Acetate Injection

Methylprednisolone Acetate Injection is a sterile suspension of Methylprednisolone Acetate in Water for Injections.

Methylprednisolone Acetate Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of methylprednisolone acetate, $C_{24}H_{32}O_6$.

Usual strength. 40 mg per ml.

Description. A white suspension which settles on standing but readily disperses on shaking. On examination under a microscope, the particles are seen to be crystalline and rarely exceed 20 µm in diameter.

Identification

Dilute a volume containing 0.1 g of Methylprednisolone Acetate to 5 ml with *water*, centrifuge and discard the supernatant liquid. Wash the residue with five quantities, each of 5 ml, of *water*, resuspending the residue in *water* each time. Centrifuge and discard the washings. The residue, after drying at 105° for 3 hours, complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *methylprednisolone acetate IPRS* or with the reference spectrum of methylprednisolone acetate.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. 90 volumes of *acetone* and 10 volumes of *formamide*.

Mobile phase. A mixture of 30 volumes of *toluene* and 10 volumes of *chloroform*.

Test solution. Dissolve 25 mg of the residue in 10 ml of the solvent mixture.

Reference solution (a). Dissolve 25 mg of *methylprednisolone acetate IPRS* in 10 ml of the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram

obtained with reference solution (b) appears as a single, compact spot.

Tests

pH (2.4.24). 3.0 to 7.0.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Solution A. Mix 0.12 g of *prednisone IPRS* (internal standard) with 0.6 ml of *glacial acetic acid*, slowly add *chloroform* with the aid of ultrasound, shake to dissolve and dilute with sufficient *chloroform* to produce 20 ml.

Test solution. Add 10 ml of solution A to a measured quantity of the injection containing about 40 mg of Methylprednisolone Acetate, add sufficient *chloroform* to produce 25.0 ml and shake for 5 minutes or until the aqueous layer is clear; to 4.0 ml of the chloroform layer, add 30 ml of chloroform and 0.4 g of *anhydrous sodium sulphate*, shake for 5 minutes, and use the clear solution.

Reference solution. Dissolve 20 mg of *methylprednisolone acetate IPRS* in 5 ml of solution A and add sufficient *chloroform* to produce 100.0 ml.

Chromatographic system
- a stainless steel column 25 cm x 4 mm, packed with silica gel for chromatography (5 to 10 µm),
- mobile phase: a mixture of 30 volumes of *glacial acetic acid* and 35 volumes of *methanol*, 75 volumes of *tetrahydrofuran*, 475 volumes of water-saturated *1-chlorobutane* and 475 volumes of *1-chlorobutane*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to methylprednisolone and the internal standard is not less than 2.5.

Inject the reference solution and the test solution.

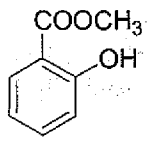
Calculate the content of $C_{24}H_{32}O_6$ in the injection from the peak response ratios of methylprednisolone to the internal standard obtained with the reference solution and the test solution respectively.

Storage. Store protected from light at a temperature not exceeding 30°. The injection should not be allowed to freeze.

Labelling. The label states (1) that the preparation is not to be given by intravenous injection; (2) that the container should be shaken gently before a dose is withdrawn.

Methyl Salicylate

Wintergreen Oil



$C_8H_8O_3$ Mol. Wt. 152.2

Methyl Salicylate is 2-hydroxybenzoic acid methyl ester.

Methyl Salicylate contains not less than 99.0 per cent w/w and not more than 100.5 per cent w/w of $C_8H_8O_3$.

Category. Counter-irritant.

Description. A colourless or slightly yellow liquid.

Identification

A. To 10 ml of a saturated aqueous solution add 0.05 ml of *ferric chloride test solution*; a violet colour develops.

B. Heat 0.25 ml with 2 ml of *2 M sodium hydroxide* on a water-bath for 5 minutes and add 3 ml of *1 M sulphuric acid*. Filter and wash the precipitate with *water*. The precipitate after drying at 105° for 1 hour melts at 156° to 161° (2.4.21).

Tests

Appearance of solution. To 2 ml add 10 ml of *ethanol (95 per cent)*. The resulting solution is clear (2.4.1), and not more intensely coloured than reference solution YS7 (2.4.1).

Acidity. Dissolve 5.0 g in 50 ml of *ethanol (95 per cent)*, previously neutralised to a blue colour with *bromocresol green solution* by the addition of *0.1 M sodium hydroxide*. Not more than 0.4 ml of *0.1 M sodium hydroxide* is required to restore the blue colour.

Refractive index (2.4.27). 1.534 to 1.538.

Weight per ml (2.4.29). 1.175 g to 1.185 g.

Assay. Dissolve 0.5 g in 25 ml of *ethanol (95 per cent)*, add 0.05 ml of *phenol red solution* and neutralise with *0.1 M sodium hydroxide*. Add 50.0 ml of *0.1 M sodium hydroxide* and heat under a reflux condenser on a water-bath for 30 minutes. Cool and titrate with *0.1 M hydrochloric acid*. Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01522 g of $C_8H_8O_3$.

Storage. Store protected from light.

Methyl Salicylate Ointment

Strong Methyl Salicylate Ointment

Methyl Salicylate Ointment contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of methyl salicylate, $C_8H_8O_3$ in a suitable ointment base.

Usual strength. 10 per cent w/w.

Identification

In the Assay, the principal peak in the chromatogram obtained with test solution (b) corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Other tests. Comply with the tests stated under Ointments.

Assay. Determine by gas chromatography (2.4.13).

Test solution (a). A solution of ointment containing 1.0 per cent w/v of Methyl Salicylate in *petroleum spirit (boiling range 80° to 100°)*.

Test solution (b). A solution of ointment containing 1.0 per cent w/v each of Methyl Salicylate and *benzyl alcohol* (internal standard) in *petroleum spirit (boiling range 80° to 100°)*.

Reference solution. A solution containing 1.0 per cent w/v of *benzyl alcohol* (internal standard) and 1.0 per cent w/v of *methyl salicylate IPRS* in *petroleum spirit (boiling range 80° to 100°)*.

Chromatographic system

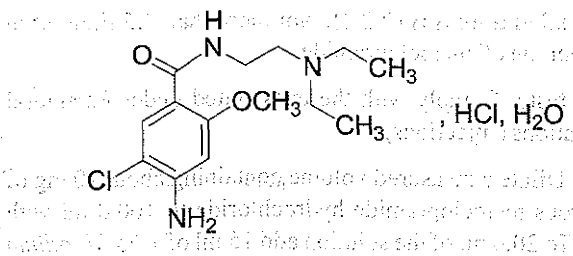
- a glass column 1.5m x 4.0 mm, packed with diatomaceous support (60 to 80 mesh), coated with 10.0 per cent w/v of polyethylene glycol 1540,
- temperature:
  column. 110°,
  inlet port and detector. 250°,
- flame ionization detector,
- flow rate: 60 ml per minute of the carrier gas.

Inject the reference solution and test solution (b).

Calculate the content of $C_8H_8O_3$ in the ointment.

Storage. Store protected from polystyrene plastic.

Metoclopramide Hydrochloride



$C_{14}H_{22}ClN_3O_2,HCl,H_2O$ Mol. Wt. 354.3

Metoclopramide Hydrochloride is 4-amino-5-chloro-*N*-(2-diethylaminoethyl)-2- methoxybenzamide hydrochloride monohydrate.

Metoclopramide Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{14}H_{22}ClN_3O_2,HCl$, calculated on the anhydrous basis.

Category. Antiemetic.

Description. A white or almost white crystals or crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and D may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *metoclopramide hydrochloride IPRS* or with the reference spectrum of metoclopramide hydrochloride.

B. In the test for Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

C. A 5 per cent w/v solution in *carbon dioxide-free water* gives reaction (A) of chlorides (2.3.1).

D. Dissolve about 2 mg in 2 ml of *water*. The solution gives the reaction of primary aromatic amines (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and colourless (2.4.1).

pH (2.4.24). 4.5 to 6.0, determined in a 10.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve a quantity of the substance under examination in the mobile phase to obtain a solution containing 0.1 per cent w/v of metoclopramide hydrochloride.

Reference solution (a). A 0.0005 per cent w/v solution of *metoclopramide hydrochloride IPRS* in the mobile phase.

Reference solution (b). A solution containing 2.0 µg per ml each of *metoclopramide hydrochloride IPRS* and *metoclopramide impurity A (N-acetylmetoclopramide) IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 25 volumes of *acetonitrile* and 100 volumes of buffer solution prepared by dissolving 6.8 g of *monobasic potassium phosphate* in

700 ml of *water*. Add 0.2 ml of *N,N-dimethyloctylamine*, adjusted to pH 4.0 with *orthophosphoric acid*, dilute to 1000 ml with *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to metoclopramide impurity A and metoclopramide is not less than 3.0.

Inject reference solution (a) and the test solution. Run the chromatogram 8 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent) and the sum of the areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent).

Heavy metals (2.3.13). 12 ml of a 10 per cent w/v solution in *carbon dioxide-free water* complies with the limit test for heavy metals, Method D (20 ppm). Use *lead standard solution (2 ppm Pb)* to prepare the standard.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 4.5 to 5.5 per cent, determined on 0.5 g.

Assay. Dissolve 0.25 g in a mixture of 50 ml of *ethanol (95 per cent)* and 5.0 ml of *0.01 M hydrochloric acid*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Note the volume added between the two inflections. Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.03363 g of $C_{14}H_{22}ClN_3O_2,HCl$.

Storage. Store protected from light and moisture.

Metoclopramide Injection

Metoclopramide Hydrochloride Injection

Metoclopramide Injection is a sterile solution of Metoclopramide Hydrochloride in Water for Injections free from dissolved air. It contains suitable buffering and stabilising agents.

Metoclopramide Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of anhydrous metoclopramide hydrochloride, $C_{14}H_{22}ClN_3O_2,HCl$.

Usual strength. The equivalent of 10 mg of anhydrous metoclopramide hydrochloride in 2 ml.

Description. A clear, colourless solution.

Identification

A. Dilute a volume containing 10 mg of anhydrous metoclopramide hydrochloride to 500 ml with *0.01 M hydrochloric acid*.

When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows absorption maxima at about 273 nm and 309 nm.

B. To a volume containing 50 mg of anhydrous metoclopramide hydrochloride add 5 ml of *water* and 5 ml of a 1 per cent w/v solution of *4-dimethylaminobenzaldehyde* in *1 M hydrochloric acid*; a yellow-orange colour is produced.

C. It gives reaction (A) of chlorides (2.3.1).

Tests

pH (2.4.24). 3.0 to 5.0.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Carry out the test protected from light.

Test solution. Dilute a volume of injection with the mobile phase to obtain a solution containing 0.1 per cent w/v of anhydrous metoclopramide hydrochloride.

Reference solution. Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm) (Such as Spherisorb ODS 1),
- mobile phase: *0.01 M sodium hexanesulphonate* in a mixture of 40 volumes of *water* and 60 volumes of *acetonitrile*, adjusted to pH 4.0 with *glacial acetic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent).

Bacterial endotoxins (2.2.3). Not more than 2.5 Endotoxin Units per mg of metoclopramide.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Dilute a measured volume containing about 10 mg of anhydrous metoclopramide hydrochloride to 100.0 ml with *water*. To 20.0 ml of the solution add 15 ml of *1.25 M sodium hydroxide* and extract with three quantities, each of 30 ml, of

chloroform, dry each extract with *anhydrous sodium sulphate* and filter. Dilute the combined extracts to 100.0 ml with *chloroform* and mix. Measure the absorbance of the resulting solution at the maximum at about 305 nm (2.4.7). Calculate the content of $C_{14}H_{22}ClN_3O_2$,HCl, taking 265 as the specific absorbance at 305 nm.

Storage. Store protected from light.

Labelling. The label states the strength in terms of the equivalent amount of anhydrous metoclopramide hydrochloride in a suitable dose-volume.

Metoclopramide Syrup

Metoclopramide Hydrochloride Syrup

Metoclopramide Syrup contains Metoclopramide Hydrochloride in a suitable flavoured vehicle.

Metoclopramide Syrup contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of anhydrous metoclopramide hydrochloride, $C_{14}H_{22}ClN_3O_2$,HCl.

Usual strength. The equivalent of 5 mg of anhydrous metoclopramide hydrochloride in 5 ml.

Identification

To 50 ml add *5 M sodium hydroxide* till the solution becomes alkaline and extract with three quantities, each of 40 ml, of *chloroform*, dry each extract with *anhydrous sodium sulphate*. Evaporate the combined extracts to dryness on a water-bath. The residue complies with the following tests.

A. Dissolve 10 mg of the residue in *0.01 M hydrochloric acid* and dilute to 500 ml with *0.01 M hydrochloric acid*.

When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows absorption maxima at about 273 nm and 309 nm.

B. To 25 mg of the residue add 2.5 ml of *water* and 2.5 ml of a 1 per cent w/v solution of *4-dimethylaminobenzaldehyde* in *1 M hydrochloric acid*; a yellow-orange colour is produced.

C. Dissolve about 2 mg in 2 ml of *water*. The solution gives the reaction of primary aromatic amines (2.3.1).

Tests

pH (2.4.24). 2.0 to 4.0.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Carry out the test protected from light.

Test solution. Disperse a quantity of the oral solution containing 5 mg of anhydrous metoclopramide hydrochloride with the mobile phase and dilute to 10.0 ml with the mobile phase and filter.

Reference solution. Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm) (Such as Spherisorb ODS 1),
- mobile phase: *0.01 M sodium hexanesulphonate* in a mixture of 40 volumes of *water* and 60 volumes of *acetonitrile*, adjusted to pH 4.0 with *glacial acetic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent). Ignore any peaks with a retention time relative to the principal peak of 0.5 or less.

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Dilute a measured volume containing about 10 mg of anhydrous metoclopramide hydrochloride to 100.0 ml with *water*. To 20.0 ml of the solution add 15 ml of *1.25 M sodium hydroxide* and extract with three quantities, each of 30 ml, of *chloroform*, dry each extract with *anhydrous sodium sulphate* and filter. Dilute the combined extracts to 100.0 ml with *chloroform* and mix. Measure the absorbance of the resulting solution at the maximum at about 305 nm (2.4.7). Calculate the content of $C_{14}H_{22}ClN_3O_2$,HCl, taking 265 as the specific absorbance at 305 nm.

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of the equivalent amount of anhydrous metoclopramide hydrochloride in a suitable dose-volume.

Metoclopramide Tablets

Metoclopramide Hydrochloride Tablets

Metoclopramide Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of anhydrous metoclopramide hydrochloride, $C_{14}H_{22}ClN_3O_2$,HCl.

Usual strength. The equivalent of 10 mg of anhydrous metoclopramide hydrochloride.

Identification

A. Shake a quantity of the powdered tablets containing 10 mg of anhydrous metoclopramide hydrochloride with 50 ml of *0.01 M hydrochloric acid* and heat at 70° for 15 minutes with frequent shaking. Cool, dilute to 100 ml with *0.01 M hydrochloric acid*, filter and dilute 10 ml of the filtrate to 50 ml with the same solvent.

When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows absorption maxima at about 273 nm and 309 nm.

B. Shake a quantity of the powdered tablets containing 50 mg of anhydrous metoclopramide hydrochloride with 5 ml of *water*, filter and add to the filtrate 5 ml of a 1 per cent w/v solution of *4-dimethylaminobenzaldehyde* in *1 M hydrochloric acid*; a yellow-orange colour is produced.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *water*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, dilute suitably if necessary with the medium, at the maximum at about 309 nm (2.4.7). Calculate the content of $C_{14}H_{22}ClN_3O_2$ in the medium from the absorbance obtained from a solution of known concentration of *metoclopramide hydrochloride IPRS* in dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_{14}H_{22}ClN_3O_2$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Carry out the test protected from light.

Test solution. Disperse a quantity of the powdered tablets containing 0.1 g of anhydrous metoclopramide hydrochloride with 20 ml of *methanol* and dilute to 100.0 ml with the mobile phase and filter.

Reference solution. Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm) (Such as Spherisorb ODS 1),
- mobile phase: *0.01 M sodium hexanesulphonate* in a mixture of 40 volumes of *water* and 60 volumes of *acetonitrile*, adjusted to pH 4.0 with *glacial acetic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described in the Assay with the following modifications.

Test solution. Disperse one tablet in 30 ml of *water*, with the aid of ultrasound for 20 minutes and dilute to 100.0 ml with *water*. Centrifuge and use the supernatant liquid.

Calculate the content of $C_{14}H_{22}ClN_3O_2$, HCl in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 20 mg of anhydrous metoclopramide hydrochloride with 80 ml of *water* with the aid of ultrasound for 10 minutes and then continue shaking mechanically for 20 minutes and dilute to 200.0 ml with *water*, filter.

Reference solution. A 0.01 per cent w/v solution of *metoclopramide hydrochloride IPRS* in *water*.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Novapack C18),
- mobile phase: a mixture of 20 volumes of a solution prepared by dissolving 2.25 g of *sodium octanesulphonate* and 0.3 g of *sodium acetate* in sufficient *water* to produce 1000 ml and adjusted to pH 3.8 with *glacial acetic acid* and 80 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 305 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

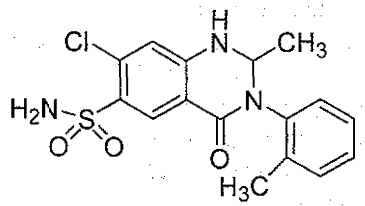
Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_{22}ClN_3O_2$,HCl in the tablets.

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of the equivalent amount of anhydrous metoclopramide hydrochloride.

Metolazone



$C_{16}H_{16}ClN_3O_3S$ Mol. Wt. 365.8

Metolazone is 7-chloro-1,2,3,4-tetrahydro-2-methyl-4-oxo-3-*o*-tolyl-6-quinazolinesulfonamide.

Metolazone contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{16}H_{16}ClN_3O_3S$, calculated on the dried basis.

Category. Diuretic.

Description. A white or slightly yellowish, crystalline powder. It shows polymorphism (2.5.11).

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *metolazone IPRS* or with the reference spectrum of metolazone.

B. When examined in the range of 200 nm to 400 nm (2.4.7), a 0.0005 per cent w/v solution in *methanol* shows absorption maxima as obtained with *metolazone IPRS* of the same concentration.

C. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve a quantity of the substance under examination with *tetrahydrofuran* in 50 per cent of the total volume and dilute with *ethanol* to obtain a solution containing 0.06 per cent w/v of Metolazone.

Reference solution. A 0.048 per cent w/v solution of *metolazone IPRS* in *tetrahydrofuran*. Dilute a volume of the solution with *ethanol* to obtain a solution containing 0.0006 per cent w/v of Metolazone.

Use chromatographic system as described in the Assay with the following modification.

– a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),

Name	Relative retention time	Relative response factor
Desmethyl metolazone[1]	0.7	1.0
Metolazone benzamide analog[2]	0.8	0.83
Metolazone	1.0	1.0
meta-Metolazone[3]	1.3	0.91
para-Metolazone[4]	1.4	0.91
Didehydrometolazone[5]	1.5	0.83

[1] 7-chloro-2-methyl-4-oxo-3-phenyl-1,2,3,4-tetrahydroquinazoline-6-sulfonamide,

[2] 2-amino-4-chloro-5-sulfamoyl-*N*-(*o*-tolyl)benzamide,

[3] 7-chloro-2-methyl-4-oxo-3-(*m*-tolyl)-1,2,3,4-tetrahydroquinazoline-6-sulfonamide,

[4] 7-chloro-2-methyl-4-oxo-3-(*p*-tolyl)-1,2,3,4-tetrahydroquinazoline-6-sulfonamide,

[5] 7-chloro-2-methyl-4-oxo-3-(*o*-tolyl)-3,4-dihydroquinazoline-6-sulfonamide.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.4 and the relative standard deviation is not more than 5.0.

Inject the reference solution and the test solution. Run the chromatogram 3.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (1.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Heavy metals (2.3.13). 1.33 g complies with limit test for heavy metals, Method B (15 ppm).

Sulphated ash (2.4.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1 g by drying in an oven at 105° for 2 hours.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light.

Test solution. Dissolve a quantity of the substance under examination in *tetrahydrofuran* to obtain a solution containing 0.05 per cent w/v of Metolazone. Dilute a volume of the solution with *ethanol* to obtain a solution containing 0.005 per cent w/v of Metolazone.

Reference solution. A 0.05 per cent w/v solution of *metolazone IPRS* in *tetrahydrofuran*. Dilute a volume of the solution with *ethanol* to obtain a solution containing 0.005 per cent w/v of Metolazone.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 10 volumes of *acetonitrile*, 25 volumes of *methanol* and 65 volumes of buffer solution prepared by dissolving 0.54 g of *monobasic potassium phosphate* in 100 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 15 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.4 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{16}ClN_3O_3S$.

Storage. Store protected from light and moisture.

Metolazone Tablets

Metolazone Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of metolazone, $C_{16}H_{16}ClN_3O_3S$.

Usual strengths. 2.5 mg; 5 mg; 10 mg.

Identification

When examined in the range 200 nm to 400 nm (2.4.7), a 0.00006 per cent w/v solution gives absorption maxima corresponds to that of the reference solution.

Tests

Dissolution (2.5.2).

NOTE — Protect the solutions from light.

Apparatus No. 2 (Paddle),
Medium. 900 ml of 2 per cent *sodium lauryl sulphate* in *0.05 M monobasic sodium phosphate*. Heat the mixture to about 37° to dissolve the *sodium lauryl sulphate* and adjusted to pH 7.5 with *10 M sodium hydroxide*,
Speed and time. 75 rpm and 120 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *metolazone IPRS* in *methanol* and dilute with dissolution medium to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 27 volumes of *acetonitrile*, 5 volumes of *methanol* and 68 volumes of *0.05 M monobasic potassium phosphate buffer*, adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Q. Not less than 75 per cent of the stated amount of $C_{16}H_{16}ClN_3O_3S$ in the tablet.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described in the Assay with the following modifications.

Test solution. Disperse 1 tablets in 0.5 ml of *water* and 10.0 ml of *methanol* with the aid of ultrasound for 30 minutes. If disintegration is not complete, sonicate for an additional 30 minutes. Shake by mechanical means for 30 minutes and dilute to 20.0 ml with *methanol*. Dilute a volume of the solution to obtain a solution containing 0.0005 per cent w/v of metolazone in the mobile phase.

Reference solution. A 0.025 per cent w/v solution of *metolazone IPRS* in *methanol*. Dilute a volume of the solution to obtain a solution containing 0.0005 per cent w/v solution of *metolazone IPRS* in mobile phase.

Calculate the content of $C_{16}H_{16}ClN_3O_3S$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14.).

NOTE — Use low-actinic glassware throughout the *Assay.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 25 mg of *metolazone* in 70 ml *methanol* with the aid of ultrasound for 30 minutes, filter and dilute to 200.0 ml with *methanol*. Dilute a volume of the solution to obtain a solution containing 0.0005 per cent w/v of metolazone in mobile phase.

Reference solution. A 0.025 per cent w/v solution of *metolazone IPRS* in *methanol*. Dilute a volume of the solution to obtain a solution containing 0.0005 per cent w/v solution of *metolazone IPRS* in mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),

- mobile phase: a mixture of 28 volumes of *methanol*, 7 volumes of *acetonitrile* and 65 volumes of buffer solution prepared by dissolving 1.38 g of *monobasic potassium phosphate monohydrate* in 900 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and dilute to 1000 ml with *water*,
- flow rate: 1.1 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 100 µl.

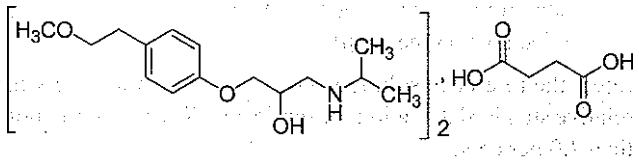
Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate content of $C_{16}H_{16}ClN_3O_3S$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Metoprolol Succinate



$(C_{15}H_{25}NO_3)_2,C_4H_6O_4$ Mol. Wt. 652.8

Metoprolol Succinate is (*RS*)-1-(Isopropylamino)-3-[4-(2-methoxyethyl)phenoxy]propan-2-ol succinate.

Metoprolol Succinate contains not less than 98.0 per cent and not more than 102.0 per cent of $(C_{15}H_{25}NO_3)_2,C_4H_6O_4$, calculated on the dried basis.

Category. Beta-adrenoceptor antagonist.

Description. A white, crystalline powder or colorless crystals.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *metoprolol succinate IPRS* treated in the same manner or with the reference spectrum of metoprolol.

Tests

pH (2.4.24). 7.0 to 7.6, determine in a 6.5 per cent w/v. solution in *carbon dioxide –free water*.

Related substances. Determine by liquid chromatography (2.4.14) as described in the Assay using the following modifications.

Test solution . Dissolve 50 mg of Metoprolol Succinate in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution. A 0.0001 per cent w/v solution of *metoprolol succinate IPRS* in the mobile phase.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent). Ignore any peak due to succinic acid.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method A (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.2 per cent, determined by drying in vaccum at 60° for 4 hours.

Assay. Determine by liquid chromatography(2.4.14)

Test solution. Dissolve 80 mg of Metoprolol Succinate in the mobile phase and dilute to 100.0 ml with the mobile phase.Dilute 5.0 ml of the solution to a 50.0 ml with the mobile phase.

Reference solution(a). A solution containing 0.0005 per cent each of *metoprolol succinate IPRS, metoprolol impurity A IPRS, metoprolol succinate B IPRS, metoprolol impurity C IPRS, metoprolol impurity D IPRS* in mobile phase.

Reference solution(b). A 0.008 per cent w/v solution of *metoprolol succinate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 12.5 cm×4 mm packed with octylsilane bonded to porous silica (3 to10 µm).
- mobile phase:a mixture of 60 volume of buffer prepared by dissolving 1.3 g of *sodium dodecyl sulphate* in 1000 ml of 0.1 per cent w/v *phosphoric acid* and 40 volume of *acetonitrile*,
- flow rate: 0.9 ml per minute,
- spectrophotometer set at 223 nm,
- injection volume: 10 µl.

Name	Relative retention time
Metoprolol impurity C[1]	0.6
Metoprolol impurity B[2]	0.7
Metoprolol impurity A[3]	0.8
Metoprolol succinate	1.0
Two diastereomers of Metoprolol Impurity D[4]	5.0 and 5.2

[1](±)4-[2-Hydroxy-3-(1-methylethyl)aminopropoxy]benzaldehyde,

[2](±)1-Chloro-2-hydroxy-3-[4-(2-methoxyethyl)phenoxy]-propane,

[3](±)1-Ethylamino)-3-[4-(2-methoxyethyl)phenoxy]-propan-2-ol,

[4](±) N,N-Bis[2-hydroxy-3-[4-(2-methoxyethyl)phenoxy]propyl](1-methylethyl)amine.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to Metoprolol Impurity A and Metoprolol Impurity B is not less than 2.5 and the resolution between Metoprolol Impurity B and Metoprolol Impurity C is not less than 1.5.

Inject reference solution (b) the relative standard deviation of replicate injection is not more than 2.0 per cent.

Inject reference solution (b) and test solution.

Calculate the content of $(C_{15}H_{25}NO_3)_2,C_4H_6O_4$.

Metoprolol Succinate Prolonged-release Tablets

Metoprolol Succinate Sustained-release Tablets; Metoprolol Succinate Extended-release tablets.

Metoprolol Succinate Extended Release Tablets manufactured by different manufacture, whilst complying with the requirements of monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Metoprolol Succinate Prolonged-release Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of metoprolol succinate, $(C_{15}H_{25}NO_3)_2,C_4H_6O_4$.

Usual Strengths. 12.5 mg; 25 mg; 50 mg; 100 mg.

Identification

Extract a quantity of powdered tablets containing 200 mg of metoprolol succinate in a centrifuge tube with 40 ml of *phosphate buffer pH 6.8* and 40 ml of *dichloromethane* after shaking for 5 minutes. Extract 3 ml of the aqueous phase with 2 ml of *ammonium hydroxide* and 20 ml of *dichloromethane*. Collect and evaporate the *dichloromethane* phase, to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *metoprolol succinate IPRS* treated in the same manner or with the reference spectrum of metoprolol.

Tests

Dissolution (2.5.2). Complies with the test stated under Tablets.

Other tests. Comply with the tests stated under Tablets.

Assay. Determined by liquid chromatography (2.4.14).

Test solution. Transfer 10 tablets in a 1000-ml volumetric flask. Add about 700 ml of 0.5M *methanolic hodrochloric acid* and shake for 15 minutes. Sonicate for 30 minutes with intermittent shaking. Dilute up to the mark with 0.5M *methanolic hydrochloric acid*. Filter through 0.45 µ membrane filter. Dilute the filtered solution quantitatively with 80 volume of *water* and 20 volume of *acetonitrile* to obtain a solution containing about 0.005 w/v of Metoprolol succinate.

Reference solution. A 0.05 w/v per cent solution of *Metoprolol succinate IPRS* in *0.5M methanolic hydrochloric acid*, Dilute 5.0 ml of the solution to 50.0 ml with the 80 volumes of *water* and 20 volumes of *acetonitrile*.

Chromatographic system

- a stainless steel column 12.5 cm x 4 mm packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 250 ml of *acetonitrile* and 750 ml of buffer solution prepared by dissolving 50 ml of *1 M sodium dihydrogen orthophosphate* and 8.0 ml of *1 M orthophosphoric acid* diluted with *water* to 1000 ml and adjusted to pH 3.0 with *1 M potassium dihydrogen orthophosphate* or *1 M orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 40 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $(C_{15}H_{25}NO_3)_2,C_4H_6O_4$ in the tablets.

Storage. Store at a temperature not exceeding 30°.

Labelling. Label it to indicate the content of metoprolol succinate and its equivalent, expressed as metoprolol tartrate.

Metoprolol Succinate Prolonged-release and Amlodipine Tablets

Metoprolol Succinate Prolonged-release and Amlodipine Besilate Tablets; Metoprolol Succinate Prolonged-release and Amlodipine Besylate Tablets.

Metoprolol Succinate Prolonged-release and Amlodipine besilate Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Metoprolol Succinate Prolonged-release and Amlodipine Besilate Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of metoprolol succinate, $(C_{15}H_{25}NO_3)_2,C_4H_6O_4$ and amlodipine, $C_{20}H_{25}ClN_2O_5$.

Usual strengths. Metoprolol Succinate 47.5 mg and Amlodipine 5 mg; Metoprolol Succinate 23.75 mg and Amlodipine 5 mg; Metoprolol Succinate 23.75 mg and Amlodipine 2.5 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution corresponds to the principal peaks in the chromatogram obtained with reference solution (c).

Tests

Dissolution (2.5.2).

For Metoprolol Succinate. Complies with the test stated under Tablets.

For Amlodipine —

NOTE—Solutions use within 12 hours of preparation.

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.01M hydrochloric acid,*
Speed and time. 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14)

Use the chromatographic system as described under Assay with following modifications.

- spectrophotometer set at 239 nm,

Test solution. Use the filtrate, dilute if necessary with the dissolution medium.

Reference solution. Weigh accurately about 30.5 mg of *amlodipine besilate IPRS* into a volumetric flask, add about 5 ml of *methanol* and sonicate to dissolve, dilute to 200.0 ml with the dissolution medium. Dilute 5.0 ml of the solution to 200.0 ml with the dissolution medium and mix.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{25}ClN_2O_5$.

Q. Not less than 70 per cent of the stated amount of $C_{20}H_{25}ClN_2O_5$.

Uniformity of content. Complies with the tests stated under Tablets.

For Amlodipine —

Determine by liquid chromatography (2.4.14), as described under Assay with following modification.

Test solution. Transfer one tablets into a volumetric flask and add about 5 ml of *acetonitrile* and sonicate to disperse the metoprolol part, add 20 ml of solvent mixture and sonicate for 10 minutes with constant shaking until the entire tablet gets dispersed. Further, add 20 ml of *acetonitrile* and sonicate for 5 minutes and add 20 ml of solvent mixture and sonicate for 15 minutes with constant shaking, allow the solution to cool to room temperature and dilute to 100.0 ml with the solvent mixture and mix. Centrifuge the solution at 3000 rpm for 10 minutes. Dilute the solution with solvent mixture to prepare *0.001 per cent w/v* of the amlodipine.

Reference solution. Weigh and transfer accurately about 27.8 mg of *amlodipine besilate IPRS* into a volumetric flask and dissolve in 100.0 ml of solvent mixture with the aid of ultrasound, dilute to volume with solvent mixture and mix. Further dilute 5.0 ml to 100.0 ml with solvent mixture and mix.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{25}ClN_2O_5$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Throughout the entire sonication maintain the temperature of sonication bath below 20°. Use solution within 12 hours.

Solvent mixture. A mixture of 50 volumes of a buffer solution prepared by dissolving 7.0 g of *sodium dihydrogen orthophosphate monohydrate* in 1000 ml of *water,* adjusted to pH 3.0 with *orthophosphoric acid,* and 50 volumes of *acetonitrile.*

Test solution. Weigh and powder 20 tablets. Dissolve the quantity of the powder containing 20.0 mg of Amlodipine with about 25.0 ml of *acetonitrile* and sonicate for 5 minutes with intermittent shaking add 20.0 ml of solvent mixture and sonicate for 15 minutes with intermittent shaking and dilute to 50.0 ml with the same solvent. Allow to cool to room temperature.

Reference solution (a). A solution of *amlodipine besilate IPRS* containing 0.04 per cent w/v of amlodipine in the solvent mixture.

Reference solution (b). A 0.4 per cent w/v solution of *metoprolol succinate IPRS* in the solvent mixture.

Reference solution (c). Dilute reference solution (a) and (b) with the solvent mixture to get a 0.0004 per cent w/v solution of metoprolol succinate and 0.00004 per cent w/v solution of amlodipine.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5µm),
- sampler temperature: 10°,
- mobile phase A: a buffer solution prepared by Dissolving 7.0 g of *sodium dihydrogen orthophosphate*

monohydrate in 1000 ml of *water*, add 0.5 ml of *triethylamine* and mix thoroughly, adjusted to pH 4.5 with *orthophosphoric acid* and filter .

B: a mixture of 90 volumes of *methanol* and 10 volumes *tetrahydrofuran*.

- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
20	60	40
35	52	48
45	40	60
50	40	60
55	60	40
60	90	10
65	90	10

The relative retention time are about 0.65 for amlodipine impurity D and 1.0 for amlodipine and correction factor for amlodipine impurity D is 0.57.

Inject reference solution (c). The test is not valid unless the column efficiency is not less than 1000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to amlodipine impurity D is not more than 10 times the area of the principal peak of amlodipine in the chromatogram obtained with reference solution (c) (1.0 per cent), the area of any other secondary peak is not more than 5 times the area of the principal peak of metoprolol in the chromatogram obtained with reference solution (c) (0.5 per cent) and the sum of the areas of all the secondary peaks excluding amlodipine impurity D is not more than 15 times the area of the principal peak of metoprolol in the chromatogram obtained with reference solution (c) (1.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak of metoprolol in the chromatogram obtained with the reference solution (c) (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of a buffer solution prepared by dissolving 7.0 g of *sodium dihydrogen orthophosphate monohydrate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and 50 volumes of *acetonitrile*.

Test solution. Weigh and transfer 5 tablets into a volumetric flask and add about 10 ml of *acetonitrile* and sonicate to disperse the Metoprolol part. Add 100 ml of a mixture of 30 volumes of *0.01M hydrochloric acid* and 70 volumes *acetonitrile* and sonicate for 10 minutes with constant shaking until the entire tablet gets dispersed. Further, add 100.0 ml of *acetonitrile* and sonicate for 5 minutes and add 100.0 ml of solvent mixture and sonicate for 15 minutes with constant shaking, allow the solution to cool to room temperature and dilute to volume to 500.0 ml with the solvent mixture and mix. Centrifuge the solution at 3000 rpm for 10 minutes. Dilute 5.0 ml of the solution to 25.0 ml with the solvent mixture.

Reference solution (a). A solution containing 0.05 per cent w/v of *metoprolol succinate IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.014 per cent w/v of *amlodipine besilate IPRS* in the solvent mixture with the aid of ultrasound.

Reference solution (c). Dilute reference solution (a) and (b) with the solvent mixture to obtain a solution having known concentration similar to the test solution.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5µm),
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolving 1 g of *1-deccane sulphonic acid* in 1000 ml *of water* and adjusted to pH 3.0 with *orthophosphoric acid,* and 40 volumes *acetonitrile*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 20 µl.

Inject reference solution (c) The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

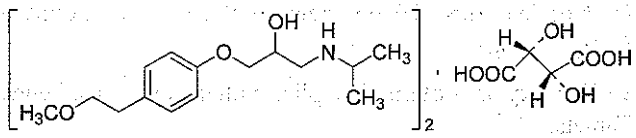
Inject reference solution (c) and the test solution.

Calculate the content of $(C_{15}H_{25}NO_3)_2$, $C_4H_6O_4$ $C_{20}H_{25}ClN_2O_5$ in the tablets.

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of the equivalent amount of amlodipine and metoprolol succinate and its equivalent expressed as metoprolol tartrate.

Metoprolol Tartrate



$(C_{15}H_{25}NO_3)_2,C_4H_6O_6$ Mol. Wt. 684.8

Metoprolol Tartrate is (*RS*)-1-isopropylamino-3-*p*-(2-methoxyethyl)phenoxypropan-2-ol tartrate.

Metoprolol Tartrate contains not less than 99.0 per cent and not more than 101.0 per cent of $(C_{15}H_{25}NO_3)_2,C_4H_6O_6$, calculated on the dried basis.

Category. Beta-adrenoceptor antagonist.

Description. A white, crystalline powder or colourless crystals.

Identification

A.To 25 ml of a 0.4 per cent w/v solution add 2 ml of *5 M ammonia*, extract with 20 ml of *dichloromethane*, filter the lower layer through *anhydrous sodium sulphate* and evaporate to dryness. Place in a freezer for a few minutes to congeal the residue and allow to warm to room temperature.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *metoprolol tartrate IPRS* treated in the same manner or with the reference spectrum of metoprolol.

B. A 5 per cent w/v solution gives reaction (C) of tartrates (2.3.1).

Tests

Appearance of solution. A 2.0 per cent w/v solution is clear (2.4.1), and not more intensely coloured than reference solution BS8 (2.4.1).

pH (2.4.24). 6.0 to 7.0, determined in a 2.0 per cent w/v solution.

Specific optical rotation (2.4.22). +7.0° to +10.0°, determined at 20° in a 2.0 per cent w/v solution.

Impurities M, N, O. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. Place 2 beakers, each containing 30 volumes of *concentrated ammonia*, at the bottom of a chromatographic tank containing a mixture of 20 volumes of *methanol* and 80 volumes of *ethyl acetate*.

Test solution. Dissolve 0.5 g of the substance under examination in *methanol* and dilute to 10.0 ml with *methanol*.

Reference solution (a). Dilute 1.0 ml of the test solution to 20.0 ml with *methanol*. Dilute 5.0 ml of the solution to 50.0 ml with *methanol*.

Reference solution (b). Dilute 4.0 ml of reference solution (a) to 10.0 ml with *methanol*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air for atleast 3 hours and then expose the plate to iodine vapour for at least 15 hours. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent) and 1 such spot is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). A solution containing 0.003 per cent w/v of *metoprolol impurity A IPRS* and 0.005 per cent w/v of *metoprolol tartrate IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 20.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica with a pore size of 10 nm and a carbon loading of 19 per cent (5 µm),
- mobile phase: dissolve 3.9 g of *ammonium acetate* in 810 ml of *water*, add 2.0 ml of *triethylamine*, 3.0 ml of *orthophosphoric acid*, 10.0 ml of *glacial acetic acid* and 146 ml of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Metoprolol impurity H[1]	0.3	—
Metoprolol impurity C[2]	0.4	0.1
Metoprolol impurity G[3]	0.45	—
Metoprolol impurity F[4]	0.7	—
Metoprolol impurity A[5]	0.8	—
Metoprolol Tartrate (retention time: about 7 minutes)	1.0	—
Metoprolol impurity J[6]	1.4	—
Metoprolol impurity D[7]	1.6	—
Metoprolol impurity E[8]	1.8	—
Metoprolol impurity B[9]	2.0	—

[1](2*RS*)-1-[4-(2-hydroxyethyl)phenoxy]-3-[(1-methylethyl)amino]propan-2-ol,

[2]4-[(2*RS*)-2-hydroxy-3-[(1-methylethyl)amino]propoxy]benzaldehyde,

[3] 2-(4-hydroxyphenyl)ethanol,

[4] (2*RS*)-1-[(1-methylethyl)amino]-3-phenoxypropan-2-ol,

[5] (2*RS*)-1-(ethylamino)-3-[4-(2-methoxyethyl)phenoxy]propan-2-ol,

[6]1-[2-hydroxy-3-[(1-methylethyl)amino]propoxy]-3-[4-(2-methoxyethyl)phenoxy]propan-2-ol,

[7] (2*RS*)-3-[4-(2-methoxyethyl)phenoxy]propane-1,2-diol,

[8](2*RS*)-1-[2-(2-methoxyethyl)phenoxy]-3-[(1-methylethyl)amino]propan-2-ol,

[9]4-(2-methoxyethyl)phenol.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to metoprolol impurity A and metoprolol is not less than 6.0.

Inject reference solution (b) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak due to metoprolol impurities A, B, C, D, E, F, G, H and J is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent). Ignore any peak due to tartaric acid.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method A (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.3 g in 30 ml *glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03424 g of $(C_{15}H_{25}NO_3)_2,C_4H_6O_6$.

Storage. Store protected from light.

Metoprolol Injection

Metoprolol Tartrate Injection

Metoprolol Injection is a sterile solution of Metoprolol Tartrate in Water for Injections.

Metoprolol Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of metoprolol tartrate, $(C_{15}H_{25}NO_3)_2,C_4H_6O_6$.

Usual strength. 1 mg per ml.

Identification

D. To a volume of the injection containing 20 mg of Metoprolol Tartrate , add 2 ml of *5 M ammonia*, mix, extract with 30 ml of *dichloromethane*, filter the dichloromethane layer through *anhydrous sodium sulphate* and evaporate the filtrate to dryness using a rotary evaporator with gentle heating if necessary. Cool the residue to –18° for 30 minutes and allow to warm to room temperature. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *metoprolol tartrate IPRS*, treated in the same manner or with the reference spectrum of metoprolol.

B. In the test for Related substances, the principal peak in the chromatogram obtained with reference solution (a) corresponds to the peak in the chromatogram obtained with reference solution (b).

C. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of injection if necessary, with the mobile phase to obtain a solution containing 0.1 per cent w/v of Metoprolol Tartrate.

Reference solution (a). A 0.2 per cent w/v solution of *potassium sodium (+)-tartrate* in the mobile phase.

Reference solution (b). A mixture of 1 volume of reference solution (a) and 2 volumes of 0.005 per cent w/v solution of *fumaric acid* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with silica bonded to amine groups (10 µm) (Such as Lichrosorb NH_2),
- mobile phase: 1 per cent w/v *sodium chloride* in a mixture of 25 volumes of *methanol* and 75 volumes of *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the chromatogram shows two clearly separated peaks.

Inject reference solution (a) and the test solution. The chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.24). 5.5 to 7.5.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Evaporate a volume of the injection containing 25 mg of Metoprolol Tartrate to dryness at a temperature not exceeding 40° and dissolve the residue in 5.0 ml of the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 20.0 ml with the mobile phase. Further dilute 3.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.005 per cent w/v of *metoprolol tartrate IPRS* and 0.003 per cent w/v of *metoprolol impurity A IPRS* in the mobile phase.

Reference solution (c). Prepare the solution in a fume cupboard in the following manner if necessary. Place an evaporating dish 10 cm in diameter containing 10 ml of a 0.1 per cent w/v solution of *metoprolol tartrate IPRS* in *0.1 M hydrochloric acid* so that the surface of the solution is 5 cm from a lamp emitting ultraviolet light at 254 nm for 6 hours. Dilute 1 volume of the solution to 50 volumes with the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 10 volumes of *glacial acetic acid* , 146 volumes of *acetonitrile* and 810 volumes of 0.48 per cent w/v of *ammonium acetate*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Name	Relative retention time
Metoprolol impurity C[1]	0.3
Metoprolol impurity A[2]	0.7
Metoprolol (retention time: about 7 minutes)	1.0

[1]4-[(2*RS*)-2-hydroxy-3-[(1-methylethyl)amino]propoxy] benzaldehyde,

[2](2*RS*)-1-(ethylamino)-3-[4-(2-methoxyethyl) phenoxy]propan-2-ol.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to metoprolol and metoprolol impurity A is not less than 6.0.

Inject reference solution (a) and the test solution. Run the chromatogram three times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent) and the sum of the areas of all the secondary peaks is not more than 1.7 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). If any of the above limits are exceeded, and if a secondary peak occurs with a retention time of 2 minutes (metoprolol impurity C), then in the chromatogram obtained with the test solution, divide the area of the peak corresponding to the principal peak in the chromatogram obtained with reference solution (c) (metoprolol impurity C) by 10; this divided area is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent); the sum of this divided area and the areas of any other secondary peaks is not more than 1.7 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.17 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Bacterial endotoxins (2.2.3). Not more than 25.0 Endotoxin Units per mg of metoprolol tartrate.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Dilute a volume of the injection containing 3 mg of Metoprolol Tartrate to 20 ml with *water* and measure the absorbance of the resulting solution at the maximum at 274 nm (2.4.7). Calculate the content of $(C_{15}H_{25}NO_3)_2,C_4H_6O_6$ from the absorbance obtained with a 0.015 per cent w/v solution of *metoprolol tartrate IPRS*.

Metoprolol Tablets

Metoprolol Tartrate Tablets

Metoprolol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of metoprolol tartrate, $(C_{15}H_{25}NO_3)_2, C_4H_6O_6$.

Usual strengths. 50 mg; 100 mg.

Identification

Transfer a quantity of the powdered tablets containing about 40 mg of Metoprolol Tartrate to a separator, add 25 ml of *water* and 4 ml of *5 M ammonia*, extract with 20 ml of *dichloromethane*, filter the lower layer through *anhydrous sodium sulphate* and evaporate to dryness. Place in a freezer for a few minutes to congeal the residue and allow to warm to room temperature.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *metoprolol tartrate IPRS* treated in the same manner or with the reference spectrum of metoprolol.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of simulated gastric juice, artificial (without enzyme),
Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the solution and filter. Dilute appropriately with the dissolution medium if necessary. Measure the absorbance (2.4.7) of the solution at the maximum at about 275 nm.

Calculate the content of $(C_{15}H_{25}NO_3)_2$, $C_4H_6O_6$ in the medium from the absorbance obtained from a solution of known concentration of *metoprolol tartrate IPRS*.

Q. Not less than 80 per cent of the stated amount of $(C_{15}H_{25}NO_3)_2, C_4H_6O_6$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 0.5 g of Metoprolol Tartrate with 20 ml of *chloroform* for 10 minutes, centrifuge, remove and retain the supernatant layer. Extract the residue with a further 20 ml quantity of *chloroform*, centrifuge and remove the supernatant layer. Evaporate the combined chloroform extracts to dryness at ambient temperature, add sufficient mobile phase to produce 25 ml and mix. Dilute 5.0 ml of the solution to 20.0 ml with the mobile phase and filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 20.0 ml with the mobile phase. Further dilute 3.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.005 per cent w/v of *metoprolol tartrate IPRS* and 0.003 per cent w/v of *metoprolol impurity A IPRS* in the mobile phase.

Reference solution (c). Prepare the solution in the fuming cupboard by placing an evaporating dish 10 cm in a diameter containing 10 ml of a 0.1 per cent w/v solution of *metoprolol tartrate IPRS* in *0.1 M hydrochloric acid* so that the surface of the solution is 5 cm from a lamp emitting ultraviolet light at 254 nm for 6 hours. Dilute 1.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Symmetry C18),
- mobile phase: a mixture of 0.2 volume of *triethylamine*, 0.3 volume of *orthophosphoric acid*, 1 volume of *glacial acetic acid*, 14.6 volumes of *acetonitrile* and 81 volumes of a 0.39 per cent w/v solution of *ammonium acetate*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Name	Relative retention time
Metoprolol impurity C[1]	0.3
Metoprolol impurity A[2]	0.7
Metoprolol tartrate (Retention itme: about 7 minutes)	1.0

[1]4-[(2*RS*)-2-hydroxy-3-[(1-methylethyl)amino]propoxy] benzaldehyde,

[2](2*RS*)-1-(ethylamino)-3-[4-(2-methoxyethyl)phenoxy]propan-2-ol.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to metoprolol and metoprolol impurity A is not less than 6.0.

Inject reference solution (a) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent) and the sum of the areas of all the secondary peaks is not more than 1.7 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent).

If any of the above limits are exceeded, and if a secondary peak occurs with a retention time of about 2 minutes (metoprolol impurity C), then in the chromatogram obtained with the test solution: divide the area of the peak corresponding to the principal peak in the chromatogram obtained with reference solution (c) (metoprolol impurity C) by 10: this divided area is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent) and the sum of this divided area and the areas of any other secondary peaks is not more than 1.7 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent).

Ignore any peak with an area less than 0.17 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.12 g of Metoprolol Tartrate, transfer to a 100-ml volumetric flask, add about 75 ml of *ethanol (95 per cent)* and shake for 15 minutes. Dilute to volume with *ethanol (95 per cent)*, mix and filter. Dilute 5.0 ml of the filtrate to 50.0 ml with *ethanol (95 per cent)*. Measure the absorbance of the resulting solution at the maximum at about 275 nm (2.4.7). Calculate the content of $(C_{15}H_{25}NO_3)_2$, $C_4H_6O_6$ from the absorbance obtained by repeating the operation using *metoprolol tartrate IPRS* in place of the substance under examination.

Metoprolol Tartrate and Hydrochlorothiazide Tablets

Metoprolol Tartrate and Hydrochlorothiazide Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of metoprolol tartrate $(C_{15}H_{25}NO_3)_2,C_4H_6O_6$ and hydrochlorothiazide $C_7H_8ClN_3O_4S_2$.

Usual strengths. Metoprolol tartrate, 50 mg and Hydrochlorothiazide, 12.5 mg; Metoprolol tartrate, 25 mg and Hydrochlorothiazide, 12.5 mg.

Identification

A. Disperse a quantity of the powder tablets containing about 0.1 g of metoprolol tartrate with 30 ml of *0.1 M sodium*

hydroxide, shake for 20 minutes and dilute to 50.0 ml with *0.1 M sodium hydroxide,* mix. Filter a portion of the solution, discarding first few ml of the filtrate. Transfer 25 ml of the filtrate in to a separating funnel and extract with three quantities, each of 15 ml of *chloroform,* collect the chloroform layer and filter through *anhydrous sodium sulphate.* Evaporate the *chloroform* to dryness, and place in a freezer to form residue.

NOTE— Retain the aqueous layer remaining after extraction for identification test B.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *metoprolol tartrate IPRS* treated in the same manner or with the reference spectrum of metoprolol.

B. Pass the aqueous layer from Identification test A through *0.1 M sodium hydroxide* prerinsed cotton. Dilute a portion of the filtrate quantitatively and stepwise with *0.1 M sodium hydroxide* to obtain a solution containing 0.001 per cent w/v of hydrochlorothiazide. The UV absorption spectrum of the solution exhibits maxima and minima at the same wavelengths as that of the reference solution prepared by dissolving 25 mg of *hydrochlorothiazide IPRS* in 50 ml of *0.1 M sodium hydroxide* in a separator, and extract with three 15-ml portions of *chloroform.* Discard the *chloroform* extracts, and pass the aqueous solution through *0.1 M sodium hydroxide* solution-prerinsed cotton. Dilute 2.0 ml of the filtrate to a 100.0 ml with *0.1 M sodium hydroxide* and mix.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of simultated gastric juice, artificial (without enzyme),
Speed and time. 100 rpm and 30 minutes.

For Metoprolol Tartrate —

NOTE— Retain about 30 ml of the remaining filtrate of the solution for the test of hydrochlorothiazide.

Withdraw about 125 ml of the solution under examination, allow to cool to room temperature, and filter, discarding the first few ml of the filtrate. Dilute suitably with medium to obtain a concentration of about 0.005 per cent w/v of metoprolol tartrate. Transfer to separate separators 50.0 ml of the filtrate, 50.0 ml of a solution of 0.005 per cent w/v of *metoprolol tartrate IPRS* and 50.0 ml of dissolution medium as a blank. Add 10 ml of *2.5 M sodium hydroxide* to each separator, and extract each with three 15 ml portions of *chloroform,* filtering the chloroform extracts through a plug of glass wool into individual 50-ml volumetric flasks. Dilute the contents of each flask with *chloroform* to volume, and mix. Measure the absorbance of the filtrate and the reference solution at the maximum at about 276 nm (2.4.7).

Calculate the content of $(C_{15}H_{25}NO_3)_2.C_4H_6O_6$ in the medium.

For Hydrochlorothiazide —

Withdraw a suitable volume of the medium retained from the determination of metoprolol tartrate and filter through 0.8µm, discarding the first few ml of the filtrate to obtain 0.001 per cent w/v of hydrochlorothiazide. Measure the absorbance of the filtered solution and reference solution, suitably diluted with the medium to obtain 0.001 per cent w/v of *hydrochlorothiazide IPRS,* at the maximum at about 316 nm (2.4.7).

Calculate the content of $C_7H_8ClN_3O_4S_2$ in the medium.

Q. Not less than 80 per cent of the stated amounts of $(C_{15}H_{25}NO_3)_2.C_4H_6O_6$ and $C_7H_8ClN_3O_4S_2$.

Diazotizable substances. Not more than 1.0 per cent, determined by the following method.

Test solution. Disperse a quantity of the powdered tablets containing 50 mg of hydrochlorothiazide in the mixture of 20 ml of *methanol* and 20 ml of *water.* Shake continuously for 5 to 10 minutes and dilute to 100.0 ml with the *water.*

Reference solution. Dissolve 5 mg of *benzothiadiazine impurity A (4-Amino-6-chloro-1,3-benzenedi-sulphonamide) IPRS* in 2.0 ml of *methanol* and dilute to 50.0 ml with *water.* Transfer 5.0 ml of the solution to 20 ml of *methanol* and dilute to 100.0 ml with *water.*

Transfer 5 ml each of the reference solution and the test solution into separate 50-ml volumetric flasks. Pipet 5 ml of *water* into a separate 50-ml volumetric flask as a blank, add 1 ml of *1.0 per cent w/v solution of sodium nitrite* and 5 ml of *10 per cent v/v solution of hydrochloric acid* in each flask and allow to stand for 5 minutes. Further add 2 ml of *2.0 per cent w/v solution of ammonium sulphamate* and allow to stand for 5 minutes with shaking then add 2 ml of *1.0 per cent w/v solution of freshly prepared disodium chromotropate* and 10 ml of 1.0 per cent w/v solution of *sodium acetate.* Dilute to volume with *water* and mix. Measure the absorbance of the resulting solution and the reference solution at about 500 nm (2.4.7).The absorbance of the test solution does not exceed with that of the reference solution .

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

For Metoprolol Tartrate —

Internal standard solution. A 0.036 per cent w/v solution of *oxprenolol hydrochloride IPRS* in the mobile phase.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 100 mg of Metoprolol Tartrate

in a 100-ml volumetric flask, add about 60 ml of *0.1M hydrochloric acid,* heat on a water-bath for 3 minutes, and sonicate for 5 minutes. Shake by mechanical means for 30 minutes. Allow the solution to cool at room temperature, dilute to volume with *0.1 M hydrochloric acid* and mix. Filter a portion of the solution, discarding the first few ml of the filtrate. Transfer 10.0 ml of the resulting solution to a separating funnel, add 2.0 ml of *2.5 M sodium hydroxide* and extract with three 25.0 ml portions of *chloroform.* Pass the chloroform extracts through *chloroform* prerinsed glass wool into a round-bottom flask, and evaporate on a rotary evaporator under vacuum to dryness. Add 20.0 ml of internal standard solution to the flask, sonicate for 3 minutes, and gently swirl to dissolve the residue in the flask. Filter a portion of the solution through a filter of 0.5 µm or finer porosity, discarding the first few ml of the filtrate and use the filtered solution.

Reference solution. Dissolve a quantity of *metoprolol tartrate IPRS* in *0.1 M hydrochloric acid* to obtain a solution containing 0.1 per cent w/v of metoprolol tartrate. Transfer 10.0 ml of the solution to a separating funnel, add 2.0 ml of *2.5 M sodium hydroxide*, and extract with three 25.0 ml portions of chloroform. Pass the chloroform extracts through *chloroform* prerinsed glass wool into a round-bottom flask, and evaporate on a rotary evaporator under vacuum to dryness. Add 20.0 ml of internal standard solution to the flask, sonicate for 3 minutes, and gently swirl to dissolve the residue in the flask.

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a solution prepared by adding 0.961 g of *1-pentanesulphonic acid sodium monohydrate* and 82 mg of *anhydrous sodium acetate* to a mixture of 550 volumes of *methanol*, 450 volumes of *water* and 0.57 ml of *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

The relative retention time for metoprolol tartrate is about 0.8 and for oxprenolol hydrochloride is about 1.0.

Inject the reference solution. The test is not valid unless the resolution between the metoprolol tartrate and oxprenolol hydrochloride is not less than 2.0 and the relative standard deviation is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $(C_{15}H_{25}NO_3)_2,C_4H_6O_6$ in the tablets.

For Hydrochlorothiazide —

Internal standard solution. A 0.04 per cent w/v solution of *sulphanilamide IPRS* in *methanol.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 25 mg of Hydrochlorothiazide in a 50-ml volumetric flask, add about 10.0 ml of internal standard solution and 20 ml of *methanol*, sonicate for 5 minutes and shake by mechanical means for 30 minutes, dilute to volume with *methanol* and mix. Centrifuge a portion of the solution and filter the supernatant liquid through 0.5 µm filter. discarding the first few ml of the filtrate.

Reference solution (a). Dissolve a quantity of *benzothiadiazine impurity A IPRS* in internal standard solution to obtain a solution containing 0.1 per cent w/v of *benzothiadiazine impurity A IPRS.* Transfer 2.0 ml of the solution to a 10-ml volumetric flask and dilute to volume with the *methanol.*

Reference solution (b). Weigh about 50 mg of *hydrochlorothiazide IPRS in* 20.0 ml of internal standard solution and dilute to 100.0 ml with *methanol.*

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a solution prepared by dissolving 1.38 g of *monobasic sodium phosphate* in 780 ml of *water,* add 220 ml of *methanol* and mix,
- flow rate: 0.6 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 4 µl.

The relative retention time for sulphanilamide and benzothiadiazine impurity A are about 0.7 and 1.0 respectively.

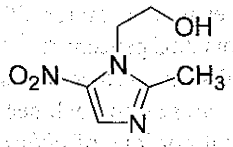
Inject reference solution (a) and (b). The test is not valid unless the resolution between *sulphanilamide IPRS* and *benzothiadiazine impurity A IPRS* is not less than 2.0 and the relative standard deviation is not more than 2.0 for reference solution (b).

Inject reference solution (b) and the test solution.

Calculate the content of $C_7H_8ClN_3O_4S_2$ in the tablets.

Storage. Store protected from light and moisture.

Metronidazole



$C_6H_9N_3O_3$ Mol. Wt. 171.2

Metronidazole is 2-(2-methyl-5-nitro-1*H*-imidazol-1-yl) ethanol.

Metronidazole contains not less than 99.0 per cent and not more than 101.0 per cent of $C_6H_9N_3O_3$, calculated on the dried basis.

Category. Antiamoebic.

Description. A white or yellowish, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *metronidazole IPRS* or with the reference spectrum of metronidazole.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *0.1 M hydrochloric acid* shows an absorption maximum at about 277 nm and a minimum at about 240 nm; absorbance at about 277 nm, between 0.365 and 0.395.

C. Heat about 10 mg in a water-bath with 10 mg of *zinc powder*, 1 ml of *water* and 0.25 ml of *2 M hydrochloric acid* for 5 minutes and cool. The solution gives the reaction of primary aromatic amines (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *1 M hydrochloric acid* is not more opalescent than opalescence standard OS2 (2.4.1), and not more intensely coloured than reference solution GYS4 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions protected from light.

Test solution. Dissolve 50 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *2-methyl-4-nitroimidazole (metronidazole impurity A) IPRS* in the mobile phase, add 10.0 ml of the test solution and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture 30 volumes of *methanol* and 70 volumes of a 0.14 per cent w/v solution of *potassium dihydrogen phosphate,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 315 nm,
- injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peak due to metronidazole and metronidazole impurity A is not less than 2.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent), the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.01 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

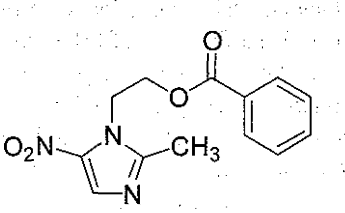
Assay. Dissolve 0.15 g in 50 ml of *anhydrous glacial acetic acid.* Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01712 g of $C_6H_9N_3O_3$.

Storage. Store protected from light and moisture.

Metronidazole Benzoate

Benzoylmetronidazole



$C_{13}H_{13}N_3O_4$ Mol. Wt. 275.3

Metronidazole Benzoate is 2-(2-methyl-5-nitro-1*H*-imidazol-1-yl)ethyl benzoate.

Metronidazole Benzoate contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{13}H_{13}N_3O_4$, calculated on the dried basis.

Category. Antiamoebic; antiprotozoal; antibacterial.

Description. A white or cream-coloured, crystalline powder or flakes.

Indentification

A. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *ethanol* shows an absorption maximum only at about 309 nm; absorbance at about 309 nm, about 0.3.

B. It gives reaction (B) of benzoates (2.3.1).

C. Melting range 98° to 102° (2.4.21).

Tests

pH (2.4.24). 5.0 to 7.0, determined in a 2.0 per cent w/v suspension.

Free benzoic acid. Not more than 0.2 per cent, determined by the following method. Dissolve 0.5 g in 25 ml of *ethanol (95 per cent)* and titrate with *0.01 M sodium hydroxide* using *phenol red solution* as indicator. Carry out a blank titration.

1 ml of *0.01 M sodium hydroxide* is equivalent to 0.001221 g of $C_7H_6O_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 45 volumes of mobile phase B and 55 volumes of mobile phase A.

Test solution. Dissolve 0.1 g of the substance under examination in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Further dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with di-isobutyloctadecylsilane bonded to porous silica (5 µm) with a specific surface area of 180 m^2/g, a pore size of 8 nm and a carbon loading of 10 per cent,
- mobile phase: A. 0.15 per cent w/v solution of *potassium dihydrogen phosphate,* adjusted to pH 3.2 with *orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
5	80	20
15	55	45
40	55	45
45	80	20

Name	Relative retention time
Metronidazole benzoate impurity A[1]	0.17
Metronidazole benzoate impurity B[2]	0.2
Metronidazole benzoate impurity C[3]	0.7
Metronidazole benzoate (Retention time: about 20 minutes)	1.0

[1]2-methyl-4-nitroimidazole,
[2]metronidazole,
[3]benzoic acid.

Inject reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.01 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying at in an oven at 60° at a pressure not exceeding 0.7 kPa.

Assay. Dissolve 0.25 g in 50 ml of *acetone*. Add 10 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02753 g of $C_{13}H_{13}N_3O_4$.

Storage. Store protected from light and moisture.

Metronidazole Injection

Metronidazole Intravenous Infusion

Metronidazole Injection is a sterile isotonic solution of Metronidazole in Water for Injections. It may contain suitable buffering agents.

Metronidazole Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of metronidazole, $C_6H_9N_3O_3$.

Usual strength. 5 mg per ml.

Description. An almost colourless to pale yellow solution.

Identification

A. Shake a volume of the injection containing about 0.1 g of Metronidazole with 9 g of *sodium chloride* for 5 minutes. Add 20 ml of *acetone*, shake for further 5 minutes and allow to separate. Evaporate the upper layer to dryness. On the residue, determine by infrared absorption spectrophotometery (2.4.6). Compare the spectrum with that obtained with *metronidazole IPRS* or with the reference spectrum of metronidazole.

B. Heat 2 ml of the injection in a water-bath for 5 minutes with 10 mg of *zinc powder* and 0.25 ml of *2 M hydrochloric acid* for 5 minutes and cool in ice. The solution gives the reaction of primary aromatic amines (2.3.1).

Tests

pH (2.4.24). 4.5 to 7.0.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of injection containing about 100 mg of metronidazole in 100 ml with the mobile phase.

Reference solution (a). A 0.0005 per cent w/v solution of *2-methyl-5-nitroimidazole IPRS* in the mobile phase.

Reference solution (b). A 0.0005 per cent w/v solution of *2-methyl-5-nitroimidazole IPRS* in the test solution.

Chromatographic system

- a stainless steel column 20 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (10 µm) (Such as Spherisorb ODS1),
- mobile phase: a mixture of 30 volumes of *methanol* and 70 volumes of a *0. 01 M potassium dihydrogen orthophosphate* prepared by dissolving 1.4 g of *potassium dihydrogen orthophosphate* with 1000 ml of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 315 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peak due to metronidazole and *2-methyl-5-nitroimidazole* is not less than 2.

Inject reference solution (a) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the peak due to *2-methyl-5-nitroimidazole* in the chromatogram obtained with reference solution (a) (0.5 per cent).

Bacterial endotoxins (2.2.3). Not more than 0.35 Endotoxin Unit per mg of metronidazole.

Other tests. Comply with the tests stated under Parenteral Preparations (Intravenous Infusions).

Assay. Dilute a suitable volume with sufficient *0.1 M hydrochloric acid* to produce a solution containing 0.001 per cent w/v of Metronidazole. Measure the absorbance of the resulting solution at the maximum at about 277 nm (2.4.7), using as the blank a solution prepared in the same manner omitting the substance under examination.

Calculate the content of $C_6H_9N_3O_3$ from the absorbance obtained by repeating the operation using *metronidazole IPRS* in place of the substance under examination.

Storage. Store protected from light, in single dose containers.

Labelling. The label states that the contents should not be used if they contain any visible solid particles.

Metronidazole Gel

Metronidazole Gel contains Metronidazole in a suitable water-soluble basis. It may contain suitable preservatives.

Metronidazole Gel contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of metronidazole, $C_6H_9N_3O_3$.

Usual strengths. 0.5 per cent w/w; 0.75 per cent w/w; 0.8 per cent w/w; 1 per cent w/w; 2 per cent w/w.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 4.0 to 6.5.

Other tests. Comply with the tests stated under Gels.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve a quantity of the gel equivalent to 75 mg of Metronidazole in a 100-ml volumetric flask, add 50 ml of mobile phase and shake on mechanical shaker for 20 minutes. Dilute with the mobile phase to volume, centrifuge and use the clear, Supernatant liquid for further dilution. Dilute 5.0 ml of the solution to 50 ml with mobile phase and mix.

Reference solution. A solution containing 0.0075 per cent w/v of *metronidazole IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of buffer solution prepared by dissolving 1.5 g of *potassium hydrogen orthophosphate* and 1.3 g of *sodium dihydrogen orthophosphate* in 350 ml of *water* and 65 volumes of *methanol*,

– flow rate: 1 ml per minute,
– spectrophotometer set at 254 nm,
– injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_6H_9N_3O_3$ in the gel.

Storage. Preserve in laminated collapsible tubes at a temperature not exceeding 30°.

Metronidazole Benzoate Oral Suspension

Benzoylmetronidazole Oral Suspension

Metronidazole Benzoate Oral Suspension is a suspension of Metronidazole Benzoate in a suitable aqueous vehicle. It may contain suitable colouring, flavouring, sweetening, buffering, suspending and antimicrobial agents.

Metronidazole Benzoate Oral Suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of metronidazole, $C_6H_9N_3O_3$.

Usual strengths. 40 mg per ml; 50 mg per ml.

Identification

Extract a quantity of the suspension containing 0.5 g of metronidazole with *chloroform*, filter and evaporate the filtrate to dryness. The residue complies with the following tests.

A. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *ethanol (95 per cent)* shows an absorption maximum only at about 309 nm; absorbance at about 309 nm, about 0.3.

B. It gives reaction (B) of benzoates (2.3.1).

Tests

Metronidazole. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the oral suspension containing 200 mg of metronidazole with 150 ml of *methanol* and dilute to 250.0 ml with *water* and centrifuge.

Reference solution. Dissolve 20 mg of *metronidazole IPRS* in 150 ml of *methanol* and dilute to 250.0 ml with *water*. Dilute 1.0 ml of the solution to 10.0 ml with *60 per cent methanol*.

Chromatographic system
– a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
– mobile phase: a mixture of 40 volumes of a 1.25 per cent w/v solution of *ammonium acetate*, adjusted to pH 7.0 with *dilute acetic acid* or *dilute ammonia* and 60 volumes of *methanol*,
– flow rate: 1 ml per minute,
– spectrophotometer set at 310 nm,
– injection volume: 20 µl.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to metronidazole is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the oral suspension containing 200 mg of metronidazole with 150 ml of *methanol* and dilute to 250.0 ml with *water* and centrifuge. Dilute 1.0 ml of the solution to 10.0 ml with *60 per cent methanol*.

Reference solution. Dissolve 62.5 mg of *metronidazole benzoate IPRS* in 1 ml of *dimethylformamide* and 30 ml of *methanol* and dilute to 50.0 ml with *water*. Dilute 1.0 ml of the solution to 10.0 ml with *60 per cent methanol*.

Use chromatographic system as described in the test for Metronidazole.

Inject the reference solution and the test solution.

Determine the weight per ml of the oral suspension (2.4.29) and calculate the content of $C_6H_9N_3O_3$, weight in volume.

Storage. store protected from light.

Labelling. The label states the strength in terms of the equivalent amount of metronidazole in a suitable dose-volume.

Metronidazole Sterile Suspension

Metronidazole Sterile Suspension is a sterile suspension of Metronidazole in Water for Injections. The suspension is prepared by suspending Metronidazole for Injection in the requisite amount of Water for Injections immediately before use.

The sterile suspension complies with the tests stated under Parenteral Preparations.

Usual Strength. 200 mg per 5 ml.

Storage. The suspension should be used immediately after preparation but in any case within the period recommended by the manufacturer when prepared and stored strictly in accordance with the manufacturer's instructions.

Metronidazole for Injection

Metronidazole for Injection is a sterile material consisting of Metronidazole with or without excipients. It is filled in a sealed container.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Metronidazole Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of metronidazole, $C_6H_9N_3O_3$.

Identification

Shake a quantity of the powder containing 0.1 g of Metronidazole with 40 ml of *chloroform* for 15 minutes, filter and evaporate the filtrate to dryness. The residue complies with the following test. Determine by infrared spectrophotometry (2.4.6). Compare the spectrum with that obtained with *metronidazole IPRS* or with the reference spectrum of metronidazole.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Determine the weight of the contents of 10 containers. Disperse a weighed quantity of the mixed contents of 10 containers containing about 0.1 g of Metronidazole with 40 ml of *chloroform*, with the aid of ultrasound for 15 minutes, filter, evaporate the filtrate to dryness and dissolve the residue in 100 ml of mobile phase.

Reference solution (a). A 0.0005 per cent w/v solution of *2-methyl-5-nitroimidazole IPRS* in the mobile phase.

Reference solution (b). A 0.0005 per cent w/v solution of *2-methyl-5-nitroimidazole IPRS* in the test solution.

Chromatographic system

- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm) (Such as Spherisorb ODS 1),
- mobile phase: a mixture of 30 volumes of *methanol* and 70 volumes of *0.01M potassium dihydrogen orthophosphate*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 315 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peak due to metronidazole and *2-methyl-5-nitroimidazole* is not less than 2.

Inject reference solution (a) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the peak due to *2-methyl-5-nitroimidazole* in the chromatogram obtained with reference solution (a) (0.5 per cent).

Assay. Determine the weight of the contents of 10 containers. Transfer a weighed quantity of the mixed contents of the 10 containers containing about 50 mg of Metronidazole, dissolve in 100 ml of *0.1 M hydrochloric acid*. Dilute 10 ml of the solution to 250 ml with *0.1 M hydrochloric acid* and measure the absorbance of the resulting solution at the maximum at about 277 nm (2.4.7). Calculate the content of $C_6H_9N_3O_3$ taking 375 as the specific absorbance at 277 nm.

Storage. Store protected from light.

Metronidazole Tablets

Metronidazole Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of metronidazole, $C_6H_9N_3O_3$.

Usual strengths. 200 mg; 400 mg.

Identification

A. Shake a quantity of the powdered tablets containing 0.1 g of Metronidazole with 40 ml of *chloroform* for 15 minutes, filter and evaporate the filtrate to dryness.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *metronidazole IPRS* or with the reference spectrum of metronidazole.

B. Heat a quantity of the powdered tablets containing 10 mg of Metronidazole in a water-bath with 10 mg of *zinc powder*, 1 ml of *water* and 0.25 ml of *2 M hydrochloric acid* for 5 minutes and cool in ice. The solution gives the reaction of primary aromatic amines (2.3.1).

C. Shake a quantity of the powdered tablets containing about 0.2 g of Metronidazole with 4 ml of *0.5 M sulphuric acid* and filter. To the filtrate add 10 ml of *picric acid solution* and allow to stand for 1 hour; the precipitate, after washing with cold *water* under suction and drying at 105°, melts at about 150° (2.4.21).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 100 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc with an average pore diameter

not more than 1.0 µm. Reject the first few ml of the filtrate and dilute a suitable volume of the filtrate with the same solvent. Measure the absorbance of the resulting solution at the maximum at about 277 nm (2.4.7). Calculate the content of $C_6H_9N_3O_3$ from the absorbance obtained by repeating the operation using *metronidazole IPRS* instead of the substance under examination.

Q. Not less than 85 per cent of the stated amount of $C_6H_9N_3O_3$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of powdered tablets containing about 100 mg of Metronidazole in 100 ml of the mobile phase,

Reference solution (a). A 0.0005 per cent w/v solution of *2-methyl-5-nitroimidazole IPRS* in the mobile phase.

Reference solution (b). A 0.0005 per cent w/v solution of *2-methyl-5-nitroimidazole IPRS* in the test solution.

Chromatographic system

- a stainless steel column 20 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (10 µm) (Such as Spherisorb ODS1),
- mobile phase: a mixture of 30 volumes of *methanol* and 70 volumes of a *0.01 M potassium dihydrogen orthophosphate* prepared by dissolving 1.4 g of *potassium dihydrogen orthophosphate* with 1000 ml of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 315 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peak due to metronidazole and *2-methyl-5-nitroimidazole* is not less than 2.

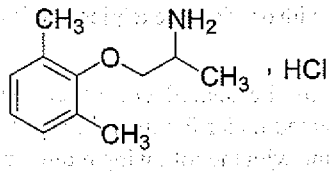
Inject reference solution (a) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the peak due to *2-methyl-5-nitroimidazole* in the chromatogram obtained with reference solution (a).

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.2 g of Metronidazole, transfer to a sintered-glass crucible and extract with six quantities, each of 10 ml, of hot *acetone*. Cool, add to the combined extracts 50 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, using 0.1 ml of a 1 per cent w/v solution of *brilliant green* in *anhydrous glacial acetic* acid as indicator to a yellowish-green end-point. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01712 g of $C_6H_9N_3O_3$.

Mexiletine Hydrochloride



$C_{11}H_{17}NO,HCl$ Mol. Wt. 215.7

Mexiletine Hydrochloride is (*RS*)-1-methyl-2-(2,6-xylyloxy) ethylamine hydrochloride.

Mexiletine Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{11}H_{17}NO,HCl$, calculated on the anhydrous basis.

Category. Antiarrhythmic.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *mexiletine hydrochloride IPRS* or with the reference spectrum of mexiletine hydrochloride.

B. When examined in the range 220 nm to 360 nm (2.4.7), a 0.04 per cent w/v solution in *0.01 M hydrochloric* acid shows an absorption maximum at about 260 nm; absorbance at 260 nm, about 0.46.

C. Dissolve 0.1 g in 3 ml of *0.02 M hydrochloric acid* and add a few crystals of *sodium nitrite*. Nitrogen is evolved and a yellow colour may be produced slowly.

D. It gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution is clear (2.4.1), and colourless (2.4.1).

pH (2.4.24). 4.0 to 5.5, determined in a 10.0 per cent w/v solution.

Impurity D. Determine by thin layer chromatography (2.4.17), coating the plate with *silica gel*.

Mobile phase. A mixture of 3 volumes of *ammonia*, 7 volumes of *ethanol (95 per cent)*, 45 volumes of *acetone* and 45 volumes of *toluene*.

Test solution. Dissolve 0.5 g of the substance under examination in *methanol* and dilute to 5.0 ml with *methanol*.

Reference solution (a). A 0.001 per cent w/v solution of *mexiletine impurity D IPRS ((2RS)-2-(2,6-dimethylphenoxy) propan-1-amine IPRS)* in *methanol*.

Reference solution (b). Dilute 1.0 ml of the test solution to 20.0 ml with *methanol.*

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 5.0 ml with *methanol.*

Reference solution (d). Dilute 1.0 ml of reference solution (a) to 5.0 ml with reference solution (b).

Apply to the plate 5 µl of reference solution (d), (e) and the test solution. Allow the mobile phase to rise 10 cm. Dry the plate in air and spray with *ninhydrin solution* and heat at 105° for 15 minutes or until the spots appear. In the chromatogram obtained with the test solution, any spot corresponding to mexiletine impurity D is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.1 per cent). The chromatogram obtained with reference solution (d) shows 2 clearly separated spots.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.2 g of the substance under examination in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase.

Reference solution (b). A 0.001 per cent w/v solution of *mexiletine impurity C IPRS* in the mobile phase and transfer the solution to a volumetric flask containing 16 mg of *2,6-dimethyl-phenol* and dilute to 20.0 ml with the mobile phase. Mix 1.0 ml of the solution with 2.0 ml of reference solution (a) and dilute to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of *methanol* and 35 volumes of a solution prepared by dissolving 11.5 g of *anhydrous sodium acetate* in 500 ml of *water*, add 3.2 ml of *glacial acetic acid*, mix and allow to cool, adjusting to pH 4.8 with *glacial acetic acid* and dilute to 1000 ml with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 262 nm,
- injection volume: 20 µl.

Name	Relative retention time
Mexiletine impurity C[1]	0.7
Mexiletine (Retention time: about 4 minutes)	1.0
Mexiletine impurity A[2]	1.8

[1]1,1'-[(3,3',5,5'-tetramethylbiphenyl-4,4'-diyl)bisoxy]dipropan-2-amine,

[2]2,6-dimethylphenol.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to mexiletine impurity C and mexiletine is not less than 5.0.

Inject reference solution (b) and the test solution. Run the chromatogram 5.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to mexiletine impurity A is not more than 2.5 times the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The area of any peak corresponding to mexiletine impurity C is not more than 20 times the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The area of any other secondarypeak is not more than 0.5 times the area of the peak due to mexiletine in the chromatogram obtained with reference solution (b) (0.1 per cent). the sum of areas of all the secondary peaks is not more than 2.5 times the area of the peak due to mexiletine in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.25 times the area of the peak due to mexiletine in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method C (10 ppm). Use 2 ml of *lead standard solution (10 ppm Pb)* to prepare the standard.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.4.19). Not more than 0.5 per cent, determined on 5 g.

Assay. Dissolve 0.15 g in 50 ml of a mixture of equal volumes of *anhydrous glacial acetic acid* and *acetic anhydride*, add 10 ml of *mercuric acetate solution.* Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02157 g of $C_{11}H_{17}NO,HCl$.

Storage. Store protected from light and moisture.

Mexiletine Capsules

Mexiletine Hydrochloride Capsules

Mexiletine Capsules contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of mexiletine hydrochloride $C_{11}H_{17}NO,HCl$.

Usual strengths. 50 mg; 100 mg.

Identification

A. Shake a quantity of the contents of the capsules containing about 0.5 g of Mexiletine Hydrochloride with 10 ml of *methanol*, filter, evaporate to dryness and dry the residue at 105°.

When examined in the range 230 nm to 360 nm (2.4.7), a 0.04 per cent w/v solution of the residue in *0.01 M hydrochloric acid* shows an absorption maximum at 260 nm.

B. Dissolve 0.1 g of the residue obtained in test A in 3 ml of *0.02 M hydrochloric acid* and add a few crystals of *sodium nitrite*; nitrogen is evolved and a yellow colour may be produced slowly.

C. In the test for Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

D. A 1 per cent w/v solution of the residue obtained in test A gives the reactions of chlorides (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water;*
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter with an average pore size of 1.0 µm. Measure the fluorescence intensities using the maximum excitation wavelength at about 265 nm and the maximum emission wavelength at about 295 nm (2.4.5). Calculate the content of $C_{11}H_{17}NO$, HCl by comparing the fluorescence intensities obtained with a standard solution of a known concentration of *mexiletine hydrochloride IPRS* in *water*.

Q. Not less than 80 per cent of the stated amount of $C_{11}H_{17}NO$, HCl.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the contents of capsules containing 0.2 g of Mexiletine Hydrochloride with 10 ml of the mobile phase with the aid of ultrasound for 10 minutes, filter through a 0.4-µm glass microfibre filter (Whatman GF/C is suitable) and use the filtrate.

Reference solution (a). A 0.2 per cent w/v solution of *mexiletine hydrochloride IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.01 per cent w/v of *mexiletine impurity C IPRS* and 0.08 per cent w/v of *2,6-dimethylphenol* in the mobile phase. Mix 1.0 ml of the solution with 2.0 ml of reference solution (a) and dilute to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil),
- mobile phase: a mixture of 35 volumes of a solution prepared by dissolving 11.5 g of *anhydrous sodium acetate* in 500 ml of *water*, add 3.2 ml of *glacial acetic acid*, mix and allow to cool, adjusted to pH 4.8 with *glacial acetic acid* and dilute to 1000 ml with *water* and 65 volumes of *methanol*,
- flow rate: 1 ml per minute;
- spectrophotometer set at 262 nm,
- injection volume: 20 µl.

Name	Relative retention time
Mexiletine impurity C[1]	0.7
Mexiletine (Retention time: about 4 minutes)	1.0
Mexiletine impurity A[2]	1.8

[1] 1,1'-[(3,3',5,5'-tetramethylbiphenyl-4,4'-diyl)bisoxy]dipropan-2-amine,

[2] 2,6- dimethylphenol.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to mexiletine and mexiletine impurity C is not less than 5.0.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 5.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to mexiletine impurity A is not more than 2.5 times the area of the peak due to 2,6-dimethylphenol in the chromatogram obtained with reference solution (b) (0.1 per cent), the area of any peak corresponding to mexiletine impurity C is not more than 20 times the area of the peak due to mexiletine impurity C in the chromatogram obtained with reference solution (b) (0.1 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.005 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Weigh a quantity of the mixed contents of 20 capsules containing about 0.05 g of Mexiletine Hydrochloride, mix with 50 ml of *0.01 M hydrochloride acid*, shake for 30 minutes, dilute to 100.0 ml with *0.01 M hydro-chloric acid* and centrifuge. Measure the absorbance of the supernatant liquid at the maximum at about 260 nm (2.4.7). Calculate the content of $C_{11}H_{17}NO$,HCl taking 11.6 as the specific absorbance at 260 nm.

Storage. Store protected from light.

Mexiletine Injection

Mexiletine Hydrochloride Injection

Mexiletine Injection is a sterile solution of Mexiletine Hydrochloride in Water for Injections.

Mexiletine Injection contains not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of Mexiletine Hydrochloride $C_{11}H_{17}NO$, HCl.

Usual strength. 250 mg per 10 ml.

Identification

A. In the test for Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

B. A volume containing 2.5 mg of Mexiletine Hydrochloride diluted to 2 ml gives reaction (A) of chlorides (2.3.1).

Tests

pH (2.4.24). 5.0 to 6.0.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of the injection to obtain 2.0 per cent w/v of Mexiletine Hydrochloride in the mobile phase.

Reference solution (a). A 0.2 per cent w/v solution of *mexiletine hydrochloride IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.01 per cent w/v of *mexiletine impurity C IPRS* and 0.08 per cent w/v of *2,6-dimethylphenol* in the mobile phase. Mix 1.0 ml of the solution with 2.0 ml of reference solution (a) and dilute to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil),
- mobile phase: a mixture of 35 volumes of a solution prepared by dissolving 11.5 g of *anhydrous sodium acetate* in 500 ml of *water*, add 3.2 ml of *glacial acetic acid*, mix and allow to cool, adjusted to pH 4.8 with *glacial acetic acid* and dilute to 1000 ml with *water* and 65 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 262 nm,
- injection volume: 20 µl.

Name	Relative retention time
Mexiletine impurity C[1]	0.7
Mexiletine (Retention time: about 4 minutes)	1.0
Mexiletine impurity A[2]	1.8

[1]1,1'-[(3,3',5,5'-tetramethylbiphenyl-4,4'-diyl)bisoxy]dipropan-2-amine,

[2]2,6- dimethylphenol.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to mexiletine and mexiletine impurity C is not less than 5.0.

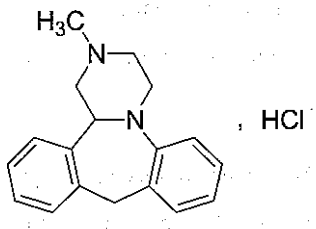
Inject reference solution (a), (b) and the test solution. Run the chromatogram 5.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to mexiletine impurity A is not more than 2.5 times the area of the peak due to 2,6-dimethylphenol in the chromatogram obtained with reference solution (b) (0.1 per cent), the area of any peak corresponding to mexiletine impurity C is not more than 20 times the area of the peak due to mexiletine impurity C in the chromatogram obtained with reference solution (b) (0.1 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. To a measured volume containing about 0.125 g of Mexiletine Hydrochloride add sufficient *0.01 M hydrochloric acid* to produce 250.0 ml and measure the absorbance of the resulting solution at the maximum at about 260 nm (2.4.7). Calculate the content of $C_{11}H_{17}NO$, HCl taking 11.6 as the specific absorbance at 260 nm.

Storage. Store in single dose containers.

Mianserin Hydrochloride



$C_{18}H_{20}N_2$,HCl Mol. Wt. 300.8

Mianserin Hydrochloride is (*RS*)-1,2,3,4,10, 14b-hexahydro-2-methyldibenzo[*c*,*f*] pyrazino[1,2-*a*]azepine hydrochloride.

Mianserin Hydrochloride contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{18}H_{20}N_2,HCl$, calculated on the dried basis.

Category. Antidepressant

Description. A white or almost white crystals or crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *mianserin hydrochloride IPRS* or with the reference spectrum of mianserin hydrochloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.01 per cent w/v solution shows an absorption maximum only at about 279 nm; absorbance at about 279 nm, 0.64 to 0.72.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 75 volumes of *cyclohexane*, 20 volumes of *ether* and 5 volumes of *diethylamine*.

Test solution. Dissolve 0.2 g of the substance under examination in 100 ml of *dichloromethane*.

Reference solution (a). A 0.2 per cent w/v solution of *mianserin hydrochloride IPRS* in *dichloromethane*.

Reference solution (b). A solution containing 0.2 per cent w/v, each of, *mianserin hydrochloride IPRS* and *cyproheptadine hydrochloride IPRS in dichloromethane*.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in a current of cold air for 5 minutes and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated principal spots.

D. It gives the reactions of chlorides (2.3.1).

Tests

pH (2.4.24). 4.0 to 5.5, determined in a 1.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with endcapped octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 37 volumes of a buffer solution prepared by dissolving 5.0 g of *sodium octanesulphonate* in *water* and dilute to 350 ml with *water*, adjusted to pH 3.0 with a mixture of 1 ml of *orthophosphoric acid* and 3 ml of *water*, dilute to 400 ml with *water* and 63 volumes of *methanol*,
- flow rate: 0.5 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Mianserin impurity B[1]	0.2	---
Mianserin impurity A[2]	0.5	2.4
Mianserin impurity D[3]	0.7	2.1
Mianserin (Retention time: about 18 minutes)	1.0	—
Mianserin impurity E[4]	1.1	—

[1](14b*RS*)-2-methyl-1,2,3,4,10,14b-hexahydrodibenzo[*c*,*f*]pyrazino[1,2-*a*]azepine-8-sulphonic acid,

[2][2-[(2*RS*)-4-methyl-2-phenylpiperazin-1-yl]phenyl]methanol,

[3][2-[(2*RS*)-4-benzyl-2-phenylpiperazin-1-yl]phenyl]methanol,

[4](14b*RS*)-1,2,3,4,10,14b-hexahydrodibenzo[*c*,*f*]pyrazino[1,2-*a*]azepine.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to mianserin impurity B is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.3 per cent), the area of any peak corresponding to mianserin impurities A, D, E is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per

cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 65° over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa for 5 hours.

Assay. Weigh 0.2 g, dissolve in a mixture of 50 ml of *ethanol (95 per cent)* and 5 ml of *0.01 M hydrochloric acid*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Note the volume added between the two points of inflection.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.03008 g of $C_{18}H_{20}N_2,HCl$.

Storage. Store protected from light and moisture.

Mianserin Tablets

Mianserin Hydrochloride Tablets

Mianserin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of mianserin hydrochloride, $C_{18}H_{20}N_2$, HCl.

Usual strengths. 10 mg; 20 mg; 30 mg.

Identification

A. Shake a quantity of the powdered tablets containing about 20 mg of Mianserin Hydrochloride with 10 ml of *methanol*, filter and evaporate the filtrate to dryness.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *mianserin hydrochloride IPRS* or with the reference spectrum of mianserin hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with test solution (b) corresponds to the peak due to mianserin in the chromatogram obtained with the reference solution.

C. The residue obtained in test A gives the reactions of chlorides (2.3.1).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 90 volumes of *dichloromethane* and 10 volumes of *methanol*.

Test solution. Triturate a quantity of the powdered tablets containing 40 mg of Mianserin Hydrochloride with 2 ml of a mixture of 4 volumes of *methanol* and 1 volume of *strong ammonia solution* and centrifuge.

Reference solution (a). Dilute 1 volume of the test solution to 200 volumes with the same solvent mixture.

Reference solution (b). Dilute 1 volume of the test solution to 500 volumes with the same solvent mixture.

Apply to the plate 5 µl of each solution. After development, dry the plate in a current of cold air for 5 minutes and expose to iodine vapour for 20 minutes. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by gas chromatography (2.4.13).

Test solution (a). Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 60 mg of Mianserin Hydrochloride with 30.0 ml of *0.2 M hydrochloric acid* for 1 hour and filter. To 10.0 ml of the filtrate add 3.0 ml of *1 M sodium hydroxide* and 10.0 ml of *toluene*, mix thoroughly, centrifuge and use the clear upper layer.

Test solution (b). To 10.0 ml of the filtrate obtained in test solution (a), add 3.0 ml of *1 M sodium hydroxide* and 10.0 ml of *toluene* containing 0.2 per cent w/v of *triphenylamine* (internal standard), mix thoroughly, centrifuge and use the clear upper layer.

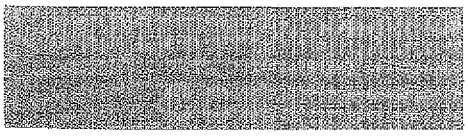
Reference solution. Add 3.0 ml of *1 M sodium hydroxide* and 10.0 ml of *toluene* containing 0.2 per cent w/v of *triphenylamine* (internal standard) to 10.0 ml of a solution containing 0.2 per cent w/v of *mianserin hydrochloride IPRS* in *0.2 M hydrochloric acid*, mix thoroughly, centrifuge and use the clear upper layer.

Chromatographic system
- a glass column 1.0 m × 4 mm, packed with acid-washed, silanised diatomaceous support (80 to 100 mesh) coated with 3 per cent w/w of phenyl methyl silicone fluid (50 per cent phenyl) (Such as OV-17),
- temperature:
  column 255°,
  inlet port and detector at 240°,
- flow rate: 30 ml per minute, using nitrogen as the carrier gas.

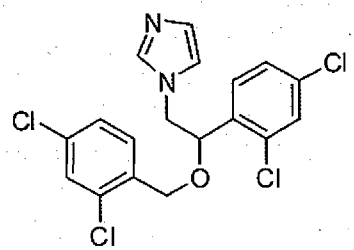
Inject 1 µl of test solution (a), (b) and the reference solution.

Calculate the content of $C_{18}H_{20}N_2$, HCl in the tablets.

Storage. Store protected from light and moisture.



Miconazole



$C_{18}H_{14}Cl_4N_2O$ Mol. Wt. 416.1

Miconazole is 1-[2-(2,4-dichlorophenyl)-2-[(2,4-dichlorophenyl)methoxy]ethyl-1*H*-imidazole.

Miconazole contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{18}H_{14}Cl_4N_2O$, calculated on the dried basis.

Category. Antifungal.

Description. A white or almost white powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *miconazole IPRS* or with the reference spectrum of miconazole.

B. Determine by thin-layer chromatography (2.4.17), using *silica gel G*.

Mobile phase. A mixture of 20 volumes of *ammonium acetate solution,* 40 volumes of *dioxin* and 40 volumes of *methanol.*

Test solution. Dissolve 30 mg of the substance under examination in 5 ml of the mobile phase.

Reference solution (a). Dissolve 30 mg of *miconazole IPRS* in 5 ml of the mobile phase.

Reference solution (b). Dissolve 30 mg each of *miconazole IPRS* and *econazole nitrate IPRS* in 5 ml of the mobile phase.

Apply 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in a current of warm air for 15 minutes. Expose to iodine vapour until the spots appear and examine in daylight. The principal spot in the chromatogram obtained with the test solution corresponds to that obtained in the chromatogram with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two distinct spots.

C. To about 30 mg in a porcelain crucible add 0.3 g of *anhydrous sodium carbonate*. Heat on flame for 10 minutes, allow to cool. Take up the residue with 5 ml of *dilute nitric acid* and filter. To 1 ml of the filtrate add 1 ml of *water*. The solution gives reaction (A) of chlorides (2.3.1).

D. Melting range (2.4.21). 83° to 87°.

Tests

Appearance of solution. A 1.0 per cent w/v solution in *methanol* (Solution A) is clear (2.4.1) and not more intensely coloured than the reference solution YS5 (2.4.1).

Optical rotation (2.4.22). – 0.10° to + 0.10°, determined in solution A.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in 10.0 ml of the mobile phase.

Reference solution (a). Dissolve 2.5 mg each of *miconazole IPRS* and *econazole nitrate IPRS* in 100 ml of the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100 ml with the mobile phase. Dilute 5.0 ml of the solution to 20 ml with the mobile phase.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: dissolve 6.0 g of *ammonium acetate* in a mixture of 30 volumes of *acetonitrile,* 32 volumes of *methanol* and 38 volumes of *water,*
- flow rate: 2 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 10 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to econazole and miconazole is not less than 10.

Inject reference solution (b) and the test solution. Run the chromatogram 1.2 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of secondary peak corresponding to (1*RS*)-1-(2,4-dichlorophenyl)-2-(1*H*-imidazol-1-yl)ethanol (miconazole impurity A), 1-[(2*RS*)-2-[(4-chlorobenzyl)oxy]-2-(2,4-dichlorophenyl)ethyl]-1*H*-imidazole (miconazole impurity B), (2*RS*)-2-[(2,4-dichlorobenzyl)oxy]-2-(2,4-dichlorophenyl) ethanamine (miconazole impurity C), 1-[(2*RS*)-2-[(2,6-dichlorobenzyl)oxy]-2-(2,4-dichlorophenyl)ethyl]-1*H*-imidazole (miconazole impurity D), 2-[1-[(2*RS*)-2-[(2,4-dichlorobenzyl)oxy]-2-(2,4-dichlorophenyl)ethyl]-1*H*-imidazol-3-io]-2-methylpropanoate (miconazole impurity E), 1-[(2*RS*)-2-[(3,4-dichlorobenzyl)oxy]-2-(2,4-dichlorophenyl)ethyl]-1*H*-imidazole (miconazole impurity F), and 1-[(2*RS*)-2-[(2,5-dichlorobenzyl)oxy]-2-(2,4-dichlorophenyl)ethyl]-1*H*-imidazole (miconazole impurity G) is not more than the area of the principal peak in the chromatogram obtained with reference

solution (b) (0.25 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

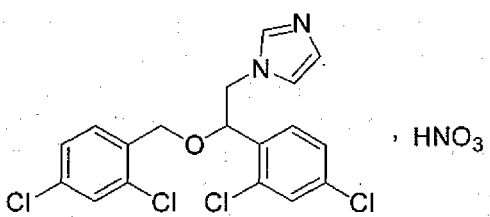
Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in vacuum at 60° for 4 hours.

Assay. Weigh 0.3 g, dissolve in 50 ml of a mixture of 1 volume of *anhydrous acetic acid* and 7 volumes of *methyl ethyl ketone*. Titrate with *0. 1 M perchloric acid* using 0.2 ml of *naphtholbenzein solution* as indicator, until the colour changes from orange-yellow to green. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04161 g of $C_{18}H_{14}Cl_4N_2O$.

Storage. Store protected from light.

Miconazole Nitrate



$C_{18}H_{14}Cl_4N_2O,HNO_3$ Mol. Wt. 479.2

Miconazole Nitrate is (*RS*)-1-[2-(2,4-dichlorophenylmethoxy)-2-(2,4-dichlorophenyl)ethyl]-1*H*-imidazole nitrate.

Miconazole Nitrate contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{18}H_{14}Cl_4N_2O,HNO_3$, calculated on the dried basis.

Category. Antifungal.

Description. A white or almost white, crystalline or microcrystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *miconazole nitrate IPRS* or with the reference spectrum of miconazole nitrate.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.04 per cent w/v solution in a mixture of 90 volumes of *2-propanol* and 10 volumes of *0.1 M hydrochloric acid* shows absorption maxima at about 264 nm, 272 nm and 280 nm; ratio of the absorbance at the maximum at about 272 nm to that at the maximum at about 280 nm, 1.18 to 1.22.

C. In the test for Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

D. It gives the reactions of nitrates (2.3.1).

Tests

Appearance of solution. A 1.0 per cent w/v solution in *methanol* is clear (2.4.1), and not more intensely coloured than reference solution YS7 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). A solution containing 0.0025 per cent w/v each of *miconazole nitrate IPRS* and *econazole nitrate IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 20.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: dissolve 6.0 g of *ammonium acetate* in a mixture of 300 volumes of *acetonitrile*, 320 volumes of *methanol* and 380 volumes of *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 10 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to econazole and miconazole is not less than 10.0.

Inject reference solution (b) and the test solution. Run the chromatogram 1.2 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent) and the peak due to nitrate ion.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

Assay. Dissolve 0.4 g in 50 ml of *anhydrous glacial acetic acid*, with slight heating if necessary. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04791 g of $C_{18}H_{14}Cl_4N_2O,HNO_3$.

Storage. Store protected from light and moisture.

Miconazole Cream

Miconazole Nitrate Cream

Miconazole Cream contains Miconazole Nitrate in a suitable cream base.

Miconazole Cream contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of miconazole nitrate, $C_{18}H_{14}Cl_4N_2O, HNO_3$.

Usual strength. 2 per cent w/w.

Identification

A. Mix a quantity containing 40 mg of Miconazole Nitrate with 20 ml of a mixture of 4 volumes of *methanol* and 1 volume of *1 M sulphuric acid* and shake with two quantities, each of 50 ml, of *hexane*, discarding the organic layers. Make the aqueous phase alkaline with *2 M ammonia* and extract with two quantities, each of 40 ml of *chloroform*. Combine the *chloroform* extracts, shake with 5 g of *anhydrous sodium sulphate*, filter and dilute the filtrate to 100 ml with *chloroform*. Evaporate 50 ml to dryness and dissolve the residue in 50 ml of a mixture of 90 volumes of *methanol* and 10 volumes of *0.1 M hydrochloric acid*.

When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows absorption maxima at about 264 nm, 272 nm and 280 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *methanol* and *tetrahydrofuran*.

Test solution. Shake a quantity of the cream containing 50 mg of Miconazole Nitrate with 30 ml of the solvent mixture for 30 minutes, dilute to 50.0 ml with the solvent mixture and filter through a glass microfiber filter (Such as Whatman GF/C).

Reference solution (a). A 0.1 per cent w/v solution of *miconazole nitrate IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Reference solution (c). A solution containing 0.0025 per cent w/v each of *miconazole nitrate IPRS* and *econazole nitrate IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with end-capped octadecylsilane bonded to porous silica (3 µm) (Such as Hypersil 3 ODS),
- mobile phase: a solution containing 0.6 per cent w/v of *ammonium acetate* in a mixture of 30 volumes of *acetonitrile*, 32 volumes of *methanol* and 38 volumes of *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 10 µl.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to miconazole and econazole is not less than 10.0.

Inject reference solution (b) and the test solution. Run the chromatogram 1.2 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent) and the sum of areas of all the secondary peaks is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore the peak due to nitrate ion.

Other tests. Comply with the tests stated under Creams.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{18}H_{14}Cl_4N_2O, HNO_3$ in the cream.

Storage. Store protected from light at a temperature not exceeding 30°. If it is packed in aluminium tubes the inner surfaces of the tubes should be coated with a suitable lacquer.

Miconazole Pessaries

Miconazole Nitrate Pessaries; Miconazole Nitrate Vaginal Tablets; Miconazole Tablets

Miconazole Pessaries contain Miconazole Nitrate in a suitable base.

Miconazole Pessaries contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of miconazole nitrate, $C_{18}H_{14}Cl_4N_2O, HNO_3$.

Usual strength. 150 mg.

Identification

A. Mix a quantity of the crushed pessaries containing 40 mg of Miconazole Nitrate with 20 ml of a mixture of 4 volumes of *methanol* and 1 volume of *1 M sulphuric acid* and shake with two quantities, each of 50 ml, of *carbon tetrachloride*, discarding the organic layers. Make the aqueous phase alkaline with *2 M ammonia* and extract with two quantities, each of 40 ml, of *chloroform*. Combine the chloroform extracts, shake with 5 g of *anhydrous sodium sulphate*, filter and dilute the filtrate to 100 ml with *chloroform*. Evaporate 50 ml to dryness and dissolve the residue in 50 ml of a mixture of 90 volumes of *methanol* and 10 volumes of *0.1 M hydrochloric acid*.

When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows absorption maxima at about 264 nm, 272 nm and 280 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to miconazole nitrate in the chromatogram obtained with reference solution (a).

Tests

Other tests. Comply with the tests stated under Pessaries.

Assay. Determine by gas chromatography (2.4.13).

Test solution. Weigh a quantity of the crushed pessaries containing about 40 mg of Miconazole Nitrate, mix with 20 ml of a mixture of 4 volumes of *methanol* and 1 volume of *0.5 M sulphuric acid* and shake with two quantities, each of 50 ml, of *carbon tetrachloride*. Wash each organic layer in turn with the same 10-ml quantity of a mixture of 4 volumes of *methanol* and 1 volume of *0.5 M sulphuric acid*. Combine the aqueous phase and the washings, make alkaline with *2 M ammonia* and extract with two quantities, each of 50 ml, of *chloroform*. To the combined extracts add 10.0 ml of a 0.3 per cent w/v solution of *cetyl palmitate* (internal standard) in *chloroform* and 5 g of *anhydrous sodium sulphate*, shake, filter, evaporate the filtrate to a low volume and add sufficient *chloroform* to produce 10.0 ml.

Reference solution (a). Weigh 40 mg of *miconazole nitrate IPRS* and mix with 10.0 ml of a 0.3 per cent w/v solution of the internal standard in *chloroform* and 0.2 ml of *strong ammonia solution*, add 1 g of *anhydrous sodium sulphate*, shake again and filter.

Reference solution (b). Prepare the solution in the same manner as reference solution (a) but omitting the addition of the internal standard solution.

Chromatographic system

- a glass column 1.5 m × 2 mm, packed with acid-washed, silanised diatomaceous support (80 to 100 mesh) coated with 3 per cent w/w of phenyl methyl silicone fluid (50 per cent phenyl) (Such as 5 per cent OV-101),
- temperature:
  column 270°,
  inlet port and detector at 300°,
- flow rate: 30 ml per minute, using nitrogen as the carrier gas.

Inject 1 µl of the test solution, reference solution (a) and reference solution (b).

Calculate the content of $C_{18}H_{14}Cl_4N_2O, HNO_3$ in the pessaries.

Storage. Store protected from light and moisture.

Microcrystalline Cellulose

Microcrystalline Cellulose is purified, partially depolymerised cellulose prepared from alpha cellulose.

Microcrystalline Cellulose contains not less than 97.0 per cent and not more than 102.0 per cent of cellulose, calculated on the dried basis.

Category. Pharmaceutical aid (suspending agent; tablet and capsule adjuvant).

Description. A fine or granular, white or almost white powder.

Identification

A. To about 1 mg add 1 ml of *phosphoric acid*, heat on a water-bath for 30 minutes, add 4 ml of a 0.2 per cent w/v solution of *catechol* in *phosphoric acid* and heat for further 30 minutes; a red colour is produced.

B. To 50 mg add 2 ml of *iodine solution*, allow to stand for 5 minutes and remove the excess reagent with the aid of a filter paper and add 1 or 2 drops of *sulphuric acid (66 per cent v/v)*; a blue-purple colour is produced.

C. Mix 30 g with 270 ml of *water*, mix in a blender at 18,000 rpm for 5 minutes, transfer 100 ml of the mixture to a 100-ml graduated cylinder and allow to stand for 3 hours. A white, opaque, bubble-free dispersion is obtained that does not produce a supernatant liquid.

Tests

pH (2.4.24). 5.0 to 7.5, determined on the supernatant liquid obtained by shaking 2.0 g with 100 ml of *carbon dioxide-free water* for 5 minutes and centrifuging.

Starch and dextrins. Mix 0.1 g with 5 ml of *water* by vigorous shaking and add 2 to 3 drops of *iodine solution*; no blue or brownish-red colour is produced.

Organic impurities. Place 10 mg on a watch-glass and add 0.05 ml of a freshly prepared solution of 0.1 g of *phloroglucinol* in 5 ml of *hydrochloric acid*; no red colour is produced.

Water-soluble substances. Shake 5.0 g with about 80 ml of *water* for 10 minutes, filter through a filter paper (Whatman No 42 or equivalent) into a tared beaker and evaporate the filtrate to dryness and dry the residue at 105° for 1 hour. The residue weighs not more than 10 mg (0.2 per cent).

Arsenic (2.3.10). Mix 5.0 g with 3 g of *anhydrous sodium carbonate*, add 10 ml of *bromine solution* and mix thoroughly. Evaporate to dryness on a water-bath, gently ignite and dissolve the cooled residue in a mixture of 15 ml of *hydrochloric acid* containing 0.15 ml of *bromine solution* and 45 ml of *water*. Add 2 ml of *stannous chloride solution AsT*. The resulting solution complies with the limit test for arsenic (2 ppm).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 6.0 per cent, determined on 0.5 g by drying in an oven at 105°.

Assay. Weigh 0.125 g and transfer to a 300-ml conical flask with the aid of about 25 ml of *water*. Add 50.0 ml of *0.083 M potassium dichromate*, mix, carefully add 100 ml of *sulphuric acid* and heat to boiling. Remove from heat, allow to stand at room temperature for 15 minutes, cool and transfer to a 250-ml volumetric flask. Dilute with *water* almost to volume, cool to 25°, dilute with *water* to volume and mix. Titrate 50.0 ml of the resulting solution with *0.1 M ferrous ammonium sulphate* using 2 to 3 drops of *ferroin sulphate solution* as indicator. Repeat the procedure without the substance under examination. The difference between the titrations represents the amount of ferrous ammonium sulphate required.

1 ml of *0.1 M ferrous ammonium sulphate* is equivalent to 0.000675 g of cellulose.

Storage. Store protected from light and moisture.

Microcrystalline Cellulose and Carboxymethylcellulose Sodium

Microcrystalline Cellulose and Carboxymethylcellulose Sodium is a colloid-forming, attrited mixture of Microcrystalline Cellulose and Carboxymethylcellulose Sodium.

Microcrystalline Cellulose and Carboxymethylcellulose Sodium contains not less than 75.0 per cent and not more than 125.0 per cent of carboxymethylcellulose sodium, calculated on the dried basis. The viscosity of its aqueous dispersion of per cent by weight stated on the label is not less than 60.0 per cent and not more than 140.0 per cent of that stated on the label in centipoises.

Identification

Mix 6 g with 300 ml of *water*, mix in a blender at 18,000 rpm for 5 minutes, transfer 100 ml of the mixture to a 100-ml graduated cylinder and allow to stand for 3 hours. A white, opaque, dispersion is produced which does not settle on standing.

A. Add few drops of the dispersion obtained to a 10 per cent w/v solution of *aluminum chloride*, each drop forms a white, opaque globule which does not disperse on standing.

B. Add 3 ml of *iodine solution* to the dispersion obtained; no blue or purplish blue color is produced

Tests

pH (2.4.24). 6.0 to 8.0, determined in the dispersion prepared in the test for Viscosity.

Viscosity (2.4.28). Determine the amounts of Microcrystalline Cellulose and Carboxymethylcellulose Sodium needed to prepare 600 g of a suitable dispersion, calculated on the dried basis. Transfer a weighed amount of *water* to a 1000-ml blender bowl. Begin stirring with an 18,000 rpm blender at a reduced speed obtained by adjusting the voltage to 30 volts by means of a suitable transformer, and immediately add the weighed portion of Microcrystalline Cellulose and Carboxymethyl cellulose Sodium, taking care to avoid contacting the sides of the bowl with the powder. Continue stirring at this speed for 15 seconds following the addition of the powder, then increase the transformer setting to 115 volts, and mix for 2 minutes, accurately timed, at 18,000 rpm. Stop the blender, and lower the appropriate spindle of a suitable rotational viscometer into the dispersion. Thirty seconds after cessation of mixing, start the viscosimeter, and determine the viscosity using the appropriate spindle to obtain a scale reading between 10 per cent and 90 per cent of full-scale at a speed of 20 rpm. Determine the scale reading after 30 seconds of rotation, and calculate the viscosity, in centipoises, by multiplying the scale reading by the constant for the spindle used at 20 rpm.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 5.0 per cent.

Loss on drying (2.4.19). Not more than 8.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 2 g of Microcrystalline Cellulose and Carboxymethylcellulose Sodium and transfer to a 250-ml of a glass-stoppered conical flask, add 75 ml of *glacial acetic acid*, attach a condenser, and reflux for 2 hours, cool, transfer the mixture to a 250-ml beaker with the aid of small volumes of

glacial acetic acid. Titrate with *0.1 M perchloric acid* in *dioxane solution*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.0296 g of carboxymethylcellulose sodium.

Storage. Store protected from light and moisture.

Labelling. Label it to indicate the percentage content of carboxymethylcellulose sodium and the viscosity of the dispersion in water of the designated weight percentage composition.

Microcrystalline Wax

Petroleum Wax (microcrystalline); Amorphous Wax

Microcrystalline Wax is a mixture of straight-chain, branched-chain and cyclic hydrocarbons, obtained by solvent fractionation of the still bottom fraction of petroleum by suitable dewaxing or de-oiling means.

Category. Pharmaceutical aid (stiffening and coating agent; ointment base).

Description. A white or cream-coloured waxy solid.

Tests

Acidity or alkalinity. Introduce 35.0 g into a 250-ml separating funnel, add 100 ml of boiling *water* and shake vigorously for 5 minutes. Draw off the separated water into a beaker, wash further with two quantities, each of 50 ml, of boiling *water* and add the washings to the liquid in the beaker. To the pooled washings add 0.05 ml of *phenolphthalein solution* and boil; the solution does not acquire a pink colour. Cool, add 0.1 ml of *methyl orange solution*; no red or pink colour is produced.

Solidifying point (2.4.10). 54° to 102°. Follow the method with the following modifications. Place in the inner test-tube sufficient of the melted substance to fill the tube to a depth of about 50 mm. Stir the substance gently and steadily, without scraping the side of the tube, while the tube and its contents are allowed to cool. The temperature at which the level of the mercury in the thermometer remains stationary for a short time is taken as the solidifying point.

Colour. Melt about 10.0 g on a water-bath and pour 5 ml of the liquid into a clear-glass (15 cm × 16 mm) bacteriological test-tube; the warm, melted liquid is not more intensely coloured than a solution prepared by mixing 3.8 ml of FCS and 1.2 ml of CCS (2.4.1), in a similar tube, the comparison being made in reflected light against a white background, the tubes being held directly against the background at such an angle that there is no fluorescence.

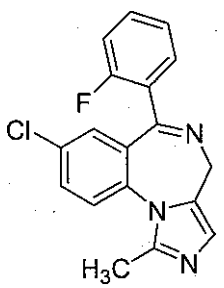
Organic acids. To 20.0 g add 100 ml of a 50 per cent v/v solution of *ethanol (95 per cent)* neutralised to *phenolphthalein solution* and titrate rapidly with *0.1 M sodium hydroxide* with vigorous agitation, to a sharp pink end-point. Not more than 0.4 ml of *0.1 M sodium hydroxide* is required.

Fats, fixed oils and rosin. Digest 10.0 g with 10 ml of *5 M sodium hydroxide* at 100° for 30 minutes. Separate the water layer and acidify with *sulphuric acid*; no oily or solid matter separates.

Ash (2.3.19). Not more than 0.1 per cent, determined on 2.0 g. It volatilises without emitting an acrid odour.

Storage. Store protected from light and moisture.

Midazolam



$C_{18}H_{13}ClFN_3$ Mol. Wt. 325.8

Midazolam is 8-chloro-6-(2-fluorophenyl)-1-methyl-4*H*-imidazo[1,5-*a*][1,4]benzodiazepine.

Midazolam contains not less than 98.5 per cent and not more than 101.5 per cent calculated on the dried basis.

Category. Sedative; Anxiolytic.

Description. A white or yellowish, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *midazolam IPRS* or with the reference spectrum of midazolam.

B. In the test for Impurity C, the principal spot in the chromatogram obtained with test solution (a) corresponds to that in the chromatogram obtained with reference solution (b).

C. Mix 90 mg with 0.3 g of *anhydrous sodium carbonate* and ignite in a crucible until an almost white residue is obtained. Allow to cool and dissolve the residue in 5 ml of *dilute nitric*

acid, filter. Add 1.0 ml of the filtrate to a freshly prepared mixture of 0.1 ml of *alizarin S solution* and 0.1 ml of *zirconyl nitrate solution*. Mix, allow to stand for 5 minutes and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow and the blank solution is red.

D. To 1 ml of the filtrate obtained in identification test C add 1 ml of *water*. The solution gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 1.0 per cent w/v solution in *0.1 M hydrochloric acid* is clear (2.4.1) and not more intensely coloured than reference solution YS6 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in *methanol* and dilute to 50.0 ml with *methanol*.

Reference solution. A 0.0001 per cent w/v solution of *midazolam IPRS* in *methanol*.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 44 volumes of a solution containing 0.77 per cent w/v of *ammonium acetate* and 1.0 per cent v/v of *tetrabutylammonium hydroxide solution* (40 per cent w/v), adjusted to pH 5.3 with *glacial acetic acid* and 56 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Midazolam impurity I[1]	0.25	—
Midazolam impurity J[2] (2 peaks)	0.3	—
Midazolam impurity D[3]	0.4	—
Midazolam impurity E[4]	0.5	2.0
Midazolam impurity F[5]	0.7	—
Midazolam impurity A[6]	0.9	2.0
Midazolam (Retention time: about 17 minutes)	1.0	—
Midazolam impurity G[7]	1.2	—
Midazolam impurity H[8]	1.9	1.7
Midazolam impurity B[9]	2.2	—

[1](3a*RS*)-8-chloro-6-(2-fluorophenyl)-1-methyl-3a,4-dihydro-3*H*-imidazo[1,5-*a*][1,4]benzodiazepine,

[2]8-chloro-6-(2-fluorophenyl)-1-methyl-3a,4,5,6-tetrahydro-3*H*-imidazo[1,5-*a*][1,4]benzodiazepine,

[5]7-chloro-5-(2-fluoropheny)-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one (1-des[(diethylamino)ethyl] flurazepam),

[6](6*RS*)-8-chloro-6-(2-fluorophenyl)-1-methyl-5,6-dihydro-4*H*-imidazo [1,5-*a*][1,4]benzodiazepine,

[7]desfluoromidazolam,

[8]6-chloro-4-(2-fluorophenyl)-2-methylquinazoline,

[9](6*RS*)-8-chloro-6-(2-fluorophenyl)-1-methyl-6*H*-imidazo[1,5-*a*][1,4] benzodiazepine.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. Run the chromatogram 3 times the retention time of the principal peak. The area of any peak due to midazolam impurity B is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent), the area of any peak due to midazolam impurities A and G is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with the reference solution (0.3 per cent). Ignore any peak with the area less than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Impurity C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 2 volumes of *glacial acetic acid*, 15 volumes of *water*, 20 volumes of *methanol* and 80 volumes of *ethyl acetate*.

Test solution (a). Dissolve 0.2 g of the substance under examination in *ethanol (95 per cent)* and dilute to 5 ml with *methanol*.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with *ethanol (95 per cent)*.

Reference solution (a). Dissolve the contents of a vial of *midazolam impurity C (8-chloro-6-(2-fluorophenyl)-1-methyl-4H-imidazo[1,5-a][1,4]benzodiazepine-3-carboxylic acid) IPRS* in 2.0 ml of *methanol*.

Reference solution (b). A 0.08 per cent w/v solution of *midazolam IPRS* in *ethanol (95 per cent)*.

Reference solution (c). Dissolve 40 mg of the substance under examination in 1 ml of reference solution (a).

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a) due to midazolam impurity C is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.1 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows 2 clearly separated spots.

Sulphated ash (2.3.18). Not more than 0.1 per cent in a platinum crucible.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

Assay. Dissolve 0.12 g in 30 ml of *anhydrous acetic acid* and add 20 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid* to the 2nd point of inflexion, determining the end-point potentiometrically (2.4.25).

1 ml of *0.1 M perchloric acid* is equivalent to 0.01629 g of $C_{18}H_{13}ClFN_3$.

Storage. Store protected from light.

Midazolam Injection

Midazolam Injection is a sterile solution of Midazolam in Water for Injections containing hydrochloric acid.

Midazolam Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of midazolam, $C_{18}H_{13}ClFN_3$.

Usual strengths. 1 mg per ml; 5 mg per ml.

Identification

To a volume of the injection containing 20 mg of Midazolam add sufficient *5 M ammonia* to make the solution just alkaline, extract with two 10- ml quantities of *dichloromethane*, dry the combined extracts over *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *midazolam IPRS* or with the reference spectrum of midazolam.

Tests

pH (2.4.24). 2.9 to 3.7.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Keep the solutions protected from light atleast for 2 hours before testing.

Test solution. Dilute a volume of the injection containing 10 mg of Midazolam to 20.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.001 per cent w/v each of *N-desalkylflurazepam IPRS* and *midazolam IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 28 volumes of a solution containing equal volumes of *0.1 M orthophosphoric acid* and *0.03 M triethylamine*, adjusted to pH 3.5 with *0.1 M sodium hydroxide* and 72 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to midazolam and *N*-desalkylflurazepam is not less than 3.0.

Inject reference solution (a) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent).

Bacterial endotoxins (2.2.3). Not more than 8.33 Endotoxin Units per mg of midazolam.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Keep the solutions protected from light atleast for 2 hours before testing.

Test solution. Dilute a volume of the injection containing 10 mg of Midazolam to 100 ml with the mobile phase.

Reference solution (a). A 0.01 per cent w/v solution of *midazolam IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.001 per cent w/v each of *N-desalkylflurazepam IPRS* and *midazolam IPRS* in the mobile phase.

Use chromatographic system as described in the Related substances.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to midazolam and *N*-desalkylflurazepam is not less than 3.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{18}H_{13}ClFN_3$ in the injection.

Storage. Store protected from light.

Midazolam Oral Solution

Midazolam Oral Solution is a solution of Midazolam in a suitable flavoured vehicle.

Midazolam Oral Solution contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of midazolam, $C_{18}H_{13}ClFN_3$.

Identification

A. To a volume of the oral solution containing 20 mg of Midazolam add sufficient *5 M ammonia* to make the solution just alkaline, extract with two 10-ml quantities of *dichloromethane*, dry the combined extracts over *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *midazolam IPRS* or with the reference spectrum of midazolam.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light for at least 2 hours before testing.

Test solution. Dilute a volume of the oral solution containing 10 mg of Midazolam to 20.0 ml with the mobile phase, filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.001 per cent w/v each of *N-desalkylflurazepam IPRS* and *midazolam IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica),
- column temperature: 40°,
- mobile phase: a mixture of 28 volumes of a solution prepared by mixing equal volumes of *0.1 M orthophosphoric acid* and *0.03 M triethylamine*, adjusted to pH 3.5 with *0.1 M sodium hydroxide* and 72 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject reference solution (b).The test is not valid unless the resolution between the peaks due to midazolam and *N*-desalkylflurazepam is not less than 3.0.

Inject reference solution (a) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent).

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

NOTE— Protect the solutions from light for at least 2 hours before testing.

Test solution. Dilute a volume of the oral solution containing 10 mg of Midazolam to 100.0 ml with the mobile phase, filter.

Reference solution (a). A 0.01 per cent w/v solution of *midazolam IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.001 per cent w/v each of *N-desalkylflurazepam IPRS* and *midazolam IPRS* in the mobile phase.

Use chromatographic system as described in the Related substances.

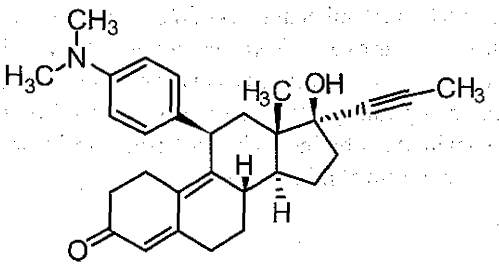
Inject reference solution (b). The test is not valid unless the resolution between the peaks due to midazolam and *N*-desalkylflurazepam is not less than 3.0.

Inject reference solution (a) and the test solution.

Determine the weight per ml (2.4.29) and calculate the content of $C_{18}H_{13}ClFN_3$ in the oral solution.

Storage. Store protected from light.

Mifepristone



$C_{29}H_{35}NO_2$ Mol Wt. 429.6

Mifepristone is 17β-Hydroxy-11β-(4-dimethylamino)phenyl-17-(1-propynyl)-4,9-estradien-3-one.

Mifepristone contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{29}H_{35}NO_2$, calculated on the dried basis.

Category. Abortifacient.

Description. A slightly yellow crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *mifepristone IPRS* or with the reference spectrum of mifepristone.

Tests

Light absorption. Not more than 1.25, determined in a 1.0 per cent w/v solution in *methanol* at 420 nm (2.4.7).

Specific optical rotation (2.4.22). +124° to +135°, determined in a 0.5 per cent w/v solution in *dichloromethane* at 20°.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *water* and *methanol.*

Test solution. Dissolve 25 mg of the substance under examination in 5 ml of *methanol* and dilute to 25.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4 mm packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature: 40°,
- sample temperature: 5°,
- mobile phase: A. dilute 0.75 ml of *formic acid* to 1000 ml with *water*, adjusted to pH 5.0 with dilute *ammonium hydroxide solution*,
  B. a mixture of equal volumes of *methanol* and *acetonitrile*,
- a gradient programme using the condition given below,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 10 µl

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	40	60
30	34	66
50	10	90
60	10	90
65	40	60
70	40	60

Inject the test solution. The area of any secondary peak is not more than 0.5 per cent and the sum of the area of all the secondary peaks is not more than 1.0 per cent, calculated by area normalisation.

Heavy metals (2.3.13). 1.0 g complies with the limit for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

Assay. Weigh 0.3 g and dissolve in 50 ml of *glacial acetic acid.* Titrate with *0.1 M perchloric acid* determining the end-point potentiometrically (2.4.25). Carry out blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04296 g of $C_{29}H_{35}NO_2$.

Mifepristone Tablets

Mifepristone Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of mifepristone, $C_{29}H_{35}NO_2$.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. When examined in the range 200 nm to 400 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* shows absorption maxima at 260 nm and 303 nm.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of 1.0 per cent w/v solution of *sodium lauryl sulphate* in *water*,
Speed and time. 75 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the dissolution medium, if necessary, at the maximum at about 302 nm (2.4.7). Calculate the content of $C_{29}H_{35}NO_2$ in the medium from the absorbance obtained from a solution of known concentration of *mifepristone IPRS*, prepared by dissolving in suitable quantity in *methanol* and diluted with the dissolution medium in such a manner to get similar concentration of the test solution.

Q. Not less than 70 per cent of the stated amount of $C_{29}H_{35}NO_2$.

Related substances. Determine by liquid chromatography (2.4.14), as described in the assay with the following modifications.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 1.0 per cent and the sum of areas of all the secondary peaks is not more than 2.0 per cent, calculated by area normalization.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing 50 mg of Mifepristone in 20 ml of the mobile phase with the aid of ultrasound for 15 minutes and dilute to 100.0 ml with the mobile phase, centrifuge. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.005 per cent w/v solution of *mifepristone IPRS* in the mobile phase.

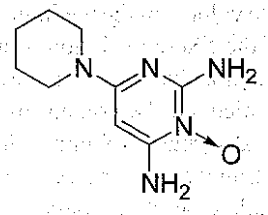
Chromatographic system
- a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 21 volumes of *methanol*, 14 volumes of *acetonitrile*, 15 volumes of *water* and 0.1 volume of *triethylamine*, adjusted to pH 4.5 with *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 302 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 4000 theoretical plates, the tailing factor for the principal peak is not more than 2.0 and relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{29}H_{35}NO_2$ in the tablets.

Minoxidil



$C_9H_{15}N_5O$ Mol. Wt. 209.3

Minoxidil is 2,4-diamino-6-piperidinopyrimidine 3-oxide.

Minoxidil contains not less than 98.5 per cent and not more than 101.0 per cent of $C_9H_{15}N_5O$, calculated on the dried basis.

Category. Antihypertensive.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *minoxidil IPRS* or with the reference spectrum of minoxidil.

B. Dissolve about 20mg in *0.1 M hydrochloric acid* and dilute to 100 ml with the same solvent (solution A). Dilute 2 ml of solution A to 100 ml with *0.1 M hydrochloric acid* (solution B) and dilute 2 ml of solution A to 100 ml with *0.1 M sodium hydroxide* (solution C).

Measure the light absorption of solutions B and C in the range 220 nm to 360 nm (2.4.7). Solution B shows absorption maxima at about 230 nm and 281 nm; absorbance at about 230 nm, 0.406 to 0.448 and at about 281 nm, 0.424 to 0.468. Solution C shows absorption maxima at about 230 nm, 262 nm and 288 nm; absorbance at about 230 nm, 0.610 to 0.674, at about 262 nm, 0.194 to 0.214 and at about 288 nm, 0.222 to 0.242.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 100 volumes of *methanol* and 1.5 volumes of *strong ammonia solution*.

Test solution. Dissolve 0.1 g of the substance under examination in 100 ml of *methanol*.

Reference solution. A 0.1 per cent w/v solution of *minoxidil IPRS* in *methanol*.

Apply to the plate 2 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

D. Dissolve about 10 mg in 1 ml of *methanol*, add 0.1 ml of *cupric sulphate solution*; a green colour develops. The solution becomes greenish-yellow on addition of 0.1ml of *2 M hydrochloric acid*.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 100 ml of the mobile phase.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *deoxyminoxidil IPRS* in the mobile phase and dilute to 20 ml with the mobile phase. To 2 ml of the solution add 2 ml of the test solution and dilute to 10 ml with the mobile phase.

Chromatographic system
- a stainless steel column 10 cm x 3 mm, packed with octadecylsilane bonded to porous silica (5 µm),

- mobile phase: dissolve 3.0 g of *dioctyl sodium sulphosuccinate* in a mixture of 10 ml of *glacial acetic acid*, 300 ml of *water* and 700 ml of *methanol* and adjusted to pH 3.0 with *perchloric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to minoxidil and deoxyminoxidil is not less than 2.0.

Inject reference solution (a), (b) and the test solution. Continue the chromatography for twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the sum of the areas of any secondary peaks is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a). Ignore any peak with an area less than 0.1 times of that of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Heavy metals (2.3.13). Dissolve 1.0 g in 25 ml of *methanol*, the solution complies with the limit test for heavy metals, Method C (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.15 g, dissolve in 50 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02093 g of $C_9H_{15}N_5O$.

Storage. Store protected from light and moisture.

Minoxidil Tablets

Minoxidil Tablets contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of minoxidil, $C_9H_{15}N_5O$.

Usual strengths. 2.5 mg; 5 mg; 10 mg.

Identification

A. Transfer a portion of the finely powdered tablets containing about 10 mg of Minoxidil to a separator, add 25 ml of *water*, and extract with three quantities, each of 15 ml, of *chloroform*. Combine the chloroform extracts and evaporate with the aid of stream of nitrogen. Wash the inside of the container with about 5 ml of *ethanol (95 per cent)*, add 0.3 g of *potassium bromide IR* and evaporate under vacuum at 50° until dry. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *minoxidil IPRS* or with the reference spectrum of minoxidil.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 100 volumes of *methanol* and 1.5 volumes of *strong ammonia solution*.

Test solution. Shake a quantity of the powdered tablets containing 10 mg of Minoxidil with 10 ml of *methanol*, centrifuge and use the supernatant liquid.

Reference solution. A 0.1 per cent w/v solution of *minoxidil IPRS* in *methanol*.

Apply to the plate 2 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *phosphate buffer pH 7.2*,
Speed and time. 75 rpm and 15 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc with an average pore diameter not greater than 1.0 µm. Reject the first few ml of the filtrate and dilute a suitable volume of the filtrate with the same solvent. Measure the absorbance of the resulting solution at the maximum at about 231 nm (2.4.7), for tablets containing up to 10 mg Minoxidil; for tablets containing more than 10 mg of Minoxidil the wavelength used is about 287 nm. Similarly measure the absorbance of a solution of known concentration of *minoxidil IPRS*. Calculate the content of $C_9H_{15}N_5O$.

Q. Not less than 75 per cent of the stated amount of $C_9H_{15}N_5O$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 5 mg of Minoxidil with 20 ml of a solution of *medroxyprogesterone acetate* (internal standard) in the mobile phase having a concentration of about 0.2 mg per ml (solution A) for 5 minutes and centrifuge.

Reference solution. Dissolve a weighed quantity of *minoxidil IPRS* in solution A to obtain a solution having a known concentration of about 0.25 mg per ml.

Chromatographic system
- a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a solution prepared by adding 3.0 g of *docusate sodium* per litre to a mixture of 700 volumes of *methanol*, 300 volumes of *water* and 10 volumes of *glacial acetic acid*, adjusting to pH 3.0 with *perchloric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

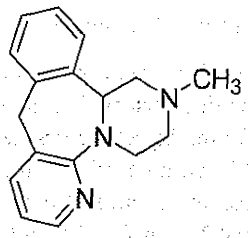
Chromatograph not less than 4 replicate injections of reference solution and record the peak response as mentioned below. The relative standard deviation is not more than 2.0 per cent and the resolution between the internal standard and minoxidil is not less than 2.0.

Inject the reference solution and the test solution. The relative retention times are about 0.8 for the internal standard and 1.0 for minoxidil.

Calculated the content of minoxidil, $C_9H_{15}N_5O$ in the tablets.

Storage. Store protected from light.

Mirtazapine



$C_{17}H_{19}N_3$ Mol. Wt. 265.4

Category. Antidepressant.

Mirtazapine is (14b*RS*)-2-methyl-1,2,3,4,10,14b-hexahydropyrazino[2,1-*a*]pyrido[2,3-*c*] [2]benzazepine.

Mirtazapine contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{17}H_{19}N_3$, calculated on the anhydrous basis.

Description. A white or almost white powder, slightly hygroscopic to hygroscopic in nature. It shows polymorphism (2.5.11).

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *mirtazapine IPRS* or with the reference spectrum of mirtazapine.

Tests

Optical rotation (2.4.22). – 0.10° to + 0.10°, determined in a 1.0 per cent w/v solution in *ethanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of *acetonitrile* and 50 volumes of *water*.

Test solution. Dissolve 30 mg of the substance under examination in the solvent mixture and dilute to 20.0 ml with the solvent mixture.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Further dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 7.5 volumes of *tetrahydrofuran*, 12.5 volumes of *methanol*, 15 volumes of *acetonitrile* and 65 volumes of buffer solution prepared by dissolving 18.0 g of *tetramethylammonium hydroxide* in 950 ml of *water*, adjusted to pH 7.4 with *orthophosphoric acid*, then dilute to 1000 ml with *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Mirtazapine impurity A[1]	0.2	1.3
Mirtazapine impurity B[2]	0.3	1.3
Mirtazapine impurity C[3]	0.35	—
Mirtazapine impurity D[4]	0.4	—
Mirtazapine (retention time: about 25 minutes)	1.0	—
Mirtazapine impurity E[5]	1.3	—
Mirtazapine impurity F[6]	1.35	0.2

[1](14b*RS*)-2-methyl-1,2,3,4,10,14b-hexahydropyrazino[2,1-*a*]pyrido [2,3-*c*] [2]benzazepine 2-oxide,

[2][2-[(2*RS*)-4-methyl-2-phenylpiperazin-1-yl]pyridin-3-yl]methanol,

[3](14b*RS*)-2-methyl-3,4,10,14b-tetrahydropyrazino[2,1-*a*]pyrido[2,3-*c*][2]benzazepin-1(2*H*)-one,

[4](14b*RS*)-1,2,3,4,10,14b-hexahydropyrazino[2,1-*a*]pyrido[2,3-*c*][2]benzazepine,

[5] (2*RS*)-4-methyl-1-(3-methylpyridin-2-yl)-2-phenylpiperazine,

[6](14b*RS*)-2-methyl-1,3,4,14b-tetrahydropyrazino[2,1-*a*]pyrido[2,3-*c*][2]benzazepin-10(2*H*)-one.

Inject the reference solution. The test is not valid unless the tailing factor for the principal peak is not more than 2.0 and the column efficiency is not less than 2000 theoretical plates.

Inject the reference solution and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 3.5 per cent, determined on 1.0 g.

Assay. Dissolve 0.1 g in 35 ml of *glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25).

1 ml of *0.1 M perchloric acid* is equivalent to 0.01327 g of $C_{17}H_{19}N_3$.

Storage. Store protected from moisture.

Mirtazapine Tablets

Mirtazapine Tablets contains not less than 95.0 per cent and not more than 105.0 per cent of $C_{17}H_{19}N_3$.

Usual strengths. 15 mg; 30 mg; 45 mg.

Identification

Mix a quantity of the powdered tablets containing 50 mg of Mirtazapine with 12.5 ml of *water*, add 12.5 ml of *n-hexane*, allow to separate, retain and filter the hexane layer and evaporate the filtrate to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *mirtazapine IPRS* or with the reference spectrum of mirtazapine.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *mirtazapine IPRS* in the dissolution medium to obtain a solution of known concentration similar to the expected concentration of the test solution.

Chromatographic system
- a stainless steel column 25 cm x 4 mm, packed with base deactivated octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil BDS C18),
- column temperature: 40°,
- mobile phase: a mixture of 80 volumes of a solution containing 2 volumes of *triethylamine* and 1000 volumes of a 0.68 per cent w/v solution of *potassium dihydrogen orthophosphate*, adjusted to pH 3.0 with *dilute orthophosphoric acid* and 20 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 292 nm,
- injection volume: 50 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{19}N_3$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{17}H_{19}N_3$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of *acetonitrile* and 50 volumes of *water*.

Test solution. Disperse a quantity of the powdered tablets containing 30 mg of Mirtazapine with 10 ml of the solvent mixture with the aid of ultrasound, dilute to 20.0 ml with the solvent mixture and filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 75 volumes of *tetrahydrofuran*, 125 volumes of *methanol*, 150 volumes of *acetonitrile* and 650 volumes of a solution of 1.8 per cent w/v of *tetramethylammonium hydroxide*, adjusted to pH 7.4 with *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Mirtazapine impurity A[1]	0.2	1.3
Mirtazapine impurity B[2]	0.3	1.3
Mirtazapine impurity C[3]	0.35	---
Mirtazapine impurity D[4]	0.4	---
Mirtazapine (retention time: about 16 minutes)	1.0	---
Mirtazapine impurity E[5]	1.3	---
Mirtazapine impurity F[6]	1.35	0.2

[1](14b*RS*)-2-methyl-1,2,3,4,10,14b-hexahydropyrazino[2,1-*a*]pyrido[2,3-*c*] [2]benzazepine 2-oxide,

[2][2-[(2*RS*)-4-methyl-2-phenylpiperazin-1-yl]pyridin-3-yl]methanol,

[3](14b*RS*)-2-methyl-3,4,10,14b-tetrahydropyrazino[2,1-*a*]pyrido[2,3-*c*] [2]benzazepin-1(2*H*)-one,

[4](14b*RS*)-1,2,3,4,10,14b-hexahydropyrazino[2,1-*a*]pyrido[2,3-*c*][2]benzazepine,

[5] (2*RS*)-4-methyl-1-(3-methylpyridin-2-yl)-2-phenylpiperazine,

[6](14b*RS*)-2-methyl-1,3,4,14b-tetrahydropyrazino[2,1-*a*]pyrido[2,3-*c*] [2]benzazepin-10(2*H*)-one.

Inject reference solution (b). The test is not valid unless the signal-to-noise ratio of the principal peak is not less than 10.

Inject reference solution (a), (b) and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any secondary peak is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of *acetonitrile* and 50 volumes of *water*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 90 mg of Mirtazapine with 50 ml of the solvent mixture and dilute to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution. A 0.009 per cent w/v solution of *mirtazapine IPRS* in the solvent mixture.

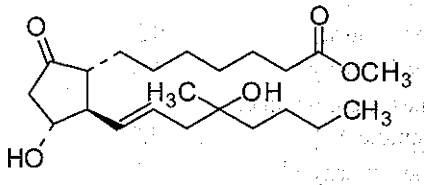
Use chromatographic system as described in the Related substances using a detection wavelength of 290 nm.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{19}N_3$ in the tables.

Misoprostol



$C_{22}H_{38}O_5$ Mol. Wt. 382.5

Misoprostol is (*RS*)-methyl (13*E*)-11,16-dihydroxy-16-methyl-9-oxoprost-13-enoate.

Misoprostol contains not less than 96.5 per cent and not more than 102.0 per cent of $C_{22}H_{38}O_5$, calculated on the anhydrous basis.

Category. Abortifacient; gastric cytoprotector.

Description. A clear, colourless or yellowish oily liquid.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *misoprostol IPRS* or with the reference spectrum of misoprostol.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of the substance under examination in 5.0 ml of *acetonitrile*.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *acetonitrile* .

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with *acetonitrile*.

Reference solution (c). A 0.0025 per cent w/v solution of *misoprostol impurity A IPRS* in reference solution (a).

Reference solution (d). A 0.2 per cent w/v solution of *misoprostol IPRS* in *acetonitrile*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 45 volumes of *acetonitrile*, 55 volumes of *water* and 0.05 volume of 2.45 per cent w/v solution of *orthophosphoric acid*,
- flow rate: 0.75 ml per minute,
- spectrophotometer set at 200 nm,
- injection volume: 10 µl.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to misoprostol impurity A and misoprostol is not less than 1.9. The relative retention time with reference to misoprostol for 8-epimisoprostol (misoprostol impurity A) is about 0.9, for 11-epi misoprostol (misoprostol impurity E) is about 0.9, for 12-epimisoprostol (misoprostol impurity B) (1st peak) is about 0.9 and for misoprostol impurity B (2nd peak) is about 0.95.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. The sum of areas of the peaks due to misoprostol impurity A, B and E is not more than 1.3 times the area of the principal

peak in the chromatogram obtained with reference solution (a) (1.3 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Diastereoisomers. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 20 mg of the substance under examination in 1.0 ml of the mobile phase.

Reference solution. Dilute 0.1 ml of the test solution to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 5 volumes of *2-propanol*, 95 volumes of *heptane* and 0.01 volume of *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the resolution between the 1st peak and the 2nd peak of misoprostol is not less than 2.3. The retention time of Misoprostol 1st peak is about 19 minutes and misoprostol 2nd peak about 21 minutes.

Inject the reference solution and the test solution. Run the chromatogram 1.5 times the retention time of the 1st peak of misoprostol. In the chromatogram obtained with the test solution, the area of the 1st peak of misoprostol is 50 per cent to 55 per cent of the sum of the areas of the 2 peaks due to misoprostol.

Water (2.3.43). Not more than 1.0 per cent, determined on 1 g.

Assay. Determine by liquid chromatography (2.4.14), as described in the Related substances.

Inject reference solution (d) and the test solution.

Calculate the content of $C_{22}H_{38}O_5$.

Storage. Store protected from moisture, at a temperature of about – 20°.

Misoprostol Tablets

Misoprostol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of misoprostol, $C_{22}H_{38}O_5$.

Usual strengths. 25 µg; 100 µg; 200 µg; 600 µg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Disintegration (2.5.1). Not more than 15 minutes.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14) as described in the Assay using following modifications.

Test solution. Disperse 1 tablet in the mobile phase and dilute to 25.0 ml with the mobile phase, filter.

Reference solution. Dissolve a weighed quantity of *misoprostol IPRS* in the mobile phase and dilute with the mobile phase to obtain a solution having a known concentration similar to the expected concentration of the test solution.

- injection volume: 50 µl.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.4 mg of Misoprostol in the mobile phase with the aid of ultrasound for 15 minutes, cool and dilute to 10.0 ml with the mobile phase, filter.

Reference solution. A 0.004 per cent w/v solution of *misoprostol IPRS* in the mobile phase.

Chromatographic system

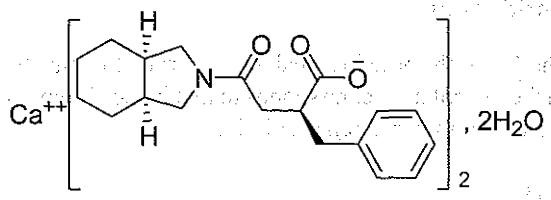
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 30 volumes of buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusting to pH 3.0 with *orthophosphoric acid* and 70 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{38}O_5$ in the tablets.

Mitiglinide Calcium Dihydrate



$C_{38}H_{48}CaN_2O_6,2H_2O$ Mol Wt. 704.9

Mitiglinide Calcium Dihydrate is calcium (*S*)-2-benzyl-4-((3a*R*,7a*S*)-hexahydro-1*H*-isoindol-2(3*H*)-yl)-4-oxobutanoate dehydrate.

Mitiglinide Calcium Dihydrate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{38}H_{48}CaN_2O_6$, calculated on the anhydrous basis.

Category. Antidiabetic.

Description. A white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *mitiglinide calcium dihydrate IPRS* or with the reference spectrum of *mitiglinide calcium dihydrate.*

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

***R*- isomer.** Not more than 0.5 per cent .

Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with mobile phase.

Reference solution. A 0.1 per cent w/v solution of *mitiglinide calcium dihydrate (racemic mixture) IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, such as Sumichiral OA-3100R (5 µm),
- mobile phase: a mixture of 85 volumes of 0.4 per cent v/v solution of *trifluoro acetic acid* in *hexane* and 15 volumes of *isopropyl alcohol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between the isomer and mitiglinide calcium dihydrate is not less than 1.5, column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of R-isomer by area normalisation.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture: 50 volumes of water and 50 volumes of *methanol.*

Test solution. Dissolve 40 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution. A 0.0004 per cent w/v solution of *mitiglinide calcium dihydrate IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase:. a mixture of 55 volumes of 0.02 *M potassium dihydrogen phosphate* in *water,* adjusted to pH 4.0 with *orthophosphoric acid,* and 45 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with test solution the area of any secondary peak is not more than 0.5 times the area of principal peak in the chromatogram obtained with reference solution (0.5 per cent) and the sum of areas of all the secondary peaks is not more than the area of principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Water (2.3.43). Not more than 7.0 per cent, determined on 0.2 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture: 50 volumes of water and 50 volumes of *methanol.*

Test solution. Dissolve 20 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with solvent mixture. Dilute 10.0 ml of the solution to 25.0 ml with the solvent mixture.

Reference solution. A 0.008 per cent w/v solution of *mitiglinide calcium dihydrate IPRS* in the solvent mixture.

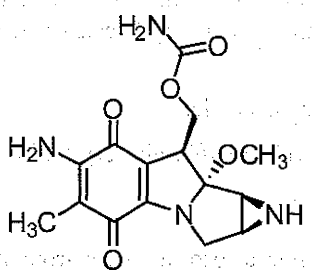
Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: a mixture of 40 volumes of 0.02 *M potassium dihydrogen phosphate* in *water*, adjusted to pH 4.0 with *orthophosphoric acid*, and 60 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates and the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{38}H_{48}CaN_2O_6$.

Mitomycin



$C_{15}H_{18}N_4O_5$ Mol. Wt. 334.3

Mitomycin is (1*S*,2*S*,8*S*,8a*R*)-[6-Amino-8a-methoxy-5-methyl-4,7-dioxo-1,1a,2,4,7,8,8a,8b-octahydroazireno[2',3':3,4] pyrrolo[1,2-*a*]-8-indolyl]methylcarbamate.

Mitomycin has a potency of not less than 970 µg per mg calculated on the anhydrous basis.

Category. Anticancer.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *mitomycin IPRS* or with the reference spectrum of mitomycin.

B. When examined in the range 200 nm to 400 nm (2.4.7), a 0.0005 per cent w/v solution in *methanol* shows an absorption maximum at 357 nm as that of solution of *mitomycin IPRS* prepared in the same manner.

Tests

pH (2.4.24). 6.0 to 7.5, determined in a 0.5 per cent w/v solution.

Water (2.3.43). Not more than 2.5 per cent, determined by Method I.

Mitomycin intended for use in the manufacture of parenteral preparations complies with the following additional requirements.

Bacterial endotoxins (2.2.3). Not more than 10.0 Endotoxin Units per mg of Mitomycin.

Sterility (2.2.11). Complies with the test for sterility.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse 25 mg of the substance under examination in *N,N-dimethylacetamide* and dilute to 50.0 ml with *N,N-dimethylacetamide*.

Reference solution (a). A 0.05 per cent w/v solution of *mitomycin IPRS* in *N,N-dimethylacetamide*.

Reference solution (b). A solution containing 0.05 per cent w/v of *mitomycin IPRS* and 0.75 per cent w/v of *3-ethoxy-4-hydroxybenzaldehyde* in *N,N-dimethylacetamide*.

Chromatographic system
- a stainless steel column 30 cm x 4.0 mm, packed with phenyl groups bonded to porous silica (5 µm),
- mobile phase: dissolve 1.54 g of *ammonium acetate* in 250 ml of *methanol*, add 5.0 ml of *0.83 M acetic acid* and dilute to 1000 ml of *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 365 nm,
- injection volume: 10 µl.

The relative retention time with reference to mitomycin for 3-ethoxy-4-hydroxybenzaldehyde is 1.4.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to mitomycin and 3-ethoxy-4-hydroxybenzaldehyde is not less than 1.8, the tailing factor for the principal peak is not more than 1.3 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{15}H_{18}N_4O_5$.

Storage. Store protected from light and moisture.

Mitomycin Injection

Mitomycin Injection contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of mitomycin, $C_{15}H_{18}N_4O_5$.

Usual strength. 5 mg per 10 ml vial.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Identification

Determine by thin-layer chromatography (2.4.17). coating the plate with *silica gel G*.

Mobile phase. A mixture of 4 volumes of *butyl alcohol*, 2 volumes of *glacial acetic acid* and 1 volume of *water*.

Test solution. Dissolve a quantiy of powder of injection containing 10 mg of Mitomycin in *water* and dilute with to 10.0 ml with *water*.

Reference solution. A 0.1 per cent w/v solution of *mitomycin IPRS* in *water*.

Apply to the plate 2 µl of each solution. After development, dry the plate in air, spray with a 1 per cent w/v solution of *ninhydrin* in *ethanol (95 per cent)*, heat at 110° for 15 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 6.0 to 8.0, where it contain mannitol and 5.5 to 8.5 where it contains hydroxypropyl betadex.

Water (2.3.43). Not more than 5.0 per cent, using Method 1.

Bacterial endotoxins (2.2.3). Not more than 10.0 Endotoxin Units per mg of Mitomycin.

Other tests. Comply with the tests stated under Parenteral Preparations (Powder for Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Add an accurately measured volume of *N,N-dimethylacetamide* to 1 container of mitomycin for injection to obtain a solution containing 0.05 per cent w/v of Mitomycin.

Reference solution (a). A 0.05 per cent w/v solution of *mitomycin IPRS* in *N,N-dimethylacetamide*.

Reference solution (b). A solution containing 0.05 per cent w/v of *mitomycin IPRS* and 0.75 per cent w/v of *3-ethoxy-4-hydroxybenzaldehyde* in *N,N-dimethylacetamide*.

Chromatographic system

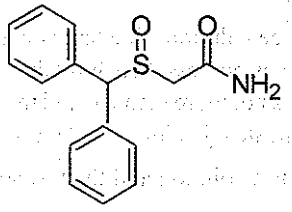
- a stainless steel column 30 cm x 4.0 mm, packed with phenyl groups bonded to porous silica (5 µm),
- mobile phase: dissolve 1.54 g of *ammonium acetate* in 250 ml of *methanol*, add 5.0 ml of *0.83 M acetic acid* and dilute to 1000 ml of *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 365 nm,
- injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to mitomycin and 3-ethoxy-4-hydroxybenzaldehyde is not less than 1.8, the tailing factor for the principal peak is not more than 1.3 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Calculate the content of $C_{15}H_{18}N_4O_5$ in the injection.

Storage. Store protected from light.

Modafinil



$C_{15}H_{15}NO_2S$ Mol.Wt. 273.4

Modafinil is acetamide, 2-[(diphenylmethyl)sulphenyl]; 2-[(Diphenylmethyl)sulfinyl]-acetamide.

Modafinil contains not less than 98.0 per cent and not more than 101.5 per cent of $C_{15}H_{15}NO_2S$, calculated on the anhydrous basis.

Category. Psychoanaleptic.

Description. A white to off-white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *modafinil IPRS* or with the reference spectrum of modafinil.

Tests

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Name	Relative retention time	Correction factor
Modafinil	1.0	—
Salicylic acid[1]	1.1	—
Modafinil acid[2]	1.4	—
Modafinil sulphone[3]	1.7	1.1
Modafinil ester[4]	3.0	—

[1]salicylic acid is used for calculating resolution and is not a potential impurity,

[2]2-[(diphenylmethyl)sulphenyl]acetic acid,

[3]2-[(diphenylmethyl)sulphonyl]acetamide,

[4]2-[(diphenylmethyl)sulphenyl]acetic acid methyl ester.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to modafinil and salicylic acid is not less than 1.3 and the tailing factor for modafinil peak is not more than 1.5.

Inject the test solution. The area of any peak due to modafinil acid, modafinil sulphone and modafinil ester is not more than 0.5 per cent each, the area of any other secondary peak is not more than 0.05 per cent and the sum of areas of all secondary peaks is not more than 1.0 per cent, calculated by area normalisation.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, method B (20 ppm).

Water (2.3.43). Not more than 0.2 per cent.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 35 volumes of *acetonitrile* and 65 volumes of *water.*

Test solution. Dissolve 50 mg of the substance under examination in 50.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the same solvent.

Reference solution (a). A solution containing 0.0005 per cent w/v of *modafinil IPRS* and 0.001 per cent w/v of salicylic acid in the solvent mixture.

Reference solution (b). A 0.01 per cent w/v solution of *modafinil IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 35 volumes of *acetonitrile* and 65 volumes of buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen phosphate* in 900 ml of *water*, adjusted to pH2.3 with *orthophosphoric acid* and diluting to 1000 ml with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

The relative retention time of salicylic acid with reference to modafinil is about 1.1.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to modafinil and salicylic acid is not less than 1.3, the tailing factor is not more than 1.5 and the relative standard deviation of replicate injections is not more than 2.0 per cent, for modafinil peak.

Inject reference solution (b) and the test solution.

Calculate the content of $C_{15}H_{15}NO_2S$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Modafinil Tablets

Modafinil Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of modafinil, $C_{15}H_{15}NO_2S$.

Usual strengths. 100 mg; 200 mg.

Identification

Extract a quantity of powdered tablets containing 0.1 g of modafinil with 50 ml each of *dichloromethane* and *water.* Shake and allow the layers to separate. Filter a portion of the lower (dichloromethane) layer, and evaporate to dryness, using a stream of nitrogen if necessary.

On the residue determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *modafinil IPRS* treated in the same manner or with the reference spectrum of modafinil.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 50 rpm for 30 minutes.

Withdraw a suitable volume of the medium and filter. Reject the first few ml of the filtrate and dilute a suitable volume of the filtrate with dissolution medium. Measure the absorbance of the resulting solution at the maximum at about 222 nm (2.4.7). Calculate the content of modafinil, $C_{15}H_{15}NO_2S$ in the medium from the absorbance obtained from a solution of known concentration of *modafinil IPRS* in the dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_{15}H_{15}NO_2S$.

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

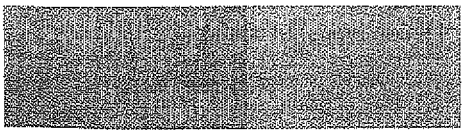
Name	Relative retention time	Correction factor
Modafinil	1.0	---
Salicylic acid A[1]	1.1	---
Modafinil acid B[2]	1.4	1.0
Modafinil sulphone C[3]	1.7	1.1

[1]salicylic acid is used for calculating resolution and is not a potential impurity,

[2]2-[(diphenylmethyl)sulphenyl]acetic acid,

[3]2-[(diphenylmethyl)sulphonyl]acetamide.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to modafinil and salicylic



acid is not less than 1.3. The tailing factor is not more than 1.5 and the relative standard deviation of replicate injections is not more than 2.0 per cent for modafinil peak.

Inject the test solution. The area of any peak due to modafinil acid and modafinil sulphone is not more than 0.5 per cent each, the area of any other secondary peak is not more than 0.2 per cent and the sum of areas of all the secondary peaks is not more than 1.5 per cent, calculated by area normalisation.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture A. 35 volumes of *acetonitrile* and 65 volumes of *water*.

Solvent mixture B. 35 volumes of *acetonitrile*, 65 volumes of *water* and 1 volume of *acetic acid*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 100 mg of Modafinil to a 250-ml volumetric flask, add 200 ml of solvent mixture B and disperse with the aid of ultrasound for about 5 minutes with intermittent shaking. Dilute with solvent mixture B to volume, mix and filter.

Reference solution (a). A solution containing 0.0005 per cent w/v of *modafinil IPRS* and 0.001 per cent w/v of *salicylic acid IPRS* in solvent mixture A.

Reference solution (b). A 0.04 per cent w/v solution of *modafinil IPRS* in solvent mixture B.

Chromatographic system
- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 35 volumes of *acetonitrile* and 65 volumes of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen phosphate* in 900 ml of *water*, adjusted to pH2.3 with *orthophosphoric acid* and diluting to 1000 ml with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 5 µl.

The relative retention time with respect to modafinil for salicylic acid is about 1.1.

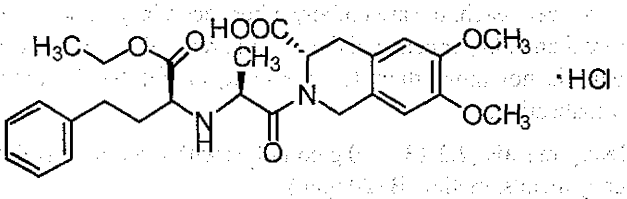
Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to modafinil and salicylic acid is not less than 1.3 in the chromatogram obtained with reference solution (a), the tailing factor is not more than 1.5 and the relative standard deviation of replicate injections is not more than 2.0 per cent for the modafinil peak in the chromatogram obtained with reference solution (b).

Inject reference solution (b) and the test solution.

Calculate the content of $C_{15}H_{15}NO_2S$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Moexipril Hydrochloride



$C_{27}H_{34}N_2O_7,HCl$ Mol Wt. 535.0

Moexipril Hydrochloride is (3*S*)-2-[(2*S*)-2-{[(1*S*)-(1-Ethoxycarbonyl)-3-phenyl]propyl]amino}propanoyl]-6,7-dimethoxy-1,2,3,4-tetrahydroisoquinoline-3-carboxylic acid hydrochloride.

Moexipril Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{27}H_{34}N_2O_7,HCl$, calculated on the anhydrous basis.

Category. Antihypertensive.

Description. A white to off white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *moexipril hydrochloride IPRS* or with the reference spectrum of moexipril hydrochloride.

Tests

Specific optical rotation (2.4.24). +33° to +35°, determined on 1.1 per cent w/v solution in *ethanol* at 23°.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of *water* and 50 volumes of *acetonitrile*.

Test solution. Dissolve 25 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with solvent mixture.

Reference solution. A 0.00025 per cent w/v solution of *moexipril hydrochloride IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: A. dissolve 2.0 g of *sodium perchlorate* in 1000 ml of *water*, add 1.0 ml of *triethylamine*, adjusted to pH 2.5 with *perchloric acid*,

B. *acetonitrile*,

– a gradient programme using the conditions given below,
– flow rate: 1 ml per minute,
– spectrophotometer set at 214 nm,
– injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	60	40
30	40	60
32	65	35
40	65	35

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates , the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of areas of all the secondary peaks is not more than 4 times the area of principal peak in the chromatogram obtained with the reference solution (2.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

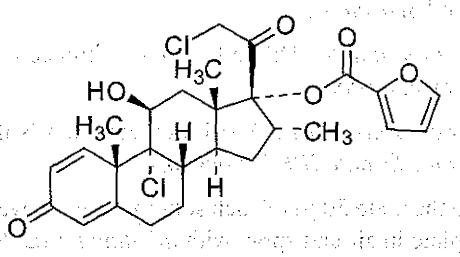
Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 2.0 per cent, determined on 0.5 g.

Assay. Dissolve 0.5 g in 50.0 ml of *glacial acetic acid* and add 15 ml of 10 percent w/v solution of *mercuric acetate* . Titrate with *0.1 M perchloric acid*, using *crystal-violet* as an indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.053503 g of $C_{27}H_{34}N_2O_7,HCl$.

Mometasone Furoate



$C_{27}H_{30}Cl_2O_6$ Mol. Wt. 521.4

Mometasone Furoate is 9α,21-Dichloro-11β-hydroxy-16α-methyl-3,20-dioxopregna-1,4-dien-17-yl furan-2-carboxylate.

Mometasone Furoate contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{27}H_{30}Cl_2O_6$, calculated on the dried basis.

Category. Glucocorticoid.

Description. A white or almost white powder.

Identification

Test A may be omitted if tests B, C and D are carried out and tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *mometasone furoate IPRS* or with the reference spectrum of mometasone furoate.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. a mixture of 1.2 volumes of *water*, 8 volumes of *methanol*, 15 volumes of *ether* and 77 volumes of *dichloromethane*.

Test solution. Dissolve 10 mg of the substance under examination in 10.0 ml of *dichloromethane*.

Reference solution (a). A 0.1 per cent w/v solution of *mometasone furoate IPRS* in *dichloromethane*.

Reference solution (b). Dissolve 10 mg of *beclometasone dipropionate IPRS* in 10.0 ml of reference solution (a).

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with reference solution (a). Spray with *ethanolic sulphuric acid*. Heat at 120° for 10 minutes or until the spots appear. Allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with reference solution (a). In the chromatogram obtained with reference solution (b), shows 2 spots which, when examined under ultraviolet light at 365 nm, may not be completely separated.

C. Shake about 2 mg with 2 ml of *sulphuric acid* for 15 minutes, a light yellow colour develops. When examined under ultraviolet light at 365 nm, no fluorescence is seen. Add this solution to 10 ml of *water* and mix. The colour fades and there is no fluorescence.

D. Mix 80 mg with 0.3 g of *anhydrous sodium carbonate* and ignite in a crucible until an almost white residue is obtained. Allow to cool and dissolve the residue in 5 ml of *dilute nitric acid*, filter. To 1 ml of the filtrate, add 1 ml of *water*. The solution gives reaction (A) of chlorides (2.3.1).

Tests

Specific optical rotation (2.4.22). + 50° to + 55°, determined in 0.5 per cent w/v solution in *ethanol (95 per cent)*.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use.

Solvent mixture. 50 volumes of *acetonitrile,* 50 volumes of *water* and 0.1 volume of *acetic acid*.

Test solution. Dissolve 25 mg of the substance under examination in 4 ml of *acetonitrile* and dilute to 25.0 ml with the solvent mixture.

Reference solution (a). Dissolve 2.5 mg of *mometasone furoate IPRS* and 6 mg of *beclometasone dipropionate IPRS* in 10.0 ml of the solvent mixture. Dilute 2.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the test solution to 20.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of *acetonitrile* and 50 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to mometasone furoate and beclometasone dipropionate is not less than 6.0.

Inject reference solution (b) and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent) and the sum of all the secondary peaks is not more than 1.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.6 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 0.67 g complies with the limit test for heavy metals, Method B (30 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 50 mg in 100.0 ml of *ethanol (95 per cent)*. Dilute 2.0 ml of the solution to 100.0 ml with *ethanol (95 per cent)* and measure the absorbance of the resulting solution at the maximum at about 249 nm (2.4.7). Calculate the content of $C_{27}H_{30}Cl_2O_6$ taking 481 as the specific absorbance at 249 nm.

Mometasone Aqueous Nasal Spray

Mometasone Aqueous Nasal Spray is an aqueous suspension of Mometasone Furoate in a suitable pressurised container fitted with an appropriate nasal delivery system.

The nasal spray complies with the requirements stated under Nasal Preparations and with the following requirements.

Mometasone Aqueous Nasal Spray contains not less than 80.0 per cent and not more than 120.0 per cent of the stated amount of mometasone furoate, $C_{27}H_{30}Cl_2O_6$.

Usual strength. 0.05 per cent w/v.

Identification

A. In the test for Related substances, the principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (d).

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 3 volumes of *methanol* and 97 volumes of *1, 2-dichloroethane*.

Test solution. Dissolve 1 mg of Mometasone Furoate in 4 ml of *acetone*, sonicate and filter. Evaporate the filtrate to dryness and dissolve in 1.0 ml of *acetone*.

Reference solution (a). A 0.002 per cent w/v of solution of *mometasone furoate IPRS* in *acetone*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) with 1.0 ml of *acetone*.

Reference solution (c). Dilute 1.0 ml of reference solution (a) with 3.0 ml of *acetone*.

Reference solution (d). A 0.1 per cent w/v solution of *mometasone furoate IPRS* in *acetone*.

Apply to the plate 50 µl of each solution. After development, dry the plate in air and spray with *alkaline tetrazolium blue solution* and heat at 50° for 5 minutes and allow to cool, again spray with *alkaline tetrazolium blue solution*. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained

with reference solution (a) (2.0 per cent). Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b) (1.0 per cent), any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.5 per cent).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a quantity of nasal spray containing1 mg of Mometasone Furoate in 20 ml of hot *methanol (90 per cent)*, and add 25 ml of *2,2,4- trimethylpentane*, cool, shake the mixture and filter the lower methanol layer through a small plug of absorbent cotton previously washed with *methanol (80 per cent)*. Repeat the extraction of the *2,2,4-trimethylpentane* layer with two further 10 ml quantities of *methanol (80 per cent)*, filtering the extracts through the absorbent cotton. Combine the extracts and add sufficient *methanol (80 per cent)* to produce 50 ml. Filter through a 0.45 µm nylon filter.

Reference solution. A 0.002 per cent w/v solution of *mometasone furoate IPRS* in *methanol (80 per cent)*.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with base-deactivated end-capped octadecylsilane bonded to porous silica (5 µm),
- column temperature: 60°,
- mobile phase: a mixture of 45 volumes of *water* and 55 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 238 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor of the peak due to mometasone furoate is not more than 1.2.

Inject the reference solution and the test solution.

Calculate the content of $C_{27}H_{30}Cl_2O_6$.

Labelling. The label states the amount of active ingredient delivered by each actuation of the valve and the number of deliveries available from the container.

Mometasone Cream

Mometasone Furoate Cream

Mometasone Cream contains Mometasone Furoate in a suitable cream base.

Mometasone Cream contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of mometasone furoate, $C_{27}H_{30}Cl_2O_6$.

Usual strength. 0.1 per cent w/w.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 5 volumes of *absolute ethanol*, 10 volumes of *acetone* and 100 volumes of *dichloromethane*.

Test solution. Disperse a quantity of the cream containing about 0.5 mg of Mometasone Furoate in 20 ml of *methanol (80 per cent)* by heating on a water-bath until the solution begins to boil. Shake vigorously, cool in ice for 30 minutes and centrifuge. Mix 10 ml of the supernatant liquid with 3 ml of *water* and 5 ml of *dichloromethane*, shake vigorously, allow the layers to separate, evaporate the *dichloromethane* layer to dryness in a current of nitrogen with gentle heating and dissolve the residue in 1 ml of *dichloromethane*.

Reference solution (a). A 0.025 per cent w/v solution of *mometasone furoate IPRS* in *dichloromethane*.

Reference solution (b). A mixture of equal volume of test solution and reference solution (a).

Apply to the plate 10 µl of each solution. After development, dry the plate in air, heat at 105° for 5 minutes and, while hot, spray with *alcoholic sulphuric acid solution* and heat at 105° for a further 5 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single compact spot.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Other tests. Comply with the tests stated under Creams.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the cream containing about 1 mg of Mometasone Furoate in 20 ml of hot *methanol (90 per cent)*, add 25 ml of *2,2,4-trimethylpentane*, cool, shake the mixture and filter the lower methanol layer through a small plug of absorbent cotton previously washed with *methanol (80 per cent)*. Repeat the extraction of the *2,2,4- trimethylpentane* layer with two further 10 ml quantities of *methanol (80 per cent)*, filter the extracts and dilute to 50 ml with *methanol (80 per cent)*, filter.

Reference solution. A 0.002 per cent w/v solution of *mometasone furoate IPRS* in *methanol (80 per cent)*.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with base deactivated endcapped octadecylsilane bonded to porous silica (5 µm) (such as Hypersil BDS C18),

- column temperature: 60°,
- mobile phase: a mixture of 45 volumes of *water* and 55 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 238 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor of the principal peak is not more than 1.2.

Inject the reference solution and the test solution.

Calculate the content of $C_{27}H_{30}Cl_2O_6$ in the cream.

Storage. Store protected from light.

Mometasone Ointment

Mometasone Furoate Ointment

Mometasone Ointment contains Mometasone Furoate in a suitable base.

Mometasone Ointment contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of mometasone furoate, $C_{27}H_{30}Cl_2O_6$.

Usual strength. 0.1 per cent w/w.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 5 volumes of *absolute ethanol*, 10 volumes of *acetone* and 100 volumes of *dichloromethane*.

Test solution. Disperse a quantity of the ointment containing about 0.5 mg of Mometasone Furoate in 20 ml of *methanol (80 per cent)* by heating on a water-bath until the solution begins to boil. Shake vigorously, cool in ice for 30 minutes and centrifuge. Mix 10 ml of the supernatant liquid with 3 ml of *water* and 5 ml of *dichloromethane*, shake vigorously, allow the layers to separate, evaporate the *dichloromethane* layer to dryness in a current of nitrogen with gentle heating and dissolve the residue in 1 ml of *dichloromethane*.

Reference solution (a). A 0.025 per cent w/v solution of *mometasone furoate IPRS* in *dichloromethane*.

Reference solution (b). A mixture of equal volume of test solution and reference solution (a).

Apply to the plate 10 µl of each solution. After development, dry the plate in air, heat at 105° for 5 minutes and, while hot, spray with *alcoholic sulphuric acid solution* and heat at 105° for a further 5 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single compact spot.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Other tests. Comply with the tests stated under Ointments.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the ointment containing about 1 mg of Mometasone Furoate in 20 ml of hot *methanol (90 per cent)*, add 25 ml of *2,2,4-trimethylpentane*, cool, shake the mixture and filter the lower methanol layer through a small plug of absorbent cotton previously washed with *methanol (80 per cent)*. Repeat the extraction of the *2,2,4- trimethylpentane* layer with two further 10 ml quantities of *methanol (80 per cent)*, filter the extracts and dilute to 50 ml with *methanol (80 per cent)*, filter.

Reference solution. A 0.002 per cent w/v solution of *mometasone furoate IPRS* in *methanol (80 per cent)*.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm) (such as Hypersil BDS C18),
- column temperature: 60°,
- mobile phase: a mixture of 45 volumes of *water* and 55 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 238 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor of the principal peak is not more than 1.2.

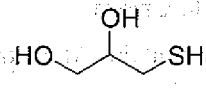
Inject the reference solution and the test solution.

Calculate the content of $C_{27}H_{30}Cl_2O_6$ in the ointment.

Storage. Store protected from light.

Monothioglycerol

Thioglycerol



$C_3H_8O_2S$ Mol. Wt. 108.2

Monothioglycerol is 3-mercaptopropane-1,2-diol.

Monothioglycerol contains not less than 97.0 per cent and not more than 101.0 per cent of $C_3H_8O_2S$, calculated on the anhydrous basis.

Category. Pharmaceutical aid.

Description. A colourless to pale yellow, viscous liquid; hygroscopic.

Tests

pH (2.4.24). 3.5 to 7.0, determined in a 10.0 per cent w/v solution.

Relative density (2.4.29). 1.241 to 1.250.

Refractive index (2.4.27). 1.521 to 1.526 at 25°.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

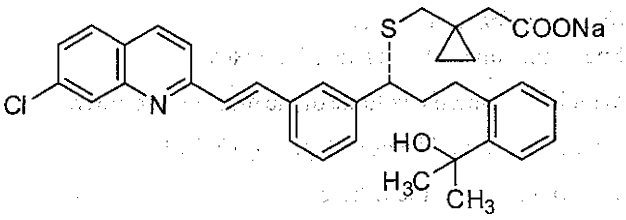
Water (2.3.43). Not more than 5.0 per cent, determined by Method 2 on 50.0 g.

Assay. Weigh 0.2 g, dissolve in 50 ml of *water* and titrate with *0.05 M iodine* using 3 ml of *starch solution*, added towards the end of the titration, as indicator.

1 ml of *0.05 M iodine* is equivalent to 0.01082 g of $C_3H_8O_2S$.

Storage. Store protected from light and moisture.

Montelukast Sodium



$C_{35}H_{35}ClNNaO_3S$ Mol. Wt. 608.2

Montelukast sodium is monosodium salt of 1-[[[(1*R*)-1-[3-[(1*E*)-2-(7-chloro-2-quinolinyl)ethenyl]phenyl]-3-[2-(1-hydroxy-1-methylethyl)phenyl]propyl]thio]methyl]cyclopropaneacetic acid.

Montelukast Sodium contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{35}H_{35}ClNNaO_3S$, calculated on the anhydrous basis.

Category. Antiasthmatic (add-on therapy for mild to moderate asthma).

Description. A white to pale yellow powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum obtained with *montelukast sodium IPRS* or with the reference spectrum of montelukast sodium.

B. It gives reaction (A) of sodium salt (2.3.1).

Tests

Specific optical rotation (2.4.22). +95.0° to +106.0°, determined on 1.0 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Use freshly prepared solution, sonicate in ice-cold water.

Solvent mixture. 20 volumes of *water* and 80 volumes of *methanol*.

Test solution. Dissolve about 100 mg of the substance under examination in 100.0 ml of the solvent mixture.

Reference solution (a). A 0.1 per cent w/v solution of *montelukast sodium IPRS* in the solvent mixture.

Reference solution (b). Dilute 10.0 ml of reference solution (a) to 100.0 ml with the solvent mixture. Dilute 3.0 ml of the solution to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (such as Hypersil ODS),
- mobile phase: A. dissolve 3.85 g of *ammonium acetate* in 1000 ml of *water*, add 1 ml of *triethylamine*, adjusted to pH 5.5 with *glacial acetic acid*,
  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	40	60
20	30	70
45	20	80
55	15	85
60	15	85
65	40	60
70	40	60

The relative retention time with reference to montelukast for montelukast sulphoxide isomers is about 0.66 and 0.69 and for montelukast styrene is about 1.38.

Inject reference solution (b). The test is not valid unless the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution the sum of areas of montelukast sulphoxide isomers is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of the peak due to montelukast styrene is not more than area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent) and the sum of areas of all the secondary peaks is not more than 3.3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent).

Heavy Metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Water (2.3.43). Not more than 3.0 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14).

NOTE—Use freshly prepared solution, sonicate in ice-cold water.

Solvent mixture. 20 volumes of *water* and 80 volumes of *methanol*.

Test solution. Dissolve about 50 mg of the substance under examination in 100.0 ml of the solvent mixture.

Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution (a). A 0.05 per cent w/v solution of *montelukast sodium IPRS* in the solvent mixture.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 50.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (such as Hypersil ODS),
- mobile phase: a mixture of 22 volumes of buffer solution prepared by dissolving 3.85 g of *ammonium acetate* in 1000 ml of *water*, add 1 ml of *triethylamine*, adjusted to pH 5.5 with *glacial acetic acid* and 78 volumes of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the theoretical plates is not less than 2000, tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (b) and the test solution.

Calculate the content of $C_{35}H_{35}ClNNaSO_3$.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Montelukast Granules

Montelukast Sodium Granules

Montelukast Granules contain not less than 94.0 per cent and not more than 105.0 per cent of the stated amount of montelukast, $C_{35}H_{36}ClNO_3S$.

Usual strength. 4 mg per pack.

Identification

A. Shake a quantity of the granules containing about 5 mg of montelukast in 150 ml of a solution of 1 volume of *water* and 3 volumes of *methanol* (solvent A). Mix with the aid of ultrasound for 70 minutes with occasional shaking. Add sufficient solvent A to obtain a solution containing 0.0025 per cent w/v of montelukast, mix and centrifuge. When examined in the range 210 to 400 nm (2.4.7), exhibits maxima at 284 nm, 328 nm, 345 nm and 359 nm.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of a 0.5 per cent w/v solution of *sodium dodecyl sulphate* in *water*,
Speed and time. 50 rpm and 20 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate.

Reference solution. A 0.025 per cent w/v solution of *montelukast sodium IPRS* in *methanol*. Dilute 1.0 ml of the solution to 50.0 ml with 0.5 per cent w/v solution of *sodium dodecyl sulphate*.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with phenylsilane bonded to porous silica (5 µm),
- column temperature: 50°,
- mobile phase: equal volumes of a 0.2 per cent v/v solution of *trifluoroacetic acid* in *water* and a 0.2 per cent v/v solution of *trifluoroacetic acid* in *acetonitrile*.
- flow rate: 0.9 ml per minute,
- spectrophotometer set at 389 nm,
- injection volume: 25 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{35}H_{36}ClNO_3S$ in the dissolution medium.

1 mg of $C_{47}H_{59}ClN_2O_3S$ is equivalent to 0.7637 mg of $C_{35}H_{36}ClNO_3S$.

Q. Not less than 80 per cent of the stated amount of $C_{35}H_{36}ClNO_3S$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of 1 volume of *water* and 3 volumes of *methanol.*

Test solution. To a quantity of the granules containing 60 mg of montelukast add 250 ml of solvent mixture and mix with the aid of ultrasound.

Reference solution (a). Dilute 1.0 ml of test solution to 100.0 ml with the solvent mixture. Further dilute 1.0 ml of the solution to 5.0 ml with solvent mixture.

Reference solution (b). To 10 ml of test solution add 4 µl of *hydrogen peroxide solution (100 vol)* and mix. Expose the solution to ambient light for 1 hour (generation of impurity G).

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with phenylhexylsilane bonded to porous silica (5 µm),
- column temperature: 50°,
- mobile phase: A. a solution containing 0.2 per cent v/v of *trifluoroacetic* acid in *water,*
  B. a mixture of 2 volumes of *acetonitrile* and 3 volumes of *methanol,*
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 255 nm,
- injection volume: 15 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	48	52
5	48	52
10	45	55
17	45	55
27	25	75
28	25	75
30	48	52
40	48	52

Name	Relative retention time
Montelukast impurity C[1]	0.45
Montelukast impurity G[2]	0.92
Montelukast (Retention time: about 20 minutes)	1.0
Montelukast impurity F[3]	1.04
Montelukast impurity D[4]	1.16
Montelukast impurity E[5]	1.18
Montelukast impurity B[6]	1.55

[1][1-[[[1-[3-[(*E*)-2-(7-chloroquinolin-2-yl)ethenyl]phenyl]-3-[2-(1-hydroxy-1-methylethyl)phenyl]propyl]sulfinyl]methyl] cyclopropyl] acetic acid,

[2][1-[[[(1*R*)-1-[3-[(*Z*)-2-(7-chloroquinolin-2-yl)ethenyl]phenyl]-3-[2-(1-hydroxy-1-methylethyl)phenyl]propyl]sulfanyl]methyl] cyclopropyl]acetic acid,

[3][1-[[[(1*R*)-3-(2-acetylphenyl)-1-[3-[(*E*)-2-(7-chloroquinolin-2-yl)ethenyl]phenyl]propyl]sulfanyl]methyl]cyclopropyl]acetic acid,

[4][1-[[[(1*R*)-1-[3-[(1*R*)-1-[[[1-(carboxymethyl)cyclopropyl]methyl] sulfanyl]-2-(7-chloroquinolin-2-yl)ethyl]phenyl]-3-[2-(1-hydroxy-1-methylethyl)phenyl]propyl]sulfanyl]methyl]cyclopropyl]acetic acid,

[5][1-[[[(1*R*)-1-[3-[(1*S*)-1-[[[1-(carboxymethyl)cyclopropyl]methyl] sulfanyl]-2-(7-chloroquinolin-2-yl)ethyl]phenyl]-3-[2-(1-hydroxy-1-methylethyl)phenyl]propyl]sulfanyl]methyl]cyclopropyl]acetic acid,

[6][1-[[[(1*R*)-1-[3-[(*E*)-2-(7-chloroquinolin-2-yl)ethenyl]phenyl]-3-[2-(1-methylethenyl)phenyl]propyl]sulfanyl]methyl]cyclopropyl]acetic acid.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to montelukast impurity G and montelukast is not less than 1.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of the peak corresponding to montelukast impurity C is not more than 8.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.7 per cent), the area of the peak corresponding to montelukast impurity B is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent), the area of the peak corresponding to montelukast impurity D and E are not more than 0.75 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent), the area of the peak corresponding to montelukast impurity F or G are not more than 0.75 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent of each), The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), The sum of areas of all the secondary peaks is not more than 13.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (2.7 per cent). Ignore any peak with an area less than half the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Uniformity of content. Complies with the test stated under Granules.

Determine by liquid chromatography (2.4.14).

Test solution. To the contents of one packet of granules add 100 ml of *methanol* and mix with the aid of ultrasound. Add sufficient *methanol* to obtain a solution containing the equivalent of 0.002 per cent w/v of montelukast.

Reference solution. A 0.002 per cent w/v solution of *montelukast sodium IPRS* in *methanol*.

Chromatographic system
- a stainless steel column 10 cm x 3.0 mm, packed with phenylsilane bonded to porous silica (5 µm),
- column temperature: 50°,
- mobile phase: equal volumes of a 0.2 per cent v/v solution of *trifluoroacetic acid* in *water* and a 0.2 per cent v/v solution of *trifluoroacetic acid* in *acetonitrile*,
- flow rate: 0.9 ml per minute,
- spectrophotometer set at 389 nm,
- injection volume: 5 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{35}H_{36}ClNO_3S$ in the tablet.

1 mg of $C_{47}H_{59}ClN_2O_3S$ is equivalent to 0.7637 mg of $C_{35}H_{36}ClNO_3S$.

Other tests. Comply with the tests stated under Granules.

Assay. Determine by liquid chromatography (2.4.14). as described under Related substances, using the following modifications.

Solvent mixture. A mixture of 1 volume of *water* and 3 volumes of *methanol*.

Test solution. To a quantity of the granules containing 60 mg of Montelukast add sufficient solvent mixture to obtain a solution containing the equivalent of 0.024 per cent w/v of Montelukast, mix with the aid of ultrasound and filter .

Reference solution (a). A 0.025 per cent w/v solution of *montelukast sodium IPRS* in the solvent mixture.

Reference solution (b). To 10 ml of test solution add 4 µl of *hydrogen peroxide solution (100 vol)* and mix. Expose the solution to ambient light for 1 hour (generation of impurity G).

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to montelukast impurity G and montelukast is not less than 1.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{35}H_{36}ClNO_3S$ in the tablets.

1 mg of $C_{47}H_{59}ClN_2O_3S$ is equivalent to 0.7637 mg of $C_{35}H_{36}ClNO_3S$.

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of the equivalent amount of montelukast.

Montelukast Tablets

Montelukast Sodium Tablets

Montelukast Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of montelukast, $C_{35}H_{36}ClNO_3S$.

Usual strengths. 5 mg; 10 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of 0.5 per cent w/v solution of *sodium dodecyl sulphate* in *water*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate.

Reference solution. Dissolve a quantity of *montelukast sodium IPRS* in the dissolution medium and dilute with dissolution medium to obtain a solution having a known concentration similar to the test solution.

Use the chromatographic system as described in the Assay.

Inject the reference solution. The test is not valid unless the theoretical plates is not less than 2000, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{35}H_{36}ClNO_3S$ in the tablet.

Q. Not less than 70 per cent of the stated amount of $C_{35}H_{36}ClNO_3S$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. A 0.1 per cent v/v solution of *triethylamine* in *methanol*.

Test solution. Weigh and transfer intact tablets containing about 100 mg of montelukast in 200-ml volumetric flask. Add

about 20 ml of *water*, sonicate. Add 150 ml of the solvent mixture and sonicate for 20 minutes at a temperature not exceeding 10° and dilute to 200.0 ml with the solvent mixture, filter.

Reference solution (a). A 0.0025 per cent w/v solution of *montelukast sodium IPRS* in the solvent mixture

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 50.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- column temperature: 40°,
- mobile phase: A. a solution containing 6.0 g of *ammonium acetate* in 1000 ml of *water*, adjusted to pH 5.5 with *acetic acid*,
  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	50	50
15	35	65
40	30	70
60	20	80
65	20	80
70	50	50
75	50	50

Inject reference solution (b). The test is not valid unless the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of the peak corresponding to sulphoxide impurity at relative retention time 0.63 is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent), and the area of the peak corresponding to styrene impurity at about relative retention time 1.37 is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than 4 times the area of the peak in the chromatogram obtained with reference solution (b) (2.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. A 0.1 per cent v/v solution of *triethylamine* in *methanol*.

Test solution. Weigh and transfer intact tablets containing about 100 mg of montelukast in 200-ml volumetric flask. Add about 20 ml of *water*, sonicate. Add 150 ml of the solvent mixture, sonicate for 20 minutes at a temperature not exceeding 10°. Dilute to 200.0 ml with the solvent mixture, filter. Dilute 5.0 ml of the solution to 25.0 ml with the solvent mixture.

Reference solution. Dissolve 26 mg of *montelukast sodium IPRS* in 250.0 ml of the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- column temperature: 40°,
- mobile phase: a mixture of 20 volumes of a buffer solution prepared by dissolving 3.85 g of *ammonium acetate* in 1000 ml of *water*, add 1.0 ml *triethylamine*, adjusted to pH5.5 with *acetic acid* and 80 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the theoretical plates is not less than 2000, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent

Inject the reference solution and the test solution.

Calculate the content of $C_{35}H_{36}ClNO_3S$ in the tablets.

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of the equivalent amount of montelukast.

Montelukast and Levocetirizine Tablets

Montelukast Sodium and Levocetirizine Hydrochloride Tablets

Montelukast and Levocetirizine Tablets contain montelukast sodium equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of montelukast, $C_{35}H_{36}ClNO_3S$ and levocetirizine hydrochloride, $C_{21}H_{25}N_2O_3Cl,2HCl$.

Usual strengths. Montelukast, 5 mg and Levocetirizine Hydrochloride, 2.5 mg; Montelukast, 4 mg and Levocetirizine Hydrochloride, 2.5 mg; Montelukast, 10 mg and Levocetirizine Hydrochloride, 5 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the principal peaks in the chromatogram obtained with reference solution (c).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of 1.0 per cent w/v *sodium lauryl sulphate* in *water*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Dilute the filtrate with mobile phase A.

Reference solution (a). A 0.057 per cent w/v solution of *montelukast sodium IPRS* in *methanol.*

Reference solution (b). A 0.028 per cent w/v solution of *levocetirizine hydrochloride IPRS* in *methanol.*

Reference solution (c). Dilute a suitable quantity of reference solution (a) and (b) with mobile phase A to obtain a solution having similar concentration as that of test solution.

Use chromatographic system as described under Assay, using 100 µl injection volumes.

Inject reference solution (c) and the test solution.

Calculate the content of $C_{35}H_{36}ClNO_3S$ and $C_{21}H_{25}N_2O_3Cl,2HCl$.

Q. Not less than 70 per cent of the stated amounts of $C_{35}H_{36}ClNO_3S$ and $C_{21}H_{25}N_2O_3Cl,2HCl$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 15 volumes of mobile phase A and 85 volumes of *methanol.*

NOTE — Carry out the test protected from light and prepare solution immediately before use.

Test solution. Disperse a quantity of powdered tablets containing 25 mg of Levocetirizine in 30 ml of solvent mixture with the aid of ultrasound for 5 minutes, and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). A solution containing 0.005 per cent w/v of *montelukast sulphoxide IPRS* and *montelukast styrene IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.053 per cent w/v of *montelukast sodium IPRS* and 0.025 per cent w/v of *levocetrizine hydrochloride IPRS* in the solvent mixture. Dilute 5.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution (c). Dilute 5.0 ml of reference solution (a) and reference solution (b) to 25.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil BDS),
- column temperature: 40°,
- sample temperature: 8°,
- mobile phase: A. a 0.6 per cent w/v solution of *ammonium acetate* in *water*, adjusted to pH 5.5 with *glacial acetic acid*,
  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1.3 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	48	52
15	48	52
38	15	85
55	15	85
60	48	52
65	48	52

Name	Relative retention time
Levocetirizine	0.24
Montelukast sulphoxide impurity	0.89
Montelukast (Retention time about 35 minutes)	1.0
Montelukast styrene impurity	1.12

Inject reference solution (c). The test is not valid unless the column efficiency is not less than 2000 theoretical plates, tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to montelukast sulphoxide is not more than the area of the peak due to montelukast sulphoxide in the chromatogram obtained with reference solution (c) (2.0 per cent), the area of any peak corresponding to montelukast styrene is not more than 0.5 times the area of the peak due to montelukast styrene in the chromatogram obtained with reference solution (c) (1.0 per cent), the area of any other secondary peak is not more than the area of the peak due to montelukast in the chromatogram obtained reference solution (c) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 4 times the area of the peak due to montelukast in the chromatogram obtained with reference

solution (c) (4.0 per cent). Ignore any peak with an area less than 0.05 times the area of the peak due to montelukast in the chromatogram obtained with reference solution (c) (0.05 per cent) and the peak due to levocetirizine.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), using the chromatographic system and reference solution (c) as described under Assay.

Test solution. Disperse one tablet in 100-ml of volumetric flask. Add 25 ml of solvent mixture and sonicate for about 10 minutes with intermittent shaking. Dilute to volume with solvent mixture, mix and centrifuge.

Inject reference solution (c) and the test solution.

Calculate the contents of $C_{35}H_{36}ClNO_3S$ and $C_{21}H_{25}N_2O_3Cl,2HCl$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14)

Solvent mixture. 30 volumes of a buffer solution prepared by dissolving 0.7791 g of *ammonium acetate* in 1000 ml of *water* and add 0.1 ml of *glacial acetic acid* and 70 volumes *acetonitrile*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 25 mg of Montelukast Sodium in a 100-ml volumetric flask, add 70.0 ml of solvent mixture and sonicate for 15 minutes and make to volume with solvent mixture, mix and centrifuge. Dilute 5.0 ml of the solution to 25.0 ml with the solvent mixture.

Reference solution (a). A 0.25 per cent w/v solution of *montelukast sodium IPRS* in the solvent mixture.

Reference solution (b). A 0.125 per cent w/v solution of *levocetirizine hydrochloride IPRS* in the solvent mixture.

Reference solution (c). Dilute reference solution (a) and (b) with the Solvent mixture to obtain a solution having a known concentration similar to the test solution.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase A. a mixture of 60 volumes of a buffer solution prepared by dissolving 0.7791 g of *ammonium acetate* in 1000 ml of *water* and add 0.1 ml of *glacial acetic acid* and 40 volumes *acetonitrile*.

  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
7	100	0
8	55	45
24	55	45
25	10	90
29	10	90
29.1	100	0
35	100	0

Inject reference solution (c). The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

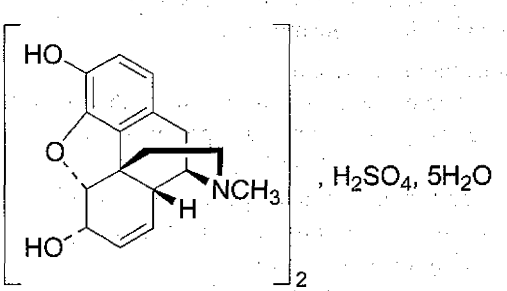
Inject reference solution (c) and the test solution.

Calculate the contents of $C_{35}H_{36}ClNO_3S$ and $C_{21}H_{25}N_2O_3Cl$, 2HCl in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of montelukast and levocetirizine hydrochloride.

Morphine Sulphate



$(C_{17}H_{19}NO_3)_2,H_2SO_4,5H_2O$ Mol. Wt. 758.8

Morphine Sulphate is 7,8-didehydro-4,5α-epoxy-17-methylmorphinan-3,6α-diol sulphate pentahydrate.

Morphine Sulphate contains not less than 98.0 per cent and not more than 102.0 per cent of $(C_{17}H_{19}NO_3)_2,H_2SO_4$, calculated on the dried basis.

Category. Narcotic analgesic.

Description. White, acicular crystals or cubical masses or a white, crystalline powder.

Identification

A. When examined in the range 230 nm to 360 nm (2.4.7), a 0.015 per cent w/v solution shows an absorption maximum only at about 285 nm; absorbance at about 285 nm, about 0.65.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.005 per cent w/v solution in *0.1 M sodium hydroxide* shows an absorption maximum only at about 298 nm; absorbance at about 298 nm, about 0.34.

C. Add a few mg of the powdered substance to a mixture of 1 ml of *sulphuric acid* and 0.05 ml of *formaldehyde solution*; a purple colour is produced.

D. Dissolve 5 mg in 5 ml of *water* and add 0.15 ml of *dilute potassium ferricyanide solution* and 0.05 ml of *ferric chloride solution*; a bluish green colour is produced immediately, which changes rapidly to blue.

E. It gives the reactions of sulphates (2.3.1).

Tests

Acidity. Dissolve 0.2 g in 10 ml of freshly boiled and cooled *water* and titrate with *0.02 M sodium hydroxide* using *methyl red solution* as indicator. Not more than 0.2 ml of *0.02 M sodium hydroxide* is required to change the colour of the solution.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 1.0 per cent v/v solution of *acetic acid.*

Test solution. Dissolve 125 mg of the substance under examination in 50 ml of the solvent mixture.

Reference solution. Dilute 1.0 ml of the test solution to 100 ml with the solvent mixture. Dilute 2.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: A. a 0.1 per cent w/v solution of *sodium heptanesulphonate*, adjusted to pH 2.6 with *orthophosphoric acid*,
  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	85	15
2	85	15
35	50	50
40	50	50
42	85	15

Name	Relative retention time	Correction factor
Morphine impurity F[1]	0.95	—
Morphine (Retention time: about 12.5 minutes)	0.32	---
Morphine impurity E[2]	1.1	0.5
Morphine impurity C[3]	1.6	0.4
Morphine impurity B[4]	1.9	0.25

[1](17*S*)-7,8-didehydro-4,5α-epoxy-17-methylmorphinan-3,6α-diol 17-oxide (morphine *N*-oxide),

[2]7,8-didehydro-4,5α-epoxy-3-hydroxy-17-methylmorphinan-6-one (morphinone),

[3](6,7,8,14-tetradehydro-4,5α-epoxy-6-methoxy-17-methylmorphinan-3-ol (oripavine),

[4]7,7',8,8'-tetradehydro-4,5α:4',5'α-diepoxy-17,17'-dimethyl-2,2'-bimorphinanyl-3, 3',6α,6'α-tetrol (2,2'-bimorphine).

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of the peak corresponding to 2,2'-bimorphine (morphine impurity B) is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (0.4 per cent). The area of the each peak corresponding to oripavine (morphine impurity C) and morphinone (morphine impurity E) is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent) and sum of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). 9.0 to 12.0 per cent, determined on 0.5 g by drying in an oven at 145° for 1 hour.

Assay. Weigh 0.5 g, dissolve in 30 ml of *glacial acetic acid.* Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.06688 g of $(C_{17}H_{19}NO_3)_2, H_2SO_4$.

Storage. Store protected from light and moisture.

Morphine and Atropine Injection

Morphine Sulphate and Atropine Sulphate Injection

Morphine and Atropine Injection is a sterile isotonic solution in Water for Injections containing 1.0 per cent w/v of Morphine Sulphate and 0.06 per cent w/v of Atropine Sulphate.

Morphine and Atropine Injection contains not less than 0.90 per cent w/v and not more than 1.10 per cent w/v of morphine sulphate, $(C_{17}H_{19}NO_3)_2,H_2SO_4,5H_2O$, and not less than 0.054 per cent w/v and not more than 0.066 per cent w/v of atropine sulphate, $(C_{17}H_{23}NO_3)_2,H_2SO_4,H_2O$.

Usual Strengths. Morphine sulphate 1 per cent and atropine sulphate 0.06 per cent.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 100 volumes of *methanol* and 1.5 volumes of *strong ammonia solution*.

Test solution. Add 1 ml of *5 M ammonia* to 1 ml of the injection, extract with two quantities, each of 5 ml, of *chloroform*, filter the combined extracts through *anhydrous sodium sulphate*, evaporate to dryness in a current of warm air and dissolve the residue in 0.5 ml of *chloroform*.

Reference solution (a). Treat 1 ml of a 0.06 per cent w/v solution of *atropine sulphate IPRS* in the same manner as for the test solution.

Reference solution (b). Treat 1 ml of a 1 per cent w/v solution of *morphine sulphate IPRS* in the same manner as for the test solution.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and spray with *dilute potassium iodobismuthate solution*. The principal spots in the chromatogram obtained with the test solution correspond to the spots in the chromatograms obtained with reference solution (a) and (b).

Tests

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. *For atropine sulphate* — To 10.0 ml add 10 ml of *water* and 5 ml of *1 M sodium hydroxide* and extract successively with 15, 10 and 10 ml of *chloroform* and continue the extraction with 10-ml quantities of *chloroform* until complete extraction of alkaloids has been effected (2.6.4). Wash the chloroform extracts with the same 5 ml of *water* (preserve the aqueous solution and the washings for the Assay for morphine sulphate). Evaporate the chloroform, dissolve the residue in 2 ml of *ethanol (95 per cent)*, add 2.0 ml of *0.025 M sulphuric acid*, cool and titrate the excess of acid with *0.05 M sodium hydroxide* using *methyl red solution* as indicator.

1 ml of *0.025 M sulphuric acid* is equivalent to 0.01737 g of $(C_{17}H_{23}NO_3)_2,H_2SO_4,H_2O$.

For morphine Sulphate — Combine the aqueous solution and washings obtained in the Assay for atropine sulphate, add 1 g of *ammonium sulphate* and 25 ml of *ethanol (95 per cent)* and extract with 40 ml, followed by successive quantities of 40, 20 and 20 ml, of a mixture of 1 volume of *ethanol (95 per cent)* and 3 volumes of *chloroform*, washing each extract with the same two successive quantities, each of 5 ml, of *water* and continue the extraction until complete extraction of alkaloids has been effected (2.6.4). Evaporate the chloroform, boil the residue with 10.0 ml of *0.05 M sulphuric acid*, cool and titrate the excess of acid with *0.1 M sodium hydroxide* using *methyl red solution* as indicator.

1 ml of *0.05 M sulphuric acid* is equivalent to 0.03794 g of $(C_{17}H_{19}NO_3)_2,H_2SO_4,5H_2O$.

Storage. Store protected from light.

Morphine Injection

Morphine Sulphate Injection

Morphine Injection is a sterile solution of Morphine Sulphate in Water for Injections.

Morphine Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of morphine sulphate, $(C_{17}H_{19}NO_3)_2,H_2SO_4,5H_2O$.

Usual strength. 10 mg per ml; 15 mg per ml; 50 ml per ml.

Identification

A. Evaporate a volume containing 5 mg of Morphine Sulphate to dryness on a water-bath. Dissolve the residue in 5 ml of *water* and add 0.15 ml of *dilute potassium ferricyanide solution*; a bluish green colour is produced immediately, which changes rapidly to blue.

B. It gives reaction (A) of sulphates (2.3.1).

Tests

pH (2.4.24). 2.5 to 6.0.

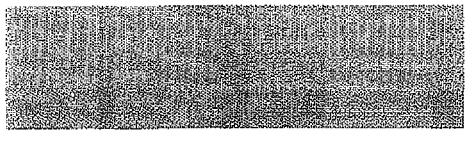
Bacterial endotoxins (2.2.3). Not more than 17.0 Endotoxin Units per mg of morphine; if labelled for intrathecal use it contains not more than 14.29 Endotoxin Units per mg of morphine.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Measure a volume containing 25 mg of Morphine Sulphate and dilute with sufficient of the mobile phase to produce 100.0 ml, freshly prepared.

Reference solution. Weigh 25 mg of *morphine sulphate IPRS* and dissolve in sufficient of the mobile phase to produce 100.0 ml, freshly prepared.



Chromatographic system
- a stainless steel column 40 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 0.73 g of *sodium heptanesulphonate* in 720 ml of *water*, add 280 ml of *methanol* and 10 ml of *glacial acetic acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Inject the test solution and reference solution.

Calculate the content of $(C_{17}H_{19}NO_3)_2,H_2SO_4,5H_2O$ in the injection.

Storage. Store protected from light.

Morphine Tablets

Morphine Sulphate Tablets

Morphine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of morphine sulphate, $(C_{17}H_{19}NO_3)_2,H_2SO_4,5H_2O$.

Usual strengths. 10 mg; 20 mg; 30 mg; 60 mg.

Identification

A. Disperse a quantity of the powdered tablets containing 20 mg of Morphine Sulphate with 5 ml of *water*, filter and add to the filtrate 0.05 ml of *iron(III) chloride solution*; a blue colour is produced.

B. Shake a quantity of the powdered tablets containing 10 mg of Morphine Sulphate with 10 ml of *water*, filter and to 5 ml of the filtrate add 0.15 ml of *dilute potassium hexacyanoferrate(III) solution* and 0.05 ml of *iron(III) chloride solution*; a bluish green colour is produced immediately, which changes rapidly to blue.

C. It gives the reactions of sulphates (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *phosphate buffer pH 6.5*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with *phosphate buffer pH 6.5*, to produce a solution containing 0.001 per cent w/w of Morphine Sulphate.

Reference solution. A 0.001 per cent w/v solution of *morphine sulphate IPRS* in *phosphate buffer pH 6.5*.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of *methanol* and 50 volumes of *0.01M sodium heptanesulphonate* in *0.1M acetic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 211 nm,
- injection volume: 50 µl.

Inject the reference solution and the test solution.

Calculate the content of $(C_{17}H_{19}NO_3)_2,H_2SO_4,5H_2O$ in the medium.

1 g of $(C_{17}H_{19}NO_3)_2$ is equivalent to 1.330 g of $(C_{17}H_{19}NO_3)_2,H_2SO_4,5H_2O$.

Q. Not less than 70 per cent of the stated amount of $(C_{17}H_{19}NO_3)_2,H_2SO_4,5H_2O_4$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 2.5 volumes of *13.5 M ammonia*, 32.5 volumes of *acetone*, 35 volumes of *ethanol (70 per cent)* and 35 volumes of *toluene*.

Solvent mixture. Equal volumes of *ethanol (95 per cent)* and *water*

Test solution. Disperse a quantity of the powdered tablets containing 10 mg of Morphine Sulphate in 10 ml of the solvent mixture for 10 minutes and filter.

Reference solution (a). Dissolve 5 mg of *codeine phosphate* in 5 ml of the test solution and dilute 1.0 ml of the solution to 200.0 ml with the solvent mixture.

Reference solution (b). Dilute 2.0 ml of reference solution (a) to 5.0 ml with the solvent mixture.

Apply to the plate 50 µl of each solution. After development, dry the plate in air and spray the plate with *potassium iodobismuthate solution*, and allow it to dry for 15 minutes in air and spray with *hydrogen peroxide solution (10 volumes)*. The spot corresponding to codeine is bluish-grey and the spot corresonding to morphine is pinkish. In the chromatogram obtained with the test solution, any spot corresponding to codeine is not more intense than the spot due to codeine in the chromatogram obtained with reference solution (a) (0.5 per cent), any other secondary spot is not more intense than the spot corresponding to morphine in the chromatogram obtained with reference solution (a) (0.5 per cent) and not more than two such spots are more intense than the spot corresponding to morphine in the chromatogram obtained with reference solution (b) (0.2 per cent). The test is not valid unless the chromatogram obtained with reference solution (a) shows two clearly separated spots. Ignore any spot with an R_f value of less than 0.1.

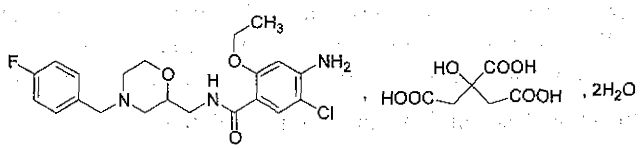
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.1 g of Morphine Sulphate with 25 ml of *water* and 5 ml of *1M sodium hydroxide*, add 1 g of *ammonium sulphate*, shake to dissolve, add 20 ml of *ethanol (95 per cent)* and extract with successive quantities of 40, 20, 20 and 20 ml of a mixture of 3 volumes of *chloroform* and 1 volume of *ethanol (95 per cent)*. Wash each extract with the same 5 ml of *water*, filter and evaporate the solvent. Dissolve the residue in 10 ml of *0.05 M hydrochloric acid*, boil, cool, add 15 ml of *water*. Titrate the excess of acid with *0.05 M sodium hydroxide* using *methyl red solution* as indicator. Carry out a blank titration.

1 ml of *0.05 M hydrochloric acid* is equivalent to 0.01897 g of $(C_{17}H_{19}NO_3)_2,H_2SO_4,5H_2O$.

Storage. Store protected from light.

Mosapride Citrate Dihydrate



$C_{21}H_{25}ClFN_3O_3,C_6H_8O_7,2H_2O$ Mol. Wt. 650.0

Mosapride Citrate Dihydrate is (*RS*)-4-amino-5-chloro-2-ethoxy-*N*-{[4-(4-fluorobenzyl)-2-morpholinyl]methyl} benzamide citrate dihydrate.

Mosapride Citrate Dihydrate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{21}H_{25}ClFN_3O_3,C_6H_8O_7$, calculated on the anhydrous basis.

Category. Gastroprokinetic agent.

Description. A white or yellowish white crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *mosapride citrate dihydrate IPRS* or with the reference spectrum of mosapride citrate dihydrate.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). Dissolve 6.5 mg of *citric acid monohydrate* in 100.0 ml of the mobile phase.

Reference solution (b). Dissolve 20 mg of *mosapride citrate dihydrate IPRS* in 100 ml of the mobile phase. Stir with the aid of ultrasound to dissolve, cool and dilute 1 ml of the solution to 200 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: 60 volumes of a buffer solution, prepared by dissolving 1.4 ml of *orthophosphoric acid* in 1000 ml of *water*, adjusted to pH 3.0 with *triethylamine*, and 40 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 276 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the column efficiency is not less than 4000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (a). Inject the test solution. Measure the responses for all peaks except the peak due to the analyte, peaks from the blank and the peak corresponding to citric acid. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the peak in the chromatogram obtained with the reference solution (b) (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). 5.0 per cent to 7.0 per cent, determined on 1.0 g.

Assay. Weigh 0.35 g, dissolve in 70 ml of a mixture of 1 volume of *glacial acetic acid* and 7 volumes of *methyl ethyl ketone*. Cover the beaker and heat on a water-bath at 80° to dissolve. Cool and titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.061405 g of $C_{21}H_{25}ClFN_3O_3,C_6H_8O_7$.

Storage. Store protected from moisture.

Mosapride Citrate Tablets

Mosapride Citrate Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of mosapride citrate, $C_{21}H_{25}ClFN_3O_3,C_6H_8O_7$.

Usual strengths. 2.5 mg; 5 mg; 10 mg; 15 mg.

Identification

In the Assay, the retention time of the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 500 ml of *0.1 M hydrochloric acid,*
Speed and time. 100 rpm and 15 minutes.

Withdraw a suitable volume of the medium and filter. Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, diluted if necessary, with the dissolution medium

Reference solution.

For 2.5 mg tablets—

Weigh 26.5 mg of *mosapride citrate dihydrate IPRS* and dissolve in 25 ml of the mobile phase. Dilute 5 ml of the solution to 1000 ml with the medium.

For other than 2.5mg tablets—

Weigh 26.5 mg of *mosapride citrate dihydrate IPRS* and dissolve in 25 ml of the mobile phase. Dilute 5 ml of the solution to 500 ml with the medium.

Use the chromatographic system described under Assay

Inject the reference solution. The test is not valid unless the column efficiency is not less than 4000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{25}ClFN_3O_3,C_6H_8O_7$.

Q. Not less than 70 per cent of the stated amount of $C_{21}H_{25}ClFN_3O_3,C_6H_8O_7$.

Uniformity of content. Complies with the test stated under tablets.

Determine by liquid chromatography (2.4.14) as described in the Assay using the following solutions.

Test solution. Dissolve 1 tablet in 100 ml of the mobile phase. Centrifuge for 15 minutes. Dilute the clear supernatant liquid if necessary, with the mobile phase to produce a solution containing 0.02 mg of mosapride citrate per ml.

Reference solution. Weigh 26.5 mg of *mosapride citrate dihydrate IPRS* and dissolve in 100 ml of the mobile phase. Dilute with the mobile phase to produce a solution containing of 0.02 mg of mosapride citrate per ml.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 10 mg of mosapride citrate and dissolve in 50 ml of the mobile phase. Centrifuge for 15 minutes. Dilute 5 ml of the clear supernatant liquid to 50 ml with the mobile phase.

Reference solution. Weigh 21.2 mg of *mosapride citrate dihydrate IPRS* and dissolve in 100 ml of the mobile phase. Dilute 5 ml of the solution to 50 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: 60 volumes of a buffer solution, prepared by dissolving 1.4 ml of *orthophosphoric acid* in 1000 ml of *water* and adjusted to pH 3.0 with *triethylamine*, and 40 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 276 nm,
- injection volume: 20 µl.

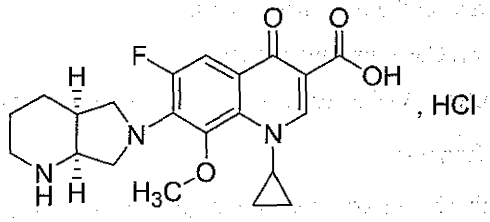
Inject the reference solution. The test is not valid unless the column efficiency is not less than 4000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and reference solution.

Calculate the content of $C_{21}H_{25}ClFN_3O_3,C_6H_8O_7$ in the tablets.

Labelling. The label states the strength in terms of the equivalent amount of anhydrous mosapride citrate.

Moxifloxacin Hydrochloride



$C_{21}H_{25}ClFN_3O_4$ Mol. Wt. 437.9.

Moxifloxacin Hydrochloride is 1-Cyclopropyl-6-fluoro-8-methoxy-7-[(4as,7as)-octahydro-6*H*-pyrolo'3,4-b] pyridin-6-yl]-4-oxo-1,4-dihydroquinoline-3-carboxylic acid hydrochloride.

Moxifloxacin Hydrochloride contains 98.0 per cent to 102.0 per cent of $C_{21}H_{25}ClFN_3O_4$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A light yellow or yellow powder or crystals, slightly hygroscopic.

Identification

A. Determined by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *moxifloxacin hydrochloride IPRS* or with the reference spectrum of moxifloxacin hydrochloride.

B. Dissolve 50 mg in 5 ml of *water*, add 1 ml of *dilute nitric acid*, mix, allow to stand for 5 minutes and filter. The filtrate gives reactions of chlorides (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *dilute sodium hydroxide* solution is not more opalescent than standard OS2 and not more intensely coloured than reference solution GYS2 (2.4.1) If intended for use in the manufacture of parenteral preparations, the solution is clear and not more intensely coloured than reference solution GYS2 (2.4.1).

pH (2.4.24). 3.9 to 4.6 , determined in 0.2 per cent w/v solution in *carbon dioxide- free water*.

Specific optical rotation (2.4.22). −138.0° to −125.0°, determined on 1.0 per cent w/v solution in equal mixture of *acetonitrile* and *water*.

Related substances. Determined by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 0.5 g of *tetrabutylamonium hydrogen sulphate* and 1.0 g of *potassium dihydrogen phosphate* in 500 ml of *water*. Add 2 ml of *orthophosphoric acid* and 0.05g of *anhydrous sodium sulphite*, dilute to 1000 ml with *water*.

Test solution (a). Dissolve 50 mg of the substances under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Test solution (b). Dilute 2.0 ml of test solution (a) to 20.0 ml with the solvent mixture.

Reference solution (a). A 0.01 per cent w/v solution of *moxifloxacin hydrochloride IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of test solution (a) to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with phenylsilane bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: a mixture of 28 volumes of *methanol* and 72 volumes of a solution containing 0.05 per cent w/v of *terabutylammonium hydrogen sulphate* and 0.1 per cent w/v of *potassium dihydrogen phosphate* and 0.34 per cent w/v of *orthophosphoric acid*,
- flow rate: 1.3 ml per minute,
- spectrophotometer set at 293 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Moxifloxacin (Retention time: about 14 minutes)	1.0	—
Moxifloxacin impurity A[1]	1.1	—
Moxifloxacin impurity B[2]	1.3	1.4
Moxifloxacin impurity C[3]	1.4	—
Moxifloxacin impurity D[4]	1.6	—
Moxifloxacin impurity E[5]	1.7	3.5

[1] 1-cyclopropyl-6,8-difluoro-7-[(4a*S*,7a*S*)-octahydro-6*H*-pyrrolo[3,4-*b*]pyridin-6-yl]-4-oxo-1,4-dihydroquinoline-3-carboxylic acid,

[2] 1-cyclopropyl-6,8-dimethoxy-7-[(4a*S*,7a*S*)-octahydro-6*H*-pyrrolo[3,4-*b*]pyridin-6-yl]-4-oxo-1,4-dihydroquinoline-3-carboxylic acid,

[3] 1-cyclopropyl-8-ethoxy-6-fluoro-7-[(4a*S*,7a*S*)-octahydro-6*H*-pyrrolo[3,4-*b*]pyridin-6-yl]-4-oxo-1,4-dihydroquinoline-3-carboxylic acid,

[4] 1-cyclopropyl-8-fluoro-6-methoxy-7-[(4a*S*,7a*S*)-octahydro-6*H*-pyrrolo[3,4-*b*]pyridin-6-yl]-4-oxo-1,4-dihydroquinoline-3-carboxylic acid,

[5] 1-cyclopropyl-6-fluoro-8-hydroxy-7-[(4a*S*,7a*S*)-octahydro-6*H*-pyrrolo[3,4-*b*]pyridin-6-yl]-4-oxo-1,4-dihydroquinoline-3-carboxylic acid.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailinag factor is not more than 2.0.

Inject reference solution (b) and test solution (a). Run the chromatogram 2.5 times the retention time of the principal peak. In the chromatogram obtained with test solution (a), the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 4.5 per cent, determined on 0.2 g.

Assay. Determine by liquid chromatography (2.4.14), as described in the Related substances.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture. Dilute 2.0 ml of the solution to 20.0 ml with the solvent mixture.

Reference solution. A 0.01 per cent w/v solution of *moxifloxacin hydrochloride IPRS* in the solvent mixture.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{25}ClFN_3O_4$.

Storage. Store protected from light and moisture.

Moxifloxacin Eye Drops

Moxifloxacin Eye Drops are a sterile solution of Moxifloxacin Hydrochloride in purified water.

Moxifloxacin Eye Drops Contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of moxifloxacin, $C_{21}H_{24}FN_3O_4$.

Usual strength. 0.5 per cent w/v.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 6.3 to 7.3.

Related substances. A. Determine by liquid chromatography (2.4.14) as described in the Assay using following modifications.

Inject the test solution. The area of any secondary peak is not more than 0.5 per cent and the sum of areas of all the secondary peaks is not more than 1.5 per cent, calculated by area normalization.

Other tests. Comply with the tests stated under Eye Drops.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a suitable volume of the eye drops containing 5 mg of moxifloxacin to 50.0 ml with mobile phase A.

Reference solution (a). A 0.01 per cent w/v solution of *moxifloxacin hydrochloride IPRS* in mobile phase A.

Reference solution (b). A 0.001 per cent w/v solution of *moxifloxacin impurity A IPRS (1-cyclopropyl-6,8-difluoro-1,4-dihydro-7-[(4aS ,7aS)-octahydro-6H -pyrrolo[3,4-b] pyridin-6-yl]-4-oxo-3-quinolinecarboxylic acid IPRS)* in reference solution (a).

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm, packed with phenyl groups chemically bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: A. dissolve 0.5 g of *tetrabutylammonium hydrogen sulphate* and 1.0 g of *monobasic potassium phosphate* in 1000 ml of *water*, add 2 ml of *orthophosphoric acid*, filter,

B. *methanol,*

- a gradient programme using the conditions given below,
- spectrophotometer set at 293 nm,
- injection volume: 25 µl.

Time (in min)	Mobile phase A (per cent w/v)	Mobile phase B (per cent v/v)	Flow rate (ml per minute)
0	69	31	0.5
30	69	31	0.5
31	60	40	0.9
36	60	40	0.9
37	69	31	0.5
42	69	31	0.5

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to moxifloxacin and moxifloxacin impurity A is not less than 2.0 in the chromatogram obtained with reference solution (b). The column efficiency is not less than 4000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_{21}H_{24}FN_3O_4$ in the eye drops.

Multiple Electrolytes and Dextrose Injection Type I

Multiple Electrolytes and Dextrose Injection Type I is a sterile solution of Dextrose and suitable salts in Water for Injection to provide sodium, potassium, magnesium, acetate, phosphate and chloride ions. It may contain Hydrochloric Acid or Sodium Hydroxide used for adjusting the pH.

Usual strength.

Sodium acetate	0.32 g
Potassium chloride	0.13 g
Dipotassium hydrogen phosphate	0.026 g
Magnesium chloride	0.031 g
Dextrose	5.0 g
Water for Injections to	100 ml
Concentration of electrolytes in mmol / l	
Sodium	23.0
Potassium	20.0
Magnesium	1.5
Acetate	23.0
Chloride	20.0
Phosphate	1.5

Multiple Electrolytes and Dextrose Injection Type I contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of sodium, Na, potassium, K, magnesium, Mg, acetate, $C_2H_3O_2$, and phosphate, PO_4. It also contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of chloride, Cl and not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of dextrose, $C_6H_{12}O_6$. It contains no antimicrobial agent.

Description. A clear, colourless or faintly straw-coloured solution.

Identification

A. To 1 ml add 0.05 ml of *potassium cupri-tartrate solution*; the solution remains blue and clear. Heat to boiling, a copious red precipitate is formed.

B. 20 ml gives the reactions of acetates, chlorides phosphates, sodium salts, potassium salts and magnesium salts (2.3.1).

Tests

pH (2.4.24). 3.0 to 7.0.

5-Hydroxymethylfurfural and Related substances. Dilute a volume containing 1.0 g of Dextrose to 500.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 284 nm; absorbance at about 284 nm, not more than 0.25 (2.4.7).

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. *For sodium* — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 589 nm and using *sodium solution FP* or *sodium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For total potassium — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 767 nm and using *potassium solution FP* or *potassium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For magnesium — To 50.0 ml add 50 ml of *water* and 5 ml of *strong ammonia-ammonium chloride solution* and titrate with *0.005 M disodium edetate* using 50 mg of *eriochrome black T mixture* as indicator.

1 ml of *0.005 M disodium edetate* is equivalent to 0.1215 mg of Mg.

For acetate — Determine by liquid chromatography (2.4.14).

Test solution. Dilute a measured volume of the preparation under examination quantitatively with *water* to obtain a solution containing about 0.12 per cent w/v of sodium acetate.

Reference solution. Dissolve a weighed quantity of *sodium acetate* in *water* to obtain a solution having a known concentration of about 0.12 per cent w/v of sodium acetate.

Chromatographic system

- a stainless steel column 30 cm × 7.8 mm, packed with strong cation-exchange resin consisting of sulphonated cross-linked styrene-divinylbenzene copolymer in the hydrogen form (7 µm) and a guard column 4 cm x 7.8 mm packed with the same column material,
- column temperature: 60°,
- mobile phase: *0.1 M sulphuric acid*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution. Calculate the content of acetate in the preparation under examination.

For phosphate — Dilute a measured volume containing about 4 mg of phosphate with sufficient *water* to produce 50.0 ml. Transfer 2.0 ml of the solution to a test-tube. Add 1.0 ml of a 5 per cent w/v solution of *ammonium molybdate* in a cooled mixture of *sulphuric acid* and *water* (15:85) and allow to stand for 3 minutes. Add 1.0 ml of a freshly prepared 0.5 per cent w/v solution of *hydroquinone* containing 1 drop of *sulphuric acid* and 1.0 ml of a freshly prepared 20 per cent w/v solution of *anhydrous sodium sulphite*, add 5.0 ml of *water*, mix and allow to stand for 30 minutes. Measure the absorbance of the resulting solution at the maximum at about 640 nm (2.4.7), using as the blank a solution prepared in the same manner by treating 2 ml of *water* instead of the solution of the preparation under examination. Calculate the content of phosphate from the absorbance obtained by simultaneously carrying out the operation using a known concentration of about 0.11 mg per ml of *dipotassium hydrogen phosphate* in *water* instead of the solution of the preparation under examination.

For total chloride — To 20.0 ml add 30 ml of *water*, 50.0 ml of *0.1 M silver nitrate* and 2 ml of *nitric acid*. Filter, wash the precipitate with *water* slightly acidified with *nitric acid* and titrate the excess of *silver nitrate* with *0.1 M ammonium thiocyanate* using *ferric ammonium sulphate solution* as indicator until a reddish yellow colour is produced. Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of total chloride, calculated as Cl.

For dextrose — To a measured volume containing 2 g to 5 g of Dextrose, add 0.2 ml of *5 M ammonia* and sufficient *water* to

produce 100.0 ml. Mix well, allow to stand for 30 minutes and determine the optical rotation in a 2-dm tube (2.4.22). The observed rotation in degrees multiplied by 0.9477 represents the weight, in g, of dextrose, $C_6H_{12}O_6$ in the volume taken for assay.

Storage. Store in single dose containers at a temperature not exceeding 30°.

Labelling. The label states (1) the content of each electrolyte in terms of millimoles in a given volume; (2) the amount of each ingredient in 100 ml; (3) the total osmolar concentration in mOsmol per litre; (4) that the preparation should not be used if it contains visible particles.

Multiple Electrolytes and Dextrose Injection Type II

Multiple Electrolytes and Dextrose Injection Type II is a sterile solution of Dextrose and suitable salts in Water for Injections to provide sodium, potassium, calcium, magnesium and chloride ions. It may contain Hydrochloric Acid or Sodium Hydroxide used for adjusting the pH.

Usual strength.

Sodium acetate	0.33 g
Sodium chloride	0.088 g
Potassium chloride	0.12 g
Calcium chloride dihydrate	0.037 g
Magnesium chloride	0.031 g
Dextrose	5.0 g
Water for Injections to	100 ml
Concentration of electrolytes in mmol / l	
Sodium	40.0
Potassium	16.0
Calcium	2.5
Chloride	40.0
Magnesium	1.5
Acetate	24.0

Multiple Electrolytes and Dextrose Injection Type II contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of sodium, Na, potassium, K, calcium, Ca, magnesium, Mg and acetate, $C_2H_3O_2$. It contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of chloride, Cl. It also contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of dextrose, $C_6H_{12}O_6$. It contains no antimicrobial agent.

Description. A clear, colourless or faintly straw-coloured solution.

Identification

A. To 1 ml add 0.05 ml of *potassium cupri-tartrate solution*; the solution remains blue and clear. Heat to boiling, a copious red precipitate is formed.

B. 20 ml gives the reactions of acetates, chlorides sodium salts, potassium salts, calcium salts and magnesium salts (2.3.1).

Tests

pH (2.4.24). 3.0 to 7.0.

5-Hydroxymethylfurfural and Related substances. Dilute a volume containing 1.0 g of Dextrose to 500.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 284 nm; absorbance at about 284 nm, not more than 0.25 (2.4.7).

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. *For total sodium* — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 589 nm and using *sodium solution FP* or *sodium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For potassium — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 767 nm and using *potassium solution FP* or *potassium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For calcium — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 422.7 nm and using *calcium solution FP* or *calcium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For magnesium — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 296 nm and using *magnesium solution FP* or *magnesium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For acetate — Determine by liquid chromatography (2.4.14).

Test solution. Dilute a measured volume of the preparation under examination quantitatively with *water* to obtain a solution containing about 0.12 per cent w/v of Sodium Acetate.

Reference solution. Dissolve a weighed quantity of *sodium acetate* in *water* to obtain a solution having a known concentration of about 0.12 per cent w/v of sodium acetate.

Chromatographic system

- a stainless steel column 30 cm x 7.8 mm, packed with strong cation-exchange resin consisting of sulphonated cross-linked styrene-divinylbenzene copolymer in the hydrogen form (7 µm) and a guard column 4 cm × 7.8 mm packed with the same column material,
- column temperature: 60°,
- mobile phase: *0.1 M sulphuric acid*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution. Calculate the content of acetate in the preparation under examination.

For total chloride — To 20.0 ml add 30 ml of *water*, 50.0 ml of *0.1 M silver nitrate* and 2 ml of *nitric acid*. Filter, wash the precipitate with *water* slightly acidified with *nitric acid* and titrate the excess of *silver nitrate* with *0.1 M ammonium thiocyanate* using *ferric ammonium sulphate solution* as indicator until a reddish yellow colour is produced. Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of total chloride, calculated as Cl.

For dextrose — To a measured volume containing 2 g to 5 g of Dextrose, add 0.2 ml of *5 M ammonia* and sufficient *water* to produce 100.0 ml. Mix well, allow to stand for 30 minutes and determine the optical rotation in a 2-dm tube (2.4.22). The observed rotation in degrees multiplied by 0.9477 represents the weight, in g, of dextrose, $C_6H_{12}O_6$ in the volume taken for assay.

Storage. Store in single dose containers at a temperature not exceeding 30°.

Labelling. The label states (1) the content of each electrolyte in terms of millimoles in a given volume; (2) the amount of each ingredient in 100 ml; (3) the total osmolar concentration in mOsmol per litre; (4) that the preparation should not be used if it contains visible particles.

Multiple Electrolytes and Dextrose Injection Type III

Multiple Electrolytes and Dextrose Injection Type III is a sterile solution of Dextrose and suitable salts in Water for Injections to provide sodium, potassium, acetate, chloride and phosphate ions. It may contain Hydrochloric Acid or Sodium Hydroxide used for adjusting the pH.

Usual strength.

Sodium acetate	0.28 g
Sodium chloride	0.10 g
Potassium chloride	0.15 g
Dipotassium hydrogen phosphate	0.13 g
Dextrose	5.0 g
Water for Injections to	100 ml
Concentration of electrolytes in mmol / l	
Sodium	37.0
Potassium	35.0
Acetate	20.0
Chloride	37.0
Phosphate	7.5

Multiple Electrolytes and Dextrose Injection Type III contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of sodium, Na, potassium, K, acetate, $C_2H_3O_2$, and phosphate, PO_4, and not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of chloride, Cl. It also contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of dextrose, $C_6H_{12}O_6$. It contains no antimicrobial agent.

Description. A clear, colourless or faintly straw-coloured solution.

Identification

A. To 1 ml add 0.05 ml of *potassium cupri-tartrate solution*; the solution remains blue and clear. Heat to boiling, a copious red precipitate is formed.

B. 20 ml gives the reactions of acetates, chlorides phosphates, sodium salts and potassium salts (2.3.1).

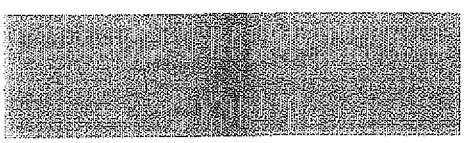
Tests

pH (2.4.24). 3.0 to 7.0.

5-Hydroxymethylfurfural and Related substances. Dilute a volume containing 1.0 g of Dextrose to 500.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 284 nm; absorbance at about 284 nm, not more than 0.25 (2.4.7).

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).



Assay. *For total sodium* — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 589 nm and using *sodium solution FP* or *sodium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For potassium — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 767 nm and using *potassium solution FP* or *potassium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For acetate — Determine by liquid chromatography (2.4.14).

Test solution. Dilute a measured volume of the preparation under examination quantitatively with *water* to obtain a solution containing about 0.12 per cent w/v of Sodium Acetate.

Reference solution. Dissolve a weighed quantity of *sodium acetate* in *water* to obtain a solution having a known concentration of about 0.12 per cent w/v of sodium acetate.

Chromatographic system
- a stainless steel column 30 cm x 7.8 mm, packed with strong cation-exchange resin consisting of sulphonated cross-linked styrene-divinylbenzene copolymer in the hydrogen form (7 µm) and a guard column 4 cm x 7.8 mm packed with the same column material,
- column temperature: 60°,
- mobile phase: *0.1 M sulphuric acid*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution. Calculate the content of acetate in the preparation under examination.

For phosphate — Dilute a measured volume containing about 4 mg of phosphate with sufficient *water* to produce 50.0 ml. Transfer 2.0 ml of the solution to a test-tube. Add 1.0 ml of a 5 per cent w/v solution of *ammonium molybdate* in a cooled mixture of *sulphuric acid* and *water* (15:85) and allow to stand for 3 minutes. Add 1.0 ml of a freshly prepared 0.5 per cent w/v solution of *hydroquinone* containing 1 drop of *sulphuric acid* and 1.0 ml of a freshly prepared 20 per cent w/v solution of *anhydrous sodium sulphite*, add 5.0 ml of *water*, mix and allow to stand for 30 minutes. Measure the absorbance of the resulting solution at the maximum at about 640 nm (2.4.7), using as the blank a solution prepared in the same manner by treating 2 ml of *water* instead of the solution of the preparation under examination. Calculate the content of phosphate from the absorbance obtained by simultaneously carrying out the operation using a known concentration of about 0.11 mg per ml of *dipotassium hydrogen phosphate* in *water* instead of the solution of the preparation under examination.

For total chloride — To 20.0 ml add 30 ml of *water*, 50.0 ml of *0.1 M silver nitrate* and 2 ml of *nitric acid*. Filter, wash the precipitate with *water* slightly acidified with *nitric acid* and titrate the excess of *silver nitrate* with *0.1 M ammonium thiocyanate* using *ferric ammonium sulphate solution* as indicator until a reddish yellow colour is produced. Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of total chloride, calculated as Cl.

For dextrose — To a measured volume containing 2 g to 5 g of Dextrose, add 0.2 ml of *5 M ammonia* and sufficient *water* to produce 100.0 ml. Mix well, allow to stand for 30 minutes and determine the optical rotation in a 2-dm tube (2.4.22). The observed rotation in degrees multiplied by 0.9477 represents the weight, in g, of dextrose, $C_6H_{12}O_6$ in the volume taken for assay.

Storage. Store in single dose containers at a temperature not exceeding 30°.

Labelling. The label states (1) the content of each electrolyte in terms of millimoles in a given volume; (2) the amount of each ingredient in 100 ml; (3) the total osmolar concentration in mOsmol per litre; (4) that the preparation should not be used if it contains visible particles.

Multiple Electrolytes and Dextrose Injection Type IV

Multiple Electrolytes and Dextrose Injection Type IV is a sterile solution of Dextrose and suitable salts in Water for Injections to provide sodium, potassium, ammonium and chloride ions. It may contain Hydrochloric Acid or Sodium Hydroxide used for adjusting the pH.

Usual strength.

Sodium chloride	0.37	g
Potassium chloride	0.13	g
Ammonium chloride	0.37	g
Dextrose	5.0	g
Water for Injections to	100	ml
Concentration of electrolytes in mmol / l		
Sodium	63.0	
Potassium	17.0	
Ammonium	70.0	
Chloride	150.0	

Multiple Electrolytes and Dextrose Injection Type IV contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of sodium, Na, potassium, K, and ammonium, NH_4 and not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of chloride, Cl. It also contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of dextrose, $C_6H_{12}O_6$. It contains no antimicrobial agent.

Description. A clear, colourless or faintly straw-coloured solution.

Identification

A. To 1 ml add 0.05 ml of *potassium cupri-tartrate solution*; the solution remains blue and clear. Heat to boiling, a copious red precipitate is formed.

B. 20 ml gives the reactions of chlorides ammonium salts, sodium salts and potassium salts (2.3.1).

Tests

pH (2.4.24). 3.0 to 7.0.

5-Hydroxymethylfurfural and Related substances. Dilute a volume containing 1.0 g of Dextrose to 500.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 284 nm: absorbance at about 284 nm, not more than 0.25 (2.4.7).

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. *For total sodium* — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 589 nm and using *sodium solution FP* or *sodium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For potassium — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 767 nm and using *potassium solution FP* or *potassium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For ammonium — Transfer a measured volume of the preparation under examination, containing about 63 mg of ammonium, to a 500-ml Kjeldahl flask, dilute to 200 ml with *water*, mix and add 50 ml of 40 per cent w/v solution of *sodium hydroxide*. Connect the flask immediately to a well-cooled condenser through a distillation trap. Let the delivery tube from the condenser dip into 40 ml of a 4.0 per cent w/v solution of *boric acid* contained in a suitable receiver. Heat to boiling and distil about 200 ml. Cool the liquid in the receiver, if necessary, and titrate with *0.05 M sulphuric acid* using *methyl red solution* as indicator. Carry out a blank titration.

1 ml of *0.05 M sulphuric acid* is equivalent to 1.804 mg of ammonium, NH_4.

For total chloride — To 20.0 ml add 30 ml of *water*, 50.0 ml of *0.1 M silver nitrate* and 2 ml of *nitric acid*. Filter, wash the precipitate with *water* slightly acidified with *nitric acid* and titrate the excess of *silver nitrate* with *0.1 M ammonium thiocyanate* using *ferric ammonium sulphate solution* as indicator until a reddish yellow colour is produced. Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of total chloride, calculated as Cl.

For dextrose — To a measured volume containing 2 g to 5 g of Dextrose, add 0.2 ml of *5 M ammonia* and sufficient *water* to produce 100.0 ml. Mix well, allow to stand for 30 minutes and determine the optical rotation in a 2-dm tube (2.4.22). The observed rotation in degrees multiplied by 0.9477 represents the weight, in g, of dextrose, $C_6H_{12}O_6$ in the volume taken for assay.

Storage. Store in single dose containers at a temperature not exceeding 30°.

Labelling. The label states (1) the content of each electrolyte in terms of millimoles in a given volume; (2) the amount of each ingredient in 100 ml; (3) the total osmolar concentration in mOsmol per litre; (4) that the preparation should not be used if it contains visible particles.

Multiple Electrolytes and Dextrose Injection Type V

Multiple Electrolytes and Dextrose Injection Type V is a sterile solution of Dextrose and suitable salts in Water for Injections to provide sodium, potassium, calcium, magnesium, acetate, citrate and chloride ions. It may contain Hydrochloric Acid or Sodium Hydroxide used for adjusting the pH.

Usual strength.

Sodium acetate	0.64 g
Sodium chloride	0.50 g
Sodium citrate	0.075 g
Potassium chloride	0.075 g
Calcium chloride	0.035 g
Magnesium chloride	0.031 g
Dextrose	5.0 g
Water for Injections to	100 ml

Concentration of electrolytes in mmol / l	
Sodium	140.0
Potassium	10.0
Calcium	2.5
Magnesium	1.5
Acetate	47.0
Chloride	103.0
Citrate	2.5

Multiple Electrolytes and Dextrose Injection Type V contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of sodium, Na, potassium, K and not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of chloride, Cl. It also contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of dextrose, $C_6H_{12}O_6$. It contains no antimicrobial agent.

Description. A clear, colourless or faintly straw-coloured solution.

Identification

A. To 1 ml add 0.05 ml of *potassium cupri-tartrate solution*; the solution remains blue and clear. Heat to boiling, a copious red precipitate is formed.

B. 20 ml gives the reactions of acetates, chlorides citrates, sodium salts, potassium salts, calcium salts and magnesium salts (2.3.1).

Tests

pH (2.4.24). 3.0 to 7.0.

5-Hydroxymethylfurfural and Related substances. Dilute a volume containing 1.0 g of Dextrose to 500.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 284 nm; absorbance at about 284 nm, not more than 0.25 (2.4.7).

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. *For total sodium* — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 589 nm and using *sodium solution FP* or *sodium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For potassium — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 767 nm and using *potassium solution FP* or *potassium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For calcium — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 422.7 nm and using *calcium solution FP* or *calcium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For magnesium — To 50.0 ml add 50 ml of *water* and 5 ml of *strong ammonia-ammonium chloride solution* and titrate with *0.005 M disodium edetate* using 50 mg of *eriochrome black T mixture* as indicator. Carry out a blank titration using 17.5 mg of $CaCl_2.2H_2O$ dissolved in 50 ml of distilled *water*, add 5.0 ml of *ammonia-ammonium chloride solution* and dilute to 250 ml with *water*. Calculate the content of magnesium with the volume obtained by subtracting the volume of EDTA required for calcium from the consumption of *0.005 M EDTA* in the titration of magnesium. Carry out a blank titration using 17.5 mg of $CaCl_2.2H_2O$ dissolved in 50 ml of distilled *water*, add 5.0 ml of *ammonia-ammonium chloride solution* and dilute to 250 ml with *water*. Calculate the content of magnesium with the volume obtained by subtracting the volume of EDTA required for calcium from the consumption of *0.005 M EDTA* in the titration of magnesium.

1 ml of *0.005 M disodium edetate* is equivalent to 0.1215 mg of Mg.

For acetate — Determine by liquid chromatography (2.4.14).

Test solution. Dilute a measured volume of the preparation under examination quantitatively with *water* to obtain a solution containing about 0.12 per cent w/v of Sodium Acetate.

Reference solution. Dissolve a weighed quantity of *sodium acetate* in *water* to obtain a solution having a known concentration of about 0.12 per cent w/v of sodium acetate.

Chromatographic system

- a stainless steel column 30 cm x 7.8 mm, packed with strong cation-exchange resin consisting of sulphonated cross-linked styrene-divinylbenzene copolymer in the hydrogen form (7 µm) and a guard column 4 cm × 7.8 mm packed with the same column material,
- column. temperature 60°,
- mobile phase: *0.1 M sulphuric acid,*
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution. Calculate the content of acetate in the preparation under examination.

For citrate — Determine by liquid chromatography (2.4.14).

Test solution. Preparation under examination.

Reference solution. Dissolve a weighed quantity of anhydrous *sodium citrate*, previously dried at 180° for 18 hours, in *water* to obtain a stock solution having a known concentration of about 10 mg per ml. Dilute measured volumes of the solution quantitatively with *water* to obtain three solutions having known concentrations of about 0.5, 1.0 and 2.0 mg, respectively of anhydrous sodium citrate per ml.

Chromatographic system

- a stainless steel column 30 cm × 7.8 mm, packed with strong cation-exchange resin consisting of sulphonated cross-linked styrene-divinylbenzene copolymer in the hydrogen form (7 µm) and a guard column 4 cm × 7.8 mm packed with the same column material,
- column. temperature 60°,
- mobile phase: *0.1 M sulphuric acid,*
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution containing 1.0 mg of anhydrous sodium citrate per ml. The test is not valid unless the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and all the three preparations of reference solution and measure the responses for the major peak. Plot the responses of all the three preparations of reference solution versus concentration, in mg of anhydrous sodium citrate per ml, and draw the straight line best fitting the three plotted points. From the graph so obtained, calculate the content of citrate in mg equivalent to anhydrous sodium citrate per litre of the preparation under examination.

For total chloride — To 20.0 ml add 30 ml of *water*, 50.0 ml of *0.1 M silver nitrate* and 2 ml of *nitric acid*. Filter, wash the precipitate with *water* slightly acidified with *nitric acid* and titrate the excess of silver nitrate with *0.1 M ammonium thiocyanate* using *ferric ammonium sulphate solution* as indicator until a reddish yellow colour is produced. Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of total chloride, calculated as Cl.

For dextrose —To a measured volume containing 2 g to 5 g of Dextrose, add 0.2 ml of *5 M ammonia* and sufficient *water* to produce 100.0 ml. Mix well, allow to stand for 30 minutes and determine the optical rotation in a 2-dm tube (2.4.22). The observed rotation in degrees multiplied by 0.9477 represents the weight, in g, of dextrose, $C_6H_{12}O_6$ in the volume taken for assay.

Storage. Store in single dose containers at a temperature not exceeding 30°.

Labelling. The label states (1) the content of each electrolyte in terms of millimoles in a given volume; (2) the amount of each ingredient in 100 ml; (3) the total osmolar concentration in mOsmol per litre; (4) that the preparation should not be used if it contains visible particles.

Multiple Electrolytes Injection Type VI

Multiple Electrolytes Injection Type VI is a sterile solution of suitable salts in Water for Injections to provide sodium, potassium, calcium, magnesium, acetate, citrate and chloride ions. It may contain Hydrochloric Acid or Sodium Hydroxide used for adjusting the pH.

Usual strength.

Sodium acetate	0.64 g
Sodium chloride	0.5 g
Sodium citrate	0.075 g
Potassium chloride	0.075 g
Calcium chloride	0.035 g
Magnesium chloride	0.031 g
Water for Injections to	100 ml
Concentration of electrolytes in mmol / l	
Sodium	140.0
Potassium	10.0
Calcium	2.5
Magnesium	1.5
Acetate	47.0
Chloride	103.0
Citrate	2.5

Multiple Electrolytes Injection Type VI contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of sodium, Na, potassium, K, calcium, Ca, magnesium, Mg, acetate, $C_2H_3O_2$, and citrate, $C_6H_5O_7$. It also contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of chloride, Cl. It contains no antimicrobial agent.

Description. A clear, colourless or faintly straw-coloured solution.

Identification

20 ml gives the reactions of acetates, chlorides citrates, sodium salts, potassium salts, calcium salts and magnesium salts (2.3.1).

Tests

pH (2.4.24). 3.0 to 7.0.

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. *For total sodium* — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 589 nm and using *sodium solution FP* or *sodium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For potassium — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 767 nm and using *potassium solution FP* or *potassium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For calcium — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 422.7 nm and using *calcium solution FP* or *calcium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For magnesium — To 50.0 ml add 50 ml of *water* and 5 ml of *strong ammonia-ammonium chloride solution* and titrate with *0.005 M disodium edetate* using 50 mg of *eriochrome black T mixture* as indicator.

1 ml of *0.005 M disodium edetate* is equivalent to 0.1215 mg of Mg.

For acetate — Determine by liquid chromatography (2.4.14).

Test solution. Dilute a measured volume of the preparation under examination quantitatively with *water* to obtain a solution containing about 0.12 per cent w/v of *Sodium Acetate*.

Reference solution. Dissolve a weighed quantity of *sodium acetate* in *water* to obtain a solution having a known concentration of about 0.12 per cent w/v of sodium acetate.

Chromatographic system

- a stainless steel column 30 cm × 7.8 mm, packed with strong cation-exchange resin consisting of sulphonated cross-linked styrene-divinylbenzene copolymer in the hydrogen form (7 µm) and a guard column 4 cm × 7.8 mm packed with the same column material,
- column. temperature 60°,
- mobile phase: *0.1 M sulphuric acid,*
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent. Inject the reference solution and the test solution. Calculate the content of acetate in the preparation under examination.

For citrate — Determine by liquid chromatography (2.4.14).

Test solution. Preparation under examination.

Reference solution. Dissolve a weighed quantity of anhydrous *sodium citrate*, previously dried at 180° for 18 hours, in *water* to obtain a stock solution having a known concentration of about 10 mg per ml. Dilute measured volumes of the solution quantitatively with *water* to obtain three solutions having known concentrations of about 0.5, 1.0 and 2.0 mg, respectively of anhydrous sodium citrate per ml.

Chromatographic system

- a stainless steel column 30 cm × 7.8 mm, packed with strong cation-exchange resin consisting of sulphonated cross-linked styrene-divinylbenzene copolymer in the hydrogen form (7 mm) and a guard column 4 cm × 7.8 mm packed with the same column material,
- column. temperature 60°,
- mobile phase: *0.1 M sulphuric acid,*
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution containing 1.0 mg of anhydrous *sodium citrate* per ml. The test is not valid unless the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and all the three preparations of reference solution and measure the responses for the major peak. Plot the responses of all the three preparations of reference solution versus concentration, in mg of anhydrous sodium citrate per ml, and draw the straight line best fitting the three plotted points. From the graph so obtained, calculate the content of citrate in mg equivalent to anhydrous sodium citrate per litre of the preparation under examination.

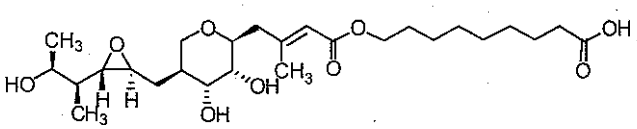
Labelling. The label states (1) the content of each electrolyte in terms of millimoles in a given volume; (2) the amount of each ingredient in 100 ml; (3) the total osmolar concentration in mOsmol per litre; (4) that the preparation should not be used if it contains visible particles.

Mupirocin



$C_{26}H_{44}O_9$ Mol. Wt. 500.6

Mupirocin is 9-[(*E*)-4-[(2*S*,3*R*,4*R*,5*S*)-3,4-Dihydroxy-5-[[(2*S*,3*S*)-3-[(2*S*,3*S*)-3-hydroxy-2-butanyl]-2-oxiranyl]methyl]-2-oxanyl]-3-methyl-2-butenoyl]oxynonanoic acid.

Mupirocin is produced by the growth of certain strains of *Pseudomonas fluorescens*or obtained by any other means.

Mupirocin contains not less than 93.0 per cent and not more than 102.0 per centof $C_{26}H_{44}O_9$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white or almost white powder. It shows polymorphism (2.5.11).

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *mupirocin IPRS* or with the reference spectrum of mupirocin.

Tests

pH(2.4.24). 3.5 to 4.0 for a freshly prepared saturated solution in *carbon dioxide- free water.*

Specific optical rotation (2.4.22). – 21.0° to – 17.0°, determined in 5.0 per cent w/v solution in *methanol.*

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Mix 50 volumes of *methanol* and 50 volumes of a 1.36 per cent w/v solution of *sodium acetate*, adjusted to pH 4.0 with *acetic acid.*

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution(a). Dilute 1.0 ml of the test solution to 50.0 ml with the solvent mixture.

Reference solution (b). Adjust 10 ml of reference solution (a) to pH 2.0 with *hydrochloric acid* and allow to stand for 20 hours.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 20 volumes of *water*, 30 volumes of *tetrahydrofuran* and 50 volumes of a 1.05 per cent w/v solution of *ammonium acetate*, adjusted to pH 5.7 with *acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

The relative retention time with respect to mupirocin for pseudomonic acid D (mupirocin impurity C) is about 0.75.

Inject reference solution (b). This test is not valid unless resolution between the second of the 2 peaks due to hydrolysis products and the peak due to mupirocin is not less than 7.0 in the chromatogram obtained with reference solution (b).

Inject reference solution (a) and the test solution. Run the chromatogram 3.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any peak corresponding to mupirocin impurity C is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (4.0 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (6.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Water (2.3.43). Not more than 1.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 5 ml of *methanol* and dilute to 200.0 ml with a 0.75 per cent w/v solution of *ammonium acetate*, adjusted to pH 5.7 with *acetic acid.*

Reference solution(a). Dissolve 25 mg of *mupirocin lithium IPRS* in 5 ml of *methanol* and dilute to 200.0 ml with a0. 75 per cent w/v solution of *ammonium acetate*, adjusted to pH 5.7 with *acetic acid.*

Reference solution (b). Adjust 10 ml of the test solution to pH 2.0 with *hydrochloric acid* and allow to stand for 20 hours.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 19 volumes of *water*, 32 volumes of *tetrahydrofuran* and 49 volumes of a 1.05 per cent *ammonium acetate solution*, adjusted to pH 5.7 with *acetic acid.*
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject reference solution (a) and (b). This test is not valid unless resolution between the second of the 2 peaks due to hydrolysis products and the peak due to mupirocin is not less than 7.0 in the chromatogram obtained with reference solution (b). The relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the contentof $C_{26}H_{44}O_9$.

1 mg of mupirocin lithium is equivalent to 0.988 mg of mupirocin.

Storage. Store protected from light.

Mupirocin Ointment

Mupirocin Ointment contains Mupirocin in a suitable base.

Mupirocin Ointment contains not less than 90.0 per cent and not more than 115.0 per cent ofthe stated amount of $C_{26}H_{44}O_9$.

Usual strength. 2 per cent w/w.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 2 volumes of *glacial acetic acid*, 5 volumes of *methanol* and 93 volumes of *ethyl acetate.*

Test solution. Disperse a quantity of the ointment containing 20 mg of Mupirocin in 20 ml of *methanol*, with the aid of ultrasound for 20 minutes and filter.

Reference solution (a). A 0.1 per cent w/v solution of *mupirocin lithium IPRS* in *methanol.*

Reference solution (b). Add *0.2 M hydrochloric acid*, dropwise, to 10 ml of reference solution (a), to adjust pH 2.0 and allow to stand at room temperature for 20 hours (generation of hydrolysis products).

Apply to the plate 25 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots at lower R_f values than the spot due to mupirocin.

B. In the Assay, the principal peak in the chromatogram obtained withthe test solution corresponds to that of the principal peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the ointment containing 50 mg of Mupirocin in 50 mlof *0.1 Mphosphate buffer solution pH 6.3*, swirl and allow to stand (with occasional swirling) until dissolution is almost complete. Shake vigorously for 10 minutes and add sufficient *0.1 Mphosphate buffer solution pH 6.3* to produce 100 ml.

Reference solution. A 0.00054 per cent w/v solution of *mupirocin lithium IPRS* in *0.1 M phosphate buffer solution pH 6.3.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (7 µm) (Such as Zorbax C8),
- mobile phase: a mixture of 28 volumes of *tetrahydrofuran* and 72 volumes of a buffer solution prepared by dissolving 7.7 g of *ammonium acetate* in 900 ml of *water*, adjusted to pH 5.7 with *0.1 M glacial acetic acid* and diluting to 1000 ml with *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Name	Relative retention time
Mupirocin impurity D[1]	0.5
Mupirocin impurity E[2]	0.55
Mupirocin impurity C[3]	0.65

[1] 9-[[(2*E*)-4-[(2*R*,3a*S*,6*S*,7*S*)-2-[(2*S*,3*S*)-1,3-dihydroxy-2-methylbutyl]-7-hydroxyhexahydro-4*H*-furo[3,2-*c*]pyran-6-yl]-3-methylbut-2-enoyl]oxy]nonanoic acid,

[2] 9-[[(2*E*)-4-[(2*R*,3*RS*,4a*S*,7*S*,8*S*,8a*R*)-3,8-dihydroxy-2-[(1*S*,2*S*)-2-hydroxy-1- methylpropyl]hexahydro-2*H*,5*H*-pyrano[4,3-*b*]pyran-7-yl]-3-methylbut-2- enoyl]oxy]nonanoic acid,

[3] pseudomonic acid D.

Inject the reference solution. This test is not valid unless resolution between the peaks corresponding to mupirocin and the peak with a relative retention time of about 0.65 (mupirocin impurity C) is not less than 3.5.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution the area of any peak corresponding to mupirocin impurity C is not more than four times the area of the principal peak in the chromatogram obtained with the reference solution (4.0 per cent). The area of any peak corresponding to mupirocin impurity D is not more than 5 times the area of the principal peak in the chromatogram obtained withthe reference solution (5.0 per cent). The area of any peak corresponding to mupirocin impurity E is not more than 10 times the area of the principal peak in the

chromatogram obtained with the reference solution (10.0 per cent), the area of any other secondary peak is not more than 1.5 times the area of the principal peak in the chromatogram obtained withthe reference solution (1.5 per cent)and the sum of areas of all the secondary peaks is not more than 20 times the area of the principal peak in the chromatogram obtained withthe reference solution (20.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent).

Other tests. Comply with the tests stated under Ointment.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the ointment containing 50 mg of Mupirocin in 100 ml of *0.1 M phosphate buffer solution pH 6.3*, swirl and allow to stand (with occasional swirling) until dissolution is complete. Add 56 ml of *acetonitrile* and sufficient *0.1 M phosphate buffer solution pH 6.3* to produce 200 ml.

Reference solution. A 0.027 per cent w/v solution of *mupirocin lithium IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (10 µm) (Such as µBondapack C18),
- mobile phase: a mixture of 28 volumes of *acetonitrile* and 72 volumes of *0.1 M phosphate buffer solution pH 6.3*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

The retention time of mupirocin is about 5 minutes. The relative retention time of mupirocin impurity C to mupirocin is about 0.77.

Inject the reference solution. This test is not valid unless resolution between the peaks corresponding to mupirocin and the peak corresponding to mupirocin impurity C is not less than 1.5.

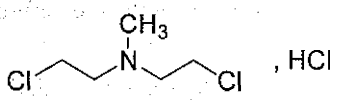
Inject the reference solutionand the test solution.

Calculate the content of $C_{26}H_{44}O_9$ in the ointment.

1 mg of $C_{26}H_{43}O_9Li$ is equivalent to 0.9882 mg of $C_{26}H_{44}O_9$.

Mustine Hydrochloride

Nitrogen Mustard



$C_5H_{11}Cl_2N,HCl$ Mol Wt. 192.4

Mustine Hydrochloride is bis(2-chloroethyl)methylamine hydrochloride.

Mustine Hydrochloride contains not less than 98.0 per cent and not more than 101.0 per cent of $C_5H_{11}Cl_2N$, HCl.

Category. Anticancer.

Description. A white or almost white, crystalline powder or mass; hydroscopic; vesicant.

Identification

A. Dissolve 50 mg in 5 ml of *water* and add 1 ml of *5 M sodium hydroxide*; oily globules are produced which dissolve on warming.

B. Dissolve 50 mg in 5 ml of *water* and add 0.02 ml of *potassium mercuri-iodide solution*; a cream-coloured precipitate is produced.

A. Melts at about 108° (2.4.21).

Tests

Assay. Weigh 0.2 g, add 15 ml of *1 M ethanolic potassium hydroxide* and 15 ml of *water* and boil under a reflux condenser for 2 hours. Evaporate the solution to half its volume on water-bath, dilute to 150 ml with *water*, add 3 ml of *nitric acid* and 50.0 ml of *0.1 M silver nitrate*. Shake vigorously and filter. Wash the residue with *water* and titrate the excess of silver nitrate in the combined filtrate and washings with *0.1 M ammonium thiocycanate* using 1 ml of *ferric ammonium sulphate solution* as indicator.

1 ml of *0.1 M silver nitrate* is equivalent to 0.006418 g of $C_5H_{11}Cl_2N$, HCl.

Storage. Store protected from light and moisture at a temperature not exceeding 30°.

Labelling. The label states that the contents of the container are strongly vesicant.

Mustine Injection

Mustine Hydrochloride Injection

Mustine Injection is a sterile material consisting of Mustine Hydrochloride with or without buffering agents and other excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections or Sodium Chloride Intravenous Infusion, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution deteriorates rapidly on storage and should be used immediately after preparation.

Mustine Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of the stated amount of mustine hydrochloride, $C_5H_{11}Cl_2N,HCl$.

Usual strength. 10 mg.

The contents of the sealed container complies with the tests stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

Dissolve about 20 mg in 1 ml of *water* and add 0.02 ml of *potassium mercuri-iodide solution*; a cream-coloured precipitate is produced.

Tests

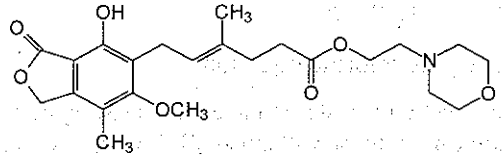
Assay. Determine the weight of the contents of 10 containers. Weigh a quantity of the mixed contents of the ten containers, containing 40 mg of Mustine Hydrochloride, dissolve in 10 ml of *ethanol (95 per cent)*, previously neutralised to dilute *phenolphthalein solution*. Titrate with *0.01 M sodium hydroxide* using *dilute phenolphthalein solution* as indicator.

1 ml of *0.01 M sodium hydroxide* is equivalent to 0.001925 g of $C_5H_{11}Cl_2N,HCl$.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Labelling. The label states (1) that the contents are strongly vesicant; (2) the amount of Mustine Hydrochloride in the container, (3) that the injection should be used immediately after preparation.

Mycophenolate Mofetil



$C_{23}H_{31}NO_7$ Mol. Wt. 433.5

Mycophenolate Mofetil is 2-(morpholin-4-yl)ethyl (4*E*)-6-(4-hydroxy-6-methoxy-7-methyl-3-oxo-1,3-dihydroisobenzofuran-5-yl)-4-methylhex-4-enoate.

Mycophenolate Mofetil contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{23}H_{31}NO_7$, calculated on the dried basis.

Category. Immunosupressant.

Description. A white or almost white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *mycophenolate mofetil IPRS* or with the reference spectrum of mycophenolate mofetil.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use. Protect the solutions from light.

Test solution. Dissolve 200 mg of the substance under examination in 100.0 ml of *acetonitrile.*

Reference solution. A 0.001 per cent w/v solution of *mycophenolate mofetil IPRS* in *acetonitrile.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (such as Zorbax SB-C8),
- column temperature: 45°,
- sample temperature. 10°,
- mobile phase: a mixture 65 volumes of *water*, 0.2 volumes of *triethylamine*, adjusted to pH 5.3 with *orthophosphoric acid* and 35 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 5.0 per cent. The relative retention time with reference to the principal peak for impurity F is about 0.3, for impurity A is about 0.4, for impurity H is about 0.5, for impurity G is about 0.6, for impurity B is about 0.8, for impurity D is about 1.2 and for impurity E is about 1.6.

Inject the reference solution and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of peak due to impurity A, B, D, E, F, G, H or any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying it at 60° for 3 hours under vacuum.

Assay. Weigh 0.4 g and dissolve in 50 ml of *glacial acetic acid* and titrate with *0.1 M perchloric acid,* determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04335 g of $C_{23}H_{31}NO_7$.

Storage. Store protected from light and moisture.

Mycophenolate Mofetil Capsules

Mycophenolate Mofetil Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of mycophenolate mofetil, $C_{23}H_{31}NO_7$.

Usual strengths. 250 mg; 500 mg.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. When examined in the range 200 nm to 400 nm (2.4.7), a 0.0025 per cent w/v solution in *methanol* shows an absorption maximum as obtained with *mycophenolate mofetil IPRS* of the same concentration.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *mycophenolate mofetil IPRS* in *methanol* and dilute with dissolution medium to obtain a solution having a known concentration similar to the test solution.

Chromatographic system as described in the Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{23}H_{31}NO_7$ in the capsule.

Q. Not less than 75 per cent of the stated amount of $C_{23}H_{31}NO_7$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Use freshly prepared solutions.

Test solution. Mix the contents of 20 capsules. Disperse a quantity of the mixed content containing about 200 mg of Mycophenolate with *acetonitrile,* sonicate for 15 minutes and dilute to 200.0 ml with *acetonitrile.*

Reference solution. A 0.001 per cent w/v solution of *mycophenolate mofetil IPRS* in *acetonitrile.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (such as Inertsil ODS-3),
- mobile phase: a mixture of 40 volumes of *acetonitrile* and 60 volumes of buffer solution prepared by dissolving 13.6 g of *potassium dihydrogen orthophosphate anhydrous* in 1000 ml of *water*, adjusted to pH 3.6 with *orthophosphoric acid* and 4.0 g of *sodium heptane sulphonate*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. Run the chromatogram 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent); the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (2.0 per cent).

Water (2.3.43). Not more than 4.0 per cent, determined on 0.5 g.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

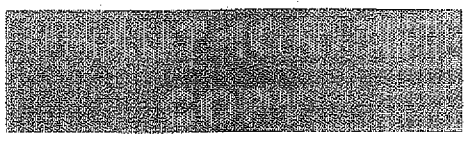
NOTE—Use freshly prepared solutions.

Test solution. Disperse a quantity of the content of the capsules containing about 500 mg of Mycophenolate Mofetil with *methanol*, sonicate for 15 minutes and dilute to 500.0 ml with the *methanol*. Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution. Dissolve 10 mg of *mycophenolate mofetil IPRS* in sufficient amount of *methanol*, sonicate for 15 minutes and dilute to 20.0 ml with *methanol*. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (such as Inertsil ODS-3V),



- mobile phase: a mixture of 50 volumes of *acetonitrile* and 50 volumes of buffer solution prepared by dissolving 13.6 g of *potassium dihydrogen orthophosphate anhydrous* in 1000 ml with *water*, adjusted to pH 3.6 with *orthophosphoric acid* and dissolve 4.0 g of *sodium heptane sulphonate*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 305 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the theoretical plates is not less than 2000 and the tailing factor is not more than 2.0. The relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference sollution and the test solution.

Calculate the content of $C_{23}H_{31}NO_7$ in the capsules.

Storage. Store protected from light, at a temperature not exceeding 30°.

Mycophenolate Mofetil Oral Suspension

Mycophenolate Mofetil Oral Suspension is a dry mixture consisting of mycophenolate mofetil with buffering agents and other excipients. It contains a suitable flavouring agent. It is filled in a sealed container.

The suspension is constituted by dispersing the contents of sealed container in the specified volume of *water* just before use.

Mycophenolate Mofetil Oral Suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of mycophenolate mofetil, $C_{23}H_{31}NO_7$.

Usual strength. Mycophenolate Mofetil 200 mg per ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

Tests

pH (2.4.24). 6.0 to 7.0.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use and protect from light.

Buffer solution (a). Prepared by diluting 10.0 ml of *triethylamine* in 950 ml of *water*, adjusted to pH 7.2 with *orthophosphoric acid* and dilute to 1000 ml with *water*.

Buffer solution (b). Prepared by diluting 10.0 ml of *triethylamine* in 950 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and dilute to 1000 ml with *water*.

Solvent mixture (a). 35 volumes of *acetonitrile*, 20 volumes of buffer solution (b) and 45 volumes of *water*.

Solvent mixture (b). 50 volumes of *acetonitrile*, 15 volumes of buffer (b) and 35 volumes of *water*.

Test solution. Mix the contents of not less than 4 constituted containers. Transfer a volume of the constituted suspension containing about 800 mg of Mycophenolate Mofetil to a 200-ml volumetric flask, diluted with the solvent mixture (b) to the volume and mix. Dilute 5.0 ml of the solution to 50.0 ml with solvent mixture (a), mix and filter.

Reference solution (a). A solution containing 0.4 per cent w/v solution of *mycophenolate mofetil IPRS* in solvent mixture (b).

Reference solution (b). A solution containing 0.04 per cent w/v of *mycophenolate mofetil IPRS* in solvent mixture (a) prepared from reference solution (a).

Reference solution (c). A solution containing 0.001 per cent w/v each of *mycophenolate mofetil impurity A IPRS* and *mycophenolate mofetil impurity B IPRS* in the solvent mixture (a).

Reference solution (d). A solution containing 0.00002 per cent w/v of *mycophenolate mofetil IPRS* in solvent mixture (a) prepared from reference solution (b).

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with phenyl group bonded to porous silica (5 µm),
- column temperature 45°,
- sample temperature 5°,
- mobile phase: a mixture of 30 volumes of *acetonitrile* and 70 volumes of a solution prepared by mixing 4 volumes of buffer solution (a) and 9 volumes of *water*.
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 249 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Mycophenolic acid[1]	0.12	0.71
Sorbitol ester of mycophenolic acid[2]	0.24	1.29
Mycophenolate mofetil impurity A	0.40	—
Mycophenolate mofetil impurity B	0.46	—
Mycophenolate mofetil	1.0	—
Any individual unspecified impurity	—	1.0

[1](*E*)-6-(1,3-dihydro-4-hydroxy-6-methoxy-7-methyl-3-oxo-5-isobenzofuranyl)-4-methyl-4-hexenoic acid,

[2]Sorbitol (*E*)-6-(4-hydroxy-6-methoxy-7-methyl-3-oxo-1,3-dihydro-isobenzofuran-5-yl)-4-methylhex-4-enoate,

[3]2-morpholinoethyl(E)-6-(1,3-dihydro-4,6-dihydroxy-7-methyl-3-oxo-5-isobenzofuranyl)-4-methyl-4-hexenoate,

[4]*(RS)*-7-hydroxy-5-methoxy-4-methyl-6-[2-(5-methyl-2-oxo-tetrahydrofuran-5-yl)ethyl]-3*H*-isobenzofuranyl-1-one.

Inject reference solution (b), (c) and (d). The test is not valid unless the resolution between mycophenolate mofetil impurity A and mycophenolate mofetil impurity B is not less than 2.0, signal-to-noise ratio for the principal peak in the chromatogram obtained with reference solution (d) is not less than 10.0, the tailing factor for the peak due to mycophenolate mofetil in the chromatogram obtained with reference solution (b) is not more than 2.0 and relative standard deviation for replicate injections is not more than 2.0 per cent with reference solution (b).

Inject the test solution. Run the chromatogram 1.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak due to mycophenolic acid is not more than 3.3 per cent. The area of any peak due to sorbitol ester of mycophenolic acid is not more than 0.2 per cent. The area of any secondary peak is not more than 0.1 per cent and the sum of the areas of all such peaks is not more than 3.8 per cent calculated by area normalization. Ignore any peak with an area less than 0.05 per cent.

Other tests. Comply with the tests stated under Oral Powders.

Assay. Determine by liquid chromatography (2.4.14) as described under related substances using the following solutions.

Inject reference solution (b). The test is not valid unless the tailing factor of the principal peak is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (b) and the test solution.

Calculate the content of $C_{23}H_{31}NO_7$ in the suspension.

Determine the weight per ml of the oral suspension (2.4.29) and calculate the content of $C_{23}H_{31}NO_7$, weight in volume.

Repeat the procedure using a portion of the constituted suspension that has been stored at the temperature and for the period stated on the label.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Labelling. The label states (1) the quantity of active ingredient in terms of the equivalent amount of mycophenolate mofetil; (2) the temperature of storage and the period during which the constituted suspension may be expected to be satisfactory for use.

Mycophenolate Mofetil Tablets

Mycophenolate Mofetil Tablets contain not less than 94.0 per cent and not more than 105.0 per cent of the stated amount of mycophenolate mofetil, $C_{23}H_{31}NO_7$.

Usual strengths. 250 mg; 360 mg; 500 mg; 750 mg.

Identification

A. When examined in the range 200 nm to 400 nm (2.4.7), the solution obtained in the dissolution test shows an absorption maxima and minima at the same wavelength ±3 as that of reference solution of *mycophenolate mofetil* prepared in the same manner.

B. In the Assay, the chromatogram obtained with the test solution corresponds to the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm, 5 minutes and 15 minutes.

Withdraw a suitable volume of the medium and filter. Dilute the filtrate, if necessary with the dissolution medium. Measure the absorbance of the resulting solution at the maximum at about 250 nm using 1 cm path length (2.4.7). Calculate the content of $C_{23}H_{31}NO_7$ in the medium from the absorbance obtained from 0.0011 per cent w/v solution of *mycophenolate mofetil IPRS* in the dissolution medium and dilute the solution as that similar concentration of test solution in the same medium.

Calculate the content of $C_{23}H_{31}NO_7$ in the medium.

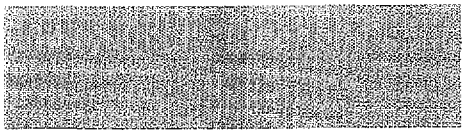
Q. Not less than 70 per cent in 5 minutes and not less than 85 per cent in 15 minutes, of the stated amount of $C_{23}H_{31}NO_7$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve a quantity of the powder tablets containing about 250 mg of *mycophenolate mofetil* with 10.0 ml of *water*, shake mechanically for a minimum of 15 minutes and add 70.0 ml of *acetonitrile*. Sonicate for 15 minutes, again shake mechanically for 20 minutes and make up to 100.0 ml with *acetonitrile*. Dilute 5.0 ml of the solution to 100.0 ml with the *acetonitrile* and filter.

Reference solution (a). A 0.0125 per cent w/v solution of *mycophenolate mofetil IPRS* in *acetonitrile*.

Reference solution (b). A 0.00000625 per cent w/v solution of *mycophenolate mofetil IPRS* in *acetonitrile*.



Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- sample temperature.10°,
- column temperature:45°,
- mobile phase: a mixture of 45 volumes of a buffer solution prepared by diluting 3.0 ml of *triethylamine* in 1000 ml of *water*, adjusted to pH 5.3 with *orthophosphoric acid* and 55 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Mycophenolic acid[1]	0.6	0.71
Mycophenolate *N*-oxide analog[2]	0.8	1.0
Mycophenolate mofetil	1.0	—
Any single unspecified impurity	—	1.0

[1](*E*)-6-(1,3-Dihydro-4-hydroxy-6-methoxy-7-methyl-3-oxo-5-isobenzofuranyl)-4-methyl-4-hexenoic acid,

[2]2-Morpholinoethyl (*E*)-6-(1,3-dihydro-4-hydroxy-6-methoxy-7-methyl-3-oxo-5-isobenzofuranyl)-4-methyl-4-hexenoate N-oxide.

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 2.0 in the chromatogram obtained with reference solution (a) and and relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (b). The chromatogram obtained shows one principal peak with a signal-to-noise ratio of not less than 10.

Inject reference solution (a) and the test solution. Run the chromatogram 3.0 times the retention time of the principal peak in the chromatogram obtained with the test solution, the area of any peak corresponding to mycophenolic acid is not more than 0.01 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent) and any peak corresponding to mycophenolate *N*-oxide analog is not more than 0.002 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any secondary peak is not more than 0.001 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of area of all secondary peaks is not more than 0.015 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent). Ignore any peak with a relative retention times of 1.45, and 2.15, any peak with an area less than 0.0005 times the area of the peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances with the following modifications.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 250 mg of Mycophenolate Mofetil with 10.0 ml of *water*, shake mechanically for a minimum of 15 minutes and add 70.0 ml of *acetonitrile*. Sonicate for 15 minutes, again shake mechanically for 20 minutes and make up to 100.0 ml with *acetonitrile*. Dilute 5.0 ml of the solution to 100.0 ml with the *acetonitrile* and filter.

Reference solution. A 0.0125 per cent solution of *mycophenolate mofetil IPRS* in *acetonitrile*.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{23}H_{31}NO_7$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Myristic Acid

$CH_3(CH_2)_{12}COOH$

$C_{14}H_{28}O_2$ Mol. Wt. 228.4

Myristic acid is tetradecanoic acid.

Myristic Acid is obtained from coconut oil and other fats.

Myristic Acid contains not less than 97.0 per cent of $C_{14}H_{28}O_2$.

Category. Pharmaceutical aid.

Tests

Congealing temperature (2.4.10). 48° to 55.5°.

Acid value (2.3.23). 242 to 249.

Saponification value (2.3.37). 242 to 251.

Iodine value (2.3.28). Not more than 1.0.

Unsaponifiable matter (2.3.39). Not more than 1.0 per cent.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.2 per cent.

Lead. Determine by atomic absorption spectrophotometry (2.4.2), measuring at 283.3 nm using a lead electrodeless discharge lamp, an air acetylene flame, and a suitable burner head, preferably a slit-width of 0.7 nm.

NOTE—Select reagents having as low a lead content as practicable, and store all solutions in high-density polyethylene containers. Rinse all plastic and glassware thoroughly with warm, 8 M nitric acid followed by deionized water.

Test solution. Weigh 5 g of Myristic Acid to an evaporating dish, add 5 ml of a 25 per cent *sulphuric acid solution* and distribute the *sulphuric acid* uniformly through the sample. Within a hood, place the dish on a steam bath to evaporate most of the *water*. Place the dish on a burner, and slowly pre-ash the sample by expelling most of the *sulphuric acid*. Place the dish in a muffle furnace that has been set at 525°, and ash the sample until the residue appears free from carbon. Prepare a blank by ashing 5 ml of 10 per cent *sulphuric acid solution*. Cool, and cautiously wash down the inside of each evaporation dish with water. Treat both the sample and the blank as follows. Add 5 ml of *1 M hydrochloric acid*. Place each dish on a steam bath, and evaporate to dryness. To each dish add 1.0 ml of *3 M hydrochloric acid* and approximately 5 ml of *water*, and heat briefly on a steam bath to dissolve any residue. Transfer each solution quantitatively to a 10-ml volumetric flask, dilute with *water* to volume, and mix.

Reference solution (a). Weigh 0.16 g of *lead nitrate* in 1 per cent v/v solution of *nitric acid*. Dilute to 1000 ml with *water* and mix.

Reference solution (b). Dissolve 10.0 ml of reference solution (a) in *water* to a 100-ml volumetric flask and mix. 1 ml of the solution contains the equivalent of about 10 µg of lead. Dilute measured volumes of the diluted reference solution (a) with *water* to obtain solutions having known concentrations of about 1 µg, 2 µg, and 5 µg of lead per ml.

NOTE—Prepare these solutions on the day of use.

Calculate the content of lead, in the substance under examination. (2 ppm).

Assay. Determine by gas chromatography (2.4.13).

Test solution. Dissolve 100 mg of the substance to a 50-ml conical flask fitted with a suitable water-cooled reflux condenser and a magnetic stir bar. Add 4 ml of *0.5 M sodium hydroxide solution methanolic*, and reflux until fat globules disappear (usually 5 to 10 minutes). Add 5 ml of a solution prepared by dissolving 14 g of boron trifluoride in *methanol* to make 100 ml, swirl to mix, and reflux for 2 minutes. Add 4 ml of chromatographic *n-heptane* through the condenser, and reflux for 1 minute. Cool, remove the condenser, add about 15 ml of *saturated sodium chloride solution*, shake, and allow the layers to separate. Pass the n-heptane layer through 0.1 g of *anhydrous sodium sulphate* (previously washed with chromatographic *n-heptane*) into a suitable flask. Transfer 1.0 ml of the solution to a 10-ml volumetric flask, dilute with chromatographic *n-heptane* to volume, and mix.

Reference solution (a). Prepare as directed for the test solution using 100 mg of *myristic acid IPRS* instead of the substance under examination.

Reference solution (b). Dissolve about 20 mg each of stearic acid, palmitic acid and oleic acid to a 25-ml conical flask fitted with a suitable water-cooled reflux condenser and a magnetic stir bar, and proceed as directed for the test solution, beginning with "Add 5.0 ml of a solution prepared by dissolving."

Chromatographic system

- a fused-silica capillary column 30 m x 0.53 mm, packed with bonded with a 1.0 µm layer of phase G16,
- temperature:
  column.70° for 2 minutes and 240° for 5 minutes,
  inlet port. 220°,
- a flame ionisation detector,
- flow rate: 30 ml per minute using nitrogen as the carrier gas.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to methyl stearate and methyl palmitate is not less than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject 1 µl of reference solution (a) and the test solution.

Calculate the content $C_{14}H_{28}O_2$ by area normalization method.

Storage. Store protected from light and moisture.
