Sodium. 11.3 per cent to 13.5 per cent.

Determine by atomic absorption spectrometry (2.4.2, Method A).

Test solution. Dissolve 50 mg in *0.1 M hydrochloric acid* containing 0.127 per cent w/v solution of *caesium chloride* and dilute to 100.0 ml with the same solvent.

Reference solution. Prepare reference solutions (25 ppm, 50 ppm and 75 ppm) using *sodium standard solution (200 ppm)* diluted with *0.1 M hydrochloric acid* containing 0.127 per cent w/v solution of *caesium chloride.*

Source. Sodium hollow-cathode lamp.

Wavelength. 330.3 nm.

Atomisation device. Flame of suitable composition (for example, 11 litres of air and 2 litres of acetylene per minute).

Nitrogen (2.3.30). 1.8 to 2.5 per cent, Method E, calculated on dried basis.

Loss on drying (2.4.19). Not more than 10.0 per cent, determined on 1.0 g by drying in an oven over phosphorous pentaoxide at 60° at a pressure not exceeding 0.7 kPa for 3 hours.

Bacterial endotoxins (2.2.3). Not more than 0.01 Endotoxin Unit per IU of anti-factor X_a activity of enoxaparin sodium.

Benzyl alcohol. Determine by liquid chromatography (2.4.14).

Internal standard solution. A 0.1 per cent w/v solution of *3,4-dimethylphenol* in *methanol.*

Test solution. Dissolve about 0.5 g of substance under examination in 5.0 ml of *1 M sodium hydroxide.* Allow to stand for 1 hour. Add 1.0 ml of *glacial acetic acid* and 1.0 ml of the internal standard solution and dilute to 10.0 ml with the *water.*

Reference solution. A 0.025 per cent w/v solution of *benzyl alcohol* in *water.* Mix 0.5 ml of the solution with 1.0 ml of the internal standard solution and dilute to 10.0 ml with the *water.*

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase. a mixture of 5 volumes of *methanol*, 15 volumes of *acetonitrile* and 80 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 256 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution. In the chromatogram obtained with the reference solution, calculate the ratio (R_1) of the height of the peak due to benzyl alcohol to the height of the peak due to the internal standard. In the chromatogram obtained with the test solution, calculate the ratio (R_2) of the height of the peak due to benzyl alcohol to the height of the peak due to the internal standard.

Calculate the percentage content (*m/m*) of benzyl alcohol using the following expression:

$$\frac{0.0125 \times R_2}{m \times R_1}$$

Where, m = mass of the substance under examination, in grams.

The content is not more than 0.1 per cent of benzyl alcohol

Assay (anti-factor X_a activity). Not less than 90 and not more than 125 Anti-Factor X_a IU per mg.

Acetic acid solution. Transfer 42 ml of *glacial acetic acid* to a 100-ml volumetric flask, dilute with *water* to volume, and mix.

Polyethylene glycol 6000 buffer pH 7.4. Dissolve 6.08 g of *tris(hydroxymethyl)aminomethane* and 8.77 g of *sodium*

chloride in 500 ml of *water*. Add 1.0 g of *polyethylene glycol 6000*, adjusted to pH 7.4 with *hydrochloric acid* and dilute with *water* to 1000 ml.

Buffer pH 7.4. Dissolve 6.08 g of *tris(hydroxymethyl) aminomethane* and 8.77 g of *sodium chloride* in 500 ml of *water*. Adjusted to pH 7.4 with *hydrochloric acid* and dilute to 1000 ml with *water*.

Buffer pH 8.4. Dissolve 3.03 g of *tris(hydroxymethyl) aminomethane*, 5.12 g of *sodium chloride* and 1.40 g of *edetate sodium* in 250 ml of *water*. Adjusted to pH 8.4 with *hydrochloric acid* and dilute to 500 ml with *water*.

Human antithrombin III solution. Reconstitute a vial of antithrombin III in *water* to obtain a solution containing 5 Antithrombin III Units per ml. Dilute the solution with *Polyethylene glycol 6000* buffer pH 7.4 to obtain a solution having a concentration of 1.0 Antithrombin III Unit per ml.

Factor X_a solution. Reconstitute an weighed quantity of bovine factor X_a in *Polyethylene glycol 6000* buffer pH 7.4 to obtain a solution that gives an increase in absorbance value at 405 nm of not more than 0.20 absorbance units per minute when assayed as described below but using as an appropriate volume (V, in µl) of Buffer pH 7.4 instead of V µl of the enoxaparin solution.

Chromogenic substrate solution. Prepare a solution of a suitable chromogenic substrate for amidolytic test for factor X_a in *water* to obtain a concentration of about 3 mM. Dilute with buffer pH 8.4 to obtain a solution having a concentration of 0.5 mM.

Reference solutions. Dilute *Enoxaparin Sodium Solution for Bioassays IPRS* with Buffer pH 7.4 to obtain four dilutions in the concentration range between 0.025 and 0.2 USP Anti-Factor X_a IU per ml.

Test solutions. Proceed as directed for reference solutions to obtain concentrations of Enoxaparin Sodium similar to those obtained for the reference solutions.

Label 18 suitable tubes: B1 and B2 for blanks; T1, T2, T3, and T4 each in duplicate for the dilutions of the test solutions; and S1, S2, S3, and S4 each in duplicate for the dilutions of the reference solutions. [*NOTE*—Treat the tubes in the order B1, S1, S2, S3, S4, T1, T2, T3, T4, T1, T2, T3, T4, S1, S2, S3, S4, B2.] To each tube add the same volume, V, (20 to 50 µl) of *Human antithrombin III solution* and an equal volume, V, of either the blank, buffer pH 7.4, or an appropriate dilution of the test solutions and reference solutions. Mix, but do not allow bubbles to form. Incubate at 37° for 1.0 minute. Add to each tube volume $2V$ (40 to 100 µl) of *Factor* X_a solution, and incubate for 1.0 minute. Add $5V$ (100 to 250 µl) volume of *chromogenic substrate solution*. Stop the reaction after 4.0 minutes with $5V$ (100 to 250 µl) volume of *acetic acid solution*. Measure the absorbance of each solution at 405 nm against blank B1.

For each series, calculate the regression of the absorbance against log concentrations of the test solutions and reference solutions, and calculate the potency of the enoxaparin sodium in IU of anti-factor X_a activity per mL using statistical methods for parallel-line assays. The four independent log relative potency estimates are then combined to obtain the final geometric mean. Its confidence limits are calculated. Express the anti-factor X_a activity of Enoxaparin Sodium per mg, calculated on the dried basis.

Anti-factor II_a activity. Not less than 20.0 and not more than 35.0 anti-Factor II_a IU per mg.

Acetic acid solution, Polyethylene glycol 6000 buffer pH 7.4, Buffer pH 7.4, Buffer pH 8.4, and *Human antithrombin III solution.* Proceed as directed under *Assay (anti-factor X_a activity)*, except that the concentration of the *Human antithrombin III solution* is 0.5 Antithrombin III Unit per ml.

Thrombin human solution. Reconstitute thrombin human in *water*, and dilute in Polyethylene glycol 6000 buffer pH 7.4 to obtain a solution having a concentration of 5 Thrombin Units per ml.

Chromogenic substrate solution. Prepare a solution of a suitable chromogenic substrate for an amidolytic test for thrombin in *water* to obtain a concentration of about 3 mM. Immediately before use, dilute with buffer pH 8.4 to 0.5 mM.

Reference solutions. Dilute *Enoxaparin Sodium Solution for Bioassays IPRS* with buffer pH 7.4 to obtain four dilutions having concentrations in the range between 0.015 and 0.075 IU of anti-factor II_a activity per ml.

Test solutions. Proceed as directed under Reference solutions to obtain concentrations of Enoxaparin Sodium similar to those obtained for the Reference solutions.

Proceed as directed under Assay (anti-factor X_a activity), except to use *Thrombin human solution* instead of *Factor X_a solution* and to use the *Human antithrombin III solution* as described above.

For each series, calculate the regression of the absorbance against log concentrations of the test solutions and of the reference solutions, and calculate the potency of the enoxaparin sodium in IU of anti-factor II_a activity per mg using statistical methods for parallel-line assays. The four independent dilution estimates are then combined to obtain the final weighted mean. Then calculate the confidence limits. Express the anti-factor II_a activity of Enoxaparin Sodium per mg, calculated on the dried basis.

Anti-factor X_a to anti-factor II_a ratio. The ratio of the numerical value of the anti-factor X_a activity in Anti-Factor X_a IU per mg to the numerical value of the anti-factor II_a activity in Anti-Factor II_a IU per mg, as determined by the Assay (anti-factor

X_a activity) and the Anti-factor II_a activity, respectively, is not less than 3.3 and not more than 5.3.

Storage. Store at a temperature not exceeding 30°.

Labelling. The label states (a) the number of International Units of anti-factor X_a activity per miligram; (b) the number of International Units of anti-factor IIa activity per miligram; (c) the mass-average molecular mass and the percentage of molecules within defined molecular mass ranges; (d) where applicable, that the contents are the sodium salt.

Enoxaparin Injection

Enoxaparin Sodium Injection

Enoxaparin Injection is a sterile solution of Enoxaparin Sodium in Water for Injections.

The potency is not less than 90.0 per cent and not more than 110.0 per cent stated in terms of International Anti-factor X_a Units (IU). It may contain, in multiple-dose containers, a suitable antimicrobial preservative, such as benzyl alcohol.

Usual strengths. 20 mg (2000 Anti-factor X_a units); 40 mg (4000 Anti-factor X_a units); 60 mg (6000 Anti-factor X_a units); 80 mg (8000 Anti-factor X_a units).

Identification

A. Add 2 ml of *water* to the total content of a single-dose container or to 0.4 ml from a multiple-dose container, and 1 ml of 2 per cent w/v solution of *protamine sulphate* in a glass test tube, and mix. A creamy white precipitate is formed.

B. Transfer the total content of a single-dose container, or 0.4 ml from a multiple-dose container, dilute to 100 ml with *0.01 M hydrochloric acid* and 0.05 per cent w/v of reference solution shows absorption maxima at 231 nm (2.4.7).

C. Complies with the test for sodium (2.3.1).

Tests

pH (2.4.24). 5.5 to 7.5.

Benzyl alcohol *(if present)*. 1.35 per cent to 1.65 per cent.

Test solution. Dilute 5.0 ml of the Injection to 50 ml with the mobile phase.

Reference solution. Dissolve about 75 mg of *benzyl alcohol IPRS* in 50 ml of the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 80 volumes of *water*, 15 volumes of *acetonitrile* and 5 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 256 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution.

Calculate the content of benzyl alcohol.

Free sulphate. Not more than 0.12 per cent.

Determine by ion chromatography (2.4.14).

Test solution. Transfer about 200 mg of a 100 mg per ml Injection, weighed, to a suitable previously tared sulfate-free vial. Add mobile phase to obtain a total mass of about 20 g.

Sulphate stock solution. Dissolve an accurately weighed quantity of *sodium sulphate* equivalent to 0.1 g of *sulphate* in 100.0 ml of the mobile phase. Dilute 5.0 ml of the solution to 25.0 ml with the mobile phase.

Reference solution. Prepare solutions of 0.1 µg per ml, 0.5 µg per ml, 1 µg per ml, 2 µg per ml, 4 µg per ml, and 5 µg per ml by appropriate dilution of the sulphate stock solution in the mobile phase.

System suitability solution. Prepare a solution containing 3 µg per ml of sulphate anion and 5 µg per ml of oxalate anion.

Chromatographic system
- a column 25 cm x 4 mm, packed with anion-exchange resin and a 5 cm x 4 mm anion-exchange guard column, both containing ethylvinylbenzene cross linked with 55 per cent divinylbenzene with latex coating of microbeads bonded with alkanol quaternary ammonium ions (6 per cent),
- mobile phase: a *3.0 mM sodium carbonate solution*,
- flow rate: 2.0 ml per minute,
- conductivity detector,
- injection volume: 25 µl.

Inject system suitability solution. The test is not valid unless the resolution between the peak due to sulphate and oxalate is not less than 1.

Inject the reference solution and the test solution.

Other tests. Comply with the tests stated under Parenteral Peparations (Injections).

Bacterial endotoxins (2.2.3). Not more than 0.01 Endotoxin Unit per unit of anti-factor X_a activity in Anti-factor X_a IU.

Assay (anti-factor X_a activity). The estimated activity is not less than 90.0 per cent and not more than 110.0 per cent of the stated activity.

Acetic acid solution. Transfer 42 ml of *glacial acetic acid* to a 100-ml volumetric flask, dilute with *water* to volume, and mix.

Polyethylene glycol 6000 buffer pH 7.4. Dissolve 6.08 g of *tris(hydroxymethyl)aminomethane* and 8.77 g of *sodium*

chloride in 500 ml of *water*. Add 1.0 g of *polyethylene glycol 6000*, adjusted to pH 7.4 with *hydrochloric acid* and dilute with *water* to 1000.0 ml.

Buffer pH 7.4. Dissolve 6.08 g of *tris(hydroxymethyl) aminomethane* and 8.77 g of *sodium chloride* in 500 ml of *water*. Adjusted to pH 7.4 with *hydrochloric acid* and dilute to 1000.0 ml with *water*.

Buffer pH 8.4. Dissolve 3.03 g of *tris(hydroxymethyl) aminomethane*, 5.12 g of *sodium chloride* and 1.40 g of *edetate sodium* in 250 ml of *water*. Adjusted to pH 8.4 with *hydrochloric acid* and dilute to 500.0 ml with *water*.

Human antithrombin III solution. Reconstitute a vial of antithrombin III in *water* to obtain a solution containing 5 Antithrombin III Units per ml. Dilute the solution with *Polyethylene glycol 6000* buffer pH 7.4 to obtain a solution having a concentration of 1.0 Antithrombin III Unit per ml.

Factor X_a solution. Reconstitute an weighed quantity of bovine factor X_a in *Polyethylene glycol 6000* buffer pH 7.4 to obtain a solution that gives an increase in absorbance value at 405 nm of not more than 0.20 absorbance units per minute when assayed as described below but using as an appropriate volume (V, in µl) of Buffer pH 7.4 instead of V µl of the enoxaparin solution.

Chromogenic substrate solution. Prepare a solution of a suitable chromogenic substrate for amidolytic test for factor X_a in *water* to obtain a concentration of about 3 mM. Dilute with buffer pH 8.4 to obtain a solution having a concentration of 0.5 mM.

Reference solutions. Dilute *Enoxaparin Sodium Solution for Bioassays IPRS* with Buffer pH 7.4 to obtain four dilutions in the concentration range between 0.025 and 0.2 USP Anti-Factor X_a IU per ml.

Test solutions. Proceed as directed for reference solutions to obtain concentrations of Enoxaparin Sodium similar to those obtained for the reference solutions.

Label 18 suitable tubes: B1 and B2 for blanks; T1, T2, T3, and T4 each in duplicate for the dilutions of the test solutions; and S1, S2, S3, and S4 each in duplicate for the dilutions of the reference solutions. [*NOTE*—Treat the tubes in the order B1, S1, S2, S3, S4, T1, T2, T3, T4, T1, T2, T3, T4, S1, S2, S3, S4, B2.] To each tube add the same volume, V, (20 to 50 µl) of *Human antithrombin III solution* and an equal volume, V, of either the blank, buffer pH 7.4, or an appropriate dilution of the test solutions and reference solutions. Mix, but do not allow bubbles to form. Incubate at 37° for 1.0 minute. Add to each tube volume $2V$ (40 to 100 µl) of *Factor* X_a solution, and incubate for 1.0 minute. Add $5V$ (100 to 250 µl) volume of *chromogenic substrate solution*. Stop the reaction after 4.0 minutes with $5V$ (100 to 250 µl) volume of *acetic acid solution*. Measure the absorbance of each solution at 405 nm against blank B1.

For each series, calculate the regression of the absorbance against log concentrations of the test solutions and reference solutions, and calculate the potency of the enoxaparin sodium in IU of anti-factor X_a activity per mL using statistical methods for parallel-line assays. The four independent log relative potency estimates are then combined to obtain the final geometric mean. Its confidence limits are calculated. Express the anti-factor X_a activity of Enoxaparin Sodium per ml.

Anti-factor II_a activity. Not less than 2000 and not more than 3500 anti-Factor II_a IU per ml.

Acetic acid solution, Polyethylene glycol 6000 buffer pH 7.4, Buffer pH 7.4, Buffer pH 8.4, and *Human antithrombin III solution.* Proceed as directed under *Assay (anti-factor X_a activity),* except that the concentration of the *Human antithrombin III solution* is 0.5 Antithrombin III Unit per ml.

Thrombin human solution. Reconstitute thrombin human in *water*, and dilute in Polyethylene glycol 6000 buffer pH 7.4 to obtain a solution having a concentration of 5 Thrombin Units per ml.

Chromogenic substrate solution. Prepare a solution of a suitable chromogenic substrate for an amidolytic test for thrombin in *water* to obtain a concentration of about 3 mM. Immediately before use, dilute with buffer pH 8.4 to 0.5 mM.

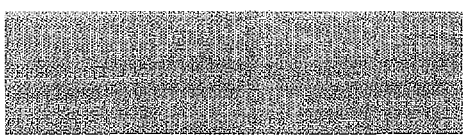
Reference solutions. Dilute *Enoxaparin Sodium Solution for Bioassays IPRS* with buffer pH 7.4 to obtain four dilutions having concentrations in the range between 0.015 and 0.075 IU of anti-factor II_a activity per ml.

Test solutions. Proceed as directed under Reference solutions to obtain concentrations of Enoxaparin Sodium similar to those obtained for the Reference solutions.

Proceed as directed under Assay (anti-factor X_a activity), except to use *Thrombin human solution* instead of *Factor X_a solution* and to use the *Human antithrombin III solution* as described above.

For each series, calculate the regression of the absorbance against log concentrations of the test solutions and of the reference solutions, and calculate the potency of the enoxaparin sodium in IU of anti-factor II_a activity per ml using statistical methods for parallel-line assays. The four independent dilution estimates are then combined to obtain the final weighted mean. Then calculate the confidence limits. Express the anti-factor II_a activity of Enoxaparin Sodium per ml.

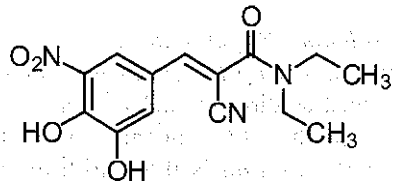
Anti-factor X_a to anti-factor II_a ratio. The ratio of the numerical value of the anti-factor X_a activity in Anti-Factor X_a IU per ml to the numerical value of the anti-factor II_a activity in Anti-Factor II_a IU per ml, as determined by the Assay (anti-factor



X_a activity) and the Anti-factor II_a activity, respectively, is not less than 3.3 and not more than 5.3.

Labelling. It indicates the amount (mg) of Enoxaparin Sodium in the total volume of contents. The label states also that the Enoxaparin Sodium starting material is porcine derived.

Entacapone



$C_{14}H_{15}N_3O_5$ Mol.Wt. 305.3

Entacapone is (2*E*)-2-Cyano-3-(3,4-dihydroxy-5-nitrophenyl)-*N,N*-diethyl-2-propenamide.

Entacapone contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{14}H_{15}N_3O_5$,calculated on the dried basis.

Category. Antiparkinson.

Identification

A. Determine by infrared absorption spectrophotometery (2.4.6).Compare the spectrum with that obtained with *entacapone IPRS* or with the reference spectrum of entacapone.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 70 volumes of *methanol* and 30 volumes of *tetrahydrofuran*.

Test solution. Dissolve 0.1g of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution. A solution containing 0.0001 per cent w/v each of *entacapone impurity A IPRS ((Z)-2-cyano-3-(3,4-dihydroxy-5-nitrophenyl)-N,N-diethylacrylamide IPRS)* and *entacapone IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with phenyl bonded to porous silica (5 µm),
- mobile phase: a mixture of 22 volumes of *methanol*, 1 volume of *tetrahydrofuran* and 27 volumes of a 0.234 per cent w/v solution of *monobasic sodium phosphate dihydrate* adjusted to pH 2.1 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 300 nm,
- injection volume: 10 µl.

The relative retation time with reference to entacapone for entacapone impurity A is 0.8.

Inject the reference solution. The test is not valid unless the resolution between the peaks corresponding to entacapone impurity A and entacapone is not less than 2.0.

Inject the reference solution and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to entacapone impurity A is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of areas of all the secondary peaks other than entacapone impurity A is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 65° at a pressure not exceeding 49 mm of Hg.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 70 volumes of *methanol* and 30 volumes of *tetrahydrofuran*.

Test solution. Dissolve 10 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). A solution containing 0.0001 per cent w/v each of *entacapone impurity A IPRS* and *entacapone IPRS* with the solvent mixture.

Reference solution (b). A 0.01 per cent w/v solution of *entacapone IPRS* in the solvent mixture.

Use the chromatographic system as described under Related substances.

The relative retation time with reference to entacopane for entacapone impurity A is about 0.8.

Inject reference solution (a). The test is not valid unless the resolution between the peaks corresponding to entacapone impurity A and entacapone is not less than 2.0.

Inject reference solution (b). The tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.0 per cent for entacapone peak.

Inject reference solution (b) and the test solution.

Calculate the content of $C_{14}H_{15}N_3O_5$.

Storage. Store protected from moisture.

Entacapone Tablets

Entacapone Tablets contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of entacapone, $C_{14}H_{15}N_3O_5$.

Usual strength. 200 mg.

Identification

A. Disperse a quantity of powdered tablets containing 0.05 g of entacapone with 50 ml of *methanol*, sonicate for about 30 minutes and filter. Evaporate the filterate to dryness on a water-bath and dry the residue in an oven at 105° for about half an hour. The residue complies with the following test

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *entacapone IPRS* or with the reference spectrum of entacapone.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of phosphate buffer, pH 5.5 prepared by dissolving 6.8 g of *monobasic potassium phosphate* in 1000 ml of *water*, adjusted to pH 5.5 with *1 M sodium hydroxide*,

Speed and time. 50 rpm and 30 minutes.

NOTE — Protect the solutions from light.

Reference solution. A 0.022 per cent w/v solution of *entacapone IPRS*, prepared by dissolving in *tetrahydrofuran* upto 2 per cent of the volume and diluting with dissolution medium to volume. Dilute 5.0 ml of the solution to 50.0 ml with the dissolution medium.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with medium, if necessary, at the maximum at about 313 nm (2.4.7). Calculate the content of $C_{14}H_{15}N_3O_5$ in the medium from the absorbance obtained from the reference solution using a mixture of 0.2 volume of *tetrahydrofuran* and 99.8 volumes of medium as blank.

Q. Not less than 80 per cent of the stated amount of $C_{14}H_{15}N_3O_5$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light.

Solvent mixture. 70 volumes of *methanol* and 30 volumes of *tetrahydrofuran*.

Test solution. Disperse a quantity of powdered tablets containing 0.3 g of Entacapone with 30 ml of *tetrahydrofuran* with the aid of ultrasound and dilute to 100.0 ml with *methanol*, centrifuge. *(NOTE — Prepare the test solution fresh and use within 7 hours of preparation).*

Reference solution (a). A solution containing 0.003 per cent w/v each of *entacapone IPRS* and *entacapone impurity A IPRS* in the solvent mixture.

Reference solution (b). A 0.0003 per cent w/v solution of *entacapone IPRS* in the solvent mixture.

Use chromatographic system as described under Assay.

Name	Relative retention time
Entacapone impurity A[1]	0.8
Entacapone	1.0

[1](*Z*)-2-Cyano-3-(3,4-dihydroxy-5-nitrophenyl)-*N*,*N*-diethylacrylamide.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to entacapone impurity A and entacapone is not less than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to entacapone impurity A is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the areas of all the secondary peaks other than entacapone impurity A is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light.

Solvent mixture. 70 volumes of *methanol* and 30 volumes of *tetrahydrofuran*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 50 mg of Entacapone in 30 ml of *tetrahydrofuran* with the aid of ultrasound and dilute to 100.0 ml with *methanol*, centrifuge.

Reference solution. A 0.05 per cent w/v solution of *entacapone IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with phenyl groups chemically bonded to porous silica (5 µm),
- mobile phase: a mixture of 22 volumes of *methanol*, 1 volume of *tetrahydrofuran* and 27 volumes of buffer solution prepared by dissolving 2.1 g of *monobasic sodium phosphate* in 1000 ml of *water*, adjusted to pH 2.1 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 300 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 1.5 per cent.

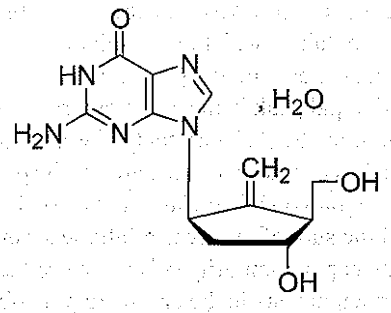
Inject the reference solution and the test solution. Run the chromatogram 1.5 times the retention time of the principal peak.

Calculate the content of $C_{14}H_{15}N_3O_5$ in the tablets.

Storage. Store protected from light at a temperature not exceeding 30°.

Entecavir

Entecavir Monohydrate



$C_{12}H_{15}N_5O_3,H_2O$ Mol.Wt.295.3

Entecavir is 2-amino-1,9-dihydro-9-[(1*S*,3*R*,4*S*)-4hydroxy-3-(hydroxymethyl)-2-methylenecyclopentyl]-6*H*-purin-6-one,monohydrate.

Entecavir contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{12}H_{15}N_5O_3$, calculated on the anhydrous basis.

Category. Antiviral.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *entecavir monohydrate IPRS* or with the reference spectrum of entecavir monohydrate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). +25.0° to +30.0°, determined in a 1.0 per cent w/v solution in a mixture of 1 volume of *dimethyl formamide* and 1 volume of *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 90 volumes of mobile phase A and 10 volumes of mobile phase B.

Test solution. Dissolve 25 mg of the substance under examination in 2.5 ml of *methanol* and dilute to 25.0 ml with mobile phase A.

Reference solution. Dissolve 25 mg of *entecavir monohydrate IPRS* in 2.5 ml of *methanol* and dilute to 25.0 ml with mobile phase A. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture. Further dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. *0.01M sodium dihydrogen phosphate*, adjusted to pH 3.0 with *orthophosphoric acid*,
  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	95	5
5	95	5
30	30	70
60	30	70
60.1	95	5
80	95	5

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent); the sum of the areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with the reference solution (0.3 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 5.5 to7.0 per cent, determined on 0.1g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 90 volumes of buffer solution and 10 volumes of *methanol.*

Test solution. Dissolve 50 mg of the substance under examination in 5 ml of *methanol* and dilute to 50.0 ml with the buffer solution. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. Dissolve 50 mg of *entecavir monohydrate IPRS* in 5 ml of *methanol* and dilute to 50.0 ml with the buffer solution. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 80 volumes of buffer solution of *0.01M sodium dihydrogen phosphate*, adjusted to pH 3.0 with *orthophosphoric acid* and 20 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{12}H_{15}N_5O_3$.

Storage. Store at a temperature not exceeding 30°.

Entecavir Tablets

Entecavir Tablets contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of entecavir, $C_{12}H_{15}N_5O_3$.

Usual strengths. 0.5 mg; 1.0 mg.

Identification

In the Assay, the retention time of principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium.1000 ml of *phosphate buffer pH 6.8,*
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *entecavir monohydrate IPRS* in the mobile phase and dilute with dissolution medium to obtain a solution having a known concentration similar to the test solution.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 80 volumes of *water* and 20 volumes of *methanol,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 100 µl.

Inject the reference solution and the test solution.

Q. Not less than 75 per cent of the stated amount of $C_{12}H_{15}N_5O_3$.

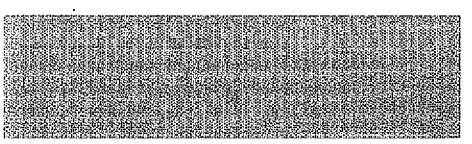
Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 90 volumes of *water* and 10 volumes of *methanol.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 10 mg of entecavir in the solvent mixture, mix with the aid of ultrasound for 30 minutes and dilute to 100.0 ml with the solvent mixture. Centrifuge this solution at 3000 rpm for 10 minutes and filter.

Reference solution. A 0.0001 per cent w/v solution of *entecavir monohydrate IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature: 40°,



- mobile phase: A. dissolve 0.77 g of *ammonium acetate* and 1 ml of *hexylamine* in 1000 ml *water*, adjusted to pH 6.5 with *glacial acetic acid*,
  B. a mixture of 75 volumes of *methanol* and 25 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 0.6 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	95	5
6	95	5
15	85	15
23	85	15
24	95	5
30	95	5

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution. (0.1 per cent).

Uniformity of content. Complies with the tests stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay using following modification.

Test solution. Disperse one tablet in 6 ml of the mobile phase. Mix with the aid of ultrasound for 15 minutes. Dilute to 10 ml with mobile phase. Dilute as necessary to obtain a solution containing 0.005 per cent w/v of entecavir.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 5 mg of entecavir in the mobile phase with the aid of ultrasound for 15 minutes and dilute to 100.0 ml with the mobile phase and filter.

Reference solution. A 0.005 per cent w/v solution of *entecavir monohydrate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil C18),
- mobile phase: a mixture of 80 volumes of *water* and 20 volumes of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0 per cent.

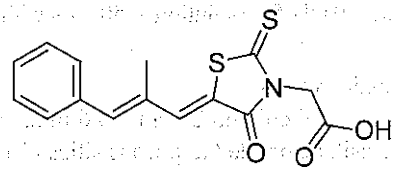
Inject the reference solution and the test solution.

Calculate the content of $C_{12}H_{15}N_5O_3$ in the tablets.

Storage. Store protected from light and moisture at a temperature not exceeding 30°.

Labelling. The label state the strength in terms of equivalent amount of entecavir.

Epalrestat



$C_{15}H_{13}NO_3S_2$ Mol. Wt. 319.4

Epalrestat is 2-{(5Z)-5-[(2E)-2-Methyl-3-phenylprop-2-en-1-ylidene]-4-oxo-2-thioxothiazolidin-3-yl}acetic acid.

Epalrestat contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{15}H_{13}NO_3S_2$, calculated on the dried basis.

Category. Antidiabetic.

Description. A yellow to orange crystalline powder. It shows polymorphism (2.5.11).

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *epalrestat IPRS* or with the reference spectrum of epalrestat.

B. When examined in the range 200 nm to 400 nm (2.4.7), a 0.0005 per cent w/v solution in *methanol* shows absorption maxima and minima at the same wavelength as that of *epalrestat IPRS* prepared in the same manner.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Carry out the tests protected from light.

Test solution. Dissolve 25 mg of the substance under examination in 10.0 ml of *N,N-dimethylformamide.*

Reference solution. A 0.0025 per cent w/v solution of *epalrestat IPRS* in *N,N-dimethylformamide.*

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen phosphate* and 7.09 g of *disodium hydrogen phosphate* in 1000 ml of *water*, adjusted to pH 6.5 and 35 volumes of *acetonitrile,*
- flow rate: Adjust, so that the retention time of epalrestat is about 12 minutes,
- spectrophotometer set at 280 nm,
- injection volume: 3 µl.

Inject the reference solution. The test is not valid unless the column efficiency in not less than 6000 theoretical plates, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injection is not more than 2.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.2 times of the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.2 per cent, determined on 1.0 g by drying under vacuum over silica gel at 60° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Carry out the tests protected from light.

Internal standard solution. A 1.0 per cent v/v solution of *propyl parahydroxy benzoate* in *N,N-dimethylformamide.*

Test solution. Dissolve 20 mg of the substance under examination in 2.0 ml of the internal standard solution and dilute to 10.0 ml with *N,N-dimethylformamide.* Dilute 1.0 ml of the solution to 10.0 ml with *N,N-dimethylformamide.*

Reference solution. Dissolve 20 mg of *epalrestat IPRS* in 2.0 ml of the internal standard solution and dilute to 10.0 ml with *N,N-dimethylformamide.* Dilute 1.0 ml of the solution to 10.0 ml with *N,N-dimethylformamide.*

Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation of the ratio of peak area of epalrestat and internal standard for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{13}NO_3S_2$ using the ratio of peak area of epalrestat and internal standard.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Epalrestat Tablets

Epalrestat Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of epalrestat, $C_{15}H_{13}NO_3S_2$.

Usual strength. 50 mg.

Identification

Extract a quantity of the powdered tablets containing 50 mg of Epalrestat, with 100.0 ml of *methanol*, filter. Dilute 1.0 ml of the filtrate to 100.0 ml with *methanol.* When examined in the range 200 nm to 400 nm (2.4.7), the solution exhibits maxima between 235 nm and 239 nm, between 290 nm and 294 nm and between 387 nm and 391 nm.

Tests

NOTE — Carry out the tests protected from light.

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of equal volumes of *phosphate buffer pH 6.8* and *water,*
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Dilute a suitable volume of the filtrate with dissolution medium, measure the absorbance of the resulting solution at the maximum at about 398 nm (2.4.7). Calculate the content of epalrestat, $C_{15}H_{13}NO_3S_2$ in the medium from the absorbance obtained from a solution of known concentration of *epalrestat IPRS* in the dissolution medium.

Q. Not less than 70 per cent of the stated amount of $C_{15}H_{13}NO_3S_2$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Internal standard solution. A 1.0 per cent v/v solution of *propyl parahydroxy benzoate* in *N,N-dimethylformamide.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 200 mg of Epalrestat in 20.0 ml of the internal standard solution and dilute to 100.0 ml with *N,N-dimethylformamide.* Dilute 1.0 ml of the solution to 10.0 ml with *N,N-dimethylformamide.*

Reference solution. Dissolve 20 mg of *epalrestat IPRS* in 2.0 ml of the internal standard solution and dilute to 10.0 ml with *N,N-dimethylformamide.* Dilute 1.0 ml of the solution to 10.0 ml with *N,N-dimethylformamide.*

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of the buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen phosphate* and 7.09 g of *disodium hydrogen phosphate* in 1000 ml of *water*, adjusted to pH 6.5 and 35 volumes of *acetonitrile,*
- flow rate: adjust, so that the retention time of epalrestat is about 12 minutes,
- spectrophotometer set at 280 nm,
- injection volume: 3 µl.

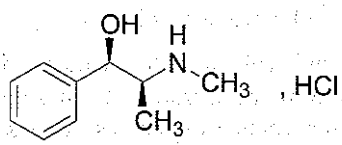
Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation of the ratio of peak area of epalrestat and internal standard for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{13}NO_3S_2$ in the tablets, using the ratio of peak area of epalrestat and internal standard.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Ephedrine Hydrochloride



$C_{10}H_{15}NO,HCl$ Mol. Wt. 201.7

Ephedrine Hydrochloride is (1*R*,2*S*)-2-methylamino-1-phenylpropan-1-ol hydrochloride.

Ephedrine Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{10}H_{15}NO,HCl$ calculated on the dried basis.

Category. Sympathomimetic; bronchodilator.

Description. Colourless crystals or a white, crystalline powder. It is affected by light.

Identification

Tests A, C and D may be omitted if tests B and E are carried out. Test B may be omitted if tests A, C, D and E are carried out.

Solution A. A 10.0 per cent w/v solution in *water*.

A. Specific optical rotation (see Tests).

B. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ephedrine hydrochloride IPRS* or with the reference spectrum of ephedrine hydrochloride.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Test solution. Dissolve 20 mg of the substance under examination in *methanol* and dilute to 10.0 ml with *methanol.*

Reference solution. A 0.2 per cent w/v solution of *ephedrine hydrochloride IPRS* in *methanol.*

Mobile phase. A mixture of 5 volumes of *dichloromethane,* 15 volumes of *concentrated ammonia* and 80 volumes of *2-propanol.*

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 15 cm. After development, dry the plate in air and spray with *ninhydrin solution*, heat at 110° for 5 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

D. To 0.1 ml of solution A, add 1 ml of *water*, 0.2 ml of *copper sulphate solution* and 1 ml of *strong sodium hydroxide solution*. A violet colour is produced. Add 2 ml of *dichloromethane* and shake. The lower (organic) layer is dark grey and the upper (aqueous) layer is blue.

E. To 5 ml of solution A, add 5 ml of *water*. The solution gives reaction (a) of chlorides (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution (Solution A) is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. To 10 ml of Solution A add 0.1 ml of *methyl red solution* and 0.2 ml of *0.01 M sodium hydroxide*; the solution is yellow. Add 0.4 ml of *0.01 M hydrochloric acid*; the solution is red.

Specific optical rotation (2.4.22). −35.5° to −33.5°, determined in a 5.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 75 mg of the substance under examination in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 2.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.01 per cent w/v each of the substance under examination and *pseudoephedrine hydrochloride IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with phenylsilane bonded to porous silica (3 µm),
- mobile phase: a mixture of 6 volumes of *methanol* and 94 volumes of a 1.16 per cent w/v solution of *ammonium acetate* adjusted to pH 4.0 with *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 257 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Ephedrine (retention time: about 8 minutes)	1.0	—
Ephedrine impurity B[1]	1.1	—
Ephedrine impurity A[2]	1.4	0.4

[1] pseudoephedrine,

[2] (-)-(1*R*)-1-hydroxy-1-phenylpropan-2-one.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to ephedrine and ephedrine impurity B is not less than 2.0.

Inject reference solution (a) and the test solution. Run the chromatogram 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak due to ephedrine impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks other than ephedrine impurity A is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Sulphates (2.3.17). 15 ml of solution A complies with the limit test for sulphates (100 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.17 g, dissolve in 10 ml of *mercuric acetate solution*, warming gently, add 50 ml of *acetone* and mix. Titrate with *0.1 M perchloric acid*, using 1 ml of a saturated solution of *methyl orange* in *acetone* as indicator, until a red colour is obtained. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02017 g of $C_{10}H_{15}NO,HCl$.

Storage. Store protected from light.

Ephedrine Nasal Drops

Ephedrine Nasal Drops are a solution of Ephedrine Hydrochloride in a suitable aqueous vehicle.

Ephedrine Nasal Drops contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of ephedrine hydrochloride, $C_{10}H_{15}NO,HCl$.

Usual strengths. 0.5 per cent; 0.75 per cent; 1.0 per cent.

Identification

A. To a quantity of the nasal drops containing 0.1 g of Ephedrine Hydrochloride, add 2 ml of *2 M hydrochloric acid*, shake with two 20 ml quantities of *chloroform* and discard the chloroform. Make the aqueous layer alkaline with *5 M ammonia* and extract with two quantities, each of 30 ml, of a mixture of 3 volumes of *chloroform* and 1 volume of *ethanol (95 per cent)*. Dry the combined extracts over *anhydrous sodium sulphate*, filter and evaporate to dryness at a pressure of 2 kPa, heating gently to remove the last traces of solvent. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ephedrine hydrochloride IPRS*, treated in the same manner or with the reference spectrum of ephedrine.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to the peak in the chromatogram obtained with reference solution (b).

Tests

pH (2.4.24). 4.0 to 7.0.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 80 volumes of *2-propanol*, 15 volumes of *13.5 M ammonia solution* and 5 volumes of *chloroform*.

Test solution (a). Dilute the nasal drops, if necessary, with *water* to obtain 0.5 per cent w/v of Ephedrine Hydrochlooride.

Test solution (b). Dilute 1.0 ml of test solution (a) to 5.0 ml with *methanol*.

Reference solution (a). Dilute 1.0 ml of test solution (a) to 200.0 ml with *water*.

Reference solution (b). A 0.1 per cent w/v solution of *ephedrine hydrochloride IPRS* in *methanol*.

Apply to the plate 20 µl of each solution. After development, dry the plate in air, spray with *ninhydrin solution* and heat at 100° for 5 minutes. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a).

Other tests. Comply with the tests stated under Nasal Preparations.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute the nasal drops with *methanol* to obtain 0.1 per cent w/v solution of Ephedrine Hydrochloride.

Reference solution. A 0.1 per cent w/v solution of *ephedrine hydrochloride IPRS* in *methanol*.

Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such Nucleosil C18),
- mobile phase: *0.005 M dioctyl sodium sulphosuccinate* in a mixture of 65 volumes of *methanol*, 35 volumes of *water* and 1 volume of *glacial acetic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 263 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{15}NO,HCl$ in the nasal drops.

Ephedrine Oral Solution

Ephedrine Hydrochloride Oral Solution; Ephedrine Hydrochloride Elixir; Ephedrine Elixir

Ephedrine Oral Solution is a solution containing 0.3 per cent w/v of Ephedrine Hydrochloride in a suitable flavoured vehicle containing a sufficient volume of Ethanol (95 per cent) or of an appropriate dilute ethanol to give a final concentration of not more than 3 per cent v/v of ethanol.

Ephedrine Oral Solution contains not less than 0.27 per cent and not more than 0.33 per cent w/v of ephedrine hydrochloride, $C_{10}H_{15}NO,HCl$.

Identification

A. To 30 ml add 2 ml of *2 M hydrochloric acid*, extract with two quantities, each of 20 ml, of *ether* and discard the ether. Add sufficient *dilute ammonia solution* to the aqueous phase to make it alkaline, extract with two quantities, each of 30 ml, of *ether*, wash the combined ether extracts with three quantities, each of 15 ml, of *water*, dry over *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ephedrine hydrochloride IPRS* treated in the same manner or with the reference spectrum of ephedrine.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to the peak in the chromatogram obtained with reference solution (b).

Tests

Ethanol content. Not more than 3 per cent v/v, determined by gas chromatography (2.4.13).

Test solution. Use the preparation under examination.

Reference solution (a). Add sufficient of *1-propanol* (internal standard) to the test solution to produce a solution containing 3.0 per cent v/v of *1-propanol*.

Reference solution (b). A 3.0 per cent v/v solution each of internal standard and *ethanol* in *water*.

Chromatographic system
- a column 1.5 m x 4 mm, packed with porous polymer beads (100 to 200 mesh) (Such as Porapak Q and Chromosorb 101),
- temperature:
  column 150°,
  inlet port and detector. 170°,
- flow rate: 30 ml per minute, using nitrogen as the carrier gas.

Inject 1 µl of reference solution (a), (b) and the test solution.

Calculate the content of ethanol from the areas of the peaks due to ethanol in the chromatograms obtained with reference solution (a) and (b).

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 80 volumes of *2-propanol*, 15 volumes of *strong ammonia solution* and 5 volumes of *chloroform*.

Test solution (a). Add sufficient *5 M ammonia* to 50 ml of the oral solution to make it alkaline, extract with two quantities, each of 100 ml, of *ether,* wash the combined extracts with 10 ml of *water,* dry with *anhydrous sodium sulphate,* filter and evaporate the filtrate to dryness. Dissolve the oily residue in sufficient *methanol* to produce 5 ml.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with *methanol.*

Reference solution (a). Dilute 1.0 ml of test solution (a) to 200.0 ml with *methanol.*

Reference solution (b). A 0.3 per cent w/v solution of *ephedrine hydrochloride IPRS* in *methanol.*

Apply to the plate 10 µl of each solution. After development, dry the plate in air, spray with *ninhydrin solution* and heat at 110° for 5 minutes. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a). Ignore any spot of lighter colour than the background.

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a weighed quantity of the oral solution containing about 60 mg of Ephedrine Hydrochloride to 50 ml with *methanol.*

Reference solution. A 0.12 per cent w/v solution of *ephedrine hydrochloride IPRS* in *methanol.*

Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: *0.005 M dioctyl sodium sulphosuccinate* in a mixture of 65 volumes of *methanol,* 35 volumes of *water* and 1 volume of *glacial acetic acid,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 263 nm,
- injection volume: 20 µl.

Determine the weight per ml of the oral solution (2.4.29), and calculate the content of $C_{10}H_{15}NO,HCl$, weight in volume.

Storage. Store protected from light.

Ephedrine Tablets

Ephedrine Hydrochloride Tablets

Ephedrine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of ephedrine hydrochloride, $C_{10}H_{15}NO,HCl$.

Usual strengths. 15 mg; 30 mg; 60 mg.

Identification

A. Shake a quantity of the powdered tablets containing about 0.1 g of Ephedrine Hydrochloride with 20 ml of *0.1 M hydrochloric acid,* filter, wash the filtrate with two quantities, each of 20 ml, of *chloroform* and discard the chloroform. Make the aqueous layer alkaline with *5 M ammonia* and extract with two quantities, each of 30 ml, of a mixture of 3 volumes of *chloroform* and 1 volume of *ethanol (95 per cent).* Dry the combined extracts over *anhydrous sodium sulphate,* filter and evaporate to a low volume at a pressure of 2 kPa. Prepare a disc using 0.3 g of *potassium bromide IR,* apply dropwise to the disc 0.1 ml of the *chloroform* solution, allowing the solvent to evaporate between applications, and dry the disc at 50° for 2 minutes. The disc so obtained complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ephedrine hydrochloride IPRS* treated in the same manner or with the reference spectrum of ephedrine.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (b).

C. Triturate a quantity of the powdered tablets containing about 0.4 g of Ephedrine Hydrochloride with 10 ml of *chloroform* and discard the *chloroform.* Repeat trituration with a further 10 ml of *chloroform* and again discard the *chloroform.* Shake the residue with 30 ml of warm *ethanol (95 per cent)* for 20 minutes, filter, evaporate the filtrate to dryness on a water-bath and dry the residue at 80° (residue R). Dissolve 10 mg of residue R in 1 ml of *water* and add 0.1 ml of *cupric sulphate solution* followed by 1 ml of *sodium hydroxide solution;* a violet colour is produced. Add 1 ml of *ether* and shake; the ether layer is purple and the aqueous layer is blue.

D. A 5.0 per cent w/v solution of residue R gives reaction (A) of chlorides (2.3.1).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G.*

Mobile phase. A mixture of 80 volumes of *2-propanol,* 15 volumes of *strong ammonia solution* and 5 volumes of *chloroform.*

Test solution (a). Extract a quantity of the powdered tablets containing 0.1 g of Ephedrine Hydrochloride with 5 ml of *methanol* and filter.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with *methanol.*

Reference solution (a). Dilute 1.0 ml of test solution (a) to 200.0 ml with *methanol.*

Reference solution (b). A 0.2 per cent w/v solution of *ephedrine hydrochloride IPRS* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air, spray with *ninhydrin solution* and heat at 110° for 5 minutes. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a). Ignore any spot of lighter colour than the background.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg of Ephedrine Hydrochloride, shake with 30 ml *methanol* for 10 minutes, add sufficient *water* to produce 50.0 ml, filter through glass fibre (Whatman GF/C is suitable) and use the filtrate.

Reference solution. A 0.1 per cent w/v solution of *ephedrine hydrochloride IPRS* in *methanol*.

Chromatographic system

- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a 0.005 M solution of *dioctyl sodium sulphosuccinate* in a mixture of 65 volumes of *methanol*, 35 volumes of *water* and 1 volume of *glacial acetic acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 263 nm,
- injection volume: 20 µl.

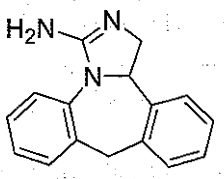
Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{15}NO,HCl$ in the tablets.

Storage. Store protected from light.

Epinastine Hydrochloride



$C_{16}H_{15}N_3,HCl$ Mol. Wt. 285.8

Epinastine Hydrochloride is (*RS*)-3-Amino-9,13b-dihydro-1*H*-dibenz[c,f]imidazo[1,5-*a*]azepine hydrochloride.

Epinastine Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{16}H_{15}N_3,HCl$, calculated on the dried basis.

Category. Antihistaminic

Description. A white or almost white, hygroscopic, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6).Compare the spectrum with that obtained with *epinastine hydrochloride IPRS* or with the reference spectrum of epinastine hydrochloride.

B. It gives reaction (a) of chlorides (2.3.1).

Tests

Acidity or alkalinity. Dissolve 1.0 g in *carbon dioxide-free water* and dilute to 10 ml with the same solvent. Add 0.1 ml of *methyl red solution* and 0.25 ml of *0.01 M sodium hydroxide*; the solution is green. Add 0.5 ml of *0.01 M hydrochloric acid*; the solution is reddish-violet.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 25 volumes of mobile phase B and 75 volumes of mobile phase A.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution. Dilute 10.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 10 cm x 3.0 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature: 50°,
- mobile phase: A. a mixture of 15 volumes of *methanol* and 85 volumes of buffer solution prepared by dissolving 3.8 g of *sodium pentanesulphonate monohydrate* and 4.0 g of *potassium dihydrogen phosphate* in *water*, adjusted to pH 4.4 with *orthophosphoric acid* and dilute to 1000 ml with *water*,
  B. a mixture of 15 volumes of *methanol* and 85 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.4 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent w/v)	Mobile phase B (per cent w/v)
0	80	20
4	80	20
13	30	70
15	80	20
20	80	20

Name	Relative retention time
Epinastine (Retention time: about 4 minutes)	1.0
Epinastine impurity A[1]	1.2
Epinastine impurity B[2]	2.0

[1] 9*H*-dibenzo[*c*,*f*]imidazo[1,5-*a*]azepin-3-amine,

[2] (13b*RS*)-7-bromo-9,13b-dihydro-1*H*-dibenzo[*c*,*f*]imidazo[1,5-*a*]azepin-3-amine.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to epinastine impurity B is not more than 3 times the area of the principal peak in the chromatogram obtained with the reference solution (0.3 per cent), the area of any peak corresponding to epinastine impurity A is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 7 times the area of the principal peak in the chromatogram obtained with the reference solution (0.7 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.2 g, dissolve in 100 ml of a mixture of 1 volume of *anhydrous acetic acid* and 2 volumes of *acetic anhydride*, add 10 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02858 g of $C_{16}H_{16}ClN_3$.

Storage. Store protected from moisture.

Epinastine Eye Drops

Epinastine Hydrochloride Eye Drops

Epinastine Eye Drops is a sterile solution of Epinastine Hydrochloride in Purified Water.

Epinastine Eye Drops contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of epinastine hydrochloride, $C_{16}H_{15}N_3$, HCl.

Usual strength. 0.05 per cent w/v.

Identification

In the Assay, the principle peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 6.5 to 7.5.

Other tests. Comply with the tests stated under Eye Drops.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal mixture of *water* and *acetonitrile*.

Test solution. Dilute a volume of eye drops to obtain a solution containing 0.05 per cent w/v Epinastine Hydrochloride in the solvent mixture.

Reference solution. A 0.05 per cent w/v solution of *epinastine hydrochloride IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 90 volumes of *water*, 10 volumes of *acetonitrile* and 0.1 volume of *trifluoroacetic acid*,
  B: a mixture of 10 volumes of *water*, 90 volumes of *acetonitrile* and 0.1 volume of *trifluoroacetic acid*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent w/v)	Mobile phase B (per cent w/v)
0	85	15
16	75	25
38	25	75
43	25	75
45	85	15
50	85	15

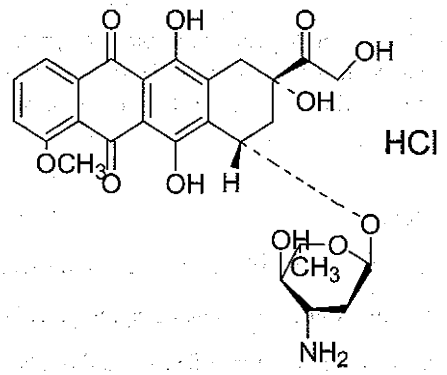
Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 3.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{15}N_3$, HCl in the eye drops.

Storage. Store protect from light.

Epirubicin Hydrochloride



$C_{27}H_{30}ClNO_{11}$ Mol. Wt. 580.0

Epirubicin Hydrochloride is (8*S*,10*S*)-10-[(3-Amino-2,3,6-trideoxy-α-*L-arabino*-hexopyranosyl)oxy]-6,8,11-trihydroxy-8-(hydroxyacetyl)-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione hydrochloride.

Epirubicin Hydrochloride contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{27}H_{30}ClNO_{11}$, calculated on the anhydrous basis.

Category. Anticancer.

Description. An orange-red powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *epirubicin hydrochloride IPRS* or with the reference spectrum of epirubicin hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

C. Dissolve about 10 mg in 0.5 ml of *nitric acid*, add 0.5 ml of *water* and heat over a flame for 2 minutes. Allow to cool and add 0.5 ml of *silver nitrate solution*. A white precipitate is formed.

Tests

pH (2.4.24). 4.0 to 5.5, determined in 0.5 per cent w/v solution in *carbon dioxide-free water*.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE —Allow the solutions to stand for 3 hours before use.

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). A 0.1 per cent w/v solution of *epirubicin hydrochloride IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.01 per cent w/v each of *epirubicin hydrochloride IPRS* and *doxorubicin hydrochloride IPRS* in the mobile phase.

Reference solution (c). Dissolve 10 mg of *doxorubicin hydrochloride IPRS* in a mixture of 5 ml of *water* and 5 ml of *orthophosphoric acid*. Allow to stand for 30 minutes. Adjusted to pH 2.6 with 8 per cent w/v solution of *sodium hydroxide*. Add 15 ml of *acetonitrile*, 10 ml of *methanol* and mix.

Reference solution (d). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with trimethylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: a mixture of 54 volumes of a buffer solution prepared by dissolving 3.7 g of *sodium lauryl sulphate* and 28 ml of *dilute phosphoric acid* in 1000 ml of *water*, 17 volumes of *methanol* and 29 volumes of *acetonitrile*,
- flow rate: 2.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Epirubicin impurity A[1]	0.3	0.7
Epirubicin impurity B[2]	0.4	—
Epirubicin impurity C[3]	0.8	—
Epirubicin (Retention time: about 9.5 minutes)	1.0	—
Epirubicin impurity D[4]	1.5	—
Epirubicin impurity E[5]	1.1	—
Epirubicin impurity F[6]	1.7	—
Epirubicin impurity G[7]	2.1	—

[1]R = OH: (8*S*,10*S*)-6,8,10,11-tetrahydroxy-8-(hydroxyacetyl)-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione (doxorubicinone),

[2]R = H: (8 *S*,10*S*)-8-acetyl-6,8,10,11-tetrahydroxy-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione (daunorubicinone),

[3](8*S*,10*S*)-10-[(3-amino-2,3,6-trideoxy-α-*L-lyxo*-hexopyranosyl)oxy]-6,8,11-trihydroxy-8-(hydroxyacetyl)-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione (doxorubicin),

[4](8*S*,10*S*)-8-acetyl-10-[(3-amino-2,3,6-trideoxy-α-*L-lyxo*-hexopyranosyl)oxy]-6,8,11-trihydroxy-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione (daunorubicin),

[5](8*S*,10*S*)-10-[(3-amino-2,3,6-trideoxy-α-*L-lyxo*-hexopyranosyl)oxy]-6,8,11-trihydroxy-8-[(1*RS*)-1-hydroxyethyl]-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione (dihydrodaunorubicin),

[6](8*S*,10*S*)-8-acetyl-10-[(3-amino-2,3,6-trideoxy-α-*L-arabino*-hexopyranosyl)oxy]-6,8,11-trihydroxy-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione (*epi*-daunorubicin),

8,82-[(2*R*,4*R*)-4-hydroxy-2-(hydroxymethyl)-1,3-dioxolan-2,4-diyl]bis[(8*S*,10*S*)-10-[(3-amino-2,3,6-trideoxy-α-*L-arabino*-hexopyranosyl)oxy]-6,8,11-trihydroxy-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione] (epirubicin dimer).

Run the chromatogram 3.5 times the retention time of epirubicin.

Inject reference solution (c). In the chromatogram, use the second most abundant peak to identify impurity A.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to impurity C and epirubicin is not less than 2.0.

Inject reference solution (d) and the test solution. In the chromatogram obtained with the test solution, the area of peak corresponding to epirubicin impurities A and C are not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (1.0 per cent). The area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.5 per cent). The sum of areas of all secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (d) (2.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.05 per cent).

Acetone (5.4). Not more than 1.5 per cent.

Water (2.3.43). Not more than 4.0 per cent, determined on 0.1 g.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modification.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{27}H_{30}ClNO_{11}$.

Epirubicin Hydrochloride intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 1.1 Endotoxin Unit per mg of epirubicin hydrochloride.

Storage. Store protected from light and moisture, at a temperature between 2° and 8°. If the substance is sterile, store in a sterile, tamper-proof container.

Epirubicin Injection

Epirubicin Hydrochloride Injection

Epirubicin Injection is a sterile solution of Epirubicin Hydrochloride in Water for Injections.

Epirubicin Injection contains not less than 95.0 per cent and not more than 110.0 per cent of the stated amount of epirubicin hydrochloride, $C_{27}H_{30}ClNO_{11}$.

Usual strengths. 2 mg per ml.

Identification

A. Dilute a volume of injection to obtain 0.001 per cent w/v of epirubicin hydrochloride in *water*. When examined in the range 220 nm to 350 nm (2.4.7), the solution shows an absorption maximum at 233, 253 and 292 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 2.5 to 4.0.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE —Allow the solutions to stand for 3 hours before use.

Test solution. Dilute a volume of the injection with sufficient mobile phase to produce a solution containing 0.1 per cent w/v of Epirubicin Hydrochloride.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). A 0.01 per cent w/v each of *epirubicin hydrochloride IPRS* and *doxorubicin hydrochloride IPRS* in the mobile phase.

Reference solution (c). Dissolve 10 mg of *doxorubicin hydrochloride IPRS* in a mixture of 5 ml of *water* and 5 ml of *orthophosphoric acid* and allow to stand for 30 minutes. Adjust the pH of the solution to 2.6 with 8 per cent w/v solution of *sodium hydroxide*, add 15 ml of *acetonitrile* and 10 ml of *methanol* and mix (generation of impurity A).

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with trimethylsilane bonded to porous silica (6 µm) (Such as Zorbax TMS),
- column temperature: 35°,
- mobile phase: a mixture of 54 volumes of a buffer solution prepared by dissolving 3.7 g of *sodium lauryl sulphate* and 28 ml of *1M orthophosphoric acid* in 1000 ml of *water*, 17 volumes of *methanol* and 29 volumes of *acetonitrile*,
- flow rate: 2.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Epirubicin impurity A[1]	0.3	0.7
Epirubicin impurity B[2]	0.4	—
Epirubicin impurity C[3]	0.8	—
Epirubicin (Retention time: about 9.5 minutes)	1.0	—
Epirubicin impurity D[4]	1.5	—
Epirubicin impurity E[5]	1.1	—
Epirubicin impurity F[6]	1.7	—
Epirubicin impurity G[7]	2.1	—

[1]R = OH:(8*S*,10*S*)-6,8,10,11-tetrahydroxy-8-(hydroxyacetyl)-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione (doxorubicinone),

[2]R = H: (8 *S*,10*S*)-8-acetyl-6,8,10,11-tetrahydroxy-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione (daunorubicinone),

[3](8*S*,10*S*)-10-[(3-amino-2,3,6-trideoxy-α-*L-lyxo*-hexopyranosyl)oxy]-6,8,11-trihydroxy-8-(hydroxyacetyl)-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione (doxorubicin),

[4](8*S*,10*S*)-8-acetyl-10-[(3-amino-2,3,6-trideoxy-α-*L-lyxo*-hexopyranosyl)oxy]-6,8,11-trihydroxy-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione (daunorubicin),

[5](8*S*,10*S*)-10-[(3-amino-2,3,6-trideoxy-α-*L-lyxo*-hexopyranosyl)oxy]-6,8,11-trihydroxy-8-[(1*RS*)-1-hydroxyethyl]-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione (dihydrodaunorubicin),

[6](8*S*,10*S*)-8-acetyl-10-[(3-amino-2,3,6-trideoxy-α-*L-arabino*-hexopyranosyl)oxy]-6,8,11-trihydroxy-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione (*epi*-daunorubicin),

[7]8,82-[(2*R*,4*R*)-4-hydroxy-2-(hydroxymethyl)-1,3-dioxolan-2,4-diyl]bis[(8*S*,10*S*)-10-[(3-amino-2,3,6-trideoxy-α-*L-arabino*-hexopyranosyl)oxy]-6,8,11-trihydroxy-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione] (epirubicin dimer).

Identify any peak in the chromatogram obtained with test solution corresponding to epirubicin impurity A using the second most abundant peak in the chromatogram obtained with reference solution (c) and multiply the area of this peak by the corresponding correction factor of 0.7.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to epirubicin and doxorubicin is not less than 2.0.

Inject reference solution (a) and the test solution. Run the chromatogram 3.5 times the retention time of epirubicin. In the chromatogram obtained with the test solution, the area of peak corresponding to epirubicin impurities A is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent). The area of peak corresponding to epirubicin impurities C is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent), the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). The sum of areas of all secondary peaks is not more than four times the area of the principal peak in the chromatogram obtained with reference solution (a) (4.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Bacterial endotoxins (2.2.3). Not more than 2.2 Endotoxin Unit per ml. A solution containing 2 mg per ml of Epirubicin Hydrochloride.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modification.

NOTE — Allow the solutions to stand for 3 hours before use.

Test solution. Dilute a volume of the injection with sufficient mobile phase to produce a solution containing 0.1 per cent w/v of Epirubicin Hydrochloride.

Reference solution (a). A 0.1 per cent w/v solution of *epirubicin hydrochloride IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.01 per cent w/v each of *epirubicin hydrochloride IPRS* and *doxorubicin hydrochloride IPRS* in the mobile phase.

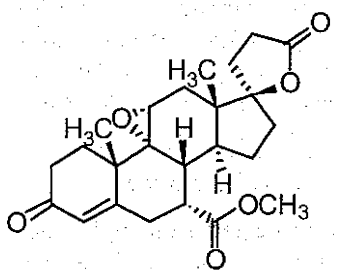
Inject reference solution (b). The test is not valid unless the resolution between the peaks due to epirubicin and doxorubicin is not less than 2.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{27}H_{30}ClNO_{11}$ in the injection.

Storage. Store at a temperature between 2° and 8°.

Eplerenone



$C_{24}H_{30}O_6$ Mol. Wt. 414.5

Eplerenone is 9α,11-Epoxy-7α-methoxycarbonyl-3-oxo-17α-pregn-4-ene-21,17-carbolactone.

Eplerenone contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{24}H_{30}O_6$, calculated on the dried basis.

Category. Antihypertensive.

Description. A white to off-white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *eplerenone IPRS* or with the reference spectrum of eplerenone.

Tests

Related substances. Determine by liquid chromatography (2.4.14) as described under Assay with the following modification.

Inject the test solution. The area of any secondary peak is not more than 0.5 per cent and the sum of areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalization.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *eplerenone IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of *10 mM ammonium acetate*, adjusted to pH 7.4 and 40 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 214 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{24}H_{30}O_6$.

Eplerenone Tablets

Eplerenone Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of eplerenone, $C_{24}H_{30}O_6$.

Usual strengths. 25 mg; 50 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.1 M hydrochloric acid*,

Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *eplerenone IPRS* in 5 ml of *methanol* and dilute with the dissolution medium to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of 0.05 per cent v/v solution of *orthophosphoric acid* and 30 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation of replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{24}H_{30}O_6$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{24}H_{30}O_6$.

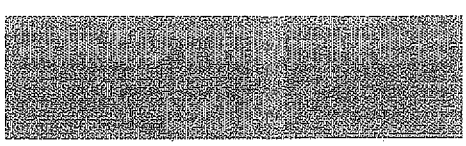
Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 20 volumes of *water* and 80 volumes of *acetonitrile*.

Test solution. Disperse a quantity of the powdered tablets containing 50 mg of Eplerenone in 70 ml of the solvent mixture, with the aid of ultrasound and dilute to 100.0 ml with the solvent mixture and filter.

Reference solution. A 0.0005 per cent w/v solution of *eplerenone IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),



– mobile phase: A. 0.05 per cent v/v solution of *orthophosphoric acid*,
B. *acetonitrile*,
– a gradient programme using the conditions given below,
– flow rate: 1 ml per minute,
– spectrophotometer set at 240 nm,
– injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
10	80	20
35	25	75
40	80	20
45	80	20

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation of replicate injections is not more than 3.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 20 volumes of *water* and 80 volumes of *acetonitrile*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 100 mg of Eplerenone in the solvent mixture, with the aid of ultrasound and dilute to 100.0 ml with the solvent mixture and filter. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.01 per cent w/v solution of *eplerenone IPRS* in the solvent mixture.

Use the chromatographic system as described under Dissolution.

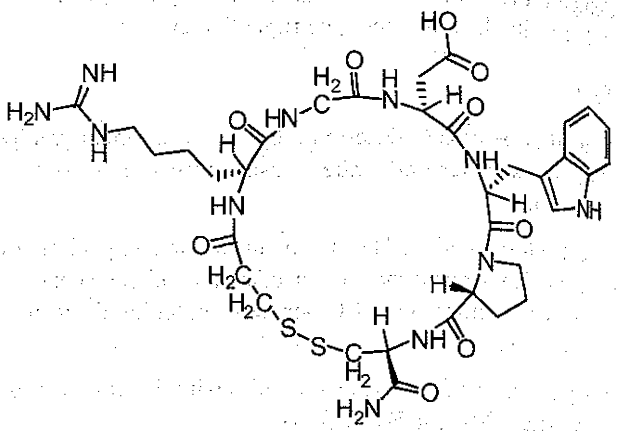
Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{24}H_{30}O_6$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Eptifibatide



$C_{35}H_{49}N_{11}O_9S_2$ Mol. Wt. 832

Eptifibatide is *S*1,*S*6-Cyclo[*N*6-carbamimidoyl-*N*2-(3-sulfanylpropanoyl)-*L*-lysylglycyl-*L*-α-aspartyl-*L*-tryptophyl-*L*-prolyl-*L*-cysteinamide].

Eptifibatide contains not less than 96.0 per cent and not more than the equivalent of 103.0 per cent of $C_{35}H_{49}N_{11}O_9S_2$, calculated on the anhydrous and acetic acid free basis.

Category. Antiplatelet.

Description. A white to off-white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *eptifibatide IPRS* or with the reference spectrum of eptifibatide.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Light absorption. Absorbance of 1.0 per cent w/v solution in *acetic acid* at 420 nm (2.4.6) is not more than 0.05.

Specific optical rotation (2.4.22). –57.0° to –50.0°, determined in a 1.0 per cent w/v solution in *1.0 per cent v/v acetic acid*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of the substance under examination in *water* and dilute to 10.0 ml with *water*.

Reference solution. A 0.02 per cent w/v solution of *eptifibatide IPRS* in *water*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 50°,
- mobile phase: a mixture of 85 volumes of 0.25 per cent w/v solution of *orthophosphoric acid* in *water*, adjusted to pH 3.0 with *triethylamine* and 15 volumes of *acetonitrile*,
- flow rate: 1 ml per minute.
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 4000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. The area of any secondary peak is not more than 1.5 per cent and the sum of areas of all the secondary peaks is not more than 2.5 per cent, calculated by area normalization.

Acetic Acid. Not more than 8.0 per cent.

Determine by liquid chromatography (2.4.14).

Solvent mixture. 95 volumes of mobile phase A and 5 volumes of *methanol*.

Test solution. Dissolve 4 mg of the substance under examination in the solvent mixture and dilute to 2.0 ml with the solvent mixture.

Reference solution. A 0.01 per cent w/v solution of *glacial acetic acid IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a 0.07 per cent v/v solution of *orthophosphoric acid* in *water*, adjusted to pH 3.0 with *1 M sodium hydroxide*,
  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1.2 ml per minute.
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0.01	95	5
10	50	50
20	50	50
21	50	50
30	95	5
35	95	5

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

The retention time of acetic acid is about 3.9 minutes.

Inject the reference solution and the test solution.

Calculate the content of acetic acid.

Water (2.3.43). Not more than 9.0 per cent, using Method 3.

Bacterial endotoxins (2.2.3). Not more than 10 Endotoxin Units per mg of eptifibatide.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 2 mg of the substance under examination in *water* and dilute to 10.0 ml with *water*.

Reference solution. A 0.02 per cent w/v solution of *eptifibatide IPRS* in *water*.

Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{35}H_{49}N_{11}O_9S_2$.

Eptifibatide Injection

Eptifibatide Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of eptifibatide, $C_{35}H_{49}N_{11}O_9S_2$.

Description. A clear, colourless solution.

Usual strength. 0.75 mg per ml; 2 mg per ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

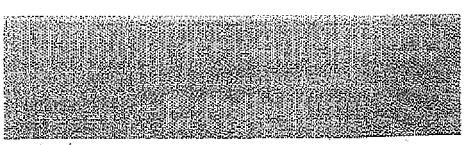
pH (2.4.24). 5.0 to 5.5.

Light absorption. Not more than 0.1, determined on 0.2 per cent w/v solution at 420 nm (2.4.7).

Related substances. Determine by liquid chromatography (2.4.14) as described under Assay with the following modifications.

Test solution. Dilute the injection containing 8 mg of Eptifibatide to 10.0 ml with *water*

Inject the test solution. The area of any secondary peak is not more than 2.0 per cent and the sum of areas of all the secondary peaks is not more than 5.0 per cent, calculated by area normalization.



Bacterial endotoxins (2.2.3). Not more than 10 Endotoxin Units per mg of eptifibatide.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute the injection to obtain a solution containing 0.024 per cent w/v of Eptifibatide in *water*.

Reference solution. A 0.024 per cent w/v solution of *eptifibatide IPRS* in *water*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecysilane bonded to porous silica (5 µm),
- column temperature: 50°,
- mobile phase: a mixture of 85 volumes of buffer solution prepared by dissolving 2.45 g of *orthophosphoric acid* in 1000 ml of *water*, adjusted to pH 3.0 with *triethylamine* and 15 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3600 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

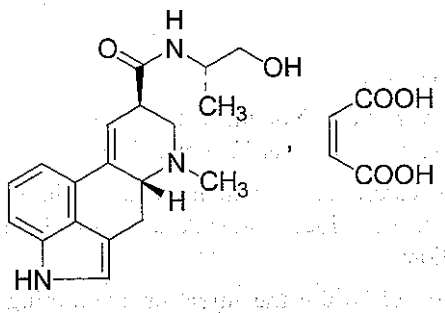
Inject the reference solution and the test solution.

Calculate the content of $C_{35}H_{49}N_{11}O_9S_2$ in the injection.

Storage. Store protected from light.

Ergometrine Maleate

Ergonovine Maleate



$C_{19}H_{23}N_3O_2,C_4H_4O_4$ Mol.Wt. 441.5

Ergometrine Maleate is 9,10-didehydro-*N*-[(*S*)-2-hydroxy-1-methylethyl]-6-methylergoline-8β-carboxamide hydrogen maleate.

Ergometrine Maleate contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{19}H_{23}N_3O_2,C_4H_4O_4$, calculated on the dried basis.

Category. Uterine stimulant.

Description. A white or faintly yellow, crystalline powder. It is affected by light.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B, D and E may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ergometrine maleate IPRS* or with the reference spectrum of ergometrine maleate.

B. Dissolve 30 mg in sufficient *0.01 M hydrochloric acid* to produce 100 ml and dilute 10 ml of the solution to 100 ml with the same solvent. When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows an absorption maximum at about 311 nm and a minimum at 265 nm to 272 nm; absorbance at 311 nm, 0.52 to 0.58.

C. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

D. Dissolve 0.1 g, without heating and protected from light, in sufficient *carbon dioxide-free water* to produce 10 ml (solution A). To 0.1 ml of solution A add 1 ml of *glacial acetic acid*, 1 drop of *ferric chloride solution* and 1 ml of *orthophosphoric acid* and heat on a water-bath at 80°; a blue or violet colour is produced after about 10 minutes.

E. To 1 ml of a 0.01 per cent w/v solution, add 2 ml of *4-dimethylaminobenzaldehyde reagent*; a deep blue colour is produced after about 10 minutes.

Tests

Appearance of solution. Solution A is clear (2.4.1), and not more intensely coloured than reference solution YS5 or BYS5 (2.4.1).

pH (2.4.24). 3.6 to 4.4, determined in solution A.

Specific optical rotation (2.4.22). +50.0° to +56.0°, determined in solution A.

Related substances. *Carry out the following operations as rapidly as possible, protected from light.*

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 75 volumes of *chloroform*, 25 volumes of *methanol* and 3 volumes of *water*.

NOTE—Prepare the following solutions freshly.

Solvent mixture. A mixture of 1 volume of *strong ammonia solution* and 9 volumes of *ethanol (80 per cent)*.

Test solution (a). Dissolve 0.1 g of the substance under examination in 10 ml with solvent mixture.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with the solvent mixture.

Reference solution (a). A 0.1 per cent w/v solution of *ergometrine maleate IPRS* in the solvent mixture.

Reference solution (b). A 0.01 per cent w/v solution of *ergometrine maleate IPRS* in the solvent mixture.

Reference solution (c). A 0.005 per cent w/v solution of *ergometrine maleate IPRS* in the solvent mixture.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 14 cm. Dry the plate in a current of cold air and spray with *4-dimethylaminobenzaldehyde reagent*. Dry in a current of warm air for about 2 minutes. Any secondary spot in the chromatogram obtained with the test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (c).

Loss on drying (2.4.19). Not more than 2.0 per cent, determined on 0.2 g by drying in an oven at 80° at a pressure not exceeding 2.7 kPa for 2 hours.

Assay. Weigh 0.15 g and dissolve in 40 ml of *anhydrous glacial acetic acid*. Titrate with *0.05 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.05 M perchloric acid* is equivalent to 0.02207 g of $C_{19}H_{23}N_3O_2,C_4H_4O_4$.

Storage. Store protected from light in a refrigerator (2° to 8°).

Ergometrine Injection

Ergometrine Maleate Injection; Ergonovine Injection, Ergonovine Maleate Injection

Ergometrine Injection is a sterile solution of Ergometrine Maleate in Water for Injections containing suitable stabilising agents.

Ergometrine Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ergometrine maleate, $C_{19}H_{23}N_3O_2,C_4H_4O_4$.

Usual strength. 500 µg per ml.

Description. A clear, colourless or faintly yellow solution.

Identification

A. In the test for Related substances, the principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution (a).

B. Exhibits a blue fluorescence.

C. To a volume containing 0.1 mg of Ergometrine Maleate, add 0.5 ml of *water* and 2 ml of *4-dimethylaminobenzaldehyde reagent*; a deep blue colour is produced after 10 minutes.

Tests

pH (2.4.24). 2.7 to 3.5.

Related substances. *Carry out the following procedure in subdued light and protect from light any solutions not used immediately.*

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G* slurried with *0.1 M sodium hydroxide*.

Mobile phase. A mixture of 90 volumes of *chloroform* and 10 volumes of *methanol*.

Test solution. Evaporate a volume of the injection containing 1 mg of Ergometrine Maleate to dryness at 20° at a pressure not exceeding 2 kPa and dissolve the residue in 0.25 ml of methanol.

Reference solution (a). A 0.4 per cent w/v solution of *ergometrine maleate IPRS* in *methanol*.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 50.0 ml with *methanol*.

Reference solution (c). Dilute 5.0 ml of reference solution (b) to 10.0 ml with *methanol*.

Reference solution (d). Dilute 5.0 ml of reference solution (c) to 10.0 ml with *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 365 nm. Assess the intensities of any secondary spots in the chromatogram obtained with the test solution by reference to the spots in the chromatograms obtained with reference solution (b), (c) and (d). The total of the intensities so assessed does not exceed 10 per cent of the intensity of the principal spot.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. *Carry out the following procedure protected from light.*

Dilute a suitable volume, accurately measured, of the injection with sufficient *water* to produce a solution containing 0.004 per cent w/v of Ergometrine Maleate. To 3.0 ml add 6.0 ml

of *4-dimethylaminobenzaldehyde reagent*, mix, cool to room temperature and allow to stand for 30 minutes (solution A). At the same time prepare solution B in the same manner but using 3.0 ml of a 0.004 per cent w/v solution of *ergometrine maleate IPRS* and beginning at the words "add 6.0 ml.....". Measure the absorbance of solution B at the maximum at about 545 nm (2.4.7), using as the blank a solution prepared by mixing 6.0 ml of *4-dimethylaminobenzaldehyde solution* and 3.0 ml of *water*. Without delay replace solution B with solution A, using the same cell, and measure the absorbance of solution A at the same wavelength. Calculate the content of $C_{19}H_{23}N_3O_2,C_4H_4O_4$.

Storage. Store protected from light in single dose containers in a refrigerator (2° to 8°).

Ergometrine Tablets

Ergometrine Maleate Tablets; Ergonovine Tablets; Ergonovine Maleate Tablets

Ergometrine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ergometrine maleate, $C_{19}H_{23}N_3O_2,C_4H_4O_4$.

Usual strengths. 250 µg; 500 µg.

Identification

A. In the test for Related substances, the principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution (a).

B. Extract a quantity of the powdered tablets containing 2 mg of Ergometrine Maleate with 20 ml of *water*, filter and wash the residue with sufficient *water* to produce 20 ml. The solution exhibits a blue fluorescence.

C. To 2 ml of the solution obtained in test B add 4 ml of *4-dimethylaminobenzaldehyde reagent*; a deep blue colour is produced after about 10 minutes.

Tests

Related substances. *Carry out the following procedure in subdued light and protect from light any solutions not used immediately.*

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G* slurried with *0.1 M sodium hydroxide*.

Mobile phase. A mixture of 90 volumes of *chloroform* and 10 volumes of *methanol*.

Test solution. Triturate a quantity of the powdered tablets containing about 1 mg of Ergometrine Maleate with 0.2 ml of a 1 per cent w/v solution of *domiphen bromide*, add 2 ml of *methanol*, centrifuge and remove the supernatant liquid. Extract the residue with two quantities, each of 1 ml, of *methanol*, evaporate the combined extracts to dryness at 20° at a pressure not exceeding 2 kPa and dissolve the residue in 0.25 ml of *methanol*, centrifuge if necessary.

Reference solution (a). A 0.4 per cent w/v solution of *ergometrine maleate IPRS* in *methanol*.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 50.0 ml with *methanol*.

Reference solution (c). Dilute 5.0 ml of reference solution (b) to 10.0 ml with *methanol*.

Reference solution (d). Dilute 5.0 ml of reference solution (c) to 10.0 ml with *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 365 nm. Assess the intensities of any secondary spots in the chromatogram obtained with the test solution by reference to the spots in the chromatograms obtained with reference solution (b), (c) and (d). The total of the intensities so assessed does not exceed 10 per cent of the intensity of the principal spot.

Uniformity of content. Complies with the test stated under Tablets.

NOTE—Protect the solutions from light throughout the test.

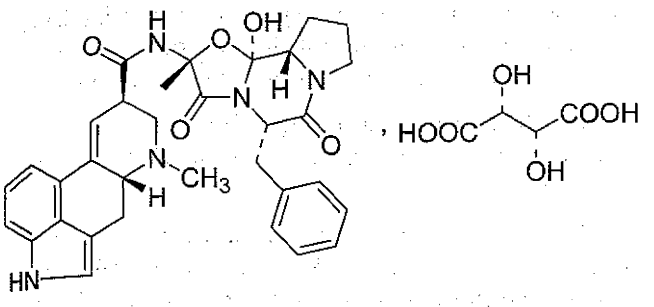
To one tablet add 10.0 ml of a 1 per cent w/v solution of *tartaric acid*, shake for 30 minutes, centrifuge and use the supernatant liquid. Dilute a suitable volume, accurately measured, with sufficient *water* to produce a solution containing 0.004 per cent w/v of Ergometrine Maleate. To 3.0 ml add 6.0 ml of *4-dimethylaminobenzaldehyde solution*, mix, cool to room temperature and allow to stand for 30 minutes (solution A). At the same time prepare solution B in the same manner but using 3.0 ml of a 0.004 per cent w/v solution of *ergometrine maleate IPRS* and beginning at the words "add 6.0 ml...." Measure the absorbance of solution B at the maximum at about 545 nm (2.4.7), using as the blank a solution prepared by mixing 6.0 ml of *4-dimethylaminobenzaldehyde reagent* and 3.0 ml of *water*. Without delay replace solution B with solution A, using the same cell, and measure the absorbance of solution A at the same wavelength. Calculate the content of $C_{19}H_{23}N_3O_2,C_4H_4O_4$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 2 mg of Ergometrine Maleate, shake with 50.0 ml of a 1 per cent w/v solution of *tartaric acid* for 30 minutes, centrifuge and use the supernatant liquid. Carry out the procedure described under Uniformity of content beginning at the words "To 3.0 ml add 6 ml.....".

Storage. Store protected from light.

Ergotamine Tartrate



$(C_{33}H_{35}N_5O_5)_2,C_4H_6O_6$ Mol. Wt. 1313.4

Ergotamine Tartrate is (5'*S*)-12'-hydroxy-2'-methyl-3',6',18-trioxo-5-benzylergotaman tartrate.

Ergotamine Tartrate contains not less than 98.0 per cent and not more than 101.0 per cent of $(C_{33}H_{35}N_5O_5)_2,C_4H_6O_6$, calculated on the dried basis.

Category. Antimigraine.

Description. Colourless crystals, or a white or almost white, crystalline powder; slightly hygroscopic. It may contain two molecular equivalents of methanol of crystallisation.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B, C and D may be omitted if tests A and E are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Before triturating with *potassium bromide IR* during preparation of the disc, triturate first with 0.2 ml of *methanol*. Compare the spectrum with that obtained with *ergotamine tartrate IPRS* or with the reference spectrum of ergotamine tartrate.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.005 per cent solution in *0.01 M hydrochloric acid* shows an absorption maximum at 311 nm to 321 nm and a minimum at 265 nm to 275 nm; absorbance at the maximum, 0.59 to 0.64, calculated on the dried basis.

C. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a) when examined for not more than 1 minute under ultraviolet light at 365 nm or when examined in daylight after spraying with *ethanolic 4-dimethylaminobenzaldehyde solution*.

D. Dissolve 1 mg in a mixture of 5 ml of *glacial acetic acid* and 5 ml of *ethyl acetate*. To 1 ml of the solution add 1 ml of *sulphuric acid*, with continuous shaking and cooling; a blue colour with a red tinge develops. Add 0.1 ml of *ferric chloride test solution* previously diluted with an equal volume of *water*; the red tinge becomes less apparent and the blue colour more pronounced.

E. Dissolve 1 mg in 5 ml of a 1 per cent w/v solution of *tartaric acid*. To 1 ml of the solution add slowly 3 ml of *4-dimethylaminobenzaldehyde solution* and mix; a deep blue colour is produced.

Tests

NOTE—Carry out the following tests as rapidly as possible, protected from light.

Appearance of solution. Mix 50 mg with 25 mg of *tartaric acid* and dissolve in 20 ml of *water*. The solution is clear (2.4.1), and not more intensely coloured than reference solution YS6 (2.4.1).

pH (2.4.24). 4.0 to 6.0, determined in a 0.25 per cent w/v suspension.

Specific optical rotation (2.4.22). The specific optical rotation of the ergotamine base, checked for purity by the method given below, is −165° to −154°, determined by the following method. Dissolve 0.4 g in 40 ml of a 1 per cent w/v solution of *tartaric acid*, cautiously add 0.5 g of *sodium bicarbonate* in small portions and mix well. Wash 100 ml of *chloroform* by shaking with 5 quantities, each of 50 ml, of *water* and extract the solution of the substance under examination with 4 quantities, each of 10 ml, of the washed chloroform. Filter the combined chloroform extracts through a small filter moistened with the washed chloroform, dilute to 50 ml with the same solvent and measure the optical rotation.

To 25 ml of the chloroform solution add 50 ml of *anhydrous glacial acetic acid*. Titrate with *0.05 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.05 M perchloric acid* is equivalent to 0.02908 g of ergotamine base, $C_{33}H_{35}N_5O_5$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 70 volumes of *ether*, 15 volumes of *dimethylformamide*, 10 volumes of *chloroform* and 5 volumes of *ethanol*.

NOTE—Prepare the following solutions immediately before use in the order stated.

Solvent mixture. 9 volumes of *chloroform* and 1 volume of *methanol*.

Test solution (a). Dissolve 0.1 g of the substance under examination in 10.0 ml with the solvent mixture.

Test solution (b). Dilute 5.0 ml of test solution (a) to 50.0 ml with the solvent mixture.

Reference solution (a). A 0.1 per cent w/v solution of *ergotamine tartrate IPRS* in the solvent mixture.

Reference solution (b). A 0.015 per cent w/v solution of *ergotamine tartrate IPRS* in the solvent mixture.

Reference solution (c). A 0.005 per cent w/v solution of *ergotamine tartrate IPRS* in the solvent mixture.

Apply to the plate 5 µl of each solution. Immediately after application expose the plate to an atmosphere saturated with ammonia vapour for exactly 20 seconds, dry the plate at the line of application in a current of cold air and immediately start developing the chromatogram, allowing the mobile phase to rise 17 cm. Dry the plate in a current of dry air for 2 minutes and examine under ultraviolet light at 365 nm for not more than 1 minute. Spray abundantly with *ethanolic 4-dimethylaminobenzaldehyde solution* and dry in a current of warm air for about 2 minutes. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (c).

Loss on drying (2.4.19). Not more than 6.0 per cent, determined on 0.1 g by drying over *phosphorus pentoxide* at a pressure of 1.5 to 2.5 kPa for 6 hours.

Assay. Weigh 0.2 g and dissolve in 40 ml of *anhydrous glacial acetic acid* Titrate with *0.05 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.05 M perchloric acid* is equivalent to 0.03284 g of $(C_{33}H_{35}N_5O_5)_2,C_4H_6O_6$.

Storage. Store protected from light in sealed glass containers, in a refrigerator (2° to 8°).

Ergotamine Injection

Ergotamine Tartrate Injection

Ergotamine Injection is a sterile solution of Ergotamine Tartrate in Water for Injection containing Ethanol (95 per cent), Glycerin and sufficient Tartaric Acid to adjust the pH of the solution to 3.3.

Ergotamine Injection contains a quantity of total alkaloids, calculated as $(C_{33}H_{35}N_5O_5)_2,C_4H_6O_6$, equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ergotamine tartrate.

Usual strength. 500 µg per ml.

Description. A clear, colourless or almost colourless solution.

Identification

A. In the test for Ergot alkaloids and related substances, the principal spot in the chromatogram obtained with the test solution corresponds to that due to ergotamine in the chromatogram obtained with the reference solution.

B. To a volume containing 0.2 mg of Ergotamine Tartrate add 1 ml of *4-dimethylaminobenzaldehyde solution*; a deep blue colour is produced.

C. Mix a volume containing about 2 mg of Ergotamine Tartrate with 2 ml of *dilute sulphuric acid*, dissolve a few mg of *magnesium powder* in the solution and add 25 mg of *resorcinol*. Shake to dissolve, carefully add 2 ml of *sulphuric acid* down the inside of the tube and warm gently; a red ring forms at the interface of the two liquid layers and spreads throughout the lower layer.

Tests

NOTE—Carry out the following tests as rapidly as possible, protected from light.

pH (2.4.24). 2.8 to 3.8.

Ergot alkaloids and related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G* slurried with *0.1 M sodium hydroxide*.

Mobile phase. A mixture of 90 volumes of *chloroform* and 10 volumes of *methanol*.

Test solution. Add sufficient of a 10 per cent w/v solution of *sodium bicarbonate* to a volume of the injection containing about 5 mg of Ergotamine Tartrate to make it distinctly alkaline to litmus paper. Extract with five quantities, each of 10 ml, of *chloroform*, filter the extracts through a small double filter paper, wash the filter with *chloroform*, evaporate the combined filtrates and washings to dryness at 20° at a pressure of about 1.5 kPa and dissolve the residue in 1 ml of a mixture of equal volumes of *chloroform* and *methanol*.

Reference solution. Dissolve 5 mg of *ergotamine tartrate IPRS* in 10 ml of a 1 per cent w/v solution of *tartaric acid* and complete the preparation described for the test solution beginning at the words "Extract with five quantities...".

Apply without delay, to the plate 20 µl of the test solution and 14 µl, 10 µl, 7 µl and 2 µl of the reference solution. After development, dry the plate in air and examine under ultraviolet light at 365 nm. The chromatogram obtained with the test solution shows two principal spots, corresponding to ergotamine and, of higher R_f value, ergotaminine; a spot between the two principal spots and a number of spots of lower R_f values may also be seen. Compare the chromatogram obtained with the test solution with the chromatograms obtained with the reference solution. The spot corresponding to ergotaminine is not larger or more intense than the spot

corresponding to ergotamine obtained with 7 µl of the reference solution. The spot corresponding to ergotamine is not smaller or less intense than the spot corresponding to ergotamine obtained with 10 µl of the reference solution and is not larger or more intense than the spot corresponding to ergotamine obtained with 14 µl of the reference solution, corresponding to not less than 50 per cent and not more than 70 per cent of ergotamine tartrate. Any other spots are not larger or more intense than the spot corresponding to ergotamine obtained with 2 µl of the reference solution.

Bacterial endotoxins (2.2.3). Not more than 357.0 Endotoxin Units per mg of ergotamine.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. To an accurately measured volume add sufficient of a 0.25 per cent w/v solution of *tartaric acid* to produce a solution containing about 0.005 per cent w/v of Ergotamine Tartrate. Mix 3.0 ml of the solution with 6.0 ml of *4-dimethylaminobenzaldehyde solution*, cool to room temperature and allow to stand for 30 minutes (solution A). At the same time, mix 3.0 ml of a 0.003 per cent w/v solution of *ergometrine maleate IPRS* in a 0.25 per cent w/v solution of *tartaric acid* with 6.0 ml of *4-dimethylaminobenzaldehyde solution*, cool to room temperature and allow to stand for 30 minutes (solution B). Prepare solution C by mixing 3.0 ml of a 0.25 per cent w/v solution of *tartaric acid* with 6.0 ml of *4-dimethylaminobenzaldehyde solution*. Measure the absorbance of solution B at 545 nm (2.4.7), using solution C as the blank. Without delay replace solution B with solution A, using the same cell, and measure the absorbance of solution A at the same wavelength. Calculate the content of total alkaloids as $(C_{33}H_{35}N_5O_5)_2,C_4H_6O_6$ from the absorbances obtained.

1 mg of *ergometrine maleate IPRS* is equivalent to 1.488 mg of $(C_{33}H_{35}N_5O_5)_2,C_4H_6O_6$.

Storage. Store protected from light in single dose glass containers.

Ergotamine Tablets

Ergotamine Tartrate Tablets

Ergotamine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ergotamine tartrate, $(C_{33}H_{35}N_5O_5)_2,C_4H_6O_6$.

Usual strength. 1 mg.

Identification

A. Triturate a quantity of the powdered tablets containing about 5 mg of Ergotamine Tartrate with 10 ml of *light petroleum (40° to 60°)*, allow to settle and discard the petroleum extract. To the residue add 10 ml of *chloroform* saturated with *strong ammonia solution*, triturate, filter and evaporate the filtrate to dryness on a water-bath. The residue so obtained complies with the following tests.

Dissolve 1 mg in a mixture of 5 ml of *glacial acetic acid* and 5 ml of *ethyl acetate*. To 1 ml of the solution add 1 ml of *sulphuric acid*, with continuous shaking and cooling; a blue colour with a red tinge develops. Add 0.1 ml of *ferric chloride test solution* previously diluted with an equal volume of *water*; the red tinge becomes less apparent and the blue colour more pronounced.

B. Dissolve 1 mg in 5 ml of a 1 per cent w/v solution of *tartaric acid*. To 1 ml of the solution add slowly 3 ml of *4-dimethylaminobenzaldehyde solution* and mix; a deep blue colour is produced.

C. In the test for Related substances, the principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

Tests

NOTE—Carry out the following tests as rapidly as possible, protected from light.

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 1000 ml of 1 per cent w/v solution of *tartaric acid* in *water*,
Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the fluorescence intensities of the filtrate, dilute suitably if necessary with the medium, using the maximum excitation wavelength at 327 nm and the maximum emission wavelength at 427 nm (2.4.5). Calculate the content of $(C_{33}H_{35}N_2O)_2,C_4H_6O_6$ in the medium by comparing the fluorescence intensities obtained from a solution of a known concentration of *ergotamine tartrate IPRS* in dissolution medium.

Q. Not less than 75 per cent of the stated amount of $(C_{33}H_{35}N_2O)_2,C_4H_6O_6$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 70 volumes of *ether*, 15 volumes of *dimethylformamide*, 10 volumes of *chloroform* and 5 volumes of *ethanol*.

NOTE—Prepare the following solutions immediately before use in the order stated.

Test solution. Extract a quantity of the powdered tablets containing 1 mg of Ergotamine Tartrate with 2 ml of a mixture of equal volumes of *chloroform* and *methanol* and centrifuge.

Remove the supernatant liquid, extract the residue with two quantities, each of 1 ml, of the solvent mixture, evaporate the combined extracts to dryness at 20° at a pressure of 2 kPa and dissolve the residue in 0.25 ml of a mixture of equal volumes of *chloroform* and *methanol*; centrifuge if necessary.

Reference solution (a). A 0.4 per cent w/v solution of *ergotamine tartrate IPRS* in the same solvent mixture.

Reference solution (b). A 0.04 per cent w/v solution of *ergotamine tartrate IPRS* in the same solvent mixture.

Reference solution (c). A 0.02 per cent w/v solution of *ergotamine tartrate IPRS* in the same solvent mixture.

Reference solution (d). A 0.01 per cent w/v solution of *ergotamine tartrate IPRS* in the same solvent mixture.

Apply to the plate 5 µl of each solution. Immediately after application expose the plate to an atmosphere saturated with ammonia vapour for exactly 20 seconds, dry the plate at the line of application in a current of cold air and immediately start developing the chromatogram, allowing the mobile phase to rise 17 cm. Dry the plate in air and examine under ultraviolet light at 365 nm. Assess the intensity of any secondary spots in the chromatogram obtained with the test solution by reference to the spots in the chromatograms obtained with reference solution (a), (b) and (c) and the sum of the intensities so assessed in the chromatogram obtained with the test solution should not exceed 10 per cent of the intensity of the principal spot in the chromatogram obtained with the test solution. In addition, any single secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (d).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modification.

Test solution. Disperse one tablet in 5.0 ml of internal standard solution and sufficient quantity of the solvent mixture, with the aid of ultrasound for 10 minutes and dilute with the solvent mixture to obtain a solution containing 0.002 per cent w/v of Ergotamine Tartrate.

Inject the reference solution and the test solution.

Calculate the content of $(C_{33}H_{35}N_2O)_2,C_4H_6O_6$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 55 volumes of *acetonitrile* and 45 volumes of *water*.

Internal standard solution: A 0.016 per cent w/v solution of *ergometrine maleate* in the solvent mixture.

Test solution. Disperse a quantity of intact tablets containing 10 mg of Ergotamine Tartrate in 50.0 ml of internal standard solution, add 300 ml of the solvent mixture, with the aid of ultrasound for 10 minutes and dilute to 500.0 ml with the solvent mixture, filter.

Reference solution. A 0.02 per cent w/v solution of *ergotamine tartrate IPRS* in the solvent mixture. To 5.0 ml of the solution, add 5.0 ml of internal standard solution and dilute to 50.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 45 volumes of *0.01 M monobasic potassium phosphate* and 55 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

The relative retention time with respect to ergotamine tartrate for ergometrine maleate is about 0.7.

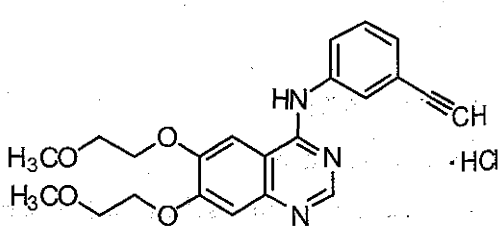
Inject the reference solution. The test is not valid unless the resolution between the peaks due to ergometrine maleate and ergotamine tartrate is not less than 3.0, the column efficiency is not less than 3000 theoretical plates the tailing factor is not more than 2.0 per cent and the relative standard deviation for replicate injections is not more than 2.0 per cent for ergotamine tartrate.

Inject the reference solution and the test solution.

Calculate the content of $(C_{33}H_{35}N_2O)_2,C_4H_6O_6$ in the tablets.

Storage. Store protected from light at a temperature not exceeding 30°.

Erlotinib Hydrochloride



$C_{22}H_{23}N_3O_4,HCl$ Mol. Wt. 429.9

Erlotinib Hydrochloride is N-(3-ethynylphenyl)-6,7-bis(2-methoxyethoxy)-4-quinazolinamine hydrochloride.

Erlotinib Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{22}H_{23}N_3O_4.HCl$, calculated on anhydrous basis.

Category. Anticancer.

Description. An off-white to pale yellow powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *erlotinib hydrochloride IPRS* or with the reference spectrum of erlotinib hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Use freshly prepared solutions.

Solvent mixture. 40 volumes of mobile phase A and 60 volumes of mobile phase B.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution. A 0.00025 per cent w/v solution of *erlotinib hydrochloride IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octylsilane bonded to porous silica (3 µm),
- column temperature: 50°,
- mobile phase: A. *0.02 M sodium dihydrogen phosphate* in 0.1 per cent v/v *triethylamine*, adjusted to pH 3.0 with *orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 248 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	85	15
2	85	15
20	75	25
25	40	60
30	40	60
30.1	85	15
35	85	15

The retention time of the principal peak is about 19 minutes.

Inject the reference solution. The test is not valid unless the the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 0.2 g.

Assay. Determine by liquid chromatography (2.4.14).

NOTE—Use freshly prepared solutions.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture. Dilute 10.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution. A 0.005 per cent w/v solution of *erlotinib hydrochloride IPRS* in the solvent mixture.

Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{23}N_3O_4.HCl$.

Storage. Store protected from light and moisture at a temperature not exceeding 30°.

Erlotinib Tablets

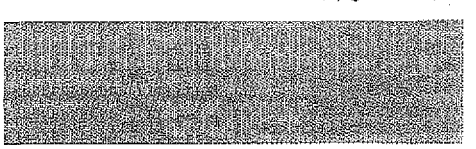
Erlotinib Hydrochloride Tablets

Erlotinib Tablets contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of erlotinib, $C_{22}H_{23}N_3O_4$.

Usual strengths. 25mg; 100 mg; 150 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.



Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 1000 ml of 1 per cent w/v of *sodium lauryl sulphate* in *0.1 M hydrochloric acid,*

Speed and time. 75 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Dilute the filtrate if necessary, with the mobile phase.

Reference solution. Dissolve a quantity of *erlotinib hydrochloride IPRS* in sufficient amount of *methanol* and dilute with the dissolution medium to obtain a 0.016 per cent w/v solution. Dilute 2.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octylsilane bonded to porous silica (3 µm),
- column temperature: 50°,
- mobile phase: a mixture of 60 volumes of a solution containing *0.02 M sodium dihydrogen orthophosphate* in 0.1 per cent v/v *triethylamine*, adjusted to pH 3.0 with *orthophosphoric acid* and 40 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 248 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution.

Calculate the content of erlotinib, $C_{22}H_{23}N_3O_4$.

Q. Not less than 75 per cent of the stated amount of $C_{22}H_{23}N_3O_4$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 40 volumes of mobile phase A and 60 volumes of mobile phase B.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 50 mg of Erlotinib with 30 ml of solvent mixture with the aid of ultrasound for 20 minutes and dilute to 100.0 ml with the solvent mixture.

Reference solution. A 0.00055 per cent w/v of *erlotinib hydrochloride IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octylsilane bonded to porous silica (3 µm),
- column temperature: 50°,
- mobile phase: A. *0.02 M sodium dihydrogen orthophosphate* in 0.1 per cent v/v *triethylamine*, adjusted to pH 3.0 with *orthophosphoric acid*,

B. *acetonitrile,*

- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 248 nm,
- injection volume: 5 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	85	15
2	85	15
20	75	25
25	40	60
45	40	60
45.1	85	15
55	85	15

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 40 volumes of mobile phase A and 60 volumes of mobile phase B.

Test solution. Disperse a quantity of the powdered tablets containing 50 mg of erlotinib in 30 ml of the solvent mixture with the aid of ultrasound for 20 minutes and dilute to 100.0 ml with the solvent mixture, filter. Dilute 10.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.01 per cent w/v solution of *erlotinib hydrochloride IPRS* in the solvent mixture.

Use chromatographic system as described under Related substances, using the following gradient programme.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	85	15
2	85	15
20	75	25
25	40	60
30	40	60
30.1	85	15
35	85	15

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

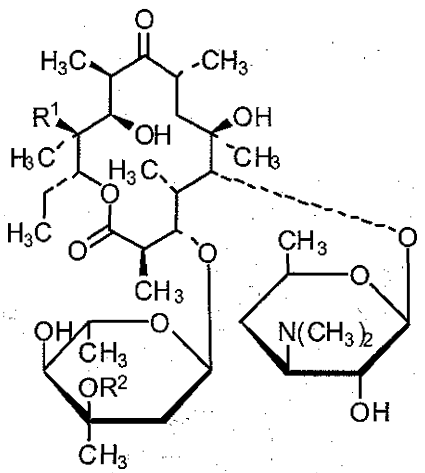
Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{23}N_3O_4$ in the tablets.

Storage. Store at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of erlotinib.

Erythromycin



$C_{37}H_{67}NO_{13}$ Mol. Wt. 733.9

Erythromycin is a mixture of macrolide antibiotics consisting largely of erythromycin A, (3*R*,4*S*,5*S*,6*R*,7*R*,9*R*,11*R*,12*R*,13*S*,14*R*)-4-[(2,6- dideoxy-3-*C*-methyl-3-*O*-methyl-α-L-*ribo*-hexopyranosyl)oxy]-14-ethyl-7,12,13- trihydroxy-3,5,7,9,11,13-hexamethyl-6-[(3,4,6-trideoxy-3-dimethylamino-β-D-*xylo*-hexopyranosyl)-oxy] oxacyclotetradecane-2,10-dione, it is produced by the growth of certain strains of *Streptomyces erythreus*.

Erythromycin has a potency not less than 920 Units per mg, calculated on the anhydrous basis.

Category. Antibacterial.

Description. Colourless or slightly yellow crystals or a white or slightly yellow powder; slightly hygroscopic.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and D may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *erythromycin IPRS* or with the reference spectrum of erythromycin.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. The upper layer obtained by shaking together 45 volumes of *ethyl acetate*, 40 volumes of a 15 per cent w/v solution of *ammonium acetate* previously adjusted to pH 9.6 with *10 M ammonia* and 20 volumes of *2-propanol* and allowing to separate.

Test solution. Dissolve 0.1 g of the substance under examination in 100 ml of *methanol*.

Reference solution (a). A 0.1 per cent w/v solution of *erythromycin IPRS* in *methanol*.

Reference solution (b). A 0.2 per cent w/v solution of *spiramycin IPRS* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air, spray with *ethanolic anisaldehyde solution*, heat at 110° for 5 minutes and allow to cool. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a) and is different in position and colour from the spots in the chromatogram obtained with reference solution (b).

C. To about 5 mg add 5 ml of a 0.02 per cent w/v solution of *xanthydrol* in a mixture of 1 volume of *hydrochloric acid* and 99 volumes of *5 M acetic acid* and heat on a water-bath; a red colour is produced.

D. Dissolve about 10 mg in 5 ml of *7 M hydrochloric acid* and allow to stand for about 20 minutes; a yellow colour develops.

Tests

pH (2.4.24). 8.0 to 10.5, determined in a 0.066 per cent w/v solution in *carbon dioxide-free water*.

Specific optical rotation (2.4.22). –78.0° to –71.0°, determined in a 2.0 per cent w/v solution in *ethanol*. Measure the optical rotation at least 30 minutes after preparing the solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silanised silica gel H*.

Mobile phase. A mixture of 75 volumes of *methanol* and 45 volumes of a 5 per cent w/v solution of *ammonium acetate*.

Test solution. Dissolve 0.2 g of the substance under examination in 100 ml of *methanol*.

Reference solution (a). A 0.2 per cent w/v solution of *erythromycin IPRS* in *methanol*.

Reference solution (b). A 0.01 per cent w/v solution of *erythromycin IPRS* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air, spray with *ethanolic anisaldehyde solution*, heat at 110° for 5 minutes and allow to cool. Any secondary spot with an R_f value lower than that of the principal spot in the chromatogram obtained with the test solution is not more intense than the principal spot in the chromatogram obtained with reference solution (b).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 6.5 per cent, determined on 0.2 g using a 10 per cent w/v solution of *imidazole* in *anhydrous methanol* as the solvent.

Assay. Determine by the microbiological assay of antibiotics, Method A (2.2.10), using a solution prepared by dissolving about 25 mg, accurately weighed, in 10 ml of *methanol* and adding sufficient sterile *phosphate buffer pH 8.0* to produce 100.0 ml. Express the results as units per mg.

Storage. Store protected from light at a temperature not exceeding 30°.

Erythromycin Gastro-resistant Tablets

Erythromycin Tablets

Erythromycin Gastro-resistant Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of erythromycin, $C_{37}H_{67}NO_{13}$. They are made gastro-resistant by enteric-coating or by other means.

Usual strength. 250 mg.

Identification

A. Shake a quantity of the powdered tablets containing about 0.1 g of Erythromycin with 5 ml of *chloroform*, decolorise if necessary, with *decolorising charcoal*, filter and evaporate the filtrate to dryness. The residue after drying at a pressure not exceeding 0.7 kPa complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *erythromycin IPRS* or with the reference spectrum of erythromycin.

B. Dissolve a quantity of the powdered tablets containing about 3 mg of Erythromycin as completely as possible in 2 ml of *acetone* and add 2 ml of *hydrochloric acid*; an orange colour is produced which changes to red and then to deep purplish red. Add 2 ml of *chloroform* and shake; the chloroform layer becomes purple.

Tests

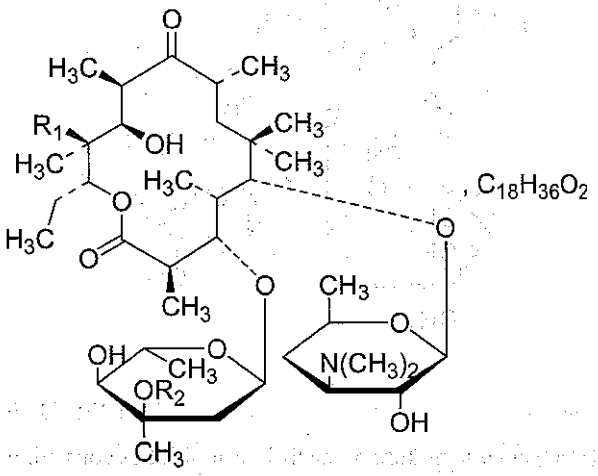
Other tests. Comply with the tests stated under Tablets.

Assay. Determine by the microbiological assay of antibiotics, Method A (2.2.10) on a solution prepared in the following manner.

Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.25 g of Erythromycin and triturate with 25 ml of *methanol* and add sufficient sterile *phosphate buffer pH 8.0* to produce 100.0 ml. Calculate the content of erythromycin in the tablets, taking each 1000 Units found to be equivalent to 1 mg of erythromycin.

Storage. Store protected from light at a temperature not exceeding 30°.

Erythromycin Stearate



$C_{37}H_{67}NO_{13},C_{18}H_{36}O_2$ Mol. Wt. 1018.4

Erythromycin Stearate is a mixture of the stearate of Erythromycin with an excess of stearic acid.

Erythromycin Stearate has a potency not less than 600 Units of erythromycin per mg, calculated on anhydrous basis.

Category. Antibacterial.

Description. Colourless or slightly yellow crystals or a white or slightly yellow, crystalline powder.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. The upper layer of a mixture of 45 volumes of *ethyl acetate*, 40 volumes of a 15 per cent w/v solution of

ammonium acetate, previously adjusted to pH 9.6 with *9 M ammonia*, and 20 volumes of *2-propanol*.

Test solution. Dissolve 0.28 g of the substance under examination in 100 ml of *methanol*.

Reference solution (a). A 0.2 per cent w/v solution of *erythromycin IPRS* in *methanol*.

Reference solution (b). A 0.1 per cent w/v solution of *stearic acid* in *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air, spray with a solution containing 0.02 per cent w/v of *2,7-dichlorofluorescein* and 0.01 per cent w/v of *rhodamine B* in *ethanol (95 per cent)*, allow the plate to stand for a few seconds in the vapour above a water-bath and examine under ultraviolet light at 365 nm. The chromatogram obtained with the test solution exhibits two spots, one of which corresponds in position to the principal spot in the chromatogram obtained with reference solution (a) and the other to the principal spot in the chromatogram obtained with reference solution (b). Spray the plate with *ethanolic anisaldehyde solution*, heat at 110° for 5 minutes and examine in daylight. The coloured spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with reference solution (a).

B. To about 5 mg add 5 ml of a 0.02 per cent w/v solution of *xanthydrol* in a mixture of 1 volume of *hydrochloric acid* and 99 volumes of *5 M acetic acid* and heat on a water-bath; a red colour is produced.

C. Dissolve about 10 mg in 5 ml of *7 M hydrochloric acid* and allow to stand for about 20 minutes; a yellow colour develops.

Tests

pH (2.4.24). 7.0 to 10.5, determined in a 1.0 per cent w/v suspension.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silanised silica gel H*.

Mobile phase. A mixture of 100 volumes of *methanol* and 60 volumes of a 15 per cent w/v solution of *ammonium acetate*.

Test solution. Dissolve 0.28 g of the substance under examination in 100 ml of *methanol*.

Reference solution (a). A 0.2 per cent w/v solution *erythromycin IPRS* in *methanol*.

Reference solution (b). A 0.01 per cent w/v solution of *erythromycin IPRS* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air, spray with *ethanolic anisaldehyde solution*, heat at 110° for 5 minutes and allow to cool. Any spot with an R_f value lower than that of the principal spot in the chromatogram obtained with the test solution is not more intense than the corresponding spot in the chromatogram obtained with reference solution (a) and any spot with an R_f value higher than that of the principal spot is not more intense than the principal spot in the chromatogram obtained with reference solution (b).

Erythromycin stearate. Not less than 84.0 per cent of $C_{37}H_{67}NO_{13},C_{18}H_{36}O_2$, calculated on the anhydrous basis and determined by the following method. Weigh accurately about 0.5 g and dissolve in 30 ml of *chloroform*. If the solution is opalescent, filter and shake the residue with three quantities, each of 25 ml, of *chloroform*. Filter, if necessary, and wash the filter with *chloroform*. Evaporate the combined filtrate and washings on a water-bath to about 30 ml, add 50 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.1018 g of $C_{37}H_{67}NO_{13},C_{18}H_{36}O_2$.

Free stearic acid. Not more than 14.0 per cent of $C_{18}H_{36}O_2$, calculated on the anhydrous basis and determined by the following method. Weigh accurately about 0.4 g and dissolve in 50 ml of *methanol*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Calculate the volume of *0.1 M sodium hydroxide* required for each g of the substance and subtract the volume of *0.1 M perchloric acid* required for each g of the substance in the test for Erythromycin stearate.

1 ml of the difference is equivalent to 0.02845 g of $C_{18}H_{36}O_2$.

Erythromycin stearate and free stearic acid. 98.0 to 103.0 per cent, calculated by adding together the percentages of erythromycin stearate and free stearic acid determined as described above.

Sulphated ash (2.3.18). Not more than 0.5 per cent.

Water (2.3.43). Not more than 4.0 per cent, determined on 0.3 g using a 10 per cent w/v solution of *imidazole* in *anhydrous methanol* as the solvent.

Assay. Determine by the microbiological assay of antibiotics, Method A (2.2.10) using a solution prepared by dissolving about 50 mg accurately weighed in sufficient *methanol* to produce 100.0 ml. Express the results as units per mg.

Storage. Store protected from light at a temperature not exceeding 30°.

Erythromycin Stearate Tablets

Erythromycin Stearate Tablets contain not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of erythromycin, $C_{37}H_{67}NO_{13}$.

Usual strengths. The equivalent of 125 mg; 250 mg of erythromycin.

Identification

A. To a quantity of the powdered tablets containing 0.1 g of erythromycin add 10 ml of *water* and shake well. Decant the supernatant liquid and discard. Extract the residue by shaking with 10 ml of *methanol,* filter the extract and evaporate to dryness. The residue after drying at a pressure not exceeding 0.7 kPa complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *erythromycin stearate IPRS* or with the reference spectrum of erythromycin stearate.

B. Dissolve a quantity of the powdered tablets containing 3 mg of erythromycin as completely as possible in 2 ml of *acetone* and add 2 ml of *hydrochloric acid*; an orange colour is produced which changes to red and then to deep purplish red. Add 2 ml of *chloroform* and shake; the chloroform layer becomes purple.

C. Extract a quantity of the powdered tablets containing 50 mg of erythromycin with 10 ml of *chloroform*, filter and evaporate to dryness. Heat 0.1 g of the residue gently with 5 ml of *2 M hydrochloric acid* and 10 ml of *water* until the solution boils; oily globules rise to the surface. Cool, remove the fatty layer, heat it with 3 ml of *0.1 M sodium hydroxide* and allow to cool; the solution sets to a gel. Add 10 ml of hot *water* and shake; the solution froths. To 1 ml add a 10 per cent w/v solution of *calcium chloride;* a granular precipitate is produced which is insoluble in *hydrochloric acid.*

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of 2.72 per cent w/v solution of *sodium acetate,* adjusted to pH 5.0 with *glacial acetic acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of medium and filter. To 5 ml of the filtrate, add 40 ml of *glacial acetic acid* and 10 ml of a 0.5 per cent w/v solution of *4- dimethylaminobenzaldehyde* in *glacial acetic acid* and dilute to 100 ml with a mixture of 35 volumes of *glacial acetic acid* and 70 volumes of *hydrochloric acid.* Allow to stand for 15 minutes and measure the absorbance of the resulting solution at the maximum at 485 nm (2.4.7). Calculate the content of $C_{37}H_{67}NO_{13}$ in the medium from the absorbance obtained from a solution of known concentration of *erythromycin stearate IPRS* prepared in the same manner.

Q. Not less than 70 per cent of the stated amount of $C_{37}H_{67}NO_{13}$.

Other tests. Comply with the tests stated under Tablets.

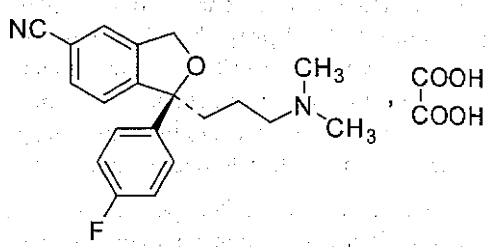
Assay. Determine by the microbiological assay of antibiotics, Method A (2.2.10) on a solution prepared in the following manner.

Weigh and powder 20 tablets. Disperse a quantity of the powder containing 25 mg of erythromycin and dissolve as completely as possible in sufficient *methanol* to produce 100.0 ml. Calculate the content of erythromycin in the tablets, taking each 1000 Units found to be equivalent to 1 mg of erythromycin.

Storage. Store protected from light.

Labelling. The label states the strength in terms of the equivalent amount of erythromycin.

Escitalopram Oxalate



$C_{20}H_{21}FN_2O,C_2H_2O_4$ Mol. Wt. 414.4

Escitalopram Oxalate is (*S*)-1-[3-(dimethylamino)propyl]-1-(4-fluorophenyl)-1,3-dihydro-5-isobenzofurancarbonitrile oxalate.

Escitalopram Oxalate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{20}H_{21}FN_2O.C_2H_2O_4$, calculated on the anhydrous basis.

Category. Antidepressant.

Description. A white to slightly yellow powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *escitalopram oxalate IPRS* or with the reference spectrum of escitalopram oxalate.

Tests

Specific optical rotation (2.4.22). +10.0° to +13.0°, determined in 1.0 per cent w/v solution in the *methanol*.

Enantiomeric Purity. Not more than 2.0 per cent of R- isomer.

Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution. Dissolve 25 mg of *citalopram hydrombromide IPRS* in 2.5 ml of *methanol* and dilute to 50.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with OD-H (5 µm) (Such as Chirelcel),
- column temperature: 30°,
- mobile phase: a mixture of 90 volumes of *n-hexane*, 10 volumes of *ethanol* and 0.4 volume of *trifluoroacetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resoluiton between the peaks due to *S*-isomer and *R*-isomer is not less than 1.5. The relative retention time with reference to S- isomer for R- isomer is about 1.2.

Inject the reference solution and the test solution.

Calculate the content of R- isomer.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE— Prepare the solutions immediately before use.

Test solution. Dissolve about 50 mg of the substance under examination in 50.0 ml of the mobile phase.

Reference solution (a). A 0.0005 per cent w/v solution of *escitalopram oxalate IPRS* in the mobile phase.

Reference solution (b). A 0.01 per cent w/v solution of *oxalic acid* in the mobile phase.

Use chromatographic system as described under Assay.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0.

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent), the sum of the area of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore the peak due to oxalic acid.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 0.1 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 100.0 ml of the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.005 per cent w/v solution of *escitalopram oxalate IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as Waters-Xterra),
- column temperature: 40°,
- mobile phase: a mixture of 50 volumes of buffer solution prepared by dissolving 4.45 g of *disodium hydrogen phosphate dihydrate* in 1000 ml of *0.1 per cent triethylamine*, adjusted to pH 8.5 with *orthophosphoric acid* and 50 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the theoretical plates is not less than 2000, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{21}FN_2O.C_2H_2O_4$.

Storage Store protected from moisture.

Escitalopram Tablets

Escitalopram Oxalate Tablets

Escitalopram Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of escitalopram, $C_{20}H_{21}FN_2O$.

Usual strengths. 5 mg; 10 mg; 20 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14), as described under Assay using the following solutions.

Test solution. The filtrate obtained as given above, diluted if necessary with the dissolution medium.

Reference solution. A solution of *escitalopram oxalate IPRS* containing about 0.00055 per cent w/v of escitalopram in the dissolution medium.

Q. Not less than 70 per cent of the stated amount of $C_{20}H_{21}FN_2O$.

Uniformity of content. Complies with the test stated under tablets.

Determine by liquid chromatography (2.4.14), as described under Assay using the following solution as the test solution.

Test solution. Disperse 1 tablet in the mobile phase, sonicate and dilute, if necessary to obtain a solution containing 0.001 per cent w/v of escitalopram in the mobile phase.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 25 mg of Escitalopram with 30 ml of mobile phase, sonicate to dissolve and dilute to 50.0 ml with the mobile phase. Further dilute to obtain a 0.001 per cent w/v solution of escitalopram.

Reference solution. A solution of *escitalopram oxalate IPRS* containing about 0.001 per cent w/v of escitalopram in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 45 volumes of buffer solution prepared by dissolving 3.7 g of *disodium hydrogen phosphate dihydrate* in 1000 ml of *water*, adjusted to pH 7.0 with *orthophosphoric acid*, 27.5 volumes of *methanol* and 27.5 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 226 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 4000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{21}FN_2O$ in the tablets.

Labelling. The label states the strength in terms of the equivalent amount of Escitalopram.

Escitalopram Oxalate and Clonazepam Tablets

Escitalopram and Clonazepam Tablets.

Escitalopram Oxalate and Clonazepam Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of escitalopram, $C_{20}H_{21}FN_2O$ and clonazepam, $C_{15}H_{10}ClN_3O_3$.

Usual strength. Escitalopram Oxalate equivalent to Escitalopram,10 mg and Clonazepam, 0.25 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution corresponds to the peaks in the chromatogram obtained with the reference solution (b).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *Water,*
Speed and time. 100 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter, rejecting first few ml of the filtrate.

Determine by liquid chromatography (2.4.14).

Test solution. The filtrate obtained as given above, diluted suitably if necessary, with the dissolution medium.

Reference solution. Dissolve an accurately weighed quantity of *escitalopram oxalate IPRS* and *clonazepam IPRS* in 5.0 ml *methanol* and dilute with the dissolution medium to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Use chromatographic system as described under Assay with the following modification.

- spectrophotometer set at 210 nm,
- injection volume: 100 µl.

Inject the reference solution and the test solution.

Calculate the contents of $C_{20}H_{21}FN_2O$ and $C_{15}H_{10}ClN_3O_3$.

Q. Not less than 70.0 per cent of the stated amounts of $C_{20}H_{21}FN_2O$ and $C_{15}H_{10}ClN_3O_3$.

Related substances. Determine by liquid chromatography (2.4.14).

Use chromatographic system, solvent mixture and test solution as described under Assay.

Inject the test solution. The area of any secondary peak is not more than 1.0 per cent and the sum of areas of all the secondary

peaks is not more than 2.0 per cent, calculated by area normalisation.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14).

Test solution. Disperse one tablet with 20 ml of *solvent mixture* for 30 minutes, add sufficient *solvent mixture* to produce 25.0 ml, mix and filter.

Use chromatographic system, reference solution (b) and solvent mixture as described under Assay.

Inject reference solution (b) and the test solution.

Calculate the contents of $C_{20}H_{21}FN_2O$ and $C_{15}H_{10}ClN_3O_3$ in the tablets.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 400 volumes of *water*, 300 volumes of *methanol* and 300 volumes of *acetonitrile.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 40 mg of Escitalopram with 50 ml of *solvent mixture*, ultrasound for 20 minutes, add sufficient *solvent mixture* to produce 100.0 ml, mix and filter.

Reference solution (a). Dissolve 10 mg of *clonazepam IPRS* in 50.0 ml of solvent mixture, ultrasound to dissolve and add sufficient solvent mixture to produce 100.0 ml.

Reference solution (b). Dissolve 25.7 mg of *escitalopram oxalate IPRS* in 40.0 ml of solvent mixture, add 5.0 ml reference solution (a) ultrasound and add sufficient solvent mixture to produce 50.0 ml.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane chemically bonded to porous silica (5 µm) (Such as Hypersil BDS),
- mobile phase: a mixture of 550 volumes of a buffer solution prepared by dissolving 6.8 g of *Potassium dihydrogen orthopsosphate* and 8.7 g of *dipotassium hydrogen orthophosphate* in 1000 ml of *water*, add 3 ml of *triethylamine* and adjusted to pH 6 with *orthophosphoric acid*, 315 volumes of *methanol*, and 135 volumes of *acetonitrile,*
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

The retention time of peaks due to escitalopram is about 10 minutes and clonazepam is about 14 minutes.

Inject reference solution (b). The test is not valid unless the column efficiency is not less than 5000 theoretical plates for escitalopram peak, tailing factor is not more than 2.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

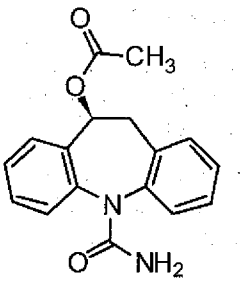
Inject reference solution (b) and the test solution.

Calculate the contents of $C_{20}H_{21}FN_2O$ and $C_{15}H_{10}ClN_3O_3$ in the tablets.

Storage. Store protected from moisture, at the temperature not exceed 30°.

Labelling. The label states the strength in terms of the equivalent amount of escitalopram and the quantity of clonazepam.

Eslicarbazepine Acetate



$C_{17}H_{16}N_2O_3$ Mol Wt. 296.3

Eslicarbazepine Acetate is (*S*)-10-Acetoxy- 10,11-dihydro-5*H*-dibenz[b,f]azepine- 5-carboxamide.

Eslicarbazepine Acetate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{17}H_{16}N_2O_3$, calculated on the anhydrous basis.

Category. Antiepileptic

Description. A white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *eslicarbazepine acetate IPRS* or with the reference spectrum of eslicarbazepine acetate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of *water* and 50 volumes of *methanol.*

Test solution. Dissolve about 25 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution. A 0.0005 per cent w/v solution of *eslicarbazepine acetate IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 2.5 with *orthophosphoric acid* , *acid* and 30 volumes of a mixture of 60 volumes of *acetonitrile* and 40 volumes of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, tailing factor is not more than 2.0.

Inject the test solution. The area of any secondary peak is not more than 0.3 per cent and the sum of areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalisation.

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of *water* and 50 volumes of *methanol*.

Test solution. Dissolve 25 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 50.0ml with the solvent mixture.

Reference solution. A 0.005 per cent w/v solution of *eslicarbazepine acetate IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 2.5 with *orthophosphoric acid*, *acid* and 30volumes of a mixture of 60 volumes of *acetonitrile* and 40 volumes of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, tailing factor is not more than 2.0.and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{16}N_2O_3$.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Eslicarbazepine Tablets

Eslicarbazepine Acetate Tablets

Eslicarbazepine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of eslicarbazepine acetate, $C_{17}H_{16}N_2O_3$.

Usual strengths. 200 mg; 400 mg; 600 mg; 800 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of 0.5 per cent w/v solution of *sodium lauryl sulphate* in *water*,
Speed and time. 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve 44 mg of *eslicarbazepine acetate IPRS* in 10 ml of *methanol* with the aid of ultrasound and dilute to 100.0 ml with the dissolution medium. Dilute 5.0 ml of the solution to 50.0 ml with the dissolution medium.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of buffer solution prepared by dissolving 1.36g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 2.5 with *orthophosphoric acid*, 50 volumes of a mixture of 60 volumes of *acetonitrile* and 40 volumes of *methanol*,

- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{16}N_2O_3$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{17}H_{16}N_2O_3$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of buffer solution and *methanol*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 100 mg of Eslicarbazepine Acetate in 120 ml of the solvent mixture with the aid of ultrasound for 25 minutes with intermittent shaking and dilute to 200.0 ml with the solvent mixture and filter.

Reference solution. A 0.00025 per cent w/v solution of *eslicarbazepine acetate IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 2.5 with *orthophosphoric acid* and 30 volumes of a mixture of 60 volumes of *acetonitrile* and 40 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of areas of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of buffer solution and *methanol*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 100 mg of Eslicarbazepine Acetate in 120 ml of the solvent mixture with the aid of ultrasound for 25 minutes with intermittent shaking and dilute to 200.0 ml with the solvent mixture, filter. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.005 per cent w/v solution of *eslicarbazepine acetate IPRS* in the solvent mixture.

Use chromatographic system as described under Related substances with the following modification.

- a mixture of 50 volumes of buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 2.5 with *orthophosphoric acid*, 50 volumes of a mixture of 60 volumes of *acetonitrile* and 40 volumes of *methanol*,

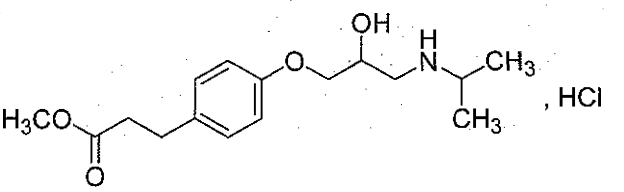
Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{16}N_2O_3$ in tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Esmolol Hydrochloride



$C_{16}H_{25}NO_4,HCl$ Mol. Wt. 331.8

Esmolol Hydrochloride is Methyl (*RS*)-3-[4-(2-hydroxy-3-isopropylaminopropoxy)phenyl]propanoate hydrochloride.

Esmolol Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{16}H_{25}NO_4,HCl$, calculated on the anhydrous basis.

Category. Antihypertensive.

Description. A white to off white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *esmolol hydrochloride IPRS* or with the reference spectrum of esmolol hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.24). 3.0 to 5.0, determined in 25.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 100 mg of the substance under examination in *water* and dilute to 100.0 ml with *water*.

Reference solution (a). A 0.001 per cent w/v solution of *esmolol hydrochloride IPRS* in *water*.

Reference solution (b). A 0.1 per cent w/v solution of *esmolol hydrochloride IPRS* in *1 M hydrochloric acid*. Allow the contents to stand for at least 30 minutes. *(NOTE— This results in the partial degradation of the esmolol resulting in the production of esmolol free acid)*. Dilute 1.0 ml of the solution to 5.0 ml with *water*.

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: A. *methanol*,
  B. a mixture of 65 volumes of buffer solution prepared by dissolving 3.0 g of *potassium dihydrogen phosphate* in 650 ml of *water*, 15 volumes of *acetonitrile* and 20 volumes of *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 2 ml per minute,
- spectrophotometer set at 222 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent w/v)	Mobile phase B (per cent w/v)
0	0	100
20	0	100
25	25	75
35	25	75
36	0	100
40	0	100

Name	Relative retention time
Esmolol free acid[1]	0.43
Esmolol dimer[2]	6.5
Esmolol isopropylamide analog[3] (if present)	0.65
N-ethyl esmolol[4]	0.84
Esmolol	1.0

[1]3-{4-[2-hydroxy-3-(isopropylamino)propoxy]phenyl}propanoic acid,

[2]methyl 3-{4-[2-hydroxy-3-(3-{4-[2-hydroxy-3-(isopropylamino)propoxy]phenyl}-*N*-isopropylpropanamido)propoxy]phenyl}propanoate,

[3]3-{4-[2-Hydroxy-3-(isopropylamino)propoxy]phenyl}-*N*-isopropylpropionamide,

[4]methyl 3-{4-[3-(ethylamino)-2-hydroxypropoxy]phenyl}propionate.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to esmolol free acid and esmolol is not less than 4.0 and the tailing factor is not more than 2.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to esmolol free acid is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent), the area of any peak corresponding to esmolol dimer is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent), the area of any peak corresponding to esmolol isopropylamide analog is not more than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent), the area of any peak corresponding to N-ethyl esmolol is not more than 0.15 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent), the area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method A (20 ppm).

Water (2.3.43). Not more than 1.0 per cent, determined on 0.5 g using Method 1.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in *water* and dilute to 100.0 ml with *water*.

Reference solution (a). A 0.02 per cent w/v solution of *esmolol hydrochloride IPRS* in *water*.

Reference solution (b). A 0.1 per cent w/v solution of *esmolol hydrochloride IPRS* in *1 M hydrochloric acid*. Allow to stand for 30 minutes. *(NOTE— This results in the partial degradation of the esmolol resulting in the production of esmolol free acid)*. Dilute 1.0 ml of the solution to 5.0 ml with *water*.

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 65 volumes of buffer solution prepared by dissolving 3.0 g of *potassium dihydrogen phosphate* in 650 ml of *water*, 15 volumes of *acetonitrile* and 20 volumes of *methanol*.
- flow rate: 2 ml per minute,
- spectrophotometer set at 222 nm,
- injection volume: 20 µl.

The relative retention time with reference to esmolol for esmolol free acid is about 0.41.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to esmolol free acid and esmolol is not less than 4.0, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{16}H_{25}NO_4,HCl$.

Storage. Store at a temperature not exceeding 30°.

Esmolol Injection

Esmolol Hydrochloride Injection

Esmolol Hydrochloride Injection is a sterile solution of Esmolol Hydrochloride in Water for Injections.

Esmolol Hydrochloride Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of esmolol hydrochloride, $C_{16}H_{25}NO_4,HCl$.

Usual Strength. 10 mg per ml.

Description. A clear, almost colourless solution.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 4.5 to 5.5.

Bacterial Endotoxins (2.2.3). Not more than 3.5 Endotoxin Units per mg of Esmolol Hydrochloride.

Other tests. Comply with the test stated under Parenteral Preparations (Injections).

Assay. Determined by liquid Chromatography (2.4.14).

Test solution. Dilute a volume of the injection containing 50 mg of Esmolol Hydrochloride to 100.0 ml with the mobile phase.

Reference solution. A 0.05 per cent w/v solution of *esmolol hydrochloride IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of a buffer solution prepared by dissolving 3.0 g of *monobasic potassium dihydrogen phosphate* in 650 ml of *water*, 20 volumes of *methanol* and 15 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 222 nm,
- injection volume: 20 µl.

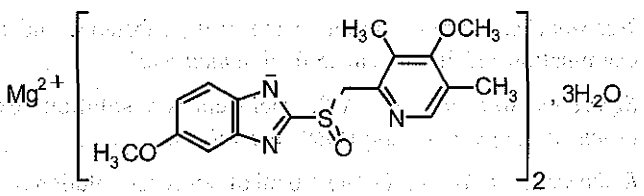
Inject the reference solution. The test is not valid unless the column efficiency is not less than 1500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{25}NO_4,HCl$ in the injection.

Storage. Store protected from light at a temperature below 25°.

Esomeprazole Magnesium Trihydrate



$(C_{17}H_{18}N_3O_3S)_2,Mg.3H_2O$ Mol. Wt. 767.2

Esomeprazole Magnesium Trihydrate is 5-methoxy-2-{(*S*)-[(4-methoxy-3,5-dimethyl-2-pyridinyl)methyl]sulfinyl}-1*H*-benzimidazole magnesium trihydrate.

Esomeprazole Magnesium Trihydrate contains not less than 98.0 per cent and not more than 102.0 per cent of $(C_{17}H_{18}N_3O_3S)_2,Mg$, calculated on the anhydrous basis.

Category. Antiulcer.

Description. A white to slightly coloured powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *esomeprazole magnesium IPRS* or with the reference spectrum esomeprazole magnesium.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Magnesium. 3.0 per cent to 3.7 per cent, calculated on the anhydrous basis and determined in the following manner.

Weigh 1 g of the substance under examination and ignite in a silica crucible until no fumes are evolved. Cool and moisten the residue with 0.5 ml of *sulphuric acid*. Evaporate the acid until no white fumes are noticed. Heat the residue at 800° for 2 hours. Cool the residue to room temperature and dissolve in 5 ml of *dilute hydrochloric acid* with the aid of ultrasound for 5 minutes. Transfer the residue to a flask, wash with about 15 ml of *water* and transfer the washing to the flask. Repeat the washing four to five times and add the washings to the extract in the flask. Add 5 ml of a mixture of 180 g of *ammonium chloride* and 750 ml of *strong ammonia solution* and sufficient *water* to produce 1000 ml and 200 mg of *eriochrome black T mixture*. Titrate with *0.05 M disodium edetate*.

1 ml of *0.05 M disodium edetate* is equivalent to 0.0012155 g of magnesium.

Specific optical rotation (2.4.22). – 155° to – 135°, determined in a 1.0 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse about 25 mg of the substance under examination and dissolve in 25.0 ml of *methanol*.

Reference solution (a). A 0.1 per cent w/v solution of *esomeprazole magnesium IPRS* in *methanol*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with *methanol*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 30 volumes of *acetonitrile* and 70 volumes of a buffer solution prepared by dissolving 1.2 g of *ammonium dihydrogen orthophosphate* in 1000 ml of *water* adding 5 ml of *triethylamine* and adjusted to pH 7.0 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 302 nm,
- injection volume: 10 µl.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 5000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), and the sum of the areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Water (2.3.43). 6.0 per cent to 11.0 per cent, determined on 0.1 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 75 volumes of *0.01 M sodium borate* and 25 volumes of *acetonitrile*.

Test solution. Disperse about 20 mg of the substance under examination in 10 ml of *methanol* and dilute to 100.0 ml with the solvent mixture.

Reference solution. Disperse about 20 mg of the *esomeprazole magnesium IPRS* in 10 ml of *methanol* and dilute to 100.0 ml with the solvent mixture.

Use the chromatographic system described under the test for Related substances.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates and the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Storage. Store protected from moisture.

Esomeprazole Gastro-resistant Capsules

Esomeprazole Capsules; Esomeprazole Magnesium Gastro-resistant Capsules; Esomeprazole Magnesium Capsules

Esomeprazole Gastro-resistant Capsules contains not less than 90.0 per cent and not more than 110.0 per cent of esomeprazole, $C_{17}H_{19}N_3O_3S$.

Usual strengths. 20 mg; 40 mg.

Identification

Enantiomeric purity (see Tests).

Tests

Dissolution (2.5.2).

A. Apparatus No. 2 (Paddle),

Medium: 900 ml of *0.1 M hydrochloric acid.*
Speed and time. 100 rpm and 2 hours.

Tap the granules from a capsule slightly with a glass rod to make them settle to the bottom. Rotate the paddle at 100 rpm for 2 hours, drain the solution slowly without losing any granules. Transfer them quantitatively to a 100-ml volumetric flask, add 20 ml of *0.1 M sodium hydroxide* and mix with the aid of ultrasound. Dilute to volume with *0.1 M sodium hydroxide,* centrifuge about 15 ml for 5 minutes and dilute 5.0 ml of the clear supernatant liquid to 50.0 ml with the mobile phase. Using the resulting solution as the test solution, carryout the determination as described under Assay. Calculate the content of $C_{17}H_{19}N_3O_3S$ in the supernatant liquid. Calculate the percentage of esomeprazole released in the acid medium by subtracting the content of $C_{17}H_{19}N_3O_3S$ in the test solution from the total content of esomeprazole determined in the Assay.

Complies with the acceptance criteria given under acid stage.

B. Apparatus No. 2 (Paddle),
Medium. 900 ml of *phosphate buffer pH 6.8,*
Speed and time. 100 rpm and 45 minutes.

Tap the granules from a capsule slightly with a glass rod to make them settle to the bottom. Rotate the paddle at 100 rpm for 45 minutes and filter the solution. Immediately transfer 5.0 ml of the solution to a test tube containing 1.0 ml of *0.1 M sodium hydroxide.* Prepare the standard solution having a known concentration similar to the expected concentration and in similar manner to the test solution. Calculate the content of $C_{17}H_{19}N_3O_3S$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{17}H_{19}N_3O_3S$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Use freshly prepared solution and protected from light.

Solvent mixture. Dissolve 5.24 g of *trisodium orthophosphate* in *water*, add 110.0 ml of *0.5 M disodium hydrogen orthophosphate* and make up the volume to 1000.0 ml with *water*, adjusted to pH 11.0 with *0.1 M sodium hydroxide solution.*

Buffer solution. Mix 5.2 ml of *1.0 M disodium hydrogen orthophosphate* buffer and 63.0 ml of *0.5 M sodium dihydrogen orthophosphate* buffer diluted to 1000.0 ml with *water*, adjusted to pH 7.6 with *0.1 M sodium hydroxide solution.*

Test solution. Disperse a quantity of mixed contents of capsules containing 80 mg of esomeprazole in 20.0 ml *methanol*, add 40.0 ml solvent mixture and mix with the aid of ultrasound for 5 minutes and dilute to 200.0 ml with the *water.*

Reference solution. Dissolve 10 mg each of *omeprazole IPRS* and *omeprazole sulphone IPRS* (omeprazole impurity A) in 100.0 ml *methanol.* Dilute 1.0 ml of the solution to 100.0 ml in a mixture of 1 volume of solvent mixture and 4 volume of *water.*

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porus silica (3 µm),
- mobile phase: A. a mixture of 100 ml of *acetonitrile* and 100 ml of buffer solution and diluted to 1000 ml with *water*,
  B. a mixture of 800 ml of *acetonitrile* and 10 ml of buffer solution and diluted to 1000 ml with *water*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 302 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
10	80	20
30	0	100
31	100	0
45	100	0

The relative retention time with reference to omeprazole for omeprazole sulphone is 0.93.

Inject the reference solution. The test is not valid unless resolution between the peaks due to omeprazole and omeprazole impurity A is not less than 2.5.

Inject the test solution. In the chromatogram obtained with the test solution the area of peak corresponding to omeprazole impurity A is not more than 0.5 per cent, the area of any other secondary peak is not more than 0.5 per cent and the sum of areas of all the secondary peaks is not more than 2.0 per cent, calculated by area normalization.

Enantiomeric purity. Determined by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 5.24 g of *trisodium phosphate* in *water*, add 110 ml of *0.5 M disodium hydrogen phosphate* and make up the volume to 1000 ml with *water* and adjusted to pH 11.0.

Test solution. Shake a quantity of the mixed contents of 20 capsules containing 20 mg of esomeprazole in 120 ml solvent mixture, add 40 ml *ethanol* and mix with the aid of ultrasound for 5 minutes and dilute to 200 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml in *water.*

Reference solution. Dissolve 20 mg of *omeprazole IPRS* in 120 ml solvent mixture, add 40 ml *ethanol* and mix with the aid

of ultrasound for 5 minutes and dilute to 200 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml in *water*.

Chromatographic system

- a stainless steel column 10 cm x 4.0 mm, packed with immobilized alpha 1 acid glycoprotein on special silica particles (5 µm),
- mobile phase: a mixture of 150 ml of *acetonitrile* and 85 ml of buffer solution prepared by dissolving 26.6 g of *disodium hydrogen orthophosphate* and 55.2 g *sodium dihydrogen orthophosphate* in 1000 ml *water*, adjusted to pH 6.0 and finally diluted to 1000 ml with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 302 nm,
- injection volume: 20 µl.

The elution order of enantiomers is R-enantiomer and then S-enantiomer which is esomeprazole peak.

Inject the reference solution and the test solution. The test is not valid unless the resolution between the peaks corresponding to esomeprazole and enantiomer R is not less than 1.0. The ratio of the retention time of esomeprazole peak in the reference solution and the test solution should be between 0.98 and 1.02.

Other tests. Comply with the tests stated under Capsules.

Assay. Determined by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 5.24 g of *trisodium phosphate* in *water*, add 110 ml of *0.5 M di-sodium hydrogen phosphate* and make up the volume to 1000 ml with *water* and adjusted to pH 11.0 with *0.1 M sodium hydroxide solution*.

Test solution. Weigh and mix the contents of 20 capsules. Disperse a quantity of the mixed content containing about 20 mg of esomeprazole with 60 ml of the solvent mixture, shake for 20 minutes to dissolve the pellets. Add 20 ml of *methanol* and mix with the aid of ultrasound and dilute to 100.0 ml with the solvent mixture. Dilute 2.0 ml of the solution to 10.0 ml using *water*, filter. Store the solution protected from light.

Reference solution. Dissolve 10 mg *omeprazole IPRS* in 10 ml *methanol*, add 40 ml solvent mixture and further dilute with *water* to obtain a concentration of 0.004 per cent of omeprazole.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porus silica (5 µm),
- mobile phase: a mixture of 350 ml of *acetonitrile*, 500 ml of buffer solution prepared by mixing 10.5 ml *1.0 M sodium dihydrogen orthophosphate* and 60.0 ml *0.5 M disodium hydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 7.3 and finally diluted to 1000 ml with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 302 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injection is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{19}N_3O_3S$ in the capsules.

Storage. Store protected from moisture at room temperature.

Labelling. The label state the strength in terms of equivalent amount of esomeprazole.

Esomeprazole Gastro-resistant Tablets

Esomeprazole Tablets; Esomeprazole Magnesium Gastro-resistant Tablets; Esomeprazole Magnesium Tablets

Esomeprazole Gastro-resistant Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of esomeprazole, $C_{17}H_{19}N_3O_3S$. They are made gastro-resistant by enteric-coating or by other means.

Usual strengths. 20 mg; 30 mg; 40 mg.

1 mg of Esomeprazole magnesium trihydrate $(C_{17}H_{18}N_3O_3S)_2.Mg.3H_2O$ is equivalent to 900.5 µg of Esomeprazole $(C_{17}H_{19}N_3O_3S)_2$.

Identification

In the Assay the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

NOTE — Perform all the tests in subdued light using low actinic glassware.

Dissolution (2.5.2).

A. Apparatus No. 2 (Paddle),
Medium. 1000 ml of *0.1 M hydrochloric acid*,
Speed and time. 75 rpm and 2 hours.

Determine by liquid chromatography (2.4.14).

Test solution. Withdraw the medium completely and disperse the intact tablet in suitable amount of *methanol* to obtain a solution containing 0.02 per cent w/v of esomeprazole. Centrifuge at about 4000 rpm for 10 minutes. Dilute 5.0 ml of the solution to 25.0 ml with the mobile phase.

Reference solution. A 0.02 per cent w/v solution of *esomeprazole magnesium IPRS* in *methanol*. Dilute 5.0 ml of the solution to 25.0 ml with the mobile phase.

Use chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{19}N_3O_3S$ released in the acid medium by subtracting the content of $C_{17}H_{19}N_3O_3S$ in the test solution from the total content of esomeprazole $C_{17}H_{19}N_3O_3S$ determined in the Assay.

Complies with the acceptance criteria given under acid stage.

B. Apparatus No. 2 (Paddle),
Medium. 900 ml of *phosphate buffer pH 6.8*,
Speed and time. 75 rpm and 60 minutes.

Transfer another 6 tablets and run the apparatus for 2 hours in *0.1 M hydrochloric acid*. Decant the medium without losing the tablets, add phosphate buffer pH 6.8 and run the apparatus for 60 minutes. Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A 0.022 per cent w/v solution of *esomeprazole magnesium IPRS* in *methanol*. Dilute a suitable volume of the solution with the dissolution medium to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Use chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{19}N_3O_3S$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{17}H_{19}N_3O_3S$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.24 g of esomeprazole, add about 150 ml of *methanol* and mix with the aid of ultrasound for 15 minutes. Mix and add sufficient *methanol* to produce 250.0 ml. Mix with the aid of ultrasound for a further 5 minutes and centrifuge. Dilute 5.0 ml of the clear supernatant liquid to 25.0 ml with the mobile phase.

Reference solution. Weigh 0.055 g of *esomeprazole magnesium IPRS*, dissolve in 50 ml of *methanol*, add sufficient mobile phase to produce 250.0 ml and mix well.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of equal volumes of *methanol* and a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen phosphate* and about 1 g of *sodium hydroxide* in 1000 ml of *water* and adjusted to pH 7.0 with *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 300 nm,
- injection volume: 50 µl.

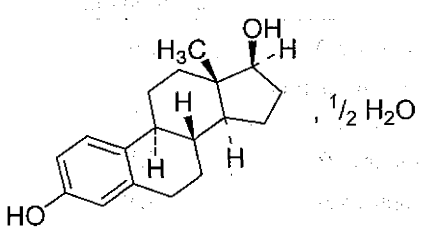
Inject the reference solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation of the replicate injections is not more than 2.0 per cent.

Calculate the content of $C_{17}H_{19}N_3O_3S$ in the tablets.

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the equivalent amount of esomeprazole.

Estradiol Hemihydrate



$C_{18}H_{24}O_2, ½H_2O$ Mol. Wt. 281.4

Estradiol Hemihydrate is Estra-1,3,5(10)-triene-3,17β-diol hemihydrate.

Estradiol Hemihydrate contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{18}H_{24}O_2, ½ H_2O$, calculated on the anhydrous basis.

Category. Estrogen.

Description. A white or almost white, crystalline powder or colourless crystals.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *estradiol hemihydrate IPRS* or with the reference spectrum of estradiol hemihydrate.

Tests

Specific optical rotation (2.4.22). + 76.0° to + 83.0°, determined in 1.0 per cent w/v solution in *ethanol (95 per cent)*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 10 ml of *acetonitrile* and dilute to 25.0 ml with the *methanol*.

Reference solution (a). A 0.0002 per cent w/v solution of *estradiol hemihydrate IPRS* in *methanol*.

Reference solution (b). A mixture of equal volumes of 0.1 per cent w/v solution, each of, *estradiol hemihydrate IPRS* and *2, 3-dichloro-5,6-dicyanobenzoquinone* in *methanol*. Allow to stand for 30 minutes before injection, to generate impurity D.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with end-capped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of *acetonitrile*, 55 volumes of *water* and 5 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Estradiol impurity D[1]	0.9	0.4
Estradiol (Retention time is about 13 minutes)	1.0	—
Estradiol impurity B[2]	1.1	—
Estradiol impurity A[3]	1.4	—
Estradiol impurity C[4]	1.9	—

[1]estra-1,3,5(10), 9(11)-tetraene-3,17β-diol,

[2]estra-1,3,5(10)-triene-3,17α-diol (17α-estradiol),

[3]3-hydroxyestra-1,3,5(10)-trien-17-one (estrone),

[4]4-methylestra-1,3,5(10)-triene-3,17β-diol.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to estradiol and impurity D is not less than 2.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to impurity A, B, C and D, each of, is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Water (2.3.43). 2.9 per cent to 3.5 per cent, determined on 0.5 g.

Assay. Dissolve 20.0 mg of substance under examination in *ethanol (95 per cent)* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of the solution to 50.0 ml with *0.1M sodium hydroxide*. Allow to cool to room temperature and measure the absorbance of the resulting solution at the maximum at about 238 nm (2.4.7). Calculate the content of $C_{18}H_{24}O_2$ taking 335 as the specific absorbance at 238 nm.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Estradiol and Norethisterone Tablets

Estradiol and Norethisterone Acetate Tablets

Estradiol and Norethisterone Tablets contain Estradiol Hemihydrate and Norethisterone Acetate.

Estradiol and Norethisterone Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amounts of estradiol, $C_{18}H_{24}O_2$ and norethisterone acetate, $C_{22}H_{28}O_3$.

Usual Strength. Estradiol 2 mg and norethisterone 1 mg.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 10 volumes of *acetone* and 90 volumes of *dichloromethane*.

Test solution. Add 0.2 ml of *water* to two tablets and shake to disperse. Add sufficient *ethanol (95 per cent)* to produce a solution containing 0.035 per cent w/v of Norethisterone Acetate, centrifuge and use the clear supernatant liquid.

Reference solution. A suitable concentration of *estradiol hemihydrate IPRS* and *norethisterone acetate IPRS* in *ethanol (95 per cent)*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 8 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. Spray with *ethanolic sulphuric acid (5 per cent)* and heat the plate at 105° for 15 minutes. The chromatogram obtained with test solution shows two clearly separated spots with R_f values corresponding to those observed in the chromatogram obtained with the reference solution.

B. In the test for Uniformity of content, the chromatogram obtained with the test solution shows two peaks with the same retention times as the peaks due to estradiol and norethisterone acetate in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 500 ml of a 0.3 per cent w/v solution of *sodium lauryl sulphate* in *water*,

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter, discarding the first 5 ml of filtrate.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate and, if necessary, dilute with the dissolution medium.

Reference solution (a). Dissolve a sufficient quantity of *estradiol hemihydrate IPRS* and *norethisterone acetate IPRS* in *methanol (80 per cent)* and dilute with dissolution medium; the concentration of the final solution should be the same as that expected for test solution.

Reference solution (b). A solution containing 0.0017 per cent w/v of *estradiol hemihydrate IPRS*, 0.00084 per cent w/v of *norethisterone acetate IPRS*, 0.00066 per cent w/v of *estrone IPRS* and 0.00034 per cent w/v of *norethisterone IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Spherisorb ODS 2),
- mobile phase: a mixture of 45 volumes of *water* and 55 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 200 µl.

Inject reference solution (b). The test is not valid unless the resolution between each pair of peaks (estradiol and norethisterone, estrone and norethisterone acetate) is not less than 1.0.

Inject reference solution (a) and the test solution.

Calculate the total content of $C_{18}H_{24}O_2$ and $C_{22}H_{28}O_3$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{18}H_{24}O_2$ and $C_{22}H_{28}O_3$ in the medium.

Estrone and norethisterone. Determine by liquid chromatography (2.4.14).

Test solution (a). Weigh and powder 20 tablets. Add 20 ml of the mobile phase to a quantity of the powdered tablets containing 5 mg of estradiol, mix with the aid of ultrasound and add sufficient mobile phase to produce 25 ml. Centrifuge and use the clear supernatant liquid.

Test solution (b). Add 20 ml of the mobile phase to a quantity of the powdered tablets containing 2.5 mg of Norethisterone Acetate, mix with the aid of ultrasound and add sufficient mobile phase to produce 25 ml. Centrifuge and use the clear supernatant liquid.

Reference solution (a). A 0.0001 per cent w/v solution of *estrone IPRS* in the mobile phase.

Reference solution (b). A 0.00005 per cent w/v solution of *norethisterone IPRS* in the mobile phase.

Reference solution (c). A solution containing 0.0017 per cent w/v of *estradiol hemihydrate IPRS*, 0.00084 per cent w/v of *norethisterone acetate IPRS*, 0.00066 per cent w/v of *estrone IPRS* and 0.00034 per cent w/v of *norethisterone IPRS* in the mobile phase.

Use the chromatographic condition as described under Dissolution.

Inject 20 µl of reference solution (c). The test is not valid unless the resolution between each pair of peaks (estradiol and norethisterone, estrone and norethisterone acetate) is not less than 1.0.

Inject 20 µl of reference solution (a), (b), test solution (a) and (b). In the chromatogram obtained with test solution (a), the area of any peak corresponding to estrone is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). In the chromatogram obtained with test solution (b) the area of any peak corresponding to norethisterone is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14).

Test solution. Powder one tablet and add 20 ml of the mobile phase, mix with the aid of ultrasound, cool, add sufficient of the mobile phase to produce 25 ml and centrifuge. Dilute the supernatant liquid if necessary, with the mobile phase to produce a solution containing 0.002 per cent w/v of estradiol.

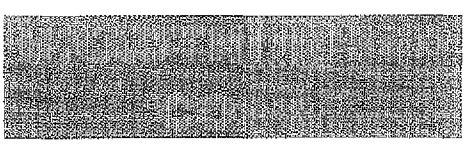
Reference solution (a). Dissolve sufficient quantities of *estradiol hemihydrate IPRS* and *norethisterone acetate IPRS* in the mobile phase and dilute an aliquot with the mobile phase; the concentrations in the final solution are the same as those expected for test solution.

Reference solution (b). A solution containing 0.0017 per cent w/v of *estradiol hemihydrate IPRS*, 0.00084 per cent w/v of *norethisterone acetate IPRS*, 0.00066 per cent w/v of *estrone IPRS* and 0.00034 per cent w/v of *norethisterone IPRS* in the mobile phase.

Use chromatographic system as described under Dissolution.

Inject 20 µl of reference solution (a), (b) and the test solution. The test is not valid unless the resolution between each pair of peaks (estradiol and norethisterone, estrone and norethisterone acetate) is not less than 1.0.

Calculate the contents of $C_{18}H_{24}O_2$ and $C_{22}H_{28}O_3$ in the tablet.



Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14), as described under Uniformity of content using the following test solution.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 10 mg of estradiol, add 20 ml of the mobile phase, mix with the aid of ultrasound, cool, add sufficient of the mobile phase to produce 25 ml and centrifuge. Dilute the supernatant liquid if necessary, with the mobile phase to produce a solution containing 0.002 per cent w/v of estradiol.

Inject 20 µl of reference solution (a) and the test solution.

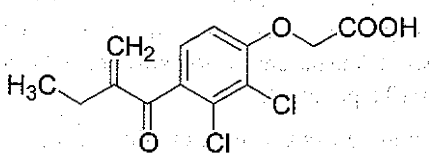
Calculate the contents of $C_{18}H_{24}O_2$ and $C_{22}H_{28}O_3$ in the tablets.

Storage. Store protected from light.

Labelling. The label states the quantity of estradiol hemihydrate in terms of the equivalent amount of estradiol.

Ethacrynic Acid

Etacrynic Acid



$C_{13}H_{12}Cl_2O_4$ Mol. Wt. 303.1

Ethacrynic Acid is 2-[2,3-dichloro-4-(2-ethylacryloyl) phenoxy]acetic acid

Ethacrynic Acid contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{13}H_{12}Cl_2O_4$, calculated on the dried basis.

Category. Diuretic.

Description. A white or almost white, crystalline powder.

CAUTION — As Ethacrynic Acid irritates the skin, eyes and the mucous membranes it should be handled with care.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ethacrynic acid IPRS* or with the reference spectrum of ethacrynic acid.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.005 per cent w/v solution in a mixture of 99 volumes of *methanol* and 1 volume of *1 M hydrochloric acid* shows a well defined absorption maximum at 270 nm and a shoulder at 285 nm; absorbance at 270 nm, 0.55 to 0.60.

C. To 25 mg add 2 ml of *1 M sodium hydroxide* and heat in a water-bath for 5 minutes, cool, add 0.25 ml of *sulphuric acid (50 per cent v/v)* and 0.5 ml of a 10 per cent w/v solution of *chromotropic acid sodium salt* and add cautiously 2 ml of *sulphuric acid*; a deep violet colour is produced.

D. On 20 mg determine by the oxygen-flask method (2.3.34), using 5 ml of *dilute sodium hydroxide solution* as the absorbing liquid. When the process is complete, acidify with *dilute sulphuric acid* and boil gently for 2 minutes; the solution gives the reactions of chlorides (2.3.1).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 60 volumes of *chloroform*, 50 volumes of *ethyl acetate* and 20 volumes of *glacial acetic acid*.

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of *ethanol (95 per cent)*.

Reference solution (a). A 0.03 per cent w/v solution of the substance under examination in *ethanol (95 per cent)*.

Reference solution (b). A 0.01 per cent w/v solution of the substance under examination in *ethanol (95 per cent)*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 2.0 g by drying in an oven over *phosphorus pentoxide* at 60° at a pressure of 0.1 to 0.5 kPa.

Assay. Weigh 0.25 g, dissolve in 100 ml of *methanol* and add 5 ml of *water*. Titrate with *0.1 M sodium hydroxide solution*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.03031 g of $C_{13}H_{12}Cl_2O_4$.

Ethacrynic Acid Tablets

Etacrynic Acid Tablets

Ethacrynic Acid Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ethacrynic acid, $C_{13}H_{12}Cl_2O_4$.

Usual strength. 50 mg.

Identification

Mix a quantity of the powdered tablets containing 50 mg of Ethacrynic Acid with *0.1 M hydrochloric acid* and extract with two quantities, each of 40 ml, of *dichloromethane*. Dry the combined extracts with *anhydrous sodium sulphate*, filter and evaporate to dryness with the aid of gentle heat. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ethacrynic acid IPRS* or with the reference spectrum of ethacrynic acid.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.005 per cent w/v solution in a mixture of 99 volumes of *methanol* and 1 volume of *1 M hydrochloric acid* shows a well defined absorption maximum at 270 nm and a shoulder at 285 nm; absorbance at 270 nm, 0.55 to 0.60.

C. To 25 mg add 2 ml of *1 M sodium hydroxide* and heat in a water-bath for 5 minutes, cool, add 0.25 ml of *sulphuric acid (50 per cent v/v)* and 0.5 ml of a 10 per cent w/v solution of chromotropic acid sodium salt and add cautiously 2 ml of *sulphuric acid*; a deep violet colour is produced.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml 0.1M phosphate buffer prepared by dissolving 13.6 g of *monobasic potassium phosphate* and 92.2 ml of *1M sodium hydroxide* with *water* to 1000 ml,

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with medium, if necessary, at the maximum at about 277 nm (2.4.7). Calculate the content of $C_{13}H_{12}Cl_2O_4$ in the medium from the absorbance obtained from a solution of known concentration of *ethacrynic acid IPRS* in the same medium.

Q. Not less than 75 per cent of the stated amount of $C_{13}H_{12}Cl_2O_4$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 60 volumes of *chloroform*, 50 volumes of *ethyl acetate* and 20 volumes of *glacial acetic acid*.

Test solution. Shake a quantity of the powdered tablets containing 0.2 g of Ethacrynic Acid with 10 ml of *ethanol (95 per cent)* and filter.

Reference solution (a). Dilute 3 volumes of the test solution to 200 volumes with *ethanol (95 per cent)*.

Reference solution (b). Dilute 1 volume of the test solution to 200 volumes with *ethanol (95 per cent)*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution (a). Weigh and powder 20 tablets. Disperse a quantity of the powdered tablets containing about 50 mg of Ethacrynic Acid with 0.5 ml of *glacial acetic acid* and 50.0 ml of *acetonitrile* for 15 minutes and filter.

Test solution (b). Prepare in the same manner as test solution (a) but using 0.5 ml of *glacial acetic acid*, 45 ml of *acetonitrile* and 5.0 ml of a 0.15 per cent w/v solution of *propyl hydroxybenzoate* (internal standard) in *acetonitrile*.

Reference solution. Dissolve 50 mg of *ethacrynic acid IPRS* in 5.0 ml of the internal standard solution and dilute to 50.0 ml with a mixture of 70 volumes of *acetonitrile* and 30 volumes of *water*.

Chromatographic system

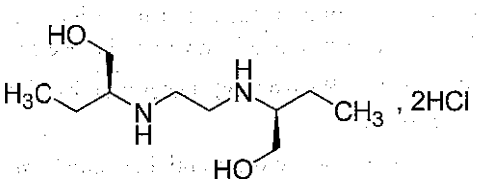
- a stainless steel column 20 cm x 4 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 60 volumes of *water*, 40 volumes of *acetonitrile* and 1 volume of *glacial acetic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{13}H_{12}Cl_2O_4$ in the tablets.

Ethambutol Hydrochloride

Ethambutol Dihydrochloride



$C_{10}H_{24}N_2O_2,2HCl$ Mol. Wt. 277.2

Ethambutol Hydrochloride is (*S*,*S*)-*N*,*N*′-ethylenebis(2-aminobutan-1-ol) dihydrochloride.

Ethambutol Hydrochloride contains not less than 97.0 per cent and not more than 101.0 per cent of $C_{10}H_{24}N_2O_2,2HCl$, calculated on the dried basis.

Category. Antituberculosis.

Description. A white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ethambutol hydrochloride IPRS* or with the reference spectrum of ethambutol hydrochloride.

B. In the test for 2-Aminobutanol, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (b).

C. A 5.0 per cent w/v solution gives reaction (A) of chlorides (2.3.1).

Tests

pH (2.4.24). 3.4 to 4.0, determined in a 2.0 per cent w/v solution.

Specific optical rotation (2.4.22). +6.0° to +6.6°, determined in a 10.0 per cent w/v solution.

2-Aminobutanol. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 75 volumes of *methanol*, 15 volumes of *water* and 10 volumes of *strong ammonia solution*.

Test solution (a). Dissolve 0.5 g of the substance under examination in 10.0 ml of *methanol*.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with *methanol*.

Reference solution (a). A 0.05 per cent w/v solution of *2-aminobutanol IPRS* in *methanol*.

Reference solution (b). A 0.5 per cent w/v solution of *ethambutol hydrochloride IPRS* in *methanol*.

Apply to the plate 2 µl of each solution. After development, dry the plate in air, heat at 110° for 10 minutes, cool, spray with *ninhydrin solution* and heat at 110° for 5 minutes. Any spot corresponding to 2-aminobutanol in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a).

Meso ethambutol (RS isomer). Determine by either of the following methods.

Method A. Determine by differential scanning calorimetry (DSC) (2.4.31).

Test preparation: Weigh between 4 and 6 mg of the sample in the 40 µl aluminium DSC crucible. Carry out the test by heating at a rate of 10° per minute from 25° to 250°, under nitrogen purging (20 ml/min) and record the thermogram. Observe the endotherms at 42° ± 2° and 77° ± 2° corresponding to the transitions of the RS isomer and SS isomer, respectively. There should not be any endothermic peak at 42° ± 2° in the thermogram.

Method B. Determine by liquid chromatography (2.4.14).

NOTE—Use freshly prepared solution.

Test solution. Suspend 4.0 mg of the substance under examination in 4.0 ml of *acetonitrile* and 100 µl of *triethylamine*. Stir the mixture with the aid of ultrasound for 5 minutes. Add 15 µl of *R-(+)-phenyl isocyanate* and heat the mixture for 20 minutes at 70° in a water-bath.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *acetonitrile*.

Reference solution (b). Suspend 4.0 mg of *ethambutol for system suitability IPRS* (containing RS isomer) 4.0 ml of *acetonitrile* and 100 µl of *triethylamine*. Mix the mixture with the aid of ultrasound for 5 minutes. Add 15 µl of *R-(+)-phenyl isocyanate* and heat the mixture for 20 minutes at 70° in a water-bath.

Chromatographic system

- a column 10 cm x 4.6 mm, packed with octadecylsilane bonded to silica (3 µm),
- column temperature. 40°,
- mobile phase: A. a mixture of equal volumes of *methanol* and *water*,
  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	71	29
30	71	29
35	0	100
37	0	100
38	71	29

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to ethambutol and the RS isomer is not less than 4.0 and the relative retention of RS isomer with reference to ethambutol (retention time about 14 min) is about 1.3.

Inject reference solution (a) and the test solution.

In the chromatogram obtained with the test solution, the area of the peak due to the RS isomer is not more than the area of the peak in the chromatogram obtained with reference solution (a) (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Diluent. Dissolve 1.4 g of *disodium hydrogen orthophosphate anhydrous* in 1000 ml of *water* and adjusted to pH 6.8 ± 0.05 with *orthophosphoric acid*.

Test solution. Dissolve 30.0 mg of the substance under examination in 100.0 ml of the diluent.

Reference solution. A 0.03 per cent w/v solution of *ethambutol hydrochloride IPRS* in the diluent.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with nitrile groups chemically bonded to porous silica particles (5 µm) (Such as Zorbax SB-CN),
- mobile phase: a mixture of equal volumes of a buffer consisting of 1 ml of *triethylamine* in sufficient *water* to produce 1000 ml, adjusted to pH 7.0 with *orthophosphoric acid* and *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 200 nm,
- injection volume: 100 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 3.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{24}N_2O_2,2HCl$.

Storage. Store protected from moisture.

Ethambutol Injection

Ethambutol Hydrochloride Injection

Ethambutol Injection is a sterile solution of Ethambutol hydrochloride in water for injection.

Ethambutol Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ethambutol hydrochloride, $C_{10}H_{24}N_2O_2,2HCl$.

Usual strength. 100 mg per ml.

Description. A clear, colourless solution.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution.

B. When examined in the range 400 nm to 750 nm (2.4.7), a 0.04 per cent w/v solution exhibits absorption maxima at 620 nm.

Tests

pH (2.4.24). 3.5 to 4.5.

Appearance of solution. A 10.0 per cent w/v solution of Ethambutol in *water* is clear (2.4.1) and colourless (2.4.1).

2-Aminobutanol. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 75 volumes of *methanol*, 15 volumes of *water* and 10 volumes of *ammonia*.

Test solution. Dilute a volume of injection containing 0.5 g of Ethambutol Hydrochloride to 10.0 ml with *methanol*.

Reference solution. A 0.05 per cent w/v solution of *2- aminobutanol IPRS* in *methanol*.

Apply to the plate 2 µl of each solution. After development, dry the plate in air, heat at 110° for 5 minutes, cool, spray with *ninhydrin solution* and heat at 110° for 5 minutes. Any spot corresponding to 2-aminobutanol in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (1.0 per cent).

Pyrogens (2.2.8). Complies with the test for pyrogens.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

NOTE— Use freshly prepared solutions.

Test solution. Dilute a volume of injection with *water* to obtain 0.04 per cent w/v solution of Ethambutol Hydrochloride.

Reference solution. A 0.04 per cent w/v solution of *ethambutol hydrochloride IPRS* in *water*.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with nitrile groups bonded to porous silica (5 µm),
- mobile phase: a mixture of equal volumes of a buffer solution prepared by diluting 2 ml of *triethylamine* to 1000 ml with *water*, adjusted to pH 7.0 with *orthophosphoric acid* and *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 200 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1500 theoretical plates, the tailing factor is not more than 3.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{24}N_2O_2,2HCl$ in the injection.

Storage. Store protected from light and moisture.

Ethambutol Tablets

Ethambutol Hydrochloride Tablets

Ethambutol Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of ethambutol hydrochloride, $C_{10}H_{24}N_2O_2,2HCl$.

Usual strengths. 200 mg; 400 mg.

Identification

A. Extract a quantity of the powdered tablets containing 50 mg of Ethambutol Hydrochloride with 5 ml of *methanol*, filter and evaporate the filtrate to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ethambutol hydrochloride IPRS* or with the reference spectrum of ethambutol hydrochloride.

B. Shake a quantity of the powdered tablets containing 0.1 g of Ethambutol Hydrochloride with 10 ml of *water*, filter, and to the filtrate add 2 ml of a 1 per cent w/v solution of *copper sulphate* and 1 ml of *1 M sodium hydroxide*; a distinct blue colour is produced.

Tests

2-Aminobutanol. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 75 volumes of *methanol*, 15 volumes of *water* and 10 volumes of *strong ammonia solution*.

Test solution. Shake a quantity of the powdered tablets containing 0.5 g of Ethambutol Hydrochloride for 5 minutes with sufficient *methanol* to produce 10 ml and filter.

Reference solution. A 0.05 per cent w/v solution of *2-aminobutanol IPRS* in *methanol*.

Apply to the plate 2 µl of each solution. After development, dry the plate in air, heat at 110° for 5 minutes, cool, spray with *ninhydrin solution* and heat at 110° for 5 minutes. Any spot corresponding to 2-aminobutanol in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Dissolution (2.5.2).
Apparatus No. 2 (Paddle),
Medium. 900 ml of freshly distilled *water*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc having an average pore diameter not greater than 1.0 µm, rejecting the first 1 ml of the filtrate. Dilute suitably with *water* to produce a solution containing about 0.030 per cent w/v of ethambutol hydrochloride. Using the resulting solution as the test solution carry out the procedure described under Assay.

Calculate the content of $C_{10}H_{24}N_2O_2,2HCl$.

Q. Not less than 75 per cent of the stated amount of $C_{10}H_{24}N_2O_2,2HCl$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

NOTE —Prepare the following solutions freshly.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 30 mg of Ethambutol Hydrochloride, add 50 ml of *water* and shake for about 15 minutes and add sufficient *water* to produce 100.0 ml. Filter and discard the first 10 ml of the filtrate. Use the clear filtrate.

Reference solution solution. A 0.03 per cent w/v solution of *ethambutol hydrochloride IPRS* in *water*.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with nitrile groups chemically bonded to porous silica (5 µm) (Such as Zorbax SB-CN),
- column temperature: 30°,
- mobile phase: a mixture of equal volumes of a buffer consisting of 1 ml of *triethylamine* in sufficient *water* to produce 1000 ml adjusted to pH 7.0 with *orthophosphoric acid*, and *acetonitrile*,
- flow rate: 1 ml per minute
- spectrophotometer set at 200 nm,
- injection volume: 50 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{24}N_2O_2,2HCl$ in the tablets.

Ethambutol and Isoniazid Tablets

Ethambutol Hydrochloride and Isoniazid Tablets

Ethambutol and Isoniazid Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of ethambutol hydrochloride, $C_{10}H_{24}N_2O_2.2HCl$ and isoniazid, $C_6H_7N_3O$.

Usual strength. Ethambutol 400 mg and isoniazid 150 mg.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due

to *ethambutol hydrochloride IPRS* in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to *isoniazid IPRS* in the chromatogram obtained with the reference solution.

Tests

2-Aminobutanol. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel* G.

Mobile phase. A mixture of 75 volumes of *methanol*, 15 volumes of *water* and 10 volumes of *strong ammonia solution*.

Test solution. Shake a quantity of the powdered tablets containing 0.5 g of ethambutol hydrochloride for 5 minutes with sufficient *methanol* to produce 10 ml and filter.

Reference solution. A 0.05 per cent w/v solution of *2-aminobutanol IPRS* in *methanol*.

Apply to the plate 2 µl of each solution. After development, dry the plate in air, heat at 110° for 5 minutes, cool, spray with *ninhydrin solution* and heat at 110° for 5 minutes. Any spot corresponding to 2-aminobutanol in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *water*,

Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc having an average pore diameter not greater than 1.0 µm, rejecting the first 10 ml of the filtrate.

On the filtrate determine by liquid chromatography (2.4.14).

For Ethambutol Hydrochloride —

Test solution. Dilute the filtrate to obtain 0.044 per cent w/v solution in the dissolution medium.

Reference solution. A 0.044 per cent w/v solution of *ethambutol hydrochloride IPRS* in the dissolution medium.

Determine the content of $C_{10}H_{24}N_2O_2.2HCl$ by the procedure given under Assay of Ethambutol hydrochloride.

Calculate the content of $C_{10}H_{24}N_2O_2.2HCl$ in the medium.

For Isoniazid — Determine the amount of $C_6H_7N_3O$ dissolved by measuring the absorbance of the filtrate, suitably diluted with the dissolution medium to obtain a solution containing about 0.015 mg of isoniazid per ml, at the maximum at about 263 nm (2.4.7). Calculate the content of $C_6H_7N_3O$ in the medium from the absorbance obtained by repeating the determination using a 0.0015 per cent w/v solution of *isoniazid IPRS* in place of the filtrate.

Q. Not less than 75 per cent of the stated amount of $C_{10}H_{24}N_2O_2.2HCl$ and $C_6H_7N_3O$.

Other tests. Comply with the tests stated under Tablets.

Assay. *For isoniazid* — Determine by liquid chromatography (2.4.14).

Diluent. Dissolve 1.4 g of *disodium hydrogen orthophosphate anhydrous* in *water*, adjusted to pH 6.8 ± 0.05 with *dilute phosphoric acid* and add sufficient *water* to produce 1000 ml.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 40 mg of Isoniazid, dissolve in 50.0 ml of *methanol* and dilute to 500.0 ml with the diluent.

Reference solution. Weigh 40 mg of *isoniazid IPRS*, dissolve in 50.0 ml of *methanol* and dilute to 500.0 ml with the diluent.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Intersil ODS-3),
- column temperature: 30°,
- mobile phase: 96 volumes of buffer solution pH 6.8 prepared by dissolving 1.4 g *disodium hydrogen orthophsophate anhydrous* in 1000 ml of *water*, adjusted to pH 6.8 ± 0.05 with dilute *orthophosphoric acid* and 4 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency determined from the isoniazid peak is not more than 1500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_6H_7N_3O$ in the tablets.

For ethambutol hydrochloride — Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 60 mg of Ethambutol Hydrochloride and dissolve in 100.0 ml of the diluent.

Reference solution. A 0.06 per cent w/v solution of *ethambutol hydrochloride IPRS* in the diluent.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with nitrile groups chemically bonded to porous silica (5 µm) (Such as Zorbax SB CN),
- mobile phase: a mixture of 50 volumes of buffer pH 7.0 prepared by mixing 1 ml of *triethylamine* in 1000 ml of *water* the pH of which is adjusted to 7.0 ± 0.05 with *orthophosphoric acid* and 50 volumes of *acetonitrile*,

- flow rate: 1 ml per minute,
- spectrophotometer set at 200 nm;
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the column efficiency determined from ethambutol peak is not more than 1500 theoretical plates, the tailing factor is not more than 3.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{24}N_2O_2.2HCl$ in the tablets.

Storage. Store protected from moisture.

Ethanol

Absolute Alcohol; Absolute Ethanol; Dehydrated Alcohol

CH_3CH_2OH Mol. Wt. 46.1

Ethanol contains not less than 99.0 per cent v/v of C_2H_6O.

Category. Pharmaceutical aid (solvent).

Description. A clear, colourless, mobile and volatile liquid; hygroscopic. Readily volatilises even at low temperature; boils at 78°; flammable, burning with a blue, smokeless flame.

Identification

A. Mix 0.25 ml in a small beaker with 1 ml of *potassium permanganate solution* and 0.25 ml of *dilute sulphuric acid* and cover the beaker immediately with a filter paper moistened with a solution freshly prepared by dissolving 0.1 g of *sodium nitroprusside* and 0.5 g of *piperazine hydrate* in 5 ml of *water*; an intense blue colour is produced on the filter paper, the colour becoming lighter after a few minutes.

B. To 5 ml of a 0.5 per cent v/v solution add 1 ml of *1 M sodium hydroxide* followed by slow addition of 2 ml of *iodine solution*; the odour of iodoform develops and a yellow precipitate is produced.

Tests

Relative density (2.4.29). 0.7871 to 0.7902, determined at 25°.

Appearance of solution. Dilute 5.0 ml to 100.0 ml with *water*. The solution is clear (2.4.1). Cool to 10° for 30 minutes; the solution remains clear.

Acidity or alkalinity. To 20 ml add 0.25 ml of *phenolphthalein solution*; the solution remains colourless and requires not more than 0.2 ml of *0.1 M sodium hydroxide* to produce a pink colour.

Methanol. To 1 drop, add 1 drop of water, 1 drop of *dilute phosphoric acid* and 1 drop of *potassium permanganate solution*. Mix, allow to stand for 1 minute and add *sodium bisulphite solution* dropwise until the permanganate colour is discharged. If a brown colour remains, add 1 drop of *dilute phosphoric acid*. To the colourless solution add 5 ml of freshly prepared *chromotropic acid solution* and heat on a water-bath at 60° for 10 minutes; no violet colour is produced.

Foreign organic substances. Clean a glass-stoppered cylinder thoroughly with *hydrochloric acid*, rinse with *water* and finally rinse with the substance under examination. Put 20 ml in the cylinder, cool to about 15° and then add from a carefully cleaned pipette 0.1 ml of *0.1 M potassium permanganate*. Mix at once by inverting the stoppered cylinder and allow to stand at 15° for 5 minutes; the pink colour does not entirely disappear.

2-Propanol and 2-methyl-2-propanol. To 1 ml add 3 ml of *water* and 10 ml of *mercuric sulphate solution* and heat in a boiling water-bath; no precipitate is formed within 3 minutes.

Aldehydes. Not more than 10 ppm, determined by the following method. To 5.0 ml add 5 ml of *water* and 1 ml of *decolorised magenta solution* and allow to stand for 30 minutes. Any colour produced is not more intense than that produced by treating in the same manner 5.0 ml of a 0.001 per cent w/v solution of redistilled *acetaldehyde* in *aldehyde-free ethanol (95 per cent)*.

Benzene and related substances. Determine by gas chromatography (2.4.13).

Test solution (a). The substance under examination.

Test solution (b). A 0.03 per cent v/v solution of *4-methylpentan-2-ol* in test solution (a).

Reference solution (a). A 0.02 per cent v/v solution of *anhydrous methanol* in test solution (a).

Reference solution (b). A 0.1 per cent v/v solution, each of, *anhydrous methanol* and *acetaldehyde* in test solution (a). Dilute 0.1 ml of the solution to 10.0 ml with test solution (a).

Reference solution (c). A 0.3 per cent v/v solution of *acetal* in test solution (a). Dilute 0.1 ml of the solution to 10.0 ml with test solution (a).

Reference solution (d). A 0.1 per cent v/v solution of *benzene* in test solution (a). Dilute 0.1 ml of the solution to 50.0 ml with test solution (a).

Chromatographic system

- a capillary column 30 m x 0.32 mm, packed with 6 per cent cyanopropylphenyl and 94 per cent of dimethyl polysiloxane (film thickness 1.8 µm),
- temperature
  column 40° for 0-12 minutes, 40° to 240° for 12-32 minutes and 240° for 32-42 minutes.

- inlet port at 200° and detector at 280°,
- flame ionization detector,
- split ratio: 1:20,
- flow 35 cm per second, using nitrogen as carrier gas,
- injection volume: 1 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to acetaldehyde (first peak) and methanol (second peak) is not less than 1.5.

Inject reference solution (a), (b), (c) and test solution (a). In the chromatogram obtained with the test solution (a), the area of any peak corresponding to methanol is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (200 ppm) and the sum of the contents of acetaldehyde and acetal, is not more than 10 ppm v/v, expressed as acetaldehyde.

Calculate the sum of the contents of acetaldehyde and acetal in parts per million v/v using the following expression:

$$\frac{10 \times A_E}{A_T - A_E} + \frac{30 \times C_E}{C_T - C_E} \times \frac{44.05}{118.2}$$

where, A_E = area of the peak due to acetaldehyde in the chromatogram obtained with test solution (a),

A_T = area of the peak due to acetaldehyde in the chromatogram obtained with reference solution (b),

C_E = area of the peak due to acetal in the chromatogram obtained with test solution (a),

C_T = area of the peak due to acetal in the chromatogramobtained with reference solution (c),

44.05 = molecular weight of acetaldehyde,

118.2 = molecular weight of acetal.

Content of benzene is not more than 2 ppm v/v, calculated in parts per million v/v using the following expression

$$\frac{2B_E}{B_T - B_E}$$

where, B_E = area of the peak due to benzene in the chromatogram obtained with test solution (a),

B_T = area of the peak due to benzene in the chromatogram obtained with reference solution (d).

The sum of areas of all other secondary peaks obtained with test solution (b) is not more than the area of 4-methylpentan-2-ol peak in the chromatogram obtained with test solution (b) (300 ppm). Ignore any peak with an area less than 0.03 times the area of 4-methylpentan-2-ol peak in the chromatogram obtained with test solution (b) (9 ppm).

Non-volatile matter. Evaporate 100.0 ml in a tared dish on a water-bath and dry the residue at 105°; the residue weighs not more than 5 mg.

Assay. Determine by gas chromatography (2.4.13).

Internal standard solution . A 1.0 per cent v/v solution of *1-propanol* in *water.*

Test solution. Dilute 1.0 ml of ethanol to 100.0 ml with internal standard solution.

Reference solution. A 1.0 per cent v/v solution of *ethanol* in internal standard solution.

Chromatographic system

- a capillary column 30 m × 0.25 mm, packed with 6.0 per cent cyanopropylphenyl and 94 per cent dimethylpolysiloxane (film thickness 1.4 µm) (Such as DB-624),
- temperature:
  column 50° for 2 minutes, 50° to 240° @ 20° per minute and hold at 240° for 2 minutes,
  inlet port 180° and detector at 260°,
- flame ionization detector,
- split ratio: 25:1,
- flow rate 0.5 ml per minutes, using nitrogen as carrier gas,
- injection volume: 1 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to ethanol and internal standard is not less than 2.0 and the relative standard deviation of peak area ratio due to ethanol and internal standard for the replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of C_2H_6O, using ratio of the peak area of ethanol to that of peak area of the internal standard.

Storage. Store in tightly-closed containers at a temperature not exceeding 30°, away from fire and protected from moisture.

Labelling. The label states that it is flammable.

Ethanol (95 per cent)

Alcohol (95 per cent)

Ethanol (95 per cent) is a mixture of Ethanol and Water.

Ethanol (95 per cent) contains not less than 94.0 per cent v/v and not more than 96.0 per cent v/v of C_2H_6O.

Category. Pharmaceutical aid (solvent); topical anti-infective.

Description. A clear, colourless, mobile and volatile liquid. It is readily volatilised even at low temperatures; boils at about 78°; flammable, burning with a blue, smokeless flame.

Identification

A. Mix 0.25 ml in a small beaker with 1 ml of *potassium permanganate solution* and 0.25 ml of *dilute sulphuric acid* and cover the beaker immediately with a filter paper moistened with a solution freshly prepared by dissolving 0.1 g of *sodium nitroprusside* and 0.5 g of *piperazine hydrate* in 5 ml of *water*; an intense blue colour is produced on the filter paper, the colour becoming lighter after a few minutes.

B. To 5 ml of a 0.5 per cent v/v solution add 1 ml of *1 M sodium hydroxide* followed by slow addition of 2 ml of *iodine solution*; the odour of iodoform develops and a yellow precipitate is produced.

Tests

Relative density (2.4.29). 0.8084 to 0.8104, determined at 25°.

Appearance of solution. Dilute 5.0 ml to 100.0 ml with *water*. The solution is clear (2.4.1). Cool to 10° for 30 minutes; the solution remains clear.

Acidity or alkalinity. To 20 ml add 0.25 ml of *phenolphthalein solution*; the solution remains colourless and requires not more than 0.2 ml of *0.1 M sodium hydroxide* to produce a pink colour.

Methanol. To 1 drop add 1 drop of *water*, 1 drop of *dilute phosphoric acid* and 1 drop of *potassium permanganate solution*. Mix, allow to stand for 1 minute and add *sodium bisulphite solution* dropwise until the permanganate colour is discharged. If a brown colour remains, add 1 drop of *dilute phosphoric acid*. To the colourless solution add 5 ml of freshly prepared *chromotropic acid solution* and heat on a water-bath at 60° for 10 minutes; no violet colour is produced.

Foreign organic substances. Clean a glass-stoppered cylinder thoroughly with *hydrochloric acid*, rinse with *water* and finally rinse with the substance under examination. Put 20 ml in the cylinder, cool to about 15° and then add from a carefully cleaned pipette 0.1 ml of *0.1 M potassium permanganate*. Mix at once by inverting the stoppered cylinder and allow to stand at 15° for 5 minutes; the pink colour does not entirely disappear.

2-Propanol and 2-methyl-2-propanol. To 1 ml add 3 ml of *water* and 10 ml of *mercuric sulphate solution* and heat in a boiling water-bath; no precipitate is formed within 3 minutes.

Aldehydes. Not more than 10 ppm, determined by the following method. To 5.0 ml add 5 ml of *water* and 1 ml of *decolorised magenta solution* and allow to stand for 30 minutes. Any colour produced is not more intense than that produced by treating in the same manner 5 ml of a 0.001 per cent w/v solution of redistilled *acetaldehyde* in *aldehyde-free ethanol (95 per cent)*.

Benzene and related substances. Determine by gas chromatography (2.4.13).

Test solution (a). The substance under examination.

Test solution (b). A 0.03 per cent v/v solution of *4-methylpentan-2-ol* in test solution (a).

Reference solution (a). A 0.02 per cent v/v solution of *anhydrous methanol* in test solution (a).

Reference solution (b). A 0.1 per cent v/v solution, each of *anhydrous methanol* and *acetaldehyde* in test solution (a). Dilute 0.1 ml of the solution to 10.0 ml with test solution (a).

Reference solution (c). A 0.3 per cent v/v solution of *acetal* in test solution (a). Dilute 0.1 ml of the solution to 10.0 ml with test solution (a).

Reference solution (d). A 0.1 per cent v/v solution of *benzene* in test solution (a). Dilute 0.1 ml of the solution to 50.0 ml with test solution (a).

Chromatographic system

- a capillary column 30 m x 0.32 mm, packed with 6 per cent cyanopropylphenyl and 94 per cent of dimethyl polysiloxane (film thickness 1.8 µm),
- temperature
  column 40° for 0-12 minutes, 40° to 240° for 12-32 minutes and 240° for 32-42 minutes.
- inlet port at 200° and detector at 280°,
- flame ionization detector,
- split ratio: 1:20,
- flow 35 cm per second, using nitrogen as carrier gas,
- injection volume: 1 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to acetaldehyde (first peak) and methanol (second peak) is not less than 1.5.

Inject reference solution (a), (b), (c) and test solution (a). In the chromatogram obtained with the test solution (a), the area of any peak corresponding to methanol is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (200 ppm) and the sum of the contents of acetaldehyde and acetal, is not more than 10 ppm v/v, expressed as acetaldehyde.

Calculate the sum of the contents of acetaldehyde and acetal in parts per million v/v using the following expression:

$$\frac{10 \times A_E}{A_T - A_E} + \frac{30 \times C_E}{C_T - C_E} \times \frac{44.05}{118.2}$$

Where, A_E = area of the peak due to acetaldehyde in the chromatogram obtained with test solution (a),

A_T = area of the peak due to acetaldehyde in the chromatogram obtained with reference solution (b),

C_E = area of the peak due to acetal in the chromatogram obtained with test solution (a).

C_T = area of the peak due to acetal in the chromatogramobtained with reference solution (c),
44.05 = molecular weight of acetaldehyde,
118.2 = molecular weight of acetal.

Content of benzene is not more than 2 ppm v/v, calculated in parts per million v/v using the following expression

$$\frac{2B_E}{B_T - B_E}$$

Where, B_E = area of the peak due to benzene in the chromatogram obtained with test solution (a),
B_T = area of the peak due to benzene in the chromatogram obtained with reference solution (d).

The sum of areas of all other secondary peaks obtained with test solution (b) is not more than the area of 4-methylpentan-2-ol peak in the chromatogram obtained with test solution (b) (300 ppm). Ignore any peak with an area less than 0.03 times the area of 4-methylpentan-2-ol peak in the chromatogram obtained with test solution (b) (9 ppm).

Fusel oil constituents. Place 25 ml in a porcelain dish protected from dust and allow the liquid to evaporate on a water-bath until a little of the liquid remains. Remove the dish from the water-bath and allow the liquid to evaporate at room temperature till the dish is almost dry. No foreign odour is perceptible. Add 1 ml of *sulphuric acid*; no red or brown colour is produced.

Non-volatile matter. Evaporate 100.0 ml in a tared dish on a water-bath and dry the residue at 105°; the residue weighs not more than 5 mg.

Assay. Determine by gas chromatography (2.4.13).

Internal standard solution. A 1.0 per cent v/v solution of *1-propanol* in *water*.

Test solution. Dilute 1.0 ml of Ethanol (95 per cent) to 100.0 ml with internal standard solution.

Reference solution. A 1.0 per cent v/v solution of *ethanol* in internal standard solution.

Chromatographic system
- a capillary column 30 m × 0.25 mm, packed with 6.0 per cent cyanopropylphenyl and 94 per cent dimethylpolysiloxane (film thickness 1.4 µm) (Such as DB-624),
- temperature:
  column 50° for 2 minutes, 50° to 240° @ 20° per minute and hold at 240° for 2 minutes,
  inlet port 180° and detector at 260°,
- flame ionization detector,
- split ratio: 25:1,
- flow rate 0.5 ml per minutes, using nitrogen as carrier gas,
- injection volume: 1 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to ethanol and internal standard is not less than 2.0 and the relative standard deviation of peak area ratio due to ethanol and internal standard for the replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of C_2H_6O, using ratio of the peak area of ethanol to that of peak area of the internal standard.

Storage. Store in tightly-closed containers at a temperature not exceeding 30° and away from fire.

Labelling. The label states that it is flammable.

Ethanolamine

Monoethanolamine

C_2H_7NO Mol. Wt. 61.1

Ethanolamine is 2-aminoethanol.

Ethanolamine contains not less than 98.0 per cent and not more than 100.5 per cent of C_2H_7NO.

Category. Sclerosing agent.

Description. A clear, colourless or pale yellow liquid.

Identification

A. To 0.1 ml add 0.3 g of *picric acid* and 1 ml of *water* and evaporate to dryness on a water-bath. The melting point of the residue (2.4.24), after recrystallisation from *ethanol (95 per cent)* and drying at 105°, is about 160°.

B. When freshly distilled the second half of the distillate freezes at about 10°.

C. It is alkaline to litmus solution.

Tests

Refractive index (2.4.27). 1.453 to 1.459.

Weight per ml (2.4.29). 1.014 to 1.023 g.

Related substances. Determine by gas chromatography (2.4.13).

Solution A. A 0.1 per cent w/v solution of *3-aminopropan-1-ol* (internal standard) in *dichloromethane*.

Test solution. A 10.0 per cent w/v solution of the substance under examination in solution A. To 0.5 ml of the solution, add

0.5 ml of *trifluoroacetic anhydride*, mix and allow to stand for 10 minutes.

Reference solution. A solution containing 0.05 per cent w/v of *ethanolamine* and 0.1 per cent w/v each of *diethanolamine* and *triethanolamine* in solution A. To 0.5 ml of the solution, add 0.5 ml of *trifluoroacetic anhydride*, mix and allow to stand for 10 minutes.

Chromatographic system

- a capillary column 25 m x 0.22 mm packed with dimethylpolysiloxane (film thickness 0.25 µm),
- column temperature: 80° for 2 minutes, then increase to 200° at a rate of 8° per minute and maintain this temperature for 10 minutes,
- Inlet port at 240° and detector at 250°,
- flame ionization detector,
- split ratio: 1:40,
- flow rate: use helium or nitrogen as the carrier gas at 1.0 ml per minute with a flow rate of the make up gas of 20 ml per minute.

The peaks eluting after the solvent peak in order of emergence are due to (a) ethanolamine, (b) 3-aminopropan-1-ol, (c) diethanolamine and (d) triethanolamine.

Inject 1 µl of the reference solution and the test solution.In the chromatogram obtained with the test solution calculate the content of diethanolamine and triethanolamine using the ratios of the peaks and by reference to the corresponding peaks in the chromatogram obtained with the reference solution. The content of diethanolamineand triethanolamine is not more than 1.0 per cent individually.

Calculate the content of other impurities using the ratios of the peaks and by reference to the peak due to ethanolamine. The content of any other impurity is not more than 0.5 per cent and the sum of the contents of all the impurities is not more than 2.0 per cent.

Assay. Dissolve 2.5 g in 50 ml of *1 M hydrochloric acid* and titrate the excess of acid with *1 M sodium hydroxide* using *methyl red solution* as indicator. Carry out a blank titration.

1 ml of *1 M hydrochloric acid* is equivalent to 0.06108 g of C_2H_7NO.

Anaesthetic Ether

$C_4H_{10}O$ Mol. Wt. 74.1

Anaesthetic Ether is diethyl ether to which a suitable non-volatile stabiliser in a proportion not greater than 0.002 per cent w/v may have been added.

Category. General anaesthetic.

Description. A clear, colourless, very mobile liquid; highly flammable.

NOTE — It is absolutely essential that a preservative of the type of sodium pyrogallate, hydroquinone or propyl gallate in suitable concentrations shall be added in Anaesthetic Ether intended for use in tropical climates unless the Anaesthetic Ether is stored in a copper container or in a container copper-plated internally. The preservative used and its concentration shall be declared on the label.

Tests

Relative density (2.4.29). 0.714 to 0.716, determined at 20°.

Boiling range (2.4.8). 34° to 35°.

CAUTION — It is dangerous to determine the boiling range if the sample does not comply with the test for peroxides.

Acidity. To 20 ml of *ethanol (95 per cent)* add 0.25 ml of *bromothymol blue solution* add dropwise *0.02 M sodium hydroxide* until the blue colour persists for 30 seconds. Add 25 ml of the substance under examination, shake and again add dropwise *0.2 M sodium hydroxide* until the blue colour reappears and persists for 30 seconds. Not more than 0.4 ml of *0.02 M sodium hydroxide* is required.

Peroxides. Place 8 ml of *potassium iodide and starch solution* in a 12-ml glass-stoppered cylinder of about 1.5 cm diameter. Fill completely with the substance under examination, insert the stopper, shake vigorously and allow to stand in the dark for 30 minutes; no colouration is produced.

Acetone and aldehydes. Place 2 ml of *alkaline potassium mercuri-iodide solution* in a 12-ml glass-stoppered cylinder of about 1.5 cm diameter and fill completely with the substance under examination, insert the stopper and shake vigorously for 15 seconds and set aside for 5 minutes, protected from light; no colour or turbidity, except for slight opalescence, is produced.

If the ether does not comply with the test, distil 40 ml *(after ensuring that it complies with the test for peroxides)* until only 5 ml remains and repeat the test using 10 ml of the distillate.

Foreign odour. Pour 10 ml in successive portions on to a clean filter paper and allow to evaporate spontaneously; no foreign odour is detectable at any stage of evaporation.

Non-volatile matter. Evaporate 50 ml in a tared dish on a water-bath and dry at 105° *(after ensuring that the sample complies with the test for peroxides)*; the residue weighs not more than 1.5 mg.

Methanol. To 10 ml, add 5 ml of *ethanol (20 per cent)* and 5 ml of *water*, in a separator, shake vigorously, set aside and allow the mixture to separate and draw off the lower layer. To 5 ml of

the lower layer add 2.0 ml of *potassium permanganate and phosphoric acid solution*, set aside for 10 minutes and add 2.0 ml of *oxalic acid* and *sulphuric acid solution* and 5 ml of *decolorised magenta solution*. Set aside for 30 minutes; no colour is produced.

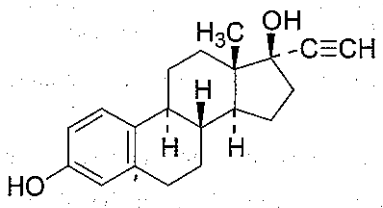
Water (2.3.43). Not more than 0.2 per cent, determined on 20.0 ml.

Storage. Store protected from light at a temperature not exceeding 30°. Ether remaining in a partly used container may deteriorate rapidly.

Labelling. The label states that (1) it is very flammable and should not be used near a naked flame; (2) the name and proportion of any stabiliser added.

Ethinyloestradiol

Ethinylestradiol



$C_{20}H_{24}O_2$ Mol. Wt. 296.4

Ethinylestradiol is 19-nor-17α-pregna-1,3,5(10)-trien-20-yne-3,17β-diol.

Ethinyloestradiol contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{20}H_{24}O_2$, calculated on the dried basis.

Category. Oestrogen.

Description. A white or slightly yellowish-white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Test C may be omitted if tests A and B are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ethinyloestradiol IPRS* or with the reference spectrum of ethinyloestradiol.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to in the in the chromatogram obtained with reference solution (b).

C. Dissolve about 1 mg in 1 ml of *sulphuric acid*; an orange-red colour develops which exhibits a greenish fluorescence when examined under ultraviolet light at 365 nm. Add the solution to 10 ml of *water*; the colour changes to violet and a violet precipitate is produced.

Tests

Appearance of solution. A 5.0 per cent w/v solution in *ethanol* is clear (2.4.1), and not more intensely coloured than reference solution BYS6 (2.4.1).

Specific optical rotation (2.4.22). −30.0° to −27.0°, determined at 20° in a 5.0 per cent w/v solution in *pyridine*.

Light absorption (2.4.7). Absorbance of a 0.01 per cent w/v solution in *ethanol (95 per cent)* at about 281 nm, 0.69 to 0.73.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 90 volumes of *toluene* and 10 volumes of *ethanol (95 per cent)*.

Test solution (a). Dissolve 0.2 g of the substance under examination in 10 ml of a mixture of 9 volumes of *chloroform* and 1 volume of *methanol*.

Test solution (b). Dilute 5.0 ml of test solution (a) to 100.0 ml with the same solvent mixture.

Reference solution (a). Dilute 5.0 ml of test solution (b) to 25.0 ml with the same solvent mixture.

Reference solution (b). A 0.1 per cent w/v solution of *ethinyloestradiol IPRS* in the same solvent mixture.

Reference solution (c). A 0.02 per cent w/v solution of *estrone IPRS* in the same solvent mixture.

Apply to the plate 5 µl of each solution. After development, dry the plate in air until the odour of the solvent is no longer detectable, heat at 110° for 10 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat again at 110° for 10 minutes and examine under ultraviolet light at 365 nm. In the chromatogram obtained with test solution (a) any spot corresponding to estrone is not more intense than the spot in the chromatogram obtained with reference solution (c) and any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (a).

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 0.5 g by drying in an oven at 105° for 3 hours.

Assay. Dissolve 0.2 g in 40 ml of *tetrahydrofuran*, add 5 ml of a 10 per cent w/v solution of *silver nitrate* and titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.02964 g of $C_{20}H_{24}O_2$.

Storage. Store protected from light.

Ethinyloestradiol Tablets

Ethinylestradiol Tablets

Ethinyloestradiol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ethinyloestradiol, $C_{20}H_{24}O_2$.

Usual strengths. 10 µg; 20 µg; 50 µg.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 90 volumes of *toluene* and 10 volumes of *ethanol (95 per cent)*.

Test solution. Shake a quantity of the powdered tablets containing 0.25 mg of Ethinyloestradiol with four quantities, each of 20 ml of *chloroform*, filter each extract in turn, evaporate the combined filtrates to dryness on a water-bath in a current of nitrogen and dissolve the residue in 0.25 ml of *chloroform*.

Reference solution. A 0.1 per cent w/v solution of *ethinyloestradiol IPRS* in *chloroform*.

Apply to the plate 20 µl of each solution. After development, dry the plate in air, spray with *ethanolic sulphuric acid (20 per cent v/v)*, heat at 110° for 10 minutes and examine under ultraviolet light at 365 nm and in daylight. By both methods of visualisation, the principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. Triturate a quantity of the powdered tablets containing 0.1 mg of Ethinyloestradiol with 0.5 ml of *0.1 M sodium hydroxide* and 5 ml of *water*, allow to stand for 5 minutes, filter, acidify the filtrate with 0.15 ml of *sulphuric acid*, add 3 ml of *ether*, shake and allow to separate. Evaporate the ether layer to dryness and heat the residue on a water-bath for 5 minutes with 0.2 ml of *glacial acetic acid* and 2 ml of *phosphoric acid*; a pink colour with an intense orange fluorescence is produced.

Tests

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14).

Test solution. Finely crush one tablet, disperse in the mobile phase with the aid of ultrasound for 10 minutes and centrifuge. Dilute the supernatant liquid with the mobile phase to obtain a solution containing 0.0005 per cent w/v of Ethinyloestradiol.

Reference solution. A 0.0005 per cent w/v solution of *ethinylestradiol IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volume of *acetonitrile* and 40 volumes of *water*.
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{24}O_2$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 100 µg of Ethinylestradiol in the mobile phase with the aid of ultrasound for 10 minutes and centrifuge. Dilute the supernatant liquid with the mobile phase to obtain a solution containing 0.0005 per cent w/v of Ethinyloestradiol.

Reference solution. A 0.0005 per cent w/v solution of *ethinylestradiol IPRS* in the mobile phase.

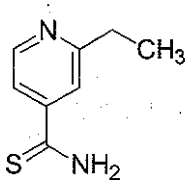
Use chromatographic system as described under Uniformity of content.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{24}O_2$ in the tablets.

Storage. Store protected from light.

Ethionamide



$C_8H_{10}N_2S$ Mol. Wt. 166.2

Ethionamide is 2-ethylpyridine-4-carbothioamide.

Ethionamide contains not less than 98.5 per cent and not more than 101.0 per cent of $C_8H_{10}N_2S$, calculated on the dried basis.

Category. Antituberculosis.

Description. A yellow crystalline powder or small yellow crystals.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ethionamide IPRS* or with the reference spectrum of ethionamide.

B. Dissolve about 10 mg in 5 ml of *methanol* and add 5 ml of *0.1 M silver nitrate*; a dark brown precipitate is produced.

C. Melting point (2.4.21). 158° to 164°.

Tests

Appearance of solution. Dissolve 0.5 g in 10 ml of *methanol*, heating to about 50° and allow to cool to room temperature. The solution is not more opalescent than opalescence standard OS2 (2.4.1).

Acidity. Dissolve 2.0 g in 20 ml of *methanol*, heating to about 50°, and add 20 ml of *water*. Cool slightly, shake until crystallisation occurs and allow to cool to room temperature. Add 60 ml of *water* and titrate with *0.1 M sodium hydroxide* using 0.2 ml of *cresol red solution* as indicator. Not more than 0.2 ml is required to change the colour of the solution to red.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 100 ml of the mobile phase.

Reference solution. Dissolve 25 mg of the *ethionamide IPRS* in 100 ml of the mobile phase. Dilute 1.0 ml of the solution to100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Intersil ODS-3),
- mobile phase: a mixture of 60 volumes of a buffer prepared by dissolving 2 ml of *triethylamine* in *water*, adjusted to pH 6.0 with *orthophosphoric acid* and diluting to 1000 ml, and 40 volumes of *acetonitrile* and filtered,
- flow rate: 1 ml per minute,
- spectrophotometer set at 290 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14) as given under the test for Related substances using the following solutions.

Test solution. Dissolve about 50 mg of the substance under examination in 100.0 ml of the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. Dissolve 50 mg of the *ethionamide IPRS* in 100.0 ml of the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Inject the reference solution. The test is not valid unless he column efficiency is not less than 5000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{10}N_2S$.

Storage. Store protected from light and moisture.

Ethionamide Tablets

Ethionamide Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of ethionamide, $C_8H_{10}N_2S$.

Usual strength. 125 mg.

Identification

A. Extract a quantity of the powdered tablets containing 25 mg of Ethionamide with 5 ml of *methanol*, filter and evaporate the filtrate to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ethionamide IPRS* or with the reference spectrum of ethionamide.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *0.1 M hydrochloric acid*
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium, filter and dilute a suitable volume of the filtrate with the same solvent. Measure the absorbance of the resulting solution at the maximum at about 274 nm (2.7.4). Calculate the content of $C_8H_{10}N_2S$ from

the absorbance of a solution of known concentration of *ethionamide IPRS*.

Q. Not less than 75 per cent of the stated amount of $C_8H_{10}N_2S$.

Related substances. Determine by liquid chromatography (2.4.14) as given under Assay using the following solutions.

Test solution. Disperse a quantity of the powder containing 50 mg of Ethionamide and dissolve in 100 ml of the mobile phase.

Reference solution. Dissolve 25 mg of the *ethionamide IPRS* in 100 ml of the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg of Ethionamide in 100.0 ml of the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. Dissolve 50 mg of the *ethionamide IPRS* in 100 ml of the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Intersil ODS-3),
- mobile phase: a mixture of 40 volumes of *acetonitrile* and 60 volumes of buffer pH 6.0 prepared by mixing 2 ml of *triethylamine* to 1000 ml with *water* and adjusted to pH 6.0 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 290 nm,
- injection volume: 20 µl.

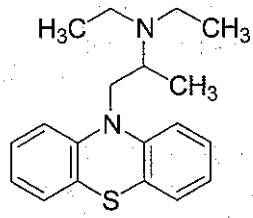
Inject the reference solution. The test is not valid unless the column efficiency in not less than 5000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{10}N_2S$ in the tablets.

Storage. Store protected from light and moisture.

Ethopropazine Hydrochloride



$C_{19}H_{24}N_2S,HCl$ Mol. Wt. 348.9

Ethopropazine Hydrochloride is 10-[2-(diethylamino)-propyl]phenothiazine hydrochloride.

Ethopropazine Hydrochloride contains not less than 99.0 per cent and not more than 101.5 per cent of $C_{19}H_{24}N_2S,HCl$, calculated on the dried basis.

Category. Antiparkinsonian.

Description. A white or slightly creamy-white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ethopropazine hydrochloride IPRS* or with the reference spectrum of ethopropazine hydrochloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.0005 per cent w/v solution in *ethanol (95 per cent)* shows an absorption maximum at 252 nm and a less well-defined maximum at 303 nm; absorbance at 252 nm, about 0.42.

C. In the test for Related substances, the principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (b).

D. It gives reaction (A) of chlorides (2.3.1).

Tests

Acidity or alkalinity. Dissolve 0.15 g in 50 ml of *carbon dioxide-free water* and add 0.15 ml of *methyl red solution*; the solution is yellow and not more than 0.2 ml of *0.01 M hydrochloric acid* is required to change the colour of the solution to red.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A freshly prepared mixture of equal volumes of *ether* and *ethyl acetate* saturated with *strong ammonia solution*.

Test solution. Dissolve 0.5 g of the substance under examination in 100 ml of *methanol*.

Reference solution (a). Dilute 1 volume of the test solution to 100 volumes with *methanol*.

Reference solution (b). A 0.5 per cent w/v solution of *ethopropazine hydrochloride IPRS* in *methanol*.

Apply to the plate 2 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.7 g, dissolve in 200 ml of *acetone*, add 15 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, using 0.15 ml of a saturated solution of *methyl orange* in *acetone* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03489 g of $C_{19}H_{24}N_2S,HCl$.

Storage. Store protected from light.

Ethopropazine Tablets

Ethopropazine Hydrochloride Tablets

Ethopropazine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of ethopropazine hydrochloride, $C_{19}H_{24}N_2S,HCl$.

Usual strength. 50 mg.

Identification

A. Extract a quantity of the powdered tablets containing 50 mg of Ethopropazine Hydrochloride with 20 ml of *chloroform*, filter, evaporate the filtrate to dryness and dry the residue at 60° at a pressure not exceeding 0.7 kPa. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ethopropazine hydrochloride IPRS* or with the reference spectrum of ethopropazine hydrochloride.

B. In the test for Related substances, the principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

C. To a quantity of the powdered tablets containing 5 mg of Ethopropazine Hydrochloride add 5 ml of *sulphuric acid* and allow to stand for 5 minutes; a red colour is produced.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A freshly prepared mixture of equal volumes of *ether* and *ethyl acetate* saturated with *strong ammonia solution*.

Test solution. Shake a quantity of the powdered tablets containing 0.1 g of Ethopropazine Hydrochloride with 50 ml of *chloroform* for 15 minutes, centrifuge and use the supernatant liquid.

Reference solution (a). A 0.2 per cent w/v solution of *ethopropazine hydrochloride IPRS* in *chloroform*.

Reference solution (b). A 0.002 per cent w/v solution of *ethopropazine hydrochloride IPRS* in *chloroform*.

Apply to the plate 2 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b).

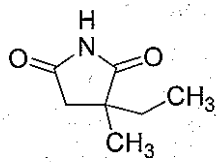
Other tests. Comply with the tests stated under Tablets.

Assay. *Protect the solution from light throughout the test.*

Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg of Ethopropazine Hydrochloride, extract with four quantities, each of 20 ml, of *ethanol (95 per cent)*. Filter and dilute the filtrate to 100.0 ml with *ethanol (95 per cent)*. Dilute 10.0 ml of the solution to 100.0 ml with *ethanol (95 per cent)*. Dilute 10.0 ml of the solution further to 100.0 ml and measure the absorbance of the resulting solution at the maximum at about 252 nm (2.4.7). Calculate the content of $C_{19}H_{24}N_2S,HCl$, taking 845 as the specific absorbance at 252 nm.

Storage. Store protected from light.

Ethosuximide



$C_7H_{11}NO_2$ Mol. Wt. 141.2

Ethosuximide is (3*RS*)-3-ethyl-3-methypyrrolidine-2,5-dione.

Ethosuximide contains not less than 99.0 per cent and not more than 101.0 per cent of $C_7H_{11}NO_2$, calculated on the anhydrous basis.

Category. Antiepileptic

Description. A white or almost white powder or waxy solid. It shows polymorphism (2.5.11).

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Melt a sufficient quantity at 50°, prepare a thin film between two previously warmed bromide plates and record the spectrum immediately. Compare the spectrum with that obtained with *ethosuximide IPRS* or with the reference spectrum of ethosuximide.

B. When examined in the range 230 nm to 360 nm (2.4.7), 0.1 per cent w/v solution in *ethanol (95 per cent)* shows an absorption maximum at 248 nm; about 0.85.

Tests

Appearance of solution. A 10 per cent w/v solution is clear (2.4.1) and colourless (2.4.1).

Cyanide. Dissolve 1.0 g in 10 ml of *ethanol (90 per cent)*, add 0.5 ml of *ferrous sulphate solution*, 1 ml of *2 M sodium hydroxide* and 0.1 ml of *ferric chloride solution*. Heat to boiling, cool and acidify using 3 ml of *1 M sulphuric acid*. After 15 minutes, there is no blue colour and no blue precipitate is produced.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.25 g of the substance under examination in mobile phase A and dilute to 10.0 ml with mobile phase A. store the solution at room temperature for at least 30 minutes before injection (*in situ* transformation of impurity B to impurity A).

Reference solution (a). A 0.05 per cent w/v solution of *ethosuximide impurity A ((2RS)-2-ethyl-2-methylbutanedionic acid) IPRS* in mobile phase A.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 20.0 ml with mobile phase A.

Reference solution (c). Mix 1.0 ml of reference solution (a) and 4.0 ml of the test solution.

Chromatographic system
- a stainless steel column 10 cm x 2.1 mm, packed with end-capped solid core octadecylsilane organosilica polymer compatible with 100 per cent aqueous mobile phase (2.6 µm),
- mobile phase: A. a buffer solution prepared by dissolving 15.6 g of *sodium dihydrogen phosphate* in 900 ml of *water*, adjusted to pH 2.0 with *orthophosphoric acid* and dilute to 1000 ml with *water*,

  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 0.25 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 3 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
10	90	10
11	30	70
15	30	70
20	90	10

The relative retention time with reference to ethosuximide (retention time: about 4 minutes) for ethosuximide impurity A is about 1.7.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to ethosuximide and ethosuximide impurity A is not less than 3.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 1.0 g.

Assay. Dissolve 0.12 g in 20 ml of *dimethylformamide*. Titrate with *0.1M tetrabutylammonium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.01412 g of $C_7H_{11}NO_2$.

Storage. Store protected from light.

Ethosuximide Capsules

Ethosuximide Capsules contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of ethosuximide, $C_7H_{11}NO_2$.

Usual strength. 250 mg.

Identification

A. Heat a quantity of the contents of the capsules containing 0.1 g of Ethosuximide with 0.2 g of *resorcinol* and 0.1 ml of *sulphuric acid* at 140° for 5 minutes, add 5 ml of *water*, make alkaline with *5 M sodium hydroxide* and add 0.2 ml to a large volume of *water;* a bright green fluorescence is produced.

B. Shake a quantity of the contents of the capsules containing 0.25 g of Ethosuximide with 80 ml of *ethanol (95 per cent)* for a few minutes, add sufficient *ethanol (95 per cent)* to produce 100 ml, mix and filter. Dilute 20 ml of the filtrate to 100 ml with *ethanol (95 per cent)*. Absorbance of the resulting solution at the maximum at about 248 nm, about 0.43 (2.4.7).

Tests

Other tests. Comply with the tests stated under Capsules.

Assay. Weigh a quantity of the contents of the capsules containing 0.2 g of Ethosuximide and dissolve in 30 ml of *dimethylformamide*. Titrate with *0.1 M tetrabutylammonium hydroxide*, using a 0.1 per cent w/v solution of *azo violet* in *dimethylformamide* as indicator. Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.01412 g of $C_7H_{11}NO_2$.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Ethosuximide Syrup

Ethosuximide Oral Solution

Ethosuximide Syrup is a solution of Ethosuximide in a suitable flavoured vehicle.

Ethosuximide Syrup contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of ethosuximide, $C_7H_{11}NO_2$.

Usual strength. 250 mg in 5 ml.

Identification

A. Extract a quantity of the syrup containing 0.5 g of Ethosuximide with two quantities, each of 30 ml, of *chloroform*, filter the combined extracts through a plug of cotton and evaporate the filtrate to dryness. Heat 100 mg of the residue with 0.2 g of *resorcinol* and 0.1 ml of *sulphuric acid* at 140° for 5 minutes, cool, add 5 ml of *water*, make alkaline with *5 M sodium hydroxide* and add 0.2 ml to a large volume of *water*; a bright green fluorescence is produced.

B. In the Assay, the principal peak in the chromatogram obtained with test solution (b) corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Other tests. Comply with the tests stated under Oral liquids.

Assay. Determine by gas chromatography (2.4.13).

Test solution (a). Add 10 ml of *water* and 2 g of *sodium bicarbonate* to a weighed quantity of the syrup containing about 0.25 g of Ethosuximide and extract with five quantities, each of 25 ml, of *chloroform*, washing each extract with the same 10 ml of *water*. To the combined extracts add 10 ml of a 3.0 per cent w/v solution of *dimethyl phthalate* (internal standard) in *chloroform*, shake with 10 g of *anhydrous sodium sulphate* and filter.

Test solution (b). Prepare in the same manner as test solution (a) but omit the internal standard.

Reference solution. Add 2 ml of the internal standard solution to 25.0 ml of a 0.2 per cent w/v solution of *ethosuximide IPRS* in *chloroform*.

Chromatographic system

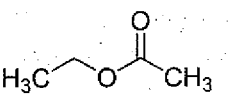
- a glass column 1.5 m x 4 mm, packed with acid-washed silanised diatomaceous support (80 to 100 mesh) impregnated with 3 per cent w/w of cyanopropylmethyl phenyl methyl silicone fluid (OV-225) of cyanopropylmethyl phenyl methyl silicone fluid (Such as OV-225),
- temperature:
  column.165°,
  inlet port and detector. 240°,
- flow rate: 30 ml per minute of the carrier gas.

Inject 2 µl of the reference solution, test solution (a) and (b).

Determine the weight per ml of the syrup (2.4.29), and calculate the content of $C_7H_{11}NO_2$, weight in volume.

Storage. Store at a temperature not exceeding 30°.

Ethyl Acetate



$C_4H_8O_2$ Mol. Wt. 88.1

Ethyl Acetate is Acetic acid, ethyl ester.

Ethyl Acetate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_4H_8O_2$.

Category. Excipient.

Description. A transparent, colourless liquid.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ethyl acetate IPRS* or with the reference spectrum of ethyl acetate.

Tests

Specific gravity (2.4.29). 0.894 to 0.898.

Acidity. To 2.0 ml, add 10 ml of neutralized *ethanol*, add 2 drops of *phenolphthalein* solution. Neutralize with *0.1M sodium hydroxide*. Not more than 0.1 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution.

Readily carbonizable substances. To 2.0 ml, add 10.0 ml of *sulphuric acid* to form separate layers. No dark zone is developed within 15 minutes.

Limit of nonvolatile residue. Not more than 0.02 per cent, determined by evaporating 100 g of Ethyl Acetate to dryness in a tared porcelain dish on a steam-bath and dry at 105° for 1 hour.

Related substances. Determine by gas chromatography (2.4.13).

Test solution. Dissolve 1.6 g of Ethyl Acetate in 10.0 ml of *N,N-dimethylacetamide*.

Reference solution (a). A solution containing 0.016 per cent w/v, each of, *acetaldehyde* and *methanol*, 16.0 per cent w/v of *ethyl acetate IPRS* and 0.16 per cent w/v of *methyl ethyl ketone IPRS* in *N,N-dimethylacetamide*.

Reference solution (b). A solution containing 0.016 per cent w/v, each of, *acetaldehyde*, *ethyl acetate IPRS* and *1-ethoxy-2-methylpropane IPRS* in *N,N-dimethylacetamide*.

Reference solution (c). A solution containing 0.016 per cent w/v, each of, *methanol, methyl acetate*, and *methyl isobutyrate* in *N,N-dimethylacetamide* (For identification of Methyl compounds).

Reference solution (d). Dilute 5.0 ml of reference solution (b) to 10.0 ml with *N,N-dimethylacetamide*.

Chromatographic system

- a fused-silica capillary column 60 m x 0.32 mm coated with 6 per cent cyanopropylphenyl- 94 per cent dimethylpolysiloxane (film thickness 1.8 µm) (Such as DB 624),
- temperature:
  column. 40° for 15 minutes, 40° to 200° @ 12° per minute and hold at 200° for 2 minutes,
- inlet port at 210° and detector at 250°,
- flame ionisation detector,
- flow rate: 3 ml per minute using nitrogen as carrier gas,
- split ratio: 30:1,
- injection volume: 1 µl.

Name	Relative retention time
Acetaldehyde	0.29
Methanol	0.31
Methyl ethyl ketone	0.97
Ethyl acetate	1.0
1-ethoxy-2-methylpropane	1.1

Inject reference solution (a), (b) and (d). The test is not valid unless the resolution between the peaks due to acetaldehyde and methanol is not less than 2.0 and between the peaks due to methyl ethyl ketone and ethyl acetate is not less than 2.0 in the chromatogram obtained with reference solution (a), the relative standard deviation for replicate injections is not more than 5.0 per cent and the tailing factor is not more than 1.5 for acetaldehyde, ethyl acetate and 1-ethoxy-2-methylpropane peaks in the chromatogram obtained with reference solution (b) and signal-to-noise ratio for acetaldehyde, ethyl acetate, and 1-ethoxy-2-methylpropane peaks is not less than 20 in the chromatogram obtained with reference solution (d).

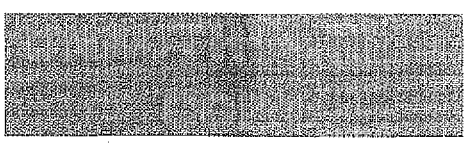
Inject reference solution (c) to identify the peaks due to methanol, methyl acetate and methyl isobutyrate.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to acetaldehyde and 1-ethoxy-2-methylpropane, each of, is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.1 per cent), the sum of the areas of the peaks corresponding to methyl compound (methanol, methyl acetate and methyl isobutyrate) multiplied by correction factor 0.1 is not more than the area of the ethyl acetate peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the areas of all the secondary peaks other than acetaldehyde, 1-ethoxy-2-methylpropane and methyl compounds is not more than 3 times the area of the ethyl acetate peak in the chromatogram obtained with reference solution (b) (0.3 per cent).

Bacterial endotoxins (2.2.3). If labeled for use in preparing parenteral dosage forms, it also meets the following requirements. The level of bacterial endotoxins is such that the requirement in the relevant dosage form monographs in which Ethyl Acetate is used can be met. Where the label states that Ethyl Acetate must be subjected to further processing during the preparation of injectable dosage forms, the level of bacterial endotoxins is such that the requirement in the relevant dosage form monograph in which Ethyl Acetate is used can be met.

Assay. Determine by gas chromatography (2.4.13).

Test solution. Dissolve 50 mg of Ethyl Acetate in 25.0 ml of *N,N-dimethylacetamide*.



Reference solution (a). A solution containing 0.2 per cent w/v of *ethyl acetate IPRS* and 0.002 per cent w/v of *methyl ethyl ketone IPRS* in *N,N-dimethylacetamide.*

Reference solution (b). A 0.2 per cent w/v solution of *ethyl acetate IPRS* in *N,N-dimethylacetamide.*

Use chromatographic system as described under Related substances.

The relative retention time with reference to ethyl acetate for methyl ethyl ketone is about 0.97.

Inject reference solution (a), (b). The test is not valid unless the resolution between the peaks due to methyl ethyl ketone and ethyl acetate is not less than 2.0 in the chromatogram obtained with reference solution (a), the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (b).

Inject reference solution (b) and the test solution.

Calculate the content of $C_4H_8O_2$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. When it is intended for use in preparing injectable dosage forms, the label states that it must be subjected to further processing during the preparation of injectable dosage forms to ensure acceptable levels of bacterial endotoxins.

Ethylcellulose

Cellulose ethyl ether

Ethylcellulose is an ethyl ether of cellulose.

Ethylcellulose contains not less than 44.0 per cent and not more than 51.0 per cent of ethoxy ($-OC_2H_5$) groups, calculated on the dried basis.

Category. Pharmaceutical aid.

Description. A white to light tan powder.

Identification

Dissolve 15 mg of the dried sample in 10 ml of dried *dichloromethane*. Grind 0.5 ml of the solution to dryness with 0.3 g of *potassium bromide*. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ethylcellulose IPRS* or with the reference spectrum of ethylcellulose.

Tests

pH (2.4.24). 5.5 to 8.0, determined in a solution prepared in the following manner. Stir 1.0 g with 50 ml of *carbon dioxide-free water* previously heated to 90°, then cool and dilute with sufficient *carbon dioxide-free water* to produce 100 ml.

Apparent viscosity. 90.0 to 110.0 per cent of that stated on the label for viscosity types of 10 mPa s or more; 80.0 to 120.0 per cent of that stated on the label for viscosity types of 6 to 10 millipascal seconds; 75.0 to 140.0 per cent of that stated on the label for viscosity types of 6 millipascal seconds or less, determined by the following method. Weigh accurately about 5.0 g, calculated on the dried basis and dissolve in 95.0 ± 0.05 g of a mixture of 80 parts of *toluene* and 20 parts of *ethanol* by weight. For ethylcellulose containing less than 46.5 per cent of ethoxy groups use a mixture of 60 parts of *toluene* and 40 parts of *ethanol*. Determine the viscosity at 25° by Method A (2.4.28).

Arsenic (2.3.10). Mix 3.30 g with 5 ml of *sulphuric acid AsT*, add a few glass beads and digest in a fumehood, preferably on a hot plate at a temperature not exceeding 120°, until charring begins. (Additional acid may be necessary to wet some samples completely but the total volume added should not exceed 10 ml). Cautiously add, dropwise, *hydrogen peroxide solution (30 per cent)* allowing the reaction to subside and again heating between additions of drops. Add the first few drops very slowly with sufficient mixing to prevent a rapid reaction. Discontinue heating if foaming becomes excessive. When the reaction has abated, heat cautiously, rotating the flask occasionally to prevent the sample from caking on glass exposed to the heating unit. *(NOTE-Maintain oxidising conditions at all times during the digestion by adding small quantities of the hydrogen peroxide solution whenever the mixture turns brown or darkens).* Continue the digestion until the organic matter is destroyed, gradually raising the temperature of the heating unit until fumes of sulphur trioxide are copiously evolved and the solution becomes colourless or retains only a light straw colour. Cool, add cautiously 10 ml of *water*, mix, and again evaporate till strong fuming, repeating this procedure to remove any trace of hydrogen peroxide. Cool, add cautiously 10 ml of *water*, wash the sides of the flask with a few ml of *water*, and dilute with *water* to 35 ml. The resulting solution complies with the limit test for arsenic (3 ppm).

Heavy metals (2.3.13). 0.5 g complies with the limit test for heavy metals, Method B (40 ppm).

Sulphated ash (2.3.18). Not more than 0.5 per cent.

Loss on drying (2.4.19). Not more than 3.0 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

Assay. Determine by gas chromatography (2.4.13).

Internal standard solution. To 10 ml of *o-xylene* add 0.5 ml of *octane* and dilute to 100.0 ml with *o-xylene.*

Test solution. To 30 mg (dried substance), add 60 mg of *adipic acid* in a 5 ml pressure–tight reaction vial equipped with a

pressure-tight membrane stopper coated with *polytetrafluoroethylene* and secured with an aluminium crimped cap or another sealing system providing a sufficient air-tightness. Add 2.0 ml of the internal standard solution and 1.0 ml of *hydriodic acid* and close immediately. Accurately weigh the vial (total mass before heating), do not mix the contents of the vial by hand before heating. Place the vial in an oven or heat in a suitable heater, with continuous mechanical agitation, maintaining the internal temperature of the vial at 115± 2° for 70 minutes. Allow to cool and accurately weigh the vial (total mass after heating). If the difference between the total mass before heating and the total mass after heating is more than 10 mg, prepare a new test solution. After phase separation, pierce through the septum of the vial with a cooled syringe and withdraw a sufficient volume of the upper layer as the test solution.

Reference solution. Place 60 mg of *adipic acid* and 2.0 ml of the internal standard solution in another 5 ml reaction vial, add 1.0 ml of *hydriodic acid* and close immediately. Accurately weigh the vial then inject 25 µl of *iodoethane* through the septum into the vial, weigh again accurately and mix. After phase separation, pierce through the septum of the vial with a cooled syringe and withdraw a sufficient volume of the upper layer as the reference solution.

Chromatographic system

- a fused silica column 30 m × 0.53 mm, packed with poly (dimethyl) siloxane (film thickness 3 µm),
- column temperature:

time (min.)	temperature (°)
0-3	50
3-8	50→100
8-12	100→250
12-20	250

- inlet port at 250° and detector at 280°,
- flow rate: 4.2 ml per minute using helium as carrier gas,
- flame ionization detector,
- split ratio: 1:40.

The relative retention time with reference to octane (retention time about 10 minutes) iodoethane about 0.6.

Inject 1µl of the reference solution. The test is not valid unless the resolution between the peaks due to iodoethane and octane is not less than 5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and internal standard solution.

Calculate the response factor of iodoethane using the following expression.

$$\frac{A_1 \times W_1 \times C}{A_2 \times 100}$$

where, A_1 = area of the peak due to the internal standard in the chromatogram obtained with the reference solution,

A_2 = area of the peak due to iodoethane in the chromatogram obtained with the reference solution,

W_1 = mass of iodoethane in the reference solution in mg,

C = percentage content of iodoethane.

Inject the reference solution, internal standard solution and the test solution.

Calculate the percentage content m/m of ethoxy groups using the following expression.

$$\frac{A_4 \times R \times M_1 \times 100}{A_3 \times W_2 \times M_2}$$

where, A_3 = area of the peak due to the internal standard in the chromatogram obtained with the test solution,

A_4 = area of the peak due to iodoethane in the chromatogram obtained with the test solution,

R = reponse factor,

M_1 = molar mass of the ethoxygroups (45.1),

M_2 = molar mass of iodoethane (156.0),

W_2 = mass of the sample (dried substance) in the test solution, in mg.

Labelling. The label states the apparent viscosity in mPa s of a 2.0 per cent w/v solution and its ethoxy content.

Ethyl Chloride

C_2H_5Cl Mol. Wt. 64.5

Ethyl Chloride is chloroethane.

Category. Anaesthetic.

Description. Gaseous at ambient temperatures and pressures but is generally compressed to a colourless, mobile, flammable and very volatile liquid.

Identification

A. Burns with a luminous flame with the production of hydrogen chloride.

B. Hydrolyse a few ml with *5 M sodium hydroxide*; the resulting solution gives the reactions of chlorides (2.3.1), and after the addition of *iodine solution* and warming, crystals of iodoform are produced.

Tests

Acidity or alkalinity. Shake 10 ml with 10 ml of ice-cold *water* and allow the ethyl chloride to evaporate at room temperature; the residual liquid (liquid A) is neutral to *litmus solution*.

Ionisable chlorides. 5 ml of liquid A gives no turbidity with *silver nitrate solution*.

Ethanol. Warm 5 ml of liquid A with *iodine solution* and *sodium carbonate*; no iodoform is produced.

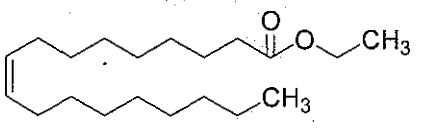
Distillation range. Into a dry 100-ml measuring cylinder insert a stopper carrying a short exit tube not less than 6 mm in internal diameter and an accurately standardised short-bulb thermometer covering the range –20° to +30° and graduated in tenths of a degree. Cover the bulb of the thermometer with a piece of very fine muslin, free from grease and sizing materials, so that one end hangs down about 10 mm below the bulb. Cool the cylinder in ice-water, transfer to it 100 ml of the sample, previously cooled in ice-water, insert the stopper and adjust the thermometer so that the end of the muslin dips into the liquid and the bulb is above the surface. Replace the ice-water with *water* at 24° to 26° and observe the temperature when 5 ml of sample has evaporated and again when 5 ml remains. Continually lower the thermometer to maintain its position relative to the liquid surface throughout the test. Correct the observed temperature by adding 0.26° for every kPa that the barometric pressure is below 101.3 kPa or by subtracting 0.26° for every kPa above. The corrected temperature is not lower than 12.0° and not higher than 12.5°.

Other organic compounds. On evaporation, no foreign odour is detectable at any stage.

Non-volatile matter. Not more than 0.01 per cent w/w, when evaporated and dried at 105°.

Storage. Store protected from light in a refrigerator (2° to 8°).

Ethyl Oleate



$C_{20}H_{38}O_2$ Mol. Wt. 310.5

Ethyl Oleate consists of the ethyl esters of (*Z*)-oleic and related acids.

Ethyl Oleate contains not less than 100.0 per cent w/w and not more than 105.0 per cent w/w of the ethyl esters of (*Z*)-oleic and related acids, calculated as $C_{20}H_{38}O_2$.

Category. Pharmaceutical aid.

Description. A clear pale yellow or colourless liquid.

Tests

Weight per ml (2.4.29). 0.869 g to 0.874 g, determined at 20°.

Acid value (2.3.23). Not more than 0.5.

Peroxides. Dissolve 5.0 g in 15 ml of *chloroform*, add 20 ml of *glacial acetic acid* and 0.5 ml of a saturated solution of *potassium iodide*, mix and allow to stand for exactly 1 minute in the dark. Add 30 ml of *water* and titrate with *0.01 M sodium thiosulphate* using *starch solution* as indicator; not more than 2.5 ml of *0.01 M sodium thiosulphate* is required.

Iodine value (2.3.28). 75 to 85.

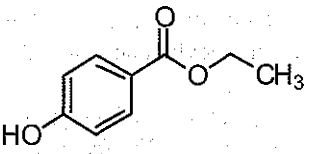
Assay. Boil a suitable volume of *ethanol (95 per cent)* to expel carbon dioxide and neutralise it to *phenolphthalein solution*. Weigh 2.0 g of the substance under examination, dissolve in 5 ml of the neutralised ethanol contained in a hard-glass flask and neutralise the free acid in the solution with *0.1 M ethanolic potassium hydroxide* using 0.2 ml of *phenolphthalein solution* as indicator. Add 25.0 ml of *0.5 M ethanolic potassium hydroxide* and boil under a reflux condenser on a water-bath for 1 hour and continue boiling for 2 hours over a flame. Add 20 ml of *water* and titrate the excess of alkali with *0.5 M hydrochloric acid* using a further 0.2 ml of *phenolphthalein solution* as indicator. Repeat the operation without the substance under examination. The difference between the titres represents the alkali required to saponify the substance under examination.

1 ml of *0.5 M ethanolic potassium hydroxide* is equivalent to 0.1553 g of $C_{20}H_{38}O_2$.

Storage. Store protected from light in small, well-filled and well-closed containers under an atmosphere of nitrogen.

Ethylparaben

Ethyl hydroxybenzoate; Ethyl parahydroxybenzoate.



$C_9H_{10}O_3$ Mol. Wt. 166.2

Ethylparaben is ethyl 4-hydroxybenzoate.

Ethylparaben contains not less than 98.0 per cent and not more than 102.0 per cent of $C_9H_{10}O_3$.

Category. Pharmaceutical aid.

Description. A white or almost white, crystalline powder or colourless crystals.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ethylparaben IPRS* or with the reference spectrum of ethylparaben.

Tests

Solution A. A 10.0 per cent w/v solution in *ethanol (95 per cent)*.

Appearance of solution. Solution A is clear (2.3.1) and not more intensely coloured than reference solution BYS6 (2.3.1).

Acidity. To 2 ml of solution A, add 3 ml of *ethanol (95 per cent)*, 5 ml of *carbon dioxide- free water* and 0.1 ml of *bromocresol green solution*. Not more than 0.1 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator to blue.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 2.5 ml of *methanol* and dilute to 50.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (a). A solution containing 0.0005 per cent w/v each of ethylparaben impurity A, ethylparaben impurity B and the substance under examination in the mobile phase.

Reference solution (b). Dissolve 50 mg of *ethylparaben IPRS* in 2.5 ml of *methanol* and dilute to 50.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of the test solution to 20.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of 0.68 per cent w/v of *potassium dihydrogen phosphate* and 65 volumes of *methanol*,
- flow rate: 1.3 ml per minute,
- spectrophotometer set at 272 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Ethylparaben impurity A[1]	0.5	1.4
Ethylparaben (Retention time: about 3 minutes)	1.0	—
Ethylparaben impurity B[2]	0.8	—

[1]4-hydroxybenzoic acid,

[2]methyl parahydroxybenzoate.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to ethylparaben impurity B and ethylparaben is not less than 2.0.

Inject reference solution (c) and the test solution. Run the chromatogram 4 times the retention time of the principal peak. The area of any peak corresponding to ethylparaben impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent). Ignore any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent).

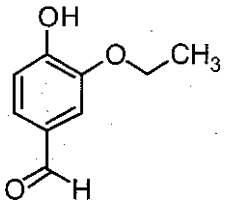
Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Determine by liquid chromatography (2.4.14), as described under test for related substances with the following modification.

Inject reference solution (b) and the test solution.

Calculate the content of $C_9H_{10}O_3$.

Ethyl Vanillin



$C_9H_{10}O_3$ Mol. Wt.166.2

Ethyl Vanillin is 3-Ethoxy-4-hydroxybenzaldehyde.

Ethyl Vanillin contains not less than 98.0 per cent and not more than 101.0 per cent of $C_9H_{10}O_3$, calculated on the dried basis.

Category. Pharmaceutical aid.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ethyl vanillin IPRS* or with the reference spectrum of ethyl vanillin.

B. When examined in the range 200 nm to 400 nm (2.4.7), a 0.0008 per cent w/v solution in *methanol* shows absorption maxima similar to that in the reference solution.

Tests

Melting range (2.4.21). 76° to 78°.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1 g by drying over *phosphorous pentoxide* for 4 hours.

Assay. Dissolve 0.3 g, in 50 ml of *dimethylformamide* contained in a 125-ml conical flask. Add *thymol blue TS* and titrate with *0.1 M sodium methoxide*, using a magnetic stirrer and taking precautions against the absorption of atmospheric carbon dioxide. Carry out a blank titration.

1 ml of *0.1 M sodium methoxide* is equivalent to 0.01662 g of $C_9H_{10}O_3$.

Storage. Store protected from light and moisture.

Ethylenediamine Hydrate

$C_2H_8N_2,H_2O$ Mol. Wt. 78.1

Ethylenediamine Hydrate is ethane-1,2-diamine monohydrate.

Ethylenediamine Hydrate contains not less than 97.5 per cent w/w and not more than 101.5 per cent w/w of $C_2H_8N_2,H_2O$.

Category. Pharmaceutical aid (for Aminophylline Injection).

Description. A clear, colourless or slightly yellow liquid.

Identification

A. Dilute 1 ml to 6 ml with *water*. To 3 drops of the solution add 2 ml of a 1 per cent w/v solution of *copper sulphate* and shake; a purple-blue colour is produced.

B. It is strongly alkaline.

Tests

Ammonia and other bases. Weigh 1.5 ml and transfer with the aid of *ethanol (95 per cent)* to a small dish. Add, with stirring, 20 ml of *dilute hydrochloric acid*. Evaporate the solution to dryness on a water-bath, breaking up any cake formed with a glass rod, and dry at 105° for 1 hour.

1 g of residue is equivalent to 0.5872 g of $C_2H_8N_2,H_2O$.

Calculate the percentage of $C_2H_8N_2,H_2O$; the result is within 0.5 per cent of the percentage of ethylenediaminehydrate determined in the Assay.

Heavy metals (2.3.13). Evaporate 5.0 ml on a water-bath to dryness, add to the residue 1 ml of *hydrochloric acid* and 0.5 ml of *nitric acid* and evaporate to dryness. Dissolve the residue in 20 ml of warm *water*, cool, add sufficient *water* to produce 100 ml and mix. 20 ml of the resulting solution complies with the limit test for heavy metals, Method A (20 ppm).

Iron (2.3.14). To the residue obtained in the test for Non-volatile matter add 1 ml of *hydrochloric acid* and 0.5 ml of *nitric acid* and evaporate to dryness on a water-bath. Dissolve the residue in 20 ml of warm *water* and dilute with *water* to 100 ml. 40 ml of the solution complies with the limit test for iron (20 ppm).

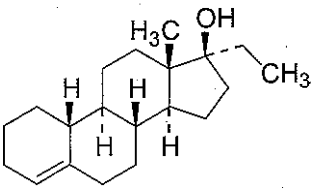
Non-volatile matter. Not more than 0.02 per cent w/v, determined on 5.0 ml by evaporating to dryness on a water-bath and drying at 105° for 1 hour.

Assay. Weigh 1.0 g, dissolve in 75 ml of *water* and titrate with *1 M hydrochloric acid* using *bromophenol blue solution* as indicator until a yellow colour is produced. Carry out a blank titration.

1 ml of *1 M hydrochloric acid* is equivalent to 0.03906 g of $C_2H_8N_2,H_2O$.

Storage. Store protected from light.

Ethyloestrenol



$C_{20}H_{32}O$ Mol. Wt. 288.5

Ethyloestrenol is 17α-ethylestr-4-en-17β-ol containing a variable amount of methanol of crystallisation.

Ethyloestrenol contains not less than 95.0 per cent and not more than 103.0 per cent of $C_{20}H_{32}O$, calculated on the anhydrous and methanol-free basis.

Category. Anabolic steroid.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ethyloestrenol IPRS* or with the reference spectrum of ethyloestrenol.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 80 volumes of *heptane* and 20 volumes of *acetone*.

Solvent mixture. A mixture of 90 volumes of *chloroform* and 10 volumes of *methanol*.

Test solution. Dissolve 0.25 g of the substance under examination in 100 ml in the solvent mixture.

Reference solution (a). A 0.25 per cent w/v solution of *ethyloestrenol IPRS* in the solvent mixture.

Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

Apply to the plate 2 µl of each solution. After development, dry the plate in air, heat it at 105° for 10 minutes, spray with *ethanolic sulphuric acid (20 per cent)* and heat at 105° for a further 10 minutes. Allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

Tests

Specific optical rotation (2.4.22). +29.0° to +33.0°, determined in a 1.0 per cent w/v solution in *dioxan*.

17α-Ethyloestran-17β-ol. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G* containing 20 per cent w/v of *silver nitrate*.

Mobile phase. A mixture of 75 volumes of *toluene* and 25 volumes of *nonan-5-one*.

Solvent mixture. 9 volumes of *chloroform* and 1 volume of *methanol*.

Test solution. Dissolve 0.4 g of the substance under examination in 10 ml in the solvent mixture.

Reference solution. A 0.08 per cent w/v solution of *17α–ethyloestran-17β-ol IPRS* in the solvent mixture.

Apply to the plate 5 µl of each solution. After development, dry the plate, heat it at 105° for 10 minutes, spray with *ethanolic sulphuric acid (20 per cent)*, heat at 105° for a further 10 minutes and allow to cool. Any spot corresponding to 17α–ethyloestran-17β-ol in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Related substances. Carry out Identification test B but using 10 µl of the following solutions.

Test solution. A 1 per cent w/v solution of the substance under examination.

Reference solution (a). A 0.01 per cent w/v solution of the substance under examination.

Reference solution (b). A 0.005 per cent w/v solution of the substance under examination.

Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

Methanol. Not more than 4.0 per cent w/w, determined by the following method.

Determine by gas chromatography (2.4.13).

Test solution (a). A solution containing 10.0 per cent w/v of the substance under examination in *acetone*.

Test solution (b). A solution containing 10.0 per cent w/v of the substance under examination and 0.4 per cent v/v of *ethanol* (internal standard) in *acetone*.

Reference solution. A solution containing 0.4 per cent v/v of *methanol* and 0.4 per cent v/v of the internal standard in *acetone*.

Chromatographic system

- a glass column 2.0 m x 0.4 mm, packed with porous polymer beads (100 to 120 mesh) (Such as Porapak Q),
- temperature:
  column.170°,
  inlet port and detector. 240°,
- flame ionisation detector,
- flow rate: 30 ml per minute, using nitrogen as the carrier gas.

Inject 1 µl of the reference solution, test solution (a) and (b).

Calculate the percentage w/w of methanol, assuming its weight per ml at 20° to be 0.792 g.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 5.0 g.

Assay. Determine by gas chromatography (2.4.13).

Test solution (a). A solution containing 0.2 per cent w/v of the substance under examination in *chloroform*.

Test solution (b). A solution containing 0.2 per cent w/v of the substance under examination and 0.1 per cent w/v of *arachidic alcohol* (internal standard) in chloroform.

Reference solution. A 0.2 per cent w/v solution of *ethyloestrenol IPRS* in *chloroform*.

Chromatographic system
- a glass column 1.0 m x 4 mm, packed with acid-washed, silanised diatomaceous support (80 to 100 mesh) coated with 3 per cent w/w of phenyl methyl silicone fluid (50 per cent phenyl) (Such as OV-17),
- temperature:
  column.200°,
  inlet port and detector. 280°,
- flame ionisation detector,
- flow rate: 30 ml per minute, using nitrogen as the carrier gas.

Inject 1 µl of the reference solution, test solution (a) and (b).

Calculate the content of $C_{20}H_{32}O$.

Storage. Store protected from light in a refrigerator (2° to 8°).

Ethyloestrenol Tablets

Ethyloestrenol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ethyloestrenol, $C_{20}H_{32}O$.

Usual strength. 2 mg.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 80 volumes of *heptane* and 20 volumes of *acetone*.

Solvent mixture. 90 volumes of *chloroform* and 10 volumes of *methanol*.

Test solution. Extract a quantity of the powdered tablets containing 1 mg of Ethyloestrenol with *chloroform*, filter, evaporate the filtrate to dryness at room temperature at a pressure not exceeding 0.2 kPa and dissolve the residue in 0.4 ml with solvent mixture.

Reference solution (a). A 0.25 per cent w/v solution of *ethyloestrenol IPRS* in the same solvent mixture.

Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

Apply to the plate 2 µl of each solution. After development, dry the plate in air, heat it at 105° for 10 minutes, spray with *ethanolic sulphuric acid (20 per cent)* and heat at 105° for a further 10 minutes. Allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

B. In the Assay, the principal peak the chromatogram obtained with the test solution has the same retention time as that of the peak due to *ethyloestrenol IPRS* in the chromatogram obtained with the reference solution (a).

Tests

17α-Ethyloestran-17β-ol. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G* containing 20 per cent w/v of *silver nitrate*.

Mobile phase. A mixture of 75 volumes of *toluene* and 25 volumes of *nonan-5-one*.

Solvent mixture. 90 volumes of *chloroform* and 10 volumes of *methanol*.

Test solution. Dissolve 20 mg of the residue obtained in the test for Related substances in 0.5 ml in the solvent mixture.

Reference solution. A 0.08 per cent w/v solution of *17α-ethyloestran-17β-ol IPRS* in the solvent mixture.

Apply to the plate 5 µl of each solution. After development, dry the plate, heat it at 105° for 10 minutes, spray with *ethanolic sulphuric acid (20 per cent)*, heat at 105° for a further 10 minutes and allow to cool. Any spot corresponding to 17α-ethyloestran-17β-ol in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Related substances. Carry out Identification test A but using 10 µl of the following solutions.

Solvent mixture. 90 volumes of *chloroform* and 10 volumes of *methanol*.

Test solution. Extract a quantity of the powdered tablets containing 40 mg of Ethyloestrenol with *chloroform*, filter, evaporate the filtrate to dryness and dissolve 10 mg of the residue in 1 ml with solvent mixture.

Reference solution (a). Dilute 1 volume of the test solution to 100 volumes with the same solvent mixture.

Reference solution (b). Dilute 1 volume of reference solution (a) to 2 volumes with the same solvent mixture.

Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

Uniformity of content. Complies with the test stated under Tablets.

Proceed as directed in the Assay using the following solutions.

Test solution. Powder one tablet, extract with 5 ml of *chloroform* in a centrifuge tube, centrifuge, evaporate 2.0 ml of the supernatant liquid in a current of nitrogen, dissolve the residue

in 2 ml of *acetone*, evaporate the solution to dryness on a water-bath and dissolve the residue in 0.4 ml of *chloroform*.

Reference solution (a). A solution containing 0.2 per cent w/v of *ethyloestranol IPRS* and 0.1 per cent w/v of *arachidic alcohol* (internal standard) in *chloroform*.

Reference solution (b). Prepare in the same manner as the test solution on 2.0 ml of the supernatant liquid but by extracting with 2.0 ml of a 0.02 per cent w/v solution of *arachidic alcohol* in *acetone*.

Calculate the content of $C_{20}H_{32}O$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by gas chromatography (2.4.13).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 8 mg of Ethyloestrenol with 20 ml of *acetone*, filter, evaporate the filtrate to dryness on a water-bath and dissolve the residue in 4.0 ml of *chloroform*.

Reference solution (a). A solution containing 0.2 per cent w/v of *ethyloestrenol IPRS* and 0.1 per cent w/v of *arachidic alcohol* (internal standard) in *chloroform*.

Reference solution (b). Prepared in a similar manner as solution (1) but extracting with 20 ml of a 0.02 per cent w/v solution of *arachidic alcohol* in *acetone*.

Chromatographic system

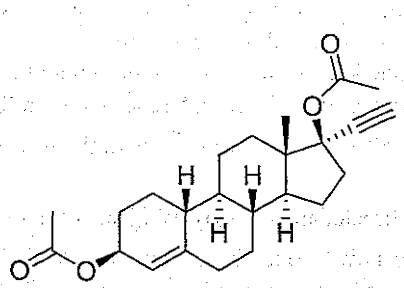
- a glass column 1.0 m x 4 mm, packed with acid-washed, silanised diatomaceous support (80 to 100 mesh) coated with 3 per cent w/w of phenyl methyl silicone fluid (50 per cent phenyl) (Such as OV-17),
- temperature:
  column. 200°,
  inlet port and detector. 280°,
- flame ionisation detector,
- flow rate: 30 ml per minute, using nitrogen as the carrier gas.

Inject 1 µl of reference solution (a), (b) and the test solution.

Calculate the content of $C_{20}H_{32}O$ in the tablets.

Storage. Store protected from light in a refrigerator (2° to 8°).

Ethynodiol Diacetate



$C_{24}H_{32}O_4$ Mol. Wt. 384.5

Ethynodiol Diacetate is 19-Norpregn-4-en-20-yne-3,17-diol, diacetate, (3β,17α).

Ethynodiol Diacetate contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{24}H_{32}O_4$.

Description. A white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ethynodiol diacetate IPRS* or with the reference spectrum of ethynodiol diacetate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Optical rotation (2.4.22). -76.0° to -70.0°, determined on 1.0 per cent w/v solution in *chloroform*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.25 g of the substance under examination in 50 ml of *acetonitrile*, with the aid of ultrasound and dilute to 100.0 ml with *water*. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. Dissolve 125 mg of *ethynodiol diacetate IPRS* in 25 ml of *acetonitrile*, with the aid of ultrasound and dilute to 50.0 ml with *water*. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with phenyl group (5 µm) (Such as Adsorbosphere Phenyl),
- column temperature: 40°,
- mobile phase: a mixture of 59 volumes of *water* and 41 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 200 nm,
- injection volume: 20 µl.

Name	Relative retention time
α-Ethynodiol diacetate	0.87
Ethynodiol diacetate (Retention time: about 18 minute)	1.0

Inject the reference solution. The test is not valid unless the tailing factor is not less than 0.75 and not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the test solution. The area of any peak corresponding to α-ethynodiol diacetate is not more than 1.5 per cent, the

area of any other secondary peak is not more than 0.5 per cent and the sum of the areas of all the secondary peaks is not more than 2.0 per cent, calculated by area normalization.

Limit of Conjugated Diene. The absorbance of a 0.05 per cent w/v solution in *methanol* at the maximum at about 236 nm (2.4.7) is not more than 0.50.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances.

Inject the reference solution and the test solution.

Calculate the content of $C_{24}H_{32}O_4$.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Ethynodiol Diacetate and Ethinyl Estradiol Tablets

Ethynodiol Diacetate and Ethinyl Estradiol Tablets contain not less than 93.0 per cent and not more than 107.0 per cent of the stated amount of ethynodiol diacetate, $C_{24}H_{32}O_4$ and not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ethinyl estradiol, $C_{20}H_{24}O_2$.

Usual strength. Ethynodiol Diacetate, 1mg and Ethinyl Estradiol, 0.05 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the principal peaks in the chromatogram obtained with the reference solution.

Tests

Disintegration (2.5.1). Not more than 15 minutes, perform the test without discs.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4. 14), as described under Assay, with the following modifications.

Test solution. Disperse one intact tablet in 10 ml of the mobile phase, with the aid of ultrasound and dilute to 25.0 ml with the mobile phase.

Inject the reference solution and the test solution.

Calculate the contents of $C_{24}H_{32}O_4$ and $C_{20}H_{24}O_2$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse 10 intact tablets in 200 ml of the mobile phase, with the aid of ultrasound and dilute to 250.0 ml with the mobile phase.

Reference solution. A solution containing 0.004 per cent w/v of *ethynodiol diacetate IPRS* and 0.0002 per cent w/v of *ethinyl estradiol IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with nitrile groups bonded to porous silica (5 µm) (Such as Zorbax CN),
- mobile phase: a mixture of 15 volumes of *methanol*, 35 volumes of *acetonitrile* and 50 volumes of *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 50 µl.

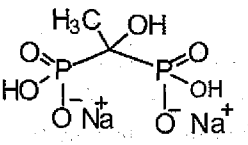
Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 1.5 for ethynodiol diacetate peak and the relative standard deviation for replicate injections is not more than 2.0 per cent for both the peaks.

Inject the reference solution and the test solution.

Calculate the contents of $C_{24}H_{32}O_4$ and $C_{20}H_{24}O_2$ in the tablets.

Storage. Store protected from moisture.

Etidronate Disodium



$C_2H_6Na_2O_7P_2$ Mol. Wt. 250.0

Etidronate Disodium is (1-Hydroxyethane-1,1-diyl)diphosphonic acid disodium salt.

Etidronate Disodium contains not less than 98.0 per cent and not more than 102.0 per cent of $C_2H_6Na_2O_7P_2$, calculated on the anhydrous basis.

Category. Bone resorption inhibitor.

Description. A white or yellowish, hygroscopic powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *etidronate disodium IPRS* or with the reference spectrum of etidronate disodium.

B. It gives reaction (A) of sodium salts (2.3.1).

Tests

pH (2.3.24). 4.2 to 5.2, determined on 1.0 per cent w/v solution in *carbon dioxide-free water.*

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in *water* and dilute to 10.0 ml with *water.*

Reference solution. To 2.0 ml of a 0.03 per cent w/v solution of etidronate impurity A *(orthophosphoric acid)* , add 2.0 ml of a 0.025 per cent w/v solution of etidronate impurity B *(phosphorous acid)* and dilute to 50.0 ml with *water.*

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with anion exachange resin bonded to silica (5 µm),
- column temperature: 35°,
- mobile phase: a mixture of 0.2 ml of *anhydrous formic acid* and 1000 ml of *water*, adjusted to pH 3.5 with 8.0 per cent w/v solution of *sodium hydroxide,*
- flow rate: 1 ml per minute,
- differential refractometer,
- injection volume: 100 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to etidronate impurity A and etidronate impurity B is not less than 2.5.

Inject the reference solution and the test solution. The area of peak corresponding to etidronate impurity A and B is not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.5 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Water (2.3.43). Not more than 5.0 per cent, determined on 1.0 ml of 1.0 per cent w/v solution in a mixture of equal volumes of *anhydrous acetic acid* and *formamide* using Method 3.

Assay. Dissolve 0.1 g in 2 ml of *formic acid* and dilute to 50 ml with *glacial acetic acid.* Titrate with *0.1 M perchloric acid,* determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.0125 g of $C_2H_6Na_2O_7P_2$.

Storage. Store protected from moisture.

Etidronate Tablets

Etidronate Tablets contain Etidronate Disodium.

Etidronate Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of etidronate disodium, $C_2H_6Na_2O_7P_2$.

Usual strengths 200 mg; 400 mg.

Identification

A. To a quantity of the powdered tablets containing 1 g of Etidronate Disodium, add 10 ml of *water* and shake for 5 minutes, filter. Add 15 ml of *methanol* to precipitate the solution, mix and centrifuge. Discard the supernatant liquid and dry the residue at 105° for 1 hour. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *etidronate disodium IPRS* or with the reference spectrum of etidronate disodium.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *water,*
Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Dilute the filtrate, if necessary to produce a solution containing 0.022 per cent w/v of Etidronate Disodium.

Reference solution. A 0.022 per cent w/v solution of *etidronate disodium IPRS* in *water.*

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with anion exchange resin (10 µm),
- mobile phase: a 0.0454 per cent v/v solution of *nitric acid* in *water,*
- flow rate: 1.6 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 200 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_2H_6Na_2O_7P_2$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_2H_6Na_2O_7P_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 20 mg of Etidronate Disodium in *water* with the aid of ultrasound and dilute to 10.0 ml with *water.*

Reference solution. To 4 volumes of a 0.03 per cent w/v solution of *orthophosphoric acid,* add 4 volumes of a 0.025 per cent w/v solution of *phosphorous acid* and dilute to 50 volumes with *water.*

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with anion exchange resin (5 µm),
- column temperature: 35°,
- mobile phase: a mixture of 0.2 volumes of *anhydrous formic acid* and 1000 volumes of *water*, adjusted to pH 3.5 with 8.0 per cent w/v solution of *sodium hydroxide*,
- flow rate: 1 ml per minute,
- differential refractometer,
- injection volume: 100 µl.

The retention times of phosphate peak is about 9.4 minutes and of phosphite peak is about 11.5 minutes.

Inject the reference solution. The test is not valid unless the resolution between the peaks corresponding to phosphate and phosphite is not less than 2.5.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to phosphite is not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (1.0 per cent). The area of any peak corresponding to phosphate is not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (1.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 44 mg of Etidronate Disodium in 190 ml of *water* with the aid of ultrasound for 5 minutes and shake for 10 minutes. Dilute to 200 ml with *water*. Centrifuge for 10 minutes and filter.

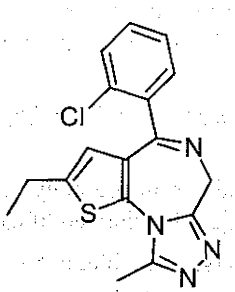
Reference solution. A 0.022 per cent w/v solution of *etidronate disodium IPRS* in *water*.

Use chromatographic system as described under Dissolution.

Inject the reference solution and the test solution.

Calculate the content of $C_2H_6Na_2O_7P_2$ in the tablets.

Etizolam



$C_{17}H_{15}ClN_4S$ Mol. Wt. 342.9

Etizolam is 4-(2-Chlorophenyl)-2-ethyl-9-methyl-6*H*-thieno[3,2-f][1,2,4]triazolo[4,3-α][1,4] diazepine.

Etizolam contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{17}H_{15}ClN_4S$, calculated on the dried basis.

Category. Antianxiety.

Description. A white to pale yellowish, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *etizolam IPRS* or with the reference spectrum of etizolam.

B. When examined in the range from 200 nm to 400 nm (2.4.7), a 0.001 per cent w/v solution in *ethanol (95 per cent)* shows an absorption maxima at the same wavelength as that of *etizolam IPRS* prepared in the same manner.

C. Melting point (2.4.21). 146° to 149°.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 40 mg of the substance under examination in *acetonitrile* and dilute to 100.0 ml with *acetonitrile*.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *acetonitrile*.

Reference solution (b). A solution containing 0.008 per cent w/v each of *etizolam IPRS* and *ethyl parahydroxybenzoate IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5µm),
- column temperature: 35°,
- mobile phase: a mixture of 55 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 3.5 with *dilute orthophosphoric acid* and 45 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 10 µl.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to ethyl parahydroxybenzoate and etizolam is not less than 3.0 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. Run the chromatogram 5 times the retention time of the principal peak, the area of any secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent determined on 1 g by drying in an oven at 105° for 3 hours.

Assay. Dissolve 0.3 g in 70 ml of a mixture of 7 volumes of *acetic anhydride* and 3 volumes of *glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01714 g of $C_{17}H_{15}ClN_4S$.

Storage. Store protected from light and moisture.

Etizolam Tablets

Etizolam Tablets contain not less than 93.0 per cent and not more than 107.0 per cent of the stated amount of etizolam, $C_{17}H_{15}ClN_4S$.

Usual strengths. 0.5 mg; 1 mg.

Identification

A. Shake a quantity of the powdered tablets containing 5 mg of etizolam, add 10 ml of *methanol* and filter. Evaporate the filtrate to dryness and dissolve the residue in 2 ml of *sulphuric acid*. The solution gives, a yellowish-green fluorescence, when examined under ultraviolet light at 365 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Dilute the filtrate with the dissolution medium to obtain a solution containing 0.000028 per cent w/v of Etizolam. Dilute 5.0 ml of the solution to 10.0 ml with *acetonitrile*.

Reference solution. Dissolve 28 mg of *etizolam IPRS* in 50 ml of *methanol* and dilute with the dissolution medium to obtain a solution containing 0.000028 per cent w/v of etizolam. To 2.0 ml of the solution, add 2.0 ml of *acetonitrile*.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of equal volumes of *water* and *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 243 nm,
- injection volume: 100 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{15}ClN_4S$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{17}H_{15}ClN_4S$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing 4 mg of Etizolam in 5 ml of the mobile phase, with the aid of ultrasound and dilute to 10.0 ml with the mobile phase and filter.

Reference solution. A 0.0004 per cent w/v solution of *etizolam IPRS* in the mobile phase.

Use chromatographic system as described under Assay.

Inject the reference solution. The test is not valid unless the theoretical plates is not less than 4500, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtain with the reference solution (1.0 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtain with the reference solution (2.0 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Disperse one tablet in 5 ml of *water* and dilute with *methanol* (*90 per cent*) to obtain a solution containing 0.001 per cent w/v of Etizolam.

Calculate the content of $C_{17}H_{15}ClN_4S$ in the tablet.

Other tests. Complies with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 10 mg of Etizolam in 10 ml of *water* and dilute to 100.0 ml with *methanol*. Dilute 5.0 ml of the solution to 50.0 ml with *methanol (90 per cent)*.

Reference solution. A 0.001 per cent w/v solution of *etizolam IPRS* in *methanol (90 per cent)*.

Chromatographic system
- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: a mixture of 55 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 3.5 with *dilute orthophosphoric acid* and 45 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 10 µl.

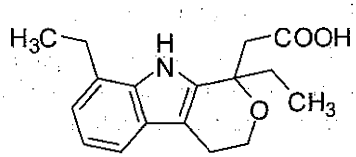
Inject the reference solution.The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{15}ClN_4S$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Etodolac



$C_{17}H_{21}NO_3$ Mol. Wt. 287.4

Etodolac is 1,8-diethyl-1,3,4,9-tetrahydropyrano [3,4-*b*]indole-1-acetic acid.

Etodolac contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{17}H_{21}NO_3$, calculated on the anhydrous basis.

Category. Analgesic; antiinflammatory.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *etodolac IPRS* or with the reference spectrum of etodolac.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 0.5 volume of *glacial acetic acid*, 30 volumes of *anhydrous ethanol* and 70 volumes of *toluene*.

Test solution. Dissolve 10 mg of the substance under examination in 10 ml of *acetone*.

Reference solution. A 0.1 per cent w/v solution of *etodolac IPRS* in *acetone*.

Impregnate the TLC plate by heating at 105° for 1 hour. Place the plate in an unsaturated chamber containing a mixture of 20 volumes of a 2.5 per cent w/v solution of *ascorbic acid* and 80 volumes of *methanol*. Allow the solution to rise 1 cm above the line of application on the plate, remove the plate and allow it to dry for 30 minutes.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 15 cm of the plate. Dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

C. Melting point (2.4.21). 144° to 150°.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.02 g of the substance under examination in *acetonitrile* and dilute to 50.0 ml with *acetonitrile*.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with *acetonitrile*. Dilute 1.0 ml of the solution to 20.0 ml with *acetonitrile*.

Reference solution (b). Dissolve 4 mg of *2-(7-ethyl-1H-indol-3-yl)ethanol IPRS (etodolac impurity H)* in 10.0 ml of the test solution. Dilute 0.5 ml of the solution to 50.0 ml with *acetonitrile*.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with endcapped butylsilane bonded to porous silica (3.5 µm),
- mobile phase: A. 0.077 per cent w/v solution of *ammonium acetate*,

B. a mixture of 10 volumes of mobile phase A and 90 volumes of *acetonitrile*,

- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 5 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
25	50	50
42	50	50
48	80	20

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to etodolac and etodolac impurity H is not less than 5.0. The relative retention time with reference to etodolac for 8-desethyl etodolac (etodolac impurity A) is about 0.68, for 8-methyl etodolac (etodolac impurity B) is about 0.83, for 1-methyl etodolac (etodolac impurity C) is about 0.85, for 2-(7-ethyl-1*H*-indol-3-yl)ethanol (etodolac impurity H) is about 1.09, for 8-isopropyl etodolac (etodolac impurity D) is about 1.17, for 1-propyl etodolac (etodolac impurity G) is about 1.19, for 8-propyl etodolac (etodolac impurity E) is about 1.2, for 1-isopropyl etodolac (etodolac impurity F) is about 1.22, for etodolac dimer (etodolac impurity I) is about 1.5 and for etodolac methyl ester (etodolac impurity K) is about 2.37.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of secondary peak due to etodolac impurity C is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent); the area of each secondary peak corresponding to etodolac impurity A, B, D, E, F, G, H, I, K is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent); the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of all other secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Chlorides. Dissolve 1.0 g of the substance under examination in 60 ml of *methanol*, add 10 ml of *water* and 20 ml of *dilute nitric acid*. Titrate with *0.01 M silver nitrate*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.01 M silver nitrate* is equivalent to 0.0003545 g of Cl (300 ppm).

Water (2.3.43). Not more than 0.5 per cent, determined on 1.0 g.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Weigh 0.25 g and dissolve in 60 ml of *methanol*. Titrate with *0.1 M tetrabutylammonium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.02874 g of $C_{17}H_{21}NO_3$.

Etodolac Capsules

Etodolac Capsules contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of etodolac, $C_{17}H_{21}NO_3$.

Usual strengths. 200 mg; 300 mg.

Identification

To a quantity of the contents of the capsules containing about 0.1 g of Etodolac, add 4 ml of *0.01 M hydrochloric acid* and mix with the aid of ultrasound for 5 minutes, shaking occasionally, centrifuge for 10 minutes, discard the supernatant liquid and wash the residue with 4 ml of *water*. Shake to disperse, centrifuge for 10 minutes and discard the supernatant liquid. Add 4 ml of *0.01 M sodium hydroxide* to the residue and mix with the aid of ultrasound for 5 minutes, shaking occasionally and centrifuge for 10 minutes. Transfer the supernatant liquid to a second centrifuge tube, add about 1 ml of *0.1 M hydrochloric acid*, the pH of the supernatant liquid should be 2 or less. Centrifuge for 10 minutes, discard the supernatant liquid and wash the residue with 4 ml of *water*, shake to disperse and centrifuge for 10 minutes. Discard the supernatant liquid and dry the residue at 105° for 1 hour. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *etodolac IPRS* or with the reference spectrum of etodolac.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),

Medium. 900 ml of *phosphate buffer pH 7.5*,

Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter. Measure the absorbance of the filtrate, suitably diluted if necessary with dissolution medium at 278 nm (2.4.7). Calculate the content of etodolac, $C_{17}H_{21}NO_3$ in the medium from the absorbances obtained from a solution of known concentration of *etodolac IPRS*.

Q. Not less than 70 per cent of the stated amount of $C_{17}H_{21}NO_3$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 0.5 volumes of *glacial acetic acid*, 30 volumes of *absolute ethanol* and 70 volumes of *toluene*.

Test solution. Shake a quantity of the contents of capsules containing 0.2 g of Etodolac with 20.0 ml of *acetone*, mix with the aid of ultrasound for 5 minutes and filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with *acetone*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 2.0 ml with *acetone*.

Place the plate in an unlined tank containing a solution prepared by dissolving 0.5 g of L-*ascorbic acid* in 20 ml of *water* and adding 80 ml of *methanol*. Allow the solution to ascend 1 cm above the line of application on the plate, remove the plate and allow it to dry for at least 30 minutes.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) (0.25 per cent).

Etodolac acid dimer. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 3 volumes of *glacial acetic acid*, 17 volumes of *1,4-dioxan* and 60 volumes of *toluene*.

Test solution. Shake a quantity of the contents of capsules containing 0.6 g of Etodolac with 20.0 ml of *acetone*, mix with the aid of ultrasound for 5 minutes and filter.

Reference solution. A 0.003 per cent w/v solution of *etodolac acid dimer IPRS* in *acetone*.

Place the plate in an unlined tank containing a solution prepared by dissolving 0.5 g of L-*ascorbic acid* in 20 ml of *water* and adding 80 ml of *methanol*. Allow the solution to ascend 1 cm above the line of application on the plate, remove the plate and allow it to dry for at least 30 minutes.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution corresponding to the acid dimer is not more intense than the spot in the chromatogram obtained with reference solution (0.1 per cent).

Total methyl analogue impurities. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the contents of capsules containing 0.1 g of Etodolac with 40 ml of *methanol*, mix with the aid of ultrasound for 5 minutes, filter and dilute 10.0 ml of the filtrate to 25.0 ml with *water*.

Reference solution. Dilute 1.0 ml of a solution containing 0.025 per cent w/v each of *etodolac 1-methyl analogue IPRS* and *etodolac 8-methyl analogue IPRS* in *methanol* to 50.0 ml with *water*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 13 volumes of *acetonitrile*, 19 volumes of *methanol* and 68 volumes of a 1.74 per cent w/v solution of *dipotassium hydrogen phosphate*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to etodolac 8-methyl analogue and etodolac 1-methyl analogue is not less than 0.75.

Inject the reference solution and the test solution. Run the chromatogram twice the retention time of the principal peak.

Calculate the content of etodolac 1-methyl analogue and etodolac 8-methyl analogue in etodolac. Total content is not more than 1.0 per cent.

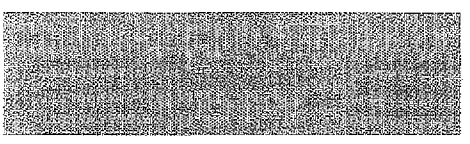
Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve a quantity of the mixed contents of 20 capsules containing 50 mg of Etodolac with about 70 ml of *0.1 M sodium hydroxide* for 30 minutes, dilute to 100.0 ml with *0.1 M sodium hydroxide*, mix and filter through a glass-fibre filter. Dilute 2.0 ml of the filtrate to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 2.0 ml of a 0.05 per cent w/v solution of *etodolac IPRS* in *0.1 M sodium hydroxide* to 100.0 ml with the mobile phase.

Reference solution (b). Add 2.0 ml of a 0.05 per cent w/v solution of *etodolac 1-methyl analogue IPRS* in *0.1 M sodium hydroxide* to 2.0 ml of a 0.05 per cent w/v solution of *etodolac IPRS* in *0.1 M sodium hydroxide* and dilute to 100 .0 ml with the mobile phase.



Chromatographic system
- a stainless steel column 12.5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Spherisorb ODS 1),
- mobile phase: a mixture of 45 volumes of *acetonitrile* and 55 volumes of *phosphate buffer pH 4.75*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to etodolac and etodolac 1-methyl analogue is not less than 1.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{17}H_{21}NO_3$ in the capsules.

Etodolac Prolonged-release Tablets

Etodolac Sustained-release Tablets; Etodolac Extended-release Tablets

Etodolac Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Etodolac Prolonged-release Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of etodolac, $C_{17}H_{21}NO_3$.

Usual strengths. 200 mg; 600 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with reference solution (b).

Tests

Dissolution (2.5.2). Complies with the test stated under Tablets.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 600 mg of Etodolac in 100.0 ml of *acetonitrile* and shake by mechanical means for 40 minutes and dilute to 200.0 ml with the *acetonitrile*, mix and filter. Dilute 2.0 ml of the solution to 10.0 ml with *acetonitrile*.

Reference solution. A 0.048 per cent w/v solution of *etodolac IPRS* and 0.005 per cent w/v solution of *etodolac related compound A IPRS (±-8-ethyl-1,3,4,9- tetrahydropyrano [3,4-b]-indole-1-acetic acid)* in *acetonitrile*.

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm, packed with octylsilance bonded to porous silica (5 µm) and a guard column 4 cm x 4.0 mm, packed with the same column material,
- mobile phase: a mixture of 500 volumes of *acetonitrile*, 500 volumes of *water* and 0.25 volumes of *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 274 nm,
- injection volume: 10 µl.

The relative retention time with reference to etodolac for etodolac impurity A is about 0.8.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to etodolac impurity A and etodolac is not less than 2.5.

Inject the test solution. The area of any secondary peak is not more than 0.2 per cent and the sum of areas of all the secondary peaks is not more than 0.75 per cent, calculated by area normalization.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14) as given under the test for Related substances using the following modification.

Reference solution. A 0.06 per cent w/v solution of *etodolac IPRS* in *acetonitrile*.

Inject the reference solution.The test is not valid unless the tailing factor is not more than 2.0 and relative standard deviation for replicate injection is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{21}NO_3$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Etodolac Tablets

Etodolac Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of etodolac, $C_{17}H_{21}NO_3$.

Usual strengths. 200 mg; 300 mg; 400 mg.

Identification

Shake a quantity of the powdered tablets containing 0.5 g of etodolac with 30 ml of *hexane* for 5 minutes, centrifuge, discard the clear hexane layer and add about 40 ml of *ether* to the residue, shake for 5 minutes, centrifuge for 5 minutes, decant the ether layer and filter if necessary. Evaporate the solution

to dryness under nitrogen and add about 5 ml of *0.1 M hydrochloric acid* to the residue. Warm on a water-bath until the residue begins to crystallise and triturate with a glass rod to promote crystallisation. Cool the mixture in an ice bath, filter through a glass-fibre filter and dry the crystals at a pressure of 2 kPa at 60° for 1 hour, Complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *etodolac IPRS* or with the reference spectrum of etodolac.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *phosphate buffer pH 7.5*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter. Measure the absorbance of the filtrate, suitably diluted if necessary, at the maximum at about 278 nm (2.4.7). Calculate the content of etodolac, $C_{17}H_{21}NO_3$ in the medium from the absorbance obtained from a solution of known concentration of *etodolac IPRS*.

Q. Not less than 70 per cent of the stated amount of $C_{17}H_{21}NO_3$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 0.5 volumes of *glacial acetic acid*, 30 volumes of *absolute ethanol* and 70 volumes of *toluene*.

Test solution. Shake a quantity of the powdered tablets containing 0.2 g of Etodolac with 20.0 ml of *acetone*, mix with the aid of ultrasound for 5 minutes and filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with *acetone*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 2.0 ml with *acetone*.

Place the plate in an unlined tank containing a solution prepared by dissolving 0.5 g of L-*ascorbic acid* in 20 ml of *water* and adding 80 ml of *methanol*. Allow the solution to ascend 1 cm above the line of application on the plate, remove the plate and allow it to dry for at least 30 minutes.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) (0.25 per cent).

Etodolac acid dimer. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 3 volumes of *glacial acetic acid*, 17 volumes of *1,4-dioxan* and 60 volumes of *toluene*.

Test solution. Dissolve a quantity of the powdered tablets containing about 0.6 g of Etodolac with 20.0 ml of *acetone*, mix with the aid of ultrasound for 5 minutes and filter.

Reference solution. A 0.003 per cent w/v solution of *etodolac acid dimer IPRS* in *acetone*.

Place the plate in an unlined tank containing a solution prepared by dissolving 0.5 g of L-*ascorbic acid* in 20 ml of *water* and adding 80 ml of *methanol*. Allow the solution to ascend 1 cm above the line of application on the plate, remove the plate and allow it to dry for at least 30 minutes.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution corresponding to the acid dimer is not more intense than the spot in the chromatogram obtained with the reference solution (0.1 per cent).

Total methyl analogue impurities. Total content is not more than 1.0 per cent.

Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the powdered tablets containing 0.1 g of Etodolac with 40 ml of *methanol*, mix with the aid of ultrasound for 5 minutes and filter. Dilute 10.0 ml of the filtrate to 25.0 ml with *water*.

Reference solution. Dilute 1.0 ml of a solution containing 0.025 per cent w/v each of *etodolac 1-methyl analogue IPRS* and *etodolac 8-methyl analogue IPRS* in *methanol* to 50.0 ml with *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 13 volumes of *acetonitrile*, 19 volumes of *methanol* and 68 volumes of a 1.74 per cent w/v solution of *dipotassium hydrogen phosphate*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to etodolac 8-methyl analogue and etodolac 1-methyl analogue is not less than 0.75.

Inject the reference solution and the test solution. Run the chromatogram twice the retention time of the principal peak.

Calculate the content of etodolac 1-methyl analogue and etodolac 8-methyl analogue in etodolac.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg of Etodolac with 70 ml of *0.1 M sodium hydroxide* for 30 minutes, dilute to 100.0 ml with *0.1 M sodium hydroxide*, mix and filter through a glass-fibre filter. Dilute 2.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 2.0 ml of a 0.05 per cent w/v solution of *etodolac IPRS* in *0.1 M sodium hydroxide* to 100.0 ml with the mobile phase.

Reference solution (b). Add 2.0 ml of a 0.05 per cent w/v solution of *etodolac 1-methyl analogue IPRS* in *0.1 M sodium hydroxide* to 2.0 ml of a 0.05 per cent w/v solution of *etodolac IPRS* in *0.1 M sodium hydroxide* and dilute to 100 .0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 12.5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 45 volumes of *acetonitrile* and 55 volumes of *phosphate buffer pH 4.75*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between peaks due to etodolac and etodolac 1-methyl analogue is not less than 1.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{17}H_{21}NO_3$ in the tablets.

Etophylline and Theophylline Prolonged-release Tablets

Etophylline and theophylline Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable.

Etophylline and Theophylline Prolonged-release Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of etophylline, $C_9H_{12}N_4O_3$ and theophylline, $C_7H_8N_4O_2,H_2O$.

Usual strength. 115 mg Etophylline and 35 mg Theophylline.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2). Complies with the test stated under Tablets.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 115 mg of Etophylline in 50 ml of *water*, with the aid of ultrasound and dilute to 200.0 ml with *water*. Stir this solution for 2 hours with magnetic stirrer, centrifuge at 3000 rpm for 5 minutes. Dilute 5.0 ml of the supernatant liquid to 25.0 ml with *water*, filter.

Reference solution. A solution containing 0.0115 per cent w/v of *etophylline IPRS* and 0.0035 per cent w/v of *theophylline IPRS* in *water*.

Chromatographic system

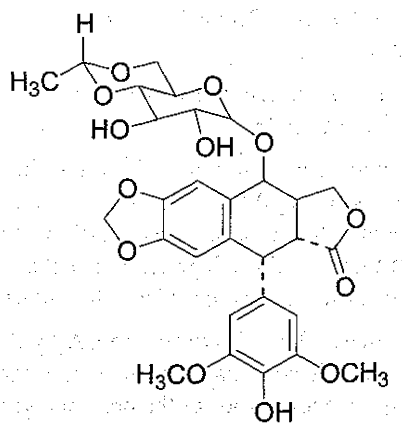
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 10 volumes of *acetonitrile* and 90 volumes of a buffer solution prepared by dissolving 2.72 g of *sodium acetate trihydrate* in 200 ml of *water*, add 10 ml of *glacial acetic acid* and dilute to 2000 ml with *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 282 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_9H_{12}N_4O_3$ and $C_7H_8N_4O_2$ in the tablets

Etoposide



$C_{29}H_{32}O_{13}$ Mol. Wt. 588.6

Etoposide is 4′-demethylepipodophyllotoxin 9-[4,6-*O*-ethylidene-β-D-glucopyranoside].

Etoposide contains not less than 95.0 per cent and not more than 105.0 per cent of $C_{29}H_{32}O_{13}$, calculated on the anhydrous basis.

CAUTION — Etoposide is potentially cytotoxic. Great care should be taken in handling the powder and preparing solutions.

Category. Anticancer.

Description. A white or almost white crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *etoposide IPRS*, or with the reference spectrum of etoposide.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H*.

Solvent mixture. 1 volume of *methanol* and 9 volumes of *dichloromethane*.

Mobile phase. A mixture of 1.5 volumes of *water*, 8 volumes of *glacial acetic acid*, 20 volumes of *acetone* and 100 volumes of *dichloromethane*.

Test solution. Dissolve 50 mg of the substance under examination in 10 ml of the solvent mixture.

Reference solution. A 0.5 per cent w/v solution of *etoposide IPRS* in the solvent mixture.

Apply to the plate 5µl of each solution as bands 10 mm by 3 mm. Allow the mobile phase to rise 17 cm. Dry the plate in warm air, spray it with a mixture of 1 volume of *sulphuric acid* and 9 volumes of *ethanol* and heat at 140° for 15 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

C. Dissolve 5 mg in 5 ml of *glacial acetic acid* and add 0.05 ml of *ferric chloride solution*. Mix and cautiously add 2 ml of *sulphuric acid*. Avoid mixing the 2 layers. Allow to stand for about 30 minutes; a pink to reddish-brown ring develops at the interface and the upper layer is yellow.

Tests

Appearance of solution. A 3.0 per cent w/v solution in a mixture of 1 volume of *methanol* and 9 volumes of *dichloromethane* is clear (2.4.1) and not more intensely coloured than reference solution YS6 or BYS6 (2.4.1).

Specific optical rotation (2.4.22). –114.0° to –106.0°, determined in a 0.5 per cent w/v solution in a mixture of 1 volume of *methanol* and 9 volumes of *dichloromethane*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of mobile phase A and mobile phase B.

Test solution (a). Dissolve 40 mg of the substance under examination in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Test solution (b). Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of test solution (a) to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution (b). To 10 ml of test solution (b), add 0.1 ml of a 4 per cent v/v solution of *glacial acetic acid* and 0.1 ml of *phenolphthalein solution*. Add *1 M sodium hydroxide* until the solution becomes faintly pink (about 0.15 ml). After 15 minutes, add 0.1 ml of a 4 per cent v/v solution of *glacial acetic acid*.

Reference solution (c) A 0.1 per cent w/v solution of *etoposide IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 12.5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. a mixture of 1 volume of *triethylamine*, 1 volume of *anhydrous formic acid* and 998 volumes of *water*,
  B. a mixture of 1 volume of *triethylamine*, 1 volume of *anhydrous formic acid* and 998 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 285 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	75	25
7	75	25
23	27	73
25	75	25

Name	Relative retention time	Correction factor
Etoposide impurity D[1]	0.4	—
Etoposide impurity E[2]	0.8	—
Etoposide (Retention time: about 5 minutes)	1.0	—
Etoposide impurity C[3]	1.1	—
Etoposide impurity B[4]	1.2	—
Etoposide impurity N[5]	3.1	—
Etoposide impurity O[6]	4.2	1.7

[1]lignan P,

[2]4'-desmethylepipodophyllotoxin,

[3]α-etoposide,

[4]*cis*-etoposide,

[5](5*R*,5a*R*,8a*R*,9*S*)-9-[[4,6-*O*-[(*R*)-ethylidene]-β-D-glucopyranosyl]oxy]-5-[4-[[(5*R*,5a*R*,8a*R*,9*S*)-5-(4-hydroxy-3,5-dimethoxyphenyl)-6-oxo-5,5a,6,8,8a,9-hexahydroisobenzofuro[5,6-*f*][1,3]benzodioxol-9-yl]oxy]3,5-dimethzxoxyphenyl]-5,8,8a,9-tetrahydroisobenzofuro-[5,6-*f*][1,3]benzodioxol-6(5a*H*)-one,

[6](5*R*,5a*R*,8a*R*,9*S*)-9-[[2,3-bis-*O*-(dichloroacetyl)-4,6-*O*-[(*S*)-ethylidene]-β-L-glucopyranosyl]oxy]-5-(4-hydroxy-3,5-dimethoxyphenyl)-5,8,8a,9-tetrahydroisobenzofuro[5,6-*f*][1,3]benzodioxol-6(5a*H*)-one.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to etoposide and to *cis*-etoposide is not less than 3.0. Ignore any peak due to phenolphthalein.

Inject reference solution (a) and test solution (a). The area of any peak corresponding to etoposide impurities B, C, D, E and N is not more than the twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any peak corresponding to etoposide impurity O is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent), the sum of the areas of all the secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 6.0 per cent, determined on 0.25 g.

Assay. Determine by liquid chromatography (2.4.14).

Follow the chromatographic procedure described under Related substances.

Inject reference solution (c). The relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (c) and test solution (b).

Calculate the content of $C_{29}H_{32}O_{13}$.

Storage. Store protected from moisture.

Etoposide Capsules

Etoposide Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of etoposide, $C_{29}H_{32}O_{13}$.

CAUTION —Etoposide is potentially cytotoxic. Great care should be taken in handling the powder and preparing solutions.

Usual strengths. 50 mg; 100 mg.

Identification

Add a quantity of the contents of the capsules containing 0.1 g of Etoposide to a separating funnel containing 100 ml of *water*, extract with two quantities, each of 20 ml, of *dichloromethane*, dry the combined organic extracts over *anhydrous sodium sulphate* and filter. Extract the filtrate with 30 ml of *water*, filter the dichloromethane layer through *anhydrous sodium sulphate* and evaporate to dryness at 25° to 35° under reduced pressure. Dissolve the oily residue in 5 ml of *water*, shake gently and allow to stand for 30 minutes. Filter through a sintered-glass funnel, wash the precipitate in the funnel with three quantities, each of 20 ml, of *water* and dry the precipitate in the funnel at 40° at a pressure of 2 kPa for 90 minutes. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *etoposide IPRS*.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of a pH 4,5 buffer prepared by dissolving 2.99 g of *sodium acetate* and 14 ml of *2 M acetic acid* in 1000 ml of *water*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution (a). A 0.005 per cent w/v solution of *etoposide IPRS* in the dissolution medium.

Reference solution (b). A solution containing 0.005 per cent w/v of *etoposide IPRS* and 0.00025 per cent w/v of *ethyl parahydroxybenzoate* in the dissolution medium.

Chromatographic system
- a stainless steel column 30 cm × 3.9 mm, packed with phenyl silica gel (10 µm) (Such as Bondapak phenyl),
- mobile phase: a mixture of 26 volumes of *acetonitrile* and 74 volumes of a 0.272 per cent w/v solution of *sodium acetate* adjusted to pH 4.0 with *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Q. Not less than 80 per cent of the stated amount of $C_{29}H_{32}O_{13}$.

***cis*-Etoposide**. Determine by liquid chromatography (2.4.14).

Test solution (a). Weigh a quantity of the mixed contents of 20 capsules containing about 0.5 g of Etoposide, dissolve in the mobile phase and dilute to 100.0 ml with the mobile phase; use immediately.

Test solution (b). Dilute 1.0 ml of test solution (a) to 50.0 ml with the mobile phase.

Reference solution. A 0.5 per cent w/v solution of *etoposide IPRS* in a mixture of 50 volumes of *acetonitrile*, 50 volumes of *water* and 0.1 volume of *triethylamine* and allow to stand for 40 minutes.

Use the chromatographic system described under Dissolution.

Inject the reference solution. The test is not valid unless the resolution between the principal peak and the peak immediately following the principal peak (*cis*-etoposide) is at least 1.0.

Inject test solution (a). The area of any peak corresponding to cis-etoposide is not more than the area of the peak in the chromatogram obtained with test solution (b) (2 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the mixed contents of 20 capsules containing about 40 mg of Etoposide dissolve in the mobile phase and dilute to 100.0 ml with the mobile phase; use immediately.

Reference solution (a). A 0.04 per cent w/v solution of *etoposide IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.005 per cent w/v of *etoposide IPRS* and 0.00025 per cent w/v of *ethyl parahydroxybenzoate* in the mobile phase.

Use the chromatographic system described under Dissolution.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is at least 2.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{29}H_{32}O_{13}$ in the capsules.

Storage. Store protected from moisture at a temperature not exceeding 30°. The capsules should not be stored in a refrigerator.

Etoposide Injection

Etoposide Injection is a sterile material consisting of Etoposide Concentrate. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections in accordance with the manufacturer's instructions, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Infusions).

Usual strength. 20 mg per ml.

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Etoposide Concentrate

Etoposide Concentrate is a sterile solution of Etoposide in a suitable ethanolic vehicle.

The concentrate complies with the requirements stated under Parenteral Preparations (Concentrated Solutions for Injection) and with the following requirements.

Etoposide Concentrate contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of etoposide, $C_{29}H_{32}O_{13}$.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 80 volumes of *dichloromethane*, 25 volumes of *acetone*, 2.5 volumes of *ethanol (95 per cent)* and 0.5 volume of *water*.

Test solution. Dilute a volume containing 20 mg of Etoposide to 25 ml with a mixture of 9 volumes of *dichloromethane* and 1 volume of *methanol*.

Reference solution. A 0.08 per cent w/v solution of *etoposide IPRS* in a mixture of 9 volumes of *dichloromethane* and 1 volume of *methanol*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 17 cm. Dry the plate in air, and examine under

ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 3.0 to 4.0, determined in a solution prepared by diluting a volume of the concentrate containing 0.1 g of Etoposide to 50 ml with *carbon dioxide-free water*.

***cis*-Etoposide**. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of the concentrate containing 0.5 g of Etoposide to 100 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 50 ml with the mobile phase.

Reference solution (b). A 0.5 per cent w/v solution of *etoposide IPRS* in a mixture of 50 volumes of *acetonitrile*, 50 volumes of *water* and 0.1 volume of *triethylamine* and allow to stand for 40 minutes.

Use the chromatographic system described under Assay.

Inject reference solution (b). The test is not valid unless the resolution between the principal peak and the peak immediately after the principal peak (*cis*-etoposide) is not less than 1.0.

Inject reference solution (a) and the test solution. The area of any peak corresponding to *cis*-etoposide is not more than the area of the principal peak in the chromatogram obtained with reference solution (a).

Bacterial endotoxins (2.2.3). Dilute the injection in *water for injection* to obtain a concentration of 0.31 mg Etoposide activity per ml; it contains not more than 2.0 Endotoxin Units per mg of etoposide.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of the concentrate containing about 40 mg of Etoposide to 100.0 ml with the mobile phase.

Reference solution. A 0.04 per cent w/v solution of *etoposide IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with phenyl silica gel (10 µm)(Such as µ Bondapak phenyl),
- mobile phase: a mixture of 26 volumes of *acetonitrile* and 74 volumes of a 0.272 per cent w/v solution of *sodium acetate* adjusted to pH 4.0 with *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

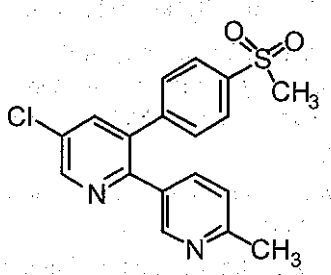
Inject the reference solution and the test solution.

Calculate the content of $C_{29}H_{32}O_{13}$ in the concentrate.

Storage. Store protected from light.

Labelling. The label states: (1) the directions for dilution of the contents; (2) that the diluted injection is to be given by intravenous injection; (3) that the concentrate should be protected from light.

Etoricoxib



$C_{18}H_{15}ClN_2O_2S$ Mol. Wt. 358.8

Etoricoxib is 5-Chloro-2-(6-methyl-3-pyridinyl)-3-(4-methylsulfonylphenyl)pyridine.

Etoricoxib contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{18}H_{15}ClN_2O_2S$, calculated on the dried basis.

Category. Non steroidal anti-inflammatory drug.

Description. An off white to creamish coloured powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *etoricoxib IPRS* or with the reference spectrum of etoricoxib.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 50 ml of the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution. A 0.0005 per cent w/v solution of *etoricoxib IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of *0.05 M ammonium acetate* and 50 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. Run the chromatogram 4 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent). The sum of the area of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying at 60° under vaccum for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 50 ml of the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.005 per cent w/v solution of *etoricoxib IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{15}ClN_2O_2S$.

Storage. Store protected from light and moisture.

Etoricoxib Tablets

Etoricoxib Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of etoricoxib, $C_{18}H_{15}ClN_2O_2S$.

Usual strengths. 60 mg; 90 mg; 120 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of buffer solution prepared by dissolving 1.38 g of *monobasic sodium phosphate* and 10 g of *sodium lauryl sulphate* in 1000 ml of *water*, adjusted to pH 7.0 with *1 M sodium hydroxide*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the dissolution medium, if necessary, at the maximum at about 240 nm (2.4.7). Calculate the content of $C_{18}H_{15}ClN_2O_2S$ in the medium from the absorbance obtained from a solution of known concentration of *etoricoxib IPRS* in the dissolution medium in such manner to get similar concentration of the test solution.

Q. Not less than 70 per cent of the stated amount of $C_{18}H_{15}ClN_2O_2S$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 50 mg of Etoricoxib with 50 ml of *methanol* with the aid of ultrasound and dilute to 100.0 ml with *methanol*. Dilute 1.0 ml of the solution to 10.0 ml with *methanol*.

Reference solution. A 0.005 per cent w/v solution of *etoricoxib IPRS* in *the methanol*.

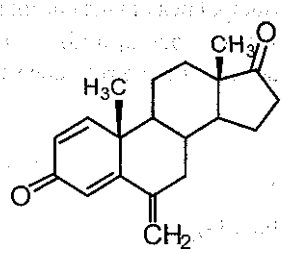
Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 55 volumes of buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 3.5 with *orthophosphoric acid* and 45 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{15}ClN_2O_2S$ in tablets.

Exemestane



$C_{20}H_{24}O_2$ Mol.Wt. 296.4

Exemestane is 6-methyleneandrosta-1, 4-diene-3, 17-dione.

Exemestane contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{20}H_{24}O_2$, calculated on the dried basis.

Category. Aromatase inhibitors.

Description. A white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *exemestane IPRS* or with the reference spectrum of exemestane.

B. When examined in the range 220 to 300 nm (2.4.7), a 0.001 per cent w/v solution in *ethanol (95 per cent)*, shows absorption maxima at 246 nm the absorbance at the absorption maxima is between 0.467 to 0.495.

Tests

Melting range (2.4.21). 192° to 195°.

Specific optical rotation (2.4.22). +280° to +300°, determined in a 1.0 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in *acetonitrile* and dilute to 10.0 ml with *acetonitrile*.

Reference solution. A solution containing 0.00125 per cent w/v, each of, *exemestane IPRS, 1,4-andrastadione IPRS, 4-andrastadione IPRS* and *6- methyleneandrosta-4-ene-3,17-dione IPRS* in *acetonitrile*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water* previously adjusted to pH 4.5 with *orthophosphoric acid* and 40 volumes of *acetonitrile*.
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Name	Relative retention time
1,4-Andrastadione	0.70
4-Andrastadione	0.95
Exemestane (Retention time: about 18 minute)	1.00
6- Methyleneandrosta-4-ene-3,17-dione	1.35

Inject the reference solution. The test is not valid unless the resolution between the peak due to 4-andrastadione and exemestane is not less than 1.5.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to 1,4-andrastadione; 4-andrastadione and 6 - methyleneandrosta-4-ene-3,17-dione is not more than 0.6 times the area of the respective peak in the chromatogram obtained with the reference solution (0.3 per cent), the area of any other secondary peak is not more than 0.2 times the area of the exemestane peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of the areas of all secondary peaks is not more than 2 times the area of the peaks corresponding to principal peak obtained with reference solution (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metal, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Dissolve 25 mg of substance under examination *in ethanol (95 per cent)* and dilute to 25 ml with *ethanol (95 per cent)*. Dilute 1.0 ml of the solution to 100.0 ml with *ethanol (95 per cent)*. Measure the absorbance of the resulting solution at the maximum at 246 nm (2.4.7).

Calculate the content of $C_{20}H_{24}O_2$ taking 481 as the specific absorbance at 246 nm.

Storage. Store protected from moisture.

Exemestane Tablets

Exemestane Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of exemestane $C_{20}H_{24}O_2$.

Usual strength. 25mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of 0.5 per cent w/v *sodium lauryl sulphate*,

Speed and time. 100 rpm and 45 minutes

Withdraw a suitable volume of the medium and filter.

Measure the absorbance of the filtrate suitably diluted if necessary, with the dissolution medium at the maximum at about 246 nm (2.4.7). Calculate the content of $C_{20}H_{24}O_2$ in the medium from the absorbance obtained from a solution of *exemestane IPRS*, prepared by dissolving in minimum quantity of *ethanol (95 per cent)* and diluted suitably with the dissoluion medium to get similar concenration of the test soluion.

Q. Not less than 75 per cent of the stated amount of $C_{20}H_{24}O_2$.

Related substances. Determine by liquid chromatography (24.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powdered tablets containing 50 mg of exemestane in 30.0 ml of *acetonitrile* with the aid of ultrasound for 5 minutes and dilute to 50.0 ml with acetonitrile and filter and filter. Dilute 5.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution. A solution containing 0.000125 per cent w/v, each of, *exemestane IPRS, 1,4-andrastadione IPRS, 4-andrastadione IPRS* and *6- methyleneandrosta-4-ene-3,17-dione IPRS* in *acetonitrile.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphiric acid* in 1000 ml of *water* previously adjusted to pH 4.5 with *orthophosphoric acid* and 40 volumes of *acetonitrile.*
- flow: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Name	Relative retention time
1,4-Andrastadione	0.70
4-Andrastadione	0.95
Exemestane (Retention time: about 18 minute)	1.00
6-Methyleneandrosta-4-ene-3,17-dione	1.35

Inject the reference solution. The test is not valid unless the resolution between the peak due to 4-andrastadione and exemestane is not less than 1.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to 4-andrastadione and 1,4-andrastadione is not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.5 per cent), the area of any peak corresponding to 6-methyleneandrosta-4-ene-3,17-dione is not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.5 per cent), the area of any other secondary peak is not more than 0.4 times the area of the exemestane peak in the chromatogram obtained with the reference solution (0.2 per cent) and the sum of all the impurities is not more than 2.0 per cent.

Other tests. Comply with the test stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14), as described under test for Related substances with the following modifications.

Reference solution. A solution containing 0.025 per cent w/v solution of *exemestane IPRS* prepared by dissolving in minimum quantity of acetonitrile and further diluted with the mobile phase.

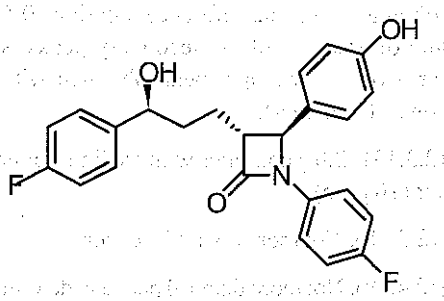
Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{24}O_2$ in the tablet.

Storage. Store protected from moisture.

Ezetimibe



$C_{24}H_{21}F_2NO_3$ Mol Wt. 409.4

Ezetimibe is (3*R*,4*S*)-1-(4-Fluorophenyl)-3-[(3*S*)-3-(4-fluorophenyl)-3-hydroxypropyl]-4-(4-hydroxyphenyl)-2-azetidinone.

Ezetimibe contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{24}H_{21}F_2NO_3$, calculated on the dried basis.

Category. Antihyperlipidemic.

Description. A white to off white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ezetimibe IPRS* or with the reference spectrum of ezetimibe.

Tests

Specific optical rotation (2.4.22). −34.0° to −25.0°, determined in a 1.0 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 25.0 ml of *acetonitrile*.

Reference solution. A 0.001 per cent w/v solution of *ezetimibe IPRS* in *acetonitrile*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of buffer solution prepared by dissolving 0.77 g of *ammonium acetate* in 1000 ml of *water* and 50 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the principal peak obtained with the reference solution (0.5 per cent) and the sum of areas of all the secondary peaks is not more than the area of the principal peak obtained with the reference solution (1.0 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in 100.0 ml of the *acetonitrile*.

Reference solution. A 0.02 per cent w/v solution of *ezetimibe IPRS* in *acetonitrile*.

Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{24}H_{21}F_2NO_3$.

Storage. Store protected from light and moisture.

Ezetimibe Tablets

Ezetimibe Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ezetimibe, $C_{24}H_{21}F_2NO_3$.

Usual strength. 10 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of 1.0 per cent w/v *sodium lauryl sulphate*,
Speed and time. 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A 0.025 per cent w/v solution of *ezetimibe IPRS* in the mobile phase. Further dilute 5.0 ml of the solution to 100.0 ml with the dissolution medium.

Use chromatographic system as described under Assay.

Calculate the content of $C_{24}H_{21}F_2NO_3$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{24}H_{21}F_2NO_3$.

Uniformity of content. Complies with the test stated under tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Disperse one tablet in 30 ml of the mobile phase, with the aid of ultrasound for 15 minutes and dilute to 50.0 ml with the mobile phase. Centrifuge and use the supernatant liquid.

Calculate the content of $C_{24}H_{21}F_2NO_3$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 25 mg of Ezetimibe with 15 ml of the mobile phase, with the aid of ultrasound 10 minutes and dilute to 25.0 ml with the mobile phase, centrifuge. Dilute 5.0 ml of the supernatant liquid to 25.0 ml with the mobile phase.

Reference solution. A 0.02 per cent w/v solution of *ezetimibe IPRS* in the mobile phase.

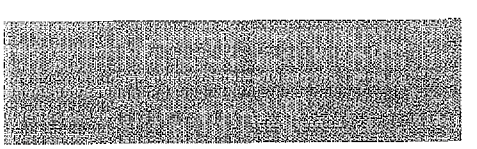
Chromatographic system

- a stainless steel column 15 cm x 4.6 mm packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of buffer solution prepared by dissolving 0.77 g of *ammonium acetate* in 1000 ml of *water* and 50 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates and tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

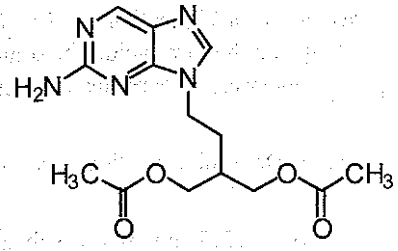
Inject the reference solution and the test solution.

Calculate the content of $C_{24}H_{21}F_2NO_3$ in the tablets.



F

Famciclovir



$C_{14}H_{19}N_5O_4$ Mol. Wt. 321.3

Famciclovir is 2-Acetoxymethyl-4-(2-amino-9*H*-purine-9-yl)butyl acetate

Famciclovir contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{14}H_{19}N_5O_4$, calculated on anhydrous basis.

Category. Antiviral.

Description. A white to cream coloured powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *famciclovir IPRS* or with the reference spectrum of famciclovir.

B. When examined in the range from 200 nm to 400 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* exhibits absorption maxima at 222 nm, 243 nm and 309 nm (2.4.7).

Tests

pH (2.4.24). 6.0 to 7.5, determined on 1.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Use chromatographic system as described under Assay using detector wavelength at 221 nm.

Inject the test solution. The area of any secondary peak is not more than 0.5 per cent. The sum of areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalisation.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 0.2 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *famciclovir IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 80 volumes of *0.02 M potassium dihydrogen orthophosphate* and 20 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 305 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_{19}N_5O_4$.

Famciclovir Tablets

Famciclovir Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of famciclovir, $C_{14}H_{19}N_5O_4$.

Usual strengths. 250 mg; 500 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *mixed phosphate buffer pH 6.8*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Dilute the filtrate if necessary with the dissolution medium and measure the absorbance at the maximum at about 305 nm (2.4.7). Calculate the content of $C_{14}H_{19}N_5O_4$ in the medium from the absorbance obtained from a solution of known concentration of *famciclovir IPRS* in the dissolution medium.

Q. Not less than 70 per cent of the stated amount $C_{14}H_{19}N_5O_4$.

Other tests. Comply with the tests stated in the Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg of Famciclovir in 30 ml of the mobile phase with the aid of ultrasound for 15 minutes and dilute to 50.0 ml with the mobile phase, filter. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *famciclovir IPRS* in the mobile phase.

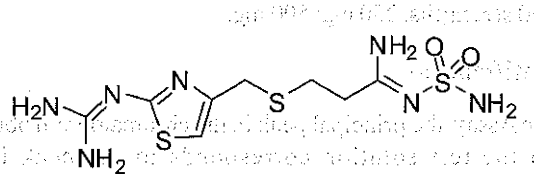
Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 75 volumes of buffer solution prepared by dissolving 3.85 g of *ammonium acetate* in 1000 ml of *water*, adjusted to pH 7.0 with *ammonia solution* and 25 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at: 300 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_{19}N_5O_4$ in the tablets.

Famotidine



$C_8H_{15}N_7O_2S_3$ Mol. Wt. 337.5

Famotidine is [1-amino-3-[[[2-(diaminomethylene)amino]-4-thiazolyl]methyl]thio]propylidene]sulphamide.

Famotidine contains not less than 98.5 per cent and not more than 101.5 per cent of $C_8H_{15}N_7O_2S_3$, calculated on the dried basis.

Category. Antiulcer.

Description. A white or yellowish-white, crystalline powder or crystals.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *famotidine IPRS* or with the reference spectrum of famotidine.

Tests

Appearance of solution. Dissolve 0.2 g in a 5.0 per cent w/v solution of *hydrochloric acid*, heating to 40°, if necessary, and dilute to 20.0 ml with the same acid. The solution is clear (2.4.1) and not more intensely coloured than reference solution BYS7 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 12.5 mg of the substance under examination in 25.0 ml of mobile phase A.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with mobile phase A. Dilute 1.0 ml of the solution to 100.0 ml with mobile phase A.

Reference solution (b). Dissolve 2.5 mg of *famotidine impurity D IPRS [3-[[[2-[(diaminomethylene)amino]thiazol-4-yl]methyl]sulphanyl] propanamide IPRS]* in *methanol* and dilute to 10.0 ml with the same solvent. To 1.0 ml of the solution, add 0.5 ml of the test solution and dilute to 100.0 ml with mobile phase A.

Reference solution (c). Dissolve 5 mg of *famotidine for system suitability IPRS* (famotidine impurities A, B, C, D, E, F, G) in mobile phase A and dilute to 10.0 ml with mobile phase A.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature 50°,
- mobile phase: A. a mixture of 6 volumes of *methanol*, 94 volumes of *acetonitrile* and 900 volumes of a 0.1882 per cent w/v solution of *sodium hexanesulphonate* previously adjusted to pH 3.5 with *acetic acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- spectrophotometer set at 265 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)	Flow rate (ml per min.)
0	100	0	1
23	96	4	1
27	96	4	2
47	78	22	2
50	100	0	2
54	100	0	1

Inject reference solution (c). The relative retention time with reference to famotidine for 3-[[[2-[(diaminomethylene)amino] thiazol-4-yl]methyl]sulphanyl]propanamide (famotidine impurity D) is about 1.1, for 3-[[[2-[(diaminomethylene) amino] amino]thiazol-4-yl]methyl]sulphanyl]-N-sulphamoyl-propanamide (famotidine impurity C) is about 1.2, for N-

cyano-3-[[[2-[(diaminomethylene)amino]thiazol-4-yl]methyl]sulphanyl]propanimidamide (famotidine impurity G) is about 1.4, for 3-[[[2-[(diaminomethylene)amino]thiazol-4-yl]methyl]sulphanyl]propanoic acid (famotidine Impurity F) is about 1.5, for 3-[[[2-[(diaminomethylene)amino]thiazol-4-yl]methyl]sulphanyl]propanimidamide (famotidine impurity A) is about 1. 6, for 3,5-bis[2-[[[2-[(diaminomethylene) amino] thiazol-4-yl]methyl]sulphanyl]ethyl]-4H-1,2,4,6-thiatriazine 1,1-dioxide (famotidine impurity B) is about 2.0, for 2,2'-[disulphanediyl bis (methylenethiazole-4,2-diyl)] diguanidine (famotidine Impurity E) is about 2.1.

For calculation of contents, multiply the areas of each known impurity by its correction factor, for impurity A=1.9, impurity B=2.5, impurity C=1.9, impurity F=1.7, impurity G=1.4 .

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to famotidine and famotidine impurity D is not less than 3.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of each secondary peak due to famotidine impurity A and G is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and for each famotidine impurity B,C,D and E is not more than three times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent), and the area of the peak due to famotidine impurity F is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent); the sum of the areas of all other secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent); Ignore any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 80° at a pressure not exceeding 0.67 kPa for 5 hours.

Assay. Weigh 0.12 g, dissolve in 60 ml of *anhydrous acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01687 g of $C_8H_{15}N_7O_2S_3$.

Storage. Store protected from light.

Famotidine Tablets

Famotidine Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of famotidine, $C_8H_{15}N_7O_2S_3$.

Usual strengths. 20 mg; 40 mg.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 2 volumes of *13.5 M ammonia*, 20 volumes of *toluene*, 25 volumes of *methanol* and 40 volumes of *ethyl acetate*.

Test solution. Shake a quantity of the powdered tablets containing about 40 mg of Famotidine with 4 ml of *glacial acetic acid*, dilute to 10 ml with the same solvent, centrifuge and use the clear supernatant liquid.

Reference solution. A 0.4 per cent w/v solution of *famotidine IPRS* in *glacial acetic acid*.

Apply to the plate 10 µl of each solution. Dry the plate in air and examine at 254 nm, The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of phosphate buffer prepared by dissolving 13.61 g of *potassium dihydrogen orthophosphate* in *water*, adjusted to pH 4.5 with *orthophosphoric acid* or *1 M potassium hydroxide*, add sufficient *water* to produce 1000 ml,

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Dilute the filtrate suitably to obtain a solution containing 0.001 per cent w/v of Famotidine with the dissolution medium.

Reference solution. A 0.001 per cent w/v solution of *famotidine IPRS* in the dissolution medium.

Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{15}N_7O_2S_3$ in the tablet.

Q. Not less than 70 per cent of the stated amount of $C_8H_{15}N_7O_2S_3$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 0.05 M potassium dihydrogen phosphate, adjusted to pH 6.0 with *1 M potassium hydroxide.*

Test solution. Shake a quantity of intact tablets containing about 0.2 g of Famotidine, with 200 ml of the solvent mixture, add 200 ml of *methanol*. Shake for 60 minutes and dilute to 500 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the test solution to 10.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 50.0 ml with the same solvent.

Reference solution (c). Dissolve 2 mg each of *3-[[[2-[(diaminomethylene)amino]-1,3-thiazol-4- yl]methyl] sulphinyl]-N-sulphamoylpropanamidine IPRS (famotidine impurity C IPRS)*, *3-[2-(Diaminomethylene-amino)-1,3-thiazol-4-ylmethylthio]propanoic acid IPRS (famotidine degradation impurity 1)* and *3-[2-(Diaminomethyleneamino)-1,3-thiazol-4-ylmethylthio] propanamide IPRS (famotidine degradation impurity 2)* in 40 ml of *acetonitrile*. Add 40 ml of *methanol* and dilute to 200.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 5.0 ml with the solvent mixture.

Reference solution (d). Dissolve 8 mg of *famotidine IPRS* in 20 ml of solvent mixture (solution A). To 1.0 ml of the solution, add 0.05 ml of *hydrogen peroxide solution* (generates famotidine degradation impurity 3).

Reference solution (e). Dilute 1.0 ml of solution A with 100.0 ml of the solvent mixture. Further dilute a suitable volume of the solution with an equal volume of reference solution (c).

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm packed with endcapped octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS-2),
- column temperature: 40°,
- mobile phase: a mixture of 7 volumes of *acetonitrile* and a mixture of 93 volumes of *0.1 M sodium acetate* containing 0.1 per cent v/v of *triethylamine*, adjusted to pH 6.0 with *glacial acetic acid*,
- flow rate: 1.4 ml per minute,
- spectrophotometer set at 275 nm,
- injection volume: 50 µl.

Inject reference solution (e). The test is not valid unless the resolution between the peaks due to famotidine and famotidine impurity C is not less than 1.4 and between the peaks due to famotidine and famotidine degradation impurity 2 is not less than 1.4.

Inject reference solution (a), (b), (c) and (d) and the test solution. In the chromatogram obtained with the test solution the areas of peaks corresponding to famotidine impurity C or famotidine degradation impurities 1 and 2 is not more than the area of the corresponding peaks in the chromatogram obtained with reference solution (c) (0.5 per cent each), the area of peak corresponding to famotidine degradation impurity 3 is not more than the area of the peak in the chromatogram obtained with reference solution (a) (1.0 per cent) and the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 12.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.5 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of intact tablets containing about 0.2 g of Famotidine with 200 ml of the solvent mixture, add 200 ml of *methanol*. Shake for 60 minutes and dilute to 500 ml with the solvent mixture. Dilute 1.0 ml of the solution to 5.0 ml with the solvent mixture.

Reference solution. Dissolve 8 mg of *famotidine IPRS* in 4 ml of *methanol*, dilute to 20 ml with the solvent mixture. Dilute 1.0 ml of the solution to 5.0 ml with the solvent mixture.

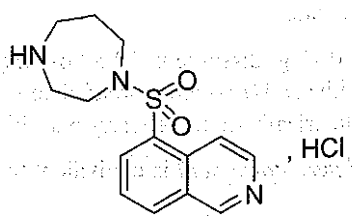
Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of famotidine, $C_8H_{15}N_7O_2S_3$.

Fasudil Hydrochloride



$C_{14}H_{17}N_3O_2S,HCl$ Mol Wt. 327.8

Fasudil Hydrochloride is 5-(1,4-Diazepane-1-sulfonyl) isoquinoline hydrochloride.

Fasudil Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{14}H_{17}N_3O_2S,HCl$, calculated on the anhydrous basis.

Category. Cerebral Vasodilator.

Description. An off-white to creamy-white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fasudil hydrochloride IPRS* or with the reference spectrum of fasudil hydrochloride.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with mobile phase.

Reference solution (a). A 0.0075 per cent w/v solution of *isoquinoline-5-sulphonic acid IPRS* in the mobile phase.

Reference solution (b). Dissolve 50 mg of *fasudil hydrochloride IPRS* in the mobile phase,add 1.0 ml of reference solution (a) and dilute to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 85 volumes of *water*, 15 volumes of *acetonitrile* and 0.5 volume of *trifluoroacetic acid*, adjusted to pH 7.0 with *triethylamine*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 10 µl.

The relative retention time for isoquinoline-5-sulphonic acid with respect to fasudil is about 0.25

Inject reference solution (b). The test is not valid unless the resolution between fasudil and isoquinoline-5-sulphonic acid is not less than 10.0, the column efficiency is not less than 3000 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution. The area of peak due to isoquinoline-5-sulphonic acid is not more than 0.5 per cent, the area of any other secondary peak is not more than 0.5 per cent and and the sum of areas of all the secondary peaks is not more than 2.0 per cent, calculated by area normalization.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

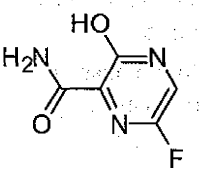
Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 2.5 to 3.5 per cent, determined on 0.5 g.

Assay. Dissolve 0.3 g and 0.6 g *of mercuric acetate* in 40.0 ml of *glacial acetic acid*, add 15 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03278 g of $C_{14}H_{17}N_3O_2S,HCl$.

Favipiravir



$C_5H_4FN_3O_2$ Mol. Wt. 157.1

Favipiravir is 6-fluoro-3-hydroxypyrazine-2-carboxamide.

Favipiravir contains not less than 98.0 per cent and not more than 102.0 per cent of $C_5H_4FN_3O_2$, calculated on the anhydrous basis.

Category. Antiviral.

Description. An off-white to light yellow powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *favipiravir IPRS* or with the reference spectrum of favipiravir.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 90 volumes of *water* and 10 volumes of *acetonitrile*.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture, with the aid of ultrasound and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). A solution containing 0.00015 per cent w/v of *6-chloro-3-hydroxy amide IPRS* and 0.1 per cent w/v of *favipiravir IPRS* in the solvent mixture.

Reference solution (b). A 0.0001 per cent w/v solution of *favipiravir IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm) (Such as Inert Sustain),
- column temperature: 35°,
- sample temperature: 5°,
- mobile phase: A. a 0.27 per cent w/v solution of *potassium dihydrogen orthophosphate* in *water*, adjusted to pH 2.5 with *orthophosphoric acid*,
  B. a mixture of 70 volumes of *acetonitrile* and 30 volumes of mobile phase A,
- a gradient programme using the conditions given below,
- flow rate: 0.6 ml per minute,
- spectrophotometer set at 300 nm and 365 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	89	11
6	89	11
14	72	28
24	26	74
35	26	74
38	3	97
47	3	97
48	89	11
55	89	11

Name	Relative retention time	Correction factor
Favipiravir acid impurity	0.52	1.04
Favipiravir (Retention time about 15 minutes)	1.0	—
6-chloro-3-hydroxy-amide impurity	1.17	0.70
6-bromo-3-hydroxy-amide impurity	1.29	0.81
6-fluoro-3-hydroxy-nitrile impurity	1.53	1.64

Inject reference solution (a) and (b) at 300 nm. The test is not valid unless resolution between the peaks due to favipiravir and 6-chloro-3-hydroxy-amide is not less than 2.0 in the chromatogram obtained with reference solution (a), the column efficiency is not less than 15000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (b).

Inject reference solution (b) and the test solution at 300 nm. In the chromatogram obtained with the test solution, the area of any peak corresponding to favipiravir acid, 6-fluoro-3-hydroxy-nitrile and any other secondary peak, each of, is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent). Ignore any peak corresponding to 6-chloro-3-hydroxy amide and 6-bromo-3-hydroxy amide.

Inject reference solution (b) and the test solution at 365 nm. In the chromatogram obtained with the test solution, the area of any peak corresponding to 6-chloro-3-hydroxy amide and 6-bromo-3-hydroxy amide, each of, is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent). The sum of all secondary peaks at 300 nm and 365 nm is not more than 1.0 per cent.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals. Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 90 volumes of *water* and 10 volumes of *acetonitrile*.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution. A 0.01 per cent w/v solution of *favipiravir IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS-3V),
- sample temperature: 8°,
- mobile phase: a mixture of 70 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 2.5 with *orthophosphoric acid* and 30 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 321 nm,
- injection volume: 5 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3500 theoretical plate, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of the $C_5H_4FN_3O_2$.

Storage. Store protected from moisture, at a temperature between 2° to 8°.

Favipiravir Tablets

Favipiravir Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of favipiravir $C_5H_4FN_3O_2$.

Usual strengths. 200 mg; 400 mg.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *favipiravir IPRS* or with the reference spectrum of favipiravir.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of a buffer solution prepared by dissolving 2.99 g of *sodium acetate trihydrate* in 500 ml of *water*, add 14 ml of *2M glacial acetic acid* and dilute to 1000 ml with *water*, adjusted to pH 4.5 with *2M glacial acetic acid* or *2M sodium hydroxide*,

Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A 0.055 per cent w/v solution of *favipiravir IPRS* in *acetonitrile*. Dilute 10.0 ml of the solution to 25.0 ml with the dissolution medium.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- sample temperature: 8°,
- mobile phase: a mixture of 70 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 2.5 with *orthophosphoric acid* and 30 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 321 nm,
- injection volume: 5 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_5H_4FN_3O_2$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_5H_4FN_3O_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 90 volumes of *water* and 10 volumes of *acetonitrile*.

Test solution. Disperse a quantity of powdered tablets containing 50 mg of Favipiravir in 40 ml of the solvent mixture, with the aid of ultrasound for 30 minutes with intermittent shaking and dilute to 50.0 ml with the solvent mixture and filter.

Reference solution. A 0.0005 per cent w/v solution of *fevipiravir IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inert Sustain),
- column temperature: 40°,
- sample temperature: 8°,
- mobile phase: A. a buffer solution prepared by dissolving 2.72 g of *potassium dihydrogen orthophosphate* into 1000 ml of *water*, adjusted to pH 2.4 with *orthophosphoric acid*,

  B. 70 volumes of *acetonitrile* and 30 volumes of mobile phase A,
- a gradient programme using the conditions given below,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 300 nm,
- injection volume: 5 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	89	11
6	89	11
14	72	28
24	26	74
35	26	74
38	3	97
47	3	97
48	89	11
55	89	11

Name	Relative retention time	Correction factor
Favipiravir acid impurity or acid impurity	0.53	1.08
Favipiravir	1.0	—
6-chloro-3-hydroxy-amide impurity or chlorohomolog impurity*	1.27	—
6-bromo-3-hydroxy-amide impurity*	1.43	—
6-fluoro-3-hydroxy-nitrile impurity*	1.73	—

*Process impurity included for identification only and not included in the calculation of total degradation products.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 10000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to favipiravir acid impurity is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 90 volumes of *water* and 10 volumes of *acetonitrile*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 0.4 g of Favipiravir in 10 ml of the *water*, with the aid of ultrasound with intermittent shaking, add 10 ml of *acetonitrile* and 50 ml of equal volumes of *acetonitrile* and *water*, sonicate for 15 minutes and dilute to 100.0 ml with equal volumes of *acetonitrile* and *water*, filter. Dilute 5.0 ml of the solution to 200.0 ml with the solvent mixture.

Reference solution. A 0.01 per cent w/v solution of *favipiravir IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Intersil ODS-3V),
- sample temperature: 8°,
- mobile phase: a mixture of 70 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 2.5 with *orthophosphoric acid* and 30 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 321 nm,
- injection volume: 5 µl.

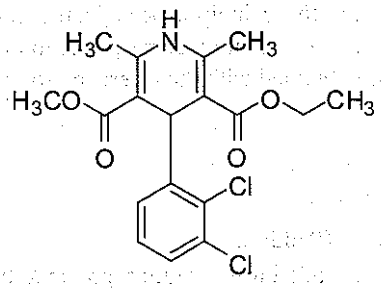
Inject the reference solution. The test is not valid unless the column efficiency is not less than 3500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of the $C_5H_4FN_3O_2$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Felodipine



$C_{18}H_{19}Cl_2NO_4$ Mol. Wt. 384.3

Felodipine is ethyl methyl (4*RS*)-4-(2,3-dichlorophenyl)-2,6-dimethyl-1,4-dihydropyridine-3,5-dicarboxylate.

Felodipine contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{18}H_{19}Cl_2NO_4$, calculated on the dried basis.

Category. Antihypertensive.

Description. A white or light yellow crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *felodipine IPRS* or with the reference spectrum of felodipine.

B. When examined in the range 220 nm to 400 nm (2.4.7), a 0.0015 per cent w/v solution in *methanol*, shows absorption maxima at about 238 nm and 361 nm; the absorbance ratio of 361 nm and 238 nm is between 0.34 to 0.36.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 40 volumes of *ethyl acetate* and 60 volumes of *cyclohexane*.

Test solution. Dissolve 10 mg of the substance under examination in 10.0 ml of *methanol*.

Reference solution (a). Dissolve 10 mg of *felodipine IPRS* in 10.0 ml of *methanol*.

Reference solution (b). Dissolve 5 mg of *nifedipine IPRS* in 5.0 ml of reference solution (a).

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine under

ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

D. Dissolve 0.15 g in a mixture of 25 ml of *2-methyl-2-propanol* and 25 ml of *perchloric acid solution*. Add 10 ml of *0.1 M cerium sulphate*, allow to stand for 15 minutes, add 3.5 ml of *strong sodium hydroxide solution* and neutralise with *dilute sodium hydroxide solution*. Shake with 25 ml of *dichloromethane*, evaporate the lower layer to dryness on a water-bath under nitrogen (the residue is also used in the test for related substances). Dissolve 20 mg of the residue in 50.0 ml of *methanol*, Dilute 2 .0 ml of the solution to 50.0 ml with *methanol*. When examined in the range 220 nm to 400 nm (2.4.7), the resulting solution shows an absorption maximum only at about 273 nm.

Tests

Appearance of solution. A 5.0 per cent w/v solution in *methanol* (Solution A) is clear (2.4.1).

Light absorption. Not more than 0.1, determined at 440 nm (2.4.7) on solution A.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 50.0 ml of the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the mobile phase.

Reference solution (c). Dissolve 10 mg of the residue obtained in identification test D [ethyl methyl 4-(2,3-dichlorophenyl)-2,6-dimethylpyridine-3,5-dicarboxylate] (felodipine impurity A) and 5 mg of *felodipine IPRS* in the mobile phase, then dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 12.5 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 20 volumes of *methanol*, 40 volumes of *acetonitrile* and 40 volumes of a *phosphate buffer solution pH 3.0* containing 0.08 per cent w/v of *orthophosphoric acid* and 0.8 per cent w/v of *sodium dihydrogen phosphate*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to felodipine and felodipine impurity A is not less than 2.5. The order of elution is dimethyl 4-(2,3-dichlorophenyl)-2,6-dimethyl-1,4-dihydropyridine-3,5-dicarboxylate, (felodipine impurity B), ethyl methyl 4-(2,3-dichlorophenyl)-2,6-dimethylpyridine-3,5-dicarboxylate (felodipine impurity A), felodipine and diethyl 4-(2,3-dichlorophenyl)-2,6-dimethyl-1,4-dihydropyridine-3,5-dicarboxylate (felodipine impurity C).

Inject reference solution (a), (b) and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of secondary peaks corresponding to felodipine impurity B and C is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). Sum of all other secondary peaks is not more than three times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent). Ignore any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.02 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.16 g, dissolve in a mixture of 25 ml of *2-methyl-2-propanol* and 25 ml of *1 M perchloric acid*. Titrate slowly with *0.1 M cerium ammonium sulphate* until the pink colour disappears using 0.05 ml of *ferroin sulphate solution* as an indicator.

1 ml of *0.1 M cerium ammonium sulphate* is equivalent to 0.01921 g of $C_{18}H_{19}Cl_2NO_4$.

Storage: Store protected from light.

Felodipine Prolonged-release Tablets

Felodipine Sustained-release Tablets; Felodipine Extended-release Tablets

Felodipine Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Felodipine Prolonged-release Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of felodipine, $C_{18}H_{19}Cl_2NO_4$.

Usual strengths. 2.5 mg; 5 mg; 10 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

Tests

Dissolution (2.5.2). Complies with the test stated under Tablets.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Proceed as directed in the Assay, except that after centrifuging a portion of the solution at high speed for 15 minutes, filter.

Reference solution (a). A 0.02 per cent w/v solution of *felodipine impurity A IPRS* in *methanol.* Dilute 10.0 ml of the solution to 100 ml with the mobile phase.

Reference solution (b). A 0.2 per cent w/v solution of *felodipine IPRS* in *methanol.*

Reference solution (c). Dilute 15.0 ml of reference solution (a) and 5.0 ml of reference solution (b) to 100 ml with the mobile phase.

Reference solution (d). Dilute 10.0 ml of reference solution (a) to 100 ml with the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture 40 volumes of a buffer solution prepared by dissolving 6.9 g of *monobasic sodium phosphate* in about 800 ml of *water*, adjusted to pH 3.0 with *orthophosphoric* acid and dilute to 1000 ml with *water*, 40 volumes of *acetonitrile* and 20 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 40 µl.

Inject reference solution (c). The test is not valid unless the relative retention time with reference to felodipine for felodipine impurity A is about 0.75 and the resolution between the peaks due to felodipine and felodipine impurity A is not less than 1.5 and the theoretical plates is not less than 1500.

Inject reference solution (d) and the test solution. In the chromatogram obtained with the test solution, the area of the peak due to felodipine impurity A is not more than 2.0 per cent the area of the principal peak in the chromatogram obtained with reference solution (d).

Uniformity of content. Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Sonicate 1 tablet with 40 ml of *acetonitrile* for 20 minutes and add 20 ml of *methanol*, and then shake by mechanical means for 30 minutes. Allow to cool to room temperature, dilute to 100.0 ml with the buffer solution. Centrifuge for 15 minutes. Dilute a portion of the supernatant with mobile phase to obtain a solution containing about 20 µg of felodipine per ml, filter.

Inject 40 µl of the reference solution and the test solution.

Calculate the content of felodipine, $C_{18}H_{19}Cl_2NO_4$ in the Tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Buffer solution. Dissolve 6.9 g of *monobasic sodium phosphate* in about 800 ml of *water,* adjusted to pH 3.0 with *orthophosphoric acid* and dilute to 1000 ml with *water.*

Test solution. Weigh and powder 10 tablets. Disperse a quantity of powder containing about 10 mg of Felodipine with 40 ml of *acetonitrile* and 20 ml of *methanol,* and sonicate for 5 minutes. Add about 30 ml of buffer solution, and shake by mechanical means for 30 minutes. Allow the solution to cool to room temperature, dilute to 100.0 ml with buffer solution. Centrifuge for 15 minutes. Dilute 10 ml of the supernatant to 50 ml with the mobile phase, filter.

Reference solution (a). A 0.2 per cent w/v solution of *felodipine IPRS* in *methanol.*

Reference solution (b). Dilute a volume of reference solution (a) with mobile phase to obtain a solution having a concentration of 0.02 mg per ml.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of buffer solution, 40 volumes of *acetonitrile* and 20 volumes of *methanol,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 362 nm,
- injection volume: 40 µl.

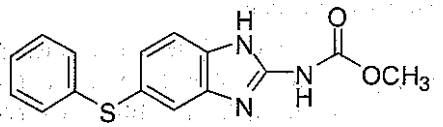
Inject reference solution (b). The test is not valid unless the column efficiency is not less than 1500 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (b) and the test solution.

Calculate the content of felodipine, $C_{18}H_{19}Cl_2NO_4$ in the tablets.

Storage. Store protected from moisture.

Fenbendazole



$C_{15}H_{13}N_3O_2S$ Mol. Wt. 299.4

Fenbendazole is methyl 5-(phenylthio)-2-benzimidazolecarbamate.

Fenbendazole contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{15}H_{13}N_3O_2S$, calculated on the dried basis.

Category. Anthelminthic.

Description. A white or almost white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fenbendazole IPRS* or with the reference spectrum of fenbendazole.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 10.0 ml of *methanolic hydrochloric acid.*

Reference solution (a). Dissolve 50 mg of *fenbendazole IPRS* in 10.0 ml of *methanolic hydrochloric acid.* Dilute 1.0 ml of the solution to 200.0 ml with *methanol.* Dilute 5.0 ml of the solution to 10.0 ml with *methanolic hydrochloric acid.*

Reference solution (b). Dissolve 10 mg of *methyl (1H-benzimidazol-2-yl)carbamate IPRS (fenbendazole impurity A IPRS)* in 100.0 ml of *methanol.* Dilute 1.0 ml of the solution to 10.0 ml with *methanolic hydrochloric acid.*

Reference solution (c). Dissolve 10 mg of *methyl (5-chloro-1H-benzimidazol-2-yl)carbamate IPRS (fenbendazole impurity B IPRS)* in 100.0 ml of *methanol.* Dilute 1.0 ml of the solution to 10.0 ml with *methanolic hydrochloric acid.*

Reference solution (d). Dissolve 10 mg of *fenbendazole IPRS* and 10 mg of *mebendazole IPRS* in 100.0 ml of *methanol.* Dilute 1.0 ml of the solution to 10.0 ml with *methanolic hydrochloric acid.*

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 1 volume of *anhydrous acetic acid,* 30 volumes of *methanol* and 70 volumes of *water,*

B. a mixture of 1 volume of *anhydrous acetic acid,* 30 volumes of *water* and 70 volumes *methanol,*
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
10	0	100
40	0	100
50	100	0
55	100	0

Inject reference solution (d). The test is not valid unless the resolution between the peaks due to fenbendazole and mebendazole is not less than 1.5.

Inject reference solution (a), (b), (c) and the test solution. In the chromatogram obtained with the test solution, the area of secondary peak due to fenbendazole impurity A is not more than 2.5 times the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.5 per cent). The area of secondary peak corresponding to fenbendazole impurity B is not more than 2.5 times the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.5 per cent), the area of any other secondary peak is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent); The sum of the areas of all other secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.3 per cent.

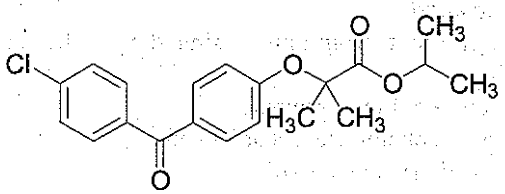
Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Dissolve 0.2 g in 30 ml of *anhydrous acetic acid,* warming gently, if necessary. Cool and titrate with *0.1 M perchloric acid,* determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02994 g of $C_{15}H_{13}N_3O_2S$.

Storage. Store protected from light.

Fenofibrate



$C_{20}H_{21}ClO_4$ Mol. Wt. 360.8

Fenofibrate is isopropyl [4-(4-chlorophenyl)-2-phenoxy-2-methyl]propionate

Fenofibrate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{20}H_{21}ClO_4$, calculated on the dried basis.

Category. Antihyperlipidemic.

Description. A white or almost white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fenofibrate IPRS* or with the reference spectrum of fenofibrate.

Tests

Appearance of solution. A 5.0 per cent w/v solution in *acetone* is clear (2.4.1) and not more intensely coloured than reference solution BYS6 (2.4.1).

Acidity. Dissolve 1.0 g in 50 ml of *ethanol (95 per cent)*, previously neutralized using 0.2 ml of *phenolphthalein* and titrate with *0.1 M sodium hydroxide*. Not more than 0.2 ml of *0.1 M sodium hydroxide* is required to change the color of the indicator to pink.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). A 0.1 per cent w/v solution of *fenofibrate IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.005 per cent w/v each of *fenofibrate IPRS*, *fenofibrate impurity A IPRS*, *fenofibrate impurity B IPRS* and 0.01 per cent w/v of *fenofibrate impurity G IPRS* in the mobile phase. Dilute 1.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of *acetonitrile* and 30 volumes of *water*, adjusted to pH 2.5 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 286 nm,
- injection volume: 20 µl.

The relative retention time with reference to fenofibrate for (4-chlorophenyl)(4-hydroxyphenyl)methanone (fenofibrate impurity A) is about 0.34, for fenofibric acid (fenofibrate impurity B) is about 0.36, for (3*RS*)-3-[4-(4-chlorobenzoyl) phenoxy]butan-2-one (fenofibrate impurity C) is about 0.50, for methyl 2-[4-(4-chlorobenzoyl)phenoxy]-2-methylpropanoate (fenofibrate impurity D) is about 0.65, for ethyl 2-[4-(4-chlorobenzoyl) phenoxy]-2-methylpropanoate (fenofibrate impurity E) is about 0.80, for (4-chlorophenyl) [4-(1-methylethoxy)phenyl] methanone (fenofibrate impurity F) is about 0.85 and for 1-methylethyl 2-[[2-[4-(4-chlorobenzoyl) phenoxy]-2-methylpropanoyl]oxy]-2-methylpropanoate (fenofibrate impurity G) is about 1.35.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to fenofibrate impurity A and fenofibrate impurity B is not less than 1.5.

Inject reference solution (b) and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of each peak due to fenofibrate impurity A and B is not more than the area of the corresponding peaks in the chromatogram obtained with reference solution (b) (0.1 per cent), the area of the peak due to fenofibrate impurity G is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The sum of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.01 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Chlorides (2.3.12). 25 ml of solution A, complies with the limit test for chlorides (100 ppm).

Sulphates (2.3.17). Dissolve 5 g in 25 ml of *distilled water* and heat at 50° for 10 minutes. Cool and dilute to 50.0 ml with the same solvent, filter (Solution A). 15 ml of the solution complies with the limit test for sulphates (100 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent determined on 1 g by drying in vacuum over phosphorus pentoxide at 60°.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances using injection volume: 5 µl.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{20}H_{21}ClO_4$.

Storage. Store protected from light.

Fenofibrate Capsules

Fenofibrate Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of fenofibrate, $C_{20}H_{21}ClO_4$.

Usual strengths. 50 mg; 150 mg.

Identification

A. Transfer the contents of 1 Capsule to a glass centrifuge tube, add an amount of *dichloromethane*, equivalent to about 10 ml per 67 mg of fenofibrate and shake vigorously. Pass through a suitable paper filter into a separatory funnel, wash with *water* and collect the dichloromethane layer. Evaporate under a stream of nitrogen and dry under vacuum at 60° for 1 hour. Determine by infrared absorption spectrophotometry (2.4.6) on the residue. Compare the spectrum with that obtained with *fenofibrate IPRS* or with the reference spectrum of fenofibrate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 1000 ml of *0.05 M sodium lauryl sulphate*,

Speed and time. 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a weighed of *fenofibrate IPRS* in the mobile phase and dilute with the dissolution medium to obtain a solution having a known concentration similar to the expected concentration of test solution.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 4000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{21}ClO_4$.

Q. Not less than 70 per cent of the stated amount of $C_{20}H_{21}ClO_4$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh the contents of 20 Capsules. Mix and transfer a weighed portion of the powder, containing about 67 mg of Fenofibrate sonicate with 80 ml of mobile phase for 10 minutes, stir for 15 minutes and dilute to 100.0 ml with the mobile phase.

Reference solution (a). A solution containing 0.067 per cent w/v of *fenofibrate IPRS* and 0.000335 per cent w/v of *fenofibrate impurity B IPRS* (*fenofibric acid IPRS*) in the mobile phase.

Reference solution (b). A solution containing 0.000335 per cent w/v each of *fenofibrate IPRS* and *fenofibrate impurity B IPRS* (*fenofibric acid IPRS*) in the mobile phase.

Use chromatographic system as described under Assay.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to fenofibrate and fenofibrate impurity B is not less than 3.0, the column efficiency for the peak due to fenofibrate impurity B is not less than 3000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to fenofibrate impurity B is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any other secondary peak is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and sum of the areas of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh the contents of 20 Capsules. Mix and transfer the powder containing 67 mg of fenofibrate and dissolve in 80 ml of the mobile phase and dilute to 100 ml with the mobile phase. Dilute 5.0 ml of the solution to 50 ml with the mobile phase.

Reference solution. A 0.0067 per cent w/v solution of *fenofibrate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),

- mobile phase: a mixture of 80 volumes of *methanol* and 20 volumes of buffer solution prepared by dissolving 136 mg of *monobasic potassium phosphate* in 1000 ml of *water*, adjusted to pH 2.9 with *dilute orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 285 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 6000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{21}ClO_4$ in the Capsules.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Fenofibrate Tablets

Fenofibrate Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of fenofibrate, $C_{20}H_{21}ClO_4$.

Category. Antihyperlipidmic.

Usual strengths. 48 mg; 54 mg; 120 mg; 145 mg; 160 mg; 200 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium: 1000 ml of *0.05 M sodium lauryl sulphate* in *water*
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter of 0.45 µm. Reject the first few ml of the filtrate and dilute a suitable volume of the filtrate with the medium. Measure the absorbance of the resulting solution at the maximum at about 292 nm (2.4.7). Calculate the content of fenofibrate, $C_{20}H_{21}ClO_4$ in the medium from the absorbance of a 0.0012 per cent w/v solution of *fenofibrate IPRS* in the dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_{20}H_{21}ClO_4$ in the tablets.

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Disperse a quantity of powder tablets containing 50 mg of fenofibrate in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 5 mg each of *fenofibrate impurity A IPRS* and *fenofibrate impurity B IPRS* in *acetonitrile* and dilute to 100.0 ml with *acetonitrile*. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). A 0.00005 per cent w/v solution of *fenofibrate IPRS* in the mobile phase.

Inject reference solution (a). The test is not valid unless the resolution between the peaks corresponding to fenofibrate impurity A and fenofibrate impurity B is not less than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of peak corresponding to fenofibrate impurity A and fenofibrate impurity B is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any other secondary peak is not more than twice the area of the principal peak obtained with reference solution (b) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than three times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent).

Other tests. Complies with the tests stated under tablets.

Assay. Determine by liquid chromatography (2.4.14).

Acidified water. Adjust the pH of *water* with *orthophosphoric acid* to 2.5.

Mobile phase. A mixture of 70 volumes of *acetonitrile* and 30 volumes of acidified water.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 50 mg of fenofibrate in 30 ml of acidified water with the aid of ultrasound, add 60 ml of *acetonitrile* and dilute to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 5 mg each of *fenofibrate impurity A IPRS* and *fenofibrate impurity B IPRS* in *acetonitrile* and dilute to 100.0 ml with *acetonitrile*. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). A 0.005 per cent w/v solution of *fenofibrate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with end capped octadecylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: a mixture of 70 volumes of *acetonitrile* and 30 volumes of acidified water,

- flow rate: 1.2 ml per minute,
- spectrophotometer set at 286 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Fenofibrate impurity A[1]	0.34	0.7
Fenofibrate impurity B[2]	0.36	1.0
(3 RS)-3-[4-(4-Chlorobenzoyl) phenoxy]butan-2one*	0.50	---
Methyl 2-[4-(4-chlorobenzoyl) phenoxy]-2-methyl-propanoate*	0.65	---
Ethyl 2-[4-(4-chlorobenzoyl) phenoxy]-2-methyl-propanoate*	0.80	---
(4-Chlorophenyl)[4-(1-methylethoxy) phenyl]methanone*	0.85	---
Fenofibrate	1.00	---
Fenofibrate impurity C[3]	1.35	---

*It is a process impurity.

[1](4- chlorophenyl) (4-hydrxyphenyl) methanone,

[2]2-[4-(4-chlorobenzoyl) phenoxy]-2-methyl propanoic acid,

[3]1-methylethyl 2-[[2-[4-(4-chlorobenzoyl)phenoxy]-2-methylpropanoyl]-2-methylpropanoate,

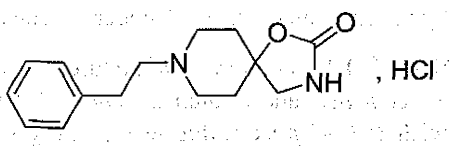
Inject reference solution (a) and reference solution (b). The test is not valid unless the resolution between the peaks corresponding to fenofibrate impurity A and fenofibrate impurity B is not less than 2.0 in the chromatogram obtained with reference solution (a) and the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (b).

Inject reference solution (b) and the test solution.

Calculate the content of $C_{20}H_{21}ClO_4$, in the tablets.

Storage. Store protected from moisture.

Fenspiride Hydrochloride



$C_{15}H_{20}N_2O_2$,HCl Mol Wt .296.8

Fenspiride Hydrochloride is 8-(2-Phenylethyl)-1-oxa-3,8-diazaspiro[4.5]decan-2-one hydrochloride.

Fenspiride Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{15}H_{20}N_2O_2$,HCl, calculated on the dried basis.

Category. Bronchodilator.

Description. A white to almost white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fenspiride hydrochloride IPRS* or with the reference spectrum of fenspiride hydrochloride.

B. It gives reaction (A) of chlorides (2.3.1).

Tests

pH (2.4.24). 4.5 to 6.5 , determined on 1.0 per cent w/v solution of substance under examination in *water* .

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *fenspiride hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 80 volumes of buffer solution prepared to dissolving 3.0 g of *sodium dihydrogen orthophosphate* in 1000 ml of *water,* adjusted to pH 3.0 with *orthophosphoric acid* and 20 volumes of *methanol,*
- flow rate: 1.3 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

The relative retention time for fensipiride impurity A is about 0.7 and for fensipiride impurity B is about 1.5 with respect to fensipiride hydrochloride.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution. The area of any peak due to fenspiride impurity A(1-phenyl ethyl-4-hydroxyl-4-amino methyl piperide-2- hydrochloride) is not more than 0.1 per cent , the area of the any peak due to fenspiride impurity B (2-phenyl ethyl -1-oxo-3,8-diazospiro-4,5 -ecan-2one-n-oxide) is not more than 0.2 per cent , the area of any other secondary peak is not more than 0.1 per cent and the sum of areas of all the secondary peaks is not more than 0.5 per cent, calculated by area normalisation.

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method A (10 ppm).

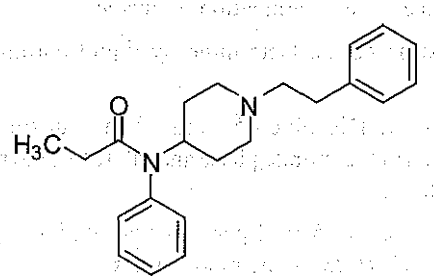
Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 0.3 g by drying in an oven at 100° for 3 hours at a pressure of 0.67 kPa.

Assay. Dissolve 0.235 g in 60.0 ml of the 1.0 per cent *mercuric acetate solution* in *glacial acetic acid*. Titrate with *0.1 M perchloric acid* to determine the end-point potentiometrically (2.4.25).

1 ml of *0.1 M perchloric acid* is equivalent to 0.029679 g of $C_{15}H_{20}N_2O_2,HCl$.

Fentanyl



$C_{22}H_{28}N_2O$ Mol. Wt. 336.5

Fentanyl is *N*-phenyl-*N*-[1-(2-phenylethyl)piperidin-4-yl]propanamide.

Fentanyl contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{22}H_{28}N_2O$, calculated on the dried basis.

Category. Analgesic.

Description. A white or almost white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fentanyl IPRS* or with the reference spectrum of fentanyl.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in 10.0 ml of *methanol*.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol*. Dilute 5.0 ml of the solution to 20.0 ml with *methanol*.

Reference solution (b). Dissolve 10 mg of the substance under examination in 10.0 ml of *dilute hydrochloric acid*. Heat on a water-bath under a reflux condenser for 4 hours. Neutralise with 10.0 ml of *dilute sodium hydroxide solution* and evaporate to dryness on a water-bath, cool and dissolve the residue in 10.0 ml of *methanol*, filter.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: A. a 0.5 per cent w/v solution of *ammonium carbonate* in a mixture of 10 volumes of *tetrahydrofuran* and 90 volumes of *water*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
15	40	60
20	40	60
25	90	10
30	90	10

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to fentanyl and fentanyl impurity D is not less than 8.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of secondary peaks corresponding to *N*-phenyl-*N*-[*cis,trans*-1-oxido-1-(2-phenylethyl)piperidin-4-yl]propanamide (fentanyl impurity A), *N*-phenyl-*N*-(piperidin-4-yl)propanamide (fentanyl impurity B), *N*-phenyl-*N*-[1-(2-phenylethyl)piperidin-4-yl]acetamide (fentanyl impurity C), *N*-phenyl-1-(2-phenylethyl)piperidin-4-amine (fentanyl impurity D) is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

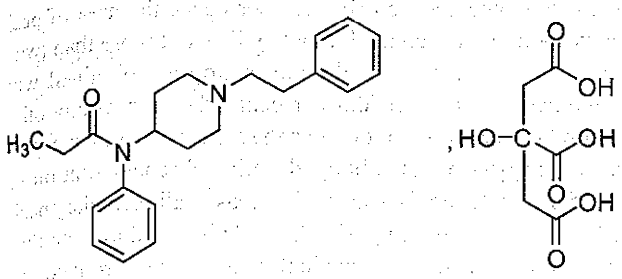
Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 50° under vacuum.

Assay. Dissolve 0.2 g in 50 ml of a mixture of 1 volume of *anhydrous acetic acid* and 7 volumes of *methyl ethyl ketone*. Titrate with *0.1 M perchloric acid*, using 0.2 ml of *naphtholbenzein solution* as indicator, until the colour changes from orange-yellow to green. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03365 g of $C_{22}H_{28}N_2O$.

Storage. Store protected from light.

Fentanyl Citrate



$C_{22}H_{28}N_2O,C_6H_8O_7$ Mol. Wt. 528.6

Fentanyl Citrate is *N*-(phenylethyl-4-piperidinyl)-*N*-phenylpropionamide citrate.

Fentanyl Citrate contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{22}H_{28}N_2O,C_6H_8O_7$, calculated on the dried basis.

Category. Analgesic.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fentanyl citrate IPRS* or with the reference spectrum of fentanyl citrate.

B. Melting point (2.4.21). 152°.

Tests

Appearance of solution. A 1.0 per cent w/v solution in *water* is clear (2.4.1) and colourless (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in 10.0 ml of *methanol.*

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol.* Dilute 5.0 ml of the solution to 20.0 ml with *methanol.*

Reference solution (b). Dissolve 10 mg of the substance under examination in 10.0 ml of *dilute hydrochloric acid.* Heat on a water-bath under a reflux condenser for 4 hours. Neutralise with 10.0 ml of *dilute sodium hydroxide solution* and evaporate to dryness on a water-bath, cool and dissolve the residue in 10.0 ml of *methanol* and filter. To prepare degradation compound *N*-phenyl-1-(2-phenylethyl)piperidin-4-amine (fentanyl citrate impurity D).

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: A. 0.5 per cent w/v solution of *ammonium carbonate* in a mixture of 10 volumes of *tetrahydrofuran* and 90 volumes of *water*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
15	40	60
20	40	60
25	90	10
30	90	10

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to fentanyl and fentanyl impurity D is not less than 3.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 50° under vacuum.

Assay. Weigh 0.3 g, dissolve in 50 ml of a mixture of 1 volume of *anhydrous acetic acid* and 7 volumes of *methyl ethyl ketone.* Titrate with *0.1 M perchloric acid,* using 0.2 ml of *naphtholbenzein solution* as indicator, until the colour changes from orange-yellow to green. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.05286 g of $C_{22}H_{28}N_2O,C_6H_8O_7$.

Storage. Store protected from light.

Fentanyl Injection

Fentanyl Citrate Injection

Fentanyl Injection is a sterile solution of Fentanyl Citrate in Water for Injections.

Fentanyl Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of fentanyl, $C_{22}H_{28}N_2O$.

Usual strength. 50 µg per ml.

Identification

A. When examined in the range 230 to 350 nm (2.4.7), a solution containing 0.005 per cent w/v of fentanyl exhibits two maxima at 251 and 257 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak obtained with the reference solution.

C. Gives reaction A for citrates (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of injection containing about 0.5 mg of Fentanyl to 10.0 ml with the mobile phase, if necessary.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (b). A 0.00005 per cent w/v solution of *N-phenyl-N-[cis,trans-1-oxido-1-(2-phenylethyl)piperidin-4-yl]propanamide IPRS (fentanyl impurity A IPRS)* in the mobile phase.

Reference solution (c). Dissolve 10 mg of *fentanyl citrate IPRS* in 10 ml of *2 M hydrochloric acid*, heat on a water-bath under a reflux condenser for 4 hours and neutralise with 10 ml of *2 M sodium hydroxide*. Evaporate to dryness on a water-bath, cool, dissolve the residue in 10 ml of *methanol* and filter. Dilute 1 ml of the filtrate to 10 ml with the mobile phase {generation of *N*-phenyl-1-(2-phenylethyl)piperidin-4-amine (fentanyl impurity D)}.

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with endcapped octadecylsilane bonded to porous silica (10 µm) (Such as Bondclone C18),
- mobile phase: a solution containing 0.3 per cent w/v of *potassium dihydrogen phosphate* in a mixture of 4 volumes of *acetonitrile*, 40 volumes of *methanol* and 56 volumes of *water*, adjusted to pH 3.2 with *ortho-phosphoric acid*,
- flow rate: 1.25 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 100 µl.

Inject reference solution (c).The relative retention time with reference to fentanyl for fentanyl impurity D is about 0.8.

Inject reference solution (a), (b) and the test solution. Run the chromatogram twice the retention time of the principal peak: In the chromatogram obtained with test solution the area of peak corresponding to fentanyl impurity A is not more than 0.5 times the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of peak corresponding to fentanyl impurity D is not more than twice the area of the peak in the chromatogram obtained with reference solution (a) (0.5 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent) and the sum of the areas of all secondary peaks other than fentanyl impurity A and D is not more than three times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.75 per cent). Ignore any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Bacterial endotoxins (2.2.3). Not more than 50.0 Endotoxin Units per mg.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of injection containing about 0.5 mg of Fentanyl to 10.0 ml with the mobile phase, if necessary.

Reference solution. A 0.008 per cent w/v solution of *fentanyl citrate IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

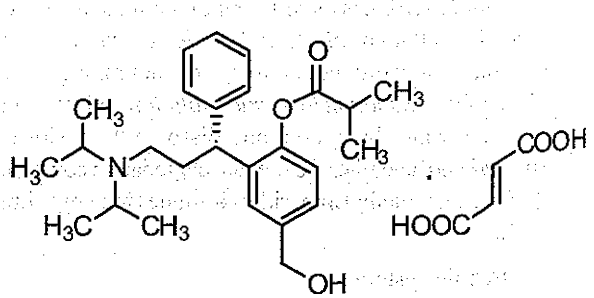
Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{28}N_2O$ in the injection.

Storage. Store protected from light.

Labelling. The quantity of active ingredient is stated in terms of the equivalent amount of fentanyl.

Fesoterodine Fumarate



$C_{30}H_{41}NO_7$ Mol Wt. 527.7

Fesoterodine Fumarate is 2-((*R*)-3-(Diisopropylamino)-1-phenylpropyl)-4-(hydroxymethyl)phenyl isobutyrate fumarate.

Fesoterodine Fumarate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{30}H_{41}NO_7$, calculated on the anhydrous basis.

Category. Anticholinergic.

Description. A white to off white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fesoterodine fumarate IPRS* or with the reference spectrum of fesoterodine fumarate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). +5.0° to +7.0°, determined in 1.0 per cent w/v solution in *ethanol* at 20°.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 60 volumes of mobile phase A and 40 volumes of *acetonitrile.*

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 25.0 ml with the solvent mixture.

Reference solution. A 0.001 per cent w/v solution of *fesoterodine fumarate IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: A. dissolve 2.72 g of *potassium dihydrogen orthophosphate* into 1000 ml of *water*, adjusted to pH 6.5 with *potassium hydroxide*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	60	40
20	60	40
45	40	60
50	40	60
53	60	40
60	60	40

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0.

Inject the test solution. The area of any secondary peak is not more than 0.5 per cent and the sum of area of all the secondary peaks is not more than 1.0 per cent, calculated by area normalization.

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 0.2 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 60 volumes of mobile phase A and 40 volumes of *acetonitrile.*

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 25.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.02 per cent w/v solution of *fesoterodine fumarate IPRS* in the solvent mixture.

Chromatographic system

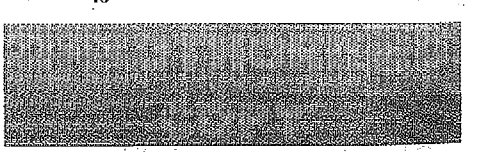
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: A. dissolve 2.72 g of *potassium dihydrogen orthophosphate* into 1000 ml of *water*, adjusted to pH 6.5 with *potassium hydroxide*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	55	45
20	55	45
25	40	60
30	40	60
32	55	45
40	55	45

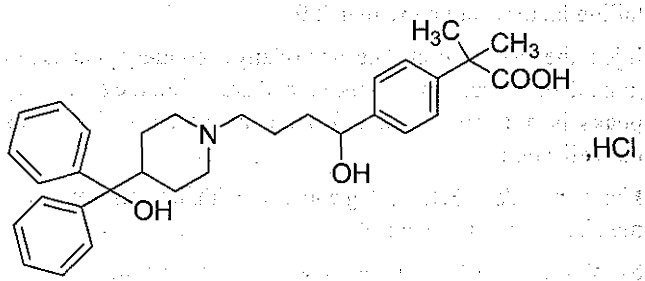
Inject the reference solution. The test is not valid unless the column efficiency is not less than 3500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{30}H_{41}NO_7$.



Fexofenadine Hydrochloride



$C_{32}H_{39}NO_4,HCl$ Mol. Wt. 538.1

Fexofenadine Hydrochloride is (*RS*) α,α-dimethyl-4-[1-hydroxy-4-[4-(hydroxydiphenylmethyl)-1 piperidinyl] butyl] benzene acetic acid hydrochloride.

Fexofenadine Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{32}H_{39}NO_4,HCl$, calculated on the anhydrous basis.

Categrory. Antihistaminic.

Description. A white to off-white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fexofenadine hydrochloride IPRS* or with the reference spectrum of fexofenadine hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Fexofenadine impurity B. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). A solution containing 0.025 per cent w/v of *fexofenadine hydrochloride IPRS* and 0.0005 per cent w/v of *{3-[1-hydroxy-4-[4-(hydroxydiphenyl-methyl)-1-piperidinyl]butyl]-α,α-dimethylbenzeneacetic acid hydrochloride} IPRS* (*fexofenadine impurity B IPRS*) in the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with beta cyclodextrin bonded to porous silica (5 µm),
- mobile phase: a mixture of 80 volumes of *ammonium acetate buffer* prepared by mixing 1.15 ml of *glacial acetic acid* in 1000 ml of *water*, adjusted to pH 4.0 with *6 M ammonium hydroxide* and 20 volumes of *acetonirile*,
- flow rate: 0.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject reference solution (a). The relative retention time with respect to fexofenadine, for fexofenadine impurity B is about 0.7 and the resolution between fexofenadine and fexofenadine impurity B is not less than 3.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to fexofenadine impurity B is not more than the area of the peak due to fexofenadine impurity B in the chromatogram obtained with reference solution (b) (0.2 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

Use the phosphate-perchlorate buffer, solvent mixture and chromatographic system as described under Assay.

Test solution. Dissolve 50 mg of the substance under examination in 50 ml of the solvent mixture.

Reference solution. A solution containing 0.0005 per cent w/v, of each, *fexofenadine hydrochloride IPRS* and *[benzeneacetic acid, 4-(1-oxy-4-[4-(hydroxydiphenylmethyl)-1-piperidinyl] butyl]-α,α-dimethyl] IPRS* (*fexofenadine impurity A IPRS*) in the mobile phase.

Inject the reference solution. The test is not valid unless the resolution between fexofenadine and fexofenadine impurity A is not less than 10, tailing factor is not more than 2.0 and the relative standard deviation for replicate injections for both peaks is not more than 2.0 per cent and 3.0 per cent respectively.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to the peak of fexofenadine impurity A is not more than 0.4 times the area of the corresponding peak in the chromatogram obtained with reference solution (0.2 per cent), area of any peak due to decarboxylated degradant [(+)-4-[1-hydroxy-4-(hydroxydi-phenylmethyl)-1-piperidinyl]-butyl]-isopropylbenzene], with a relative retention time of 3.2 with respect to fexofenadine hydrochloride, is not more than 0.3 times the area of the peak due to fexofenadine hydrochloride in the chromatogram obtained with reference solution (0.15 per cent) and the area of any secondary peak is not more than 0.2 times the area of the peak due to fexofenadine hydrochloride in the chromatogram obtained with reference solution (0.1 per cent). The sum of all the impurities is not more than 0.5 per cent.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Chlorides. 6.45 per cent to 6.75 per cent.

Dissolve about 0.3 g of the substance under examination in 50 ml of *methanol*. Titrate with *0.1 M silver nitrate*. Determine the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.00354 g of chloride.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent for the anhydrous form and 6.0 per cent to 10.0 per cent for the hydrate form (dihydrate and trihydrate forms of fexofenadine hydrochloride), determined on 1 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and *phosphate-perchlorate buffer*.

Test solution. Dissolve 50 mg of the substance under examination in 50 ml of the solvent mixture. Dilute 3.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A solution containing 0.006 per cent w/v of *fexofenadine hydrochloride IPRS* and 0.0005 per cent w/v of *fexofenadine impurity A IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with phenyl groups chemically bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of *phosphate-perchlorate buffer* prepared by dissolving 6.64 g of *monobasic sodium phosphate* and 0.84 g of *sodium perchlorate* in 1000 ml of *water*, adjusted to pH 2.0 with *orthophosphoric acid* and 35 volumes of *acetonitrile*. Add 3 ml of *triethylamine* to 1000 ml of the mixture,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between fexofenadine and fexofenadine impurity A is not less than 10, tailing factor is not more than 2.0 and the relative standard deviation for replicate injections for both peaks is not more than 2.0 per cent and 3.0 per cent respectively.

Inject the reference solution and the test solution.

Calculate the content of $C_{32}H_{39}NO_4$, HCl.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Fexofenadine Capsules

Fexofenadine Hydrochloride Capsules

Fexofenadine Capsules contain not less than 93.0 per cent and not more than 105.0 per cent of the stated amount of fexofenadine hydrochloride, $C_{32}H_{39}NO_4$,HCl.

Usual strengths. 120 mg; 180 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution (b) corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 50 rpm and 15 and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution (a). A 0.007 per cent w/v solution of *fexofenadine hydrochloride IPRS* in the dissolution medium.

NOTE — A small amount of methanol, not exceeding 0.5 per cent of the total volume, can be used to dissolve fexofenadine hydrochloride.

Reference solution (b). A solution containing 0.001 per cent w/v of *benzene acetic acid-4-[1-oxy-4(4-(hydroxydiphenyl-methyl)-1-piperidinyl]butyl)-α,α-dimethyl IPRS (fexofenadine impurity A IPRS)* and 0.006 per cent w/v of *fexofenadine hydrochloride IPRS* in *water*.

NOTE — A small amount of acetic acid, not exceeding 5 per cent of the total volume, can be used to dissolve fexofenadine impurity A.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 30 volumes of a buffer solution prepared by dissolving 1.0 g of *monobasic sodium phosphate*, 0.5 g of *sodium perchlorate*, and 0.3 ml of *orthophosphoric acid* in 300 ml of *water* and 70 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 50 µl.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to fexofenadine and fexofenadine impurity A is not less than 2.0 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Q. Not less than 50 per cent in 15 minutes and not less than 75 per cent in 45 minutes, of the stated amount of $C_{32}H_{39}NO_4$,HCl.

Related substances. Determine by liquid chromatography (2.4.14).

Phosphate-perchlorate buffer. Dissolve 6.64 g of *monobasic sodium phosphate* and 0.84 g of *sodium perchlorate* in 1000 ml of *water*. Adjusted to pH 2.0 with *orthophosphoric acid*.

Solvent mixture. 50 volumes of *acetonitrile* and 50 volumes of *phosphate-perchlorate buffer*.

Test solution (a). Weigh a quantity of the mixed contents of 20 capsules containing about 50 mg of Fexofenadine Hydrochloride, add 40 ml of solvent mixture and shake by mechanical means for 60 minutes. Mix with the aid of ultrasound for about 2 minutes. Cool and dilute to 50.0 ml with the solvent mixture.

Test solution (b). Dilute 3.0 ml of test solution (a) to 50.0 ml with the mobile phase.

Reference solution. A solution containing 0.006 per cent w/v of *fexofenadine hydrochloride IPRS* and 0.0005 per cent w/v of *fexofenadine impurity A IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with phenyl groups chemically bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of *phosphate-perchlorate buffer* and 35 volumes of *acetonitrile*. Add 0.3 ml of *triethylamine* and mix,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution.The test is not valid unless the resolution between fexofenadine and fexofenadine impurity A is not less than 10, tailing factor is not more than 2.0 and the relative standard deviation for replicate injections determined from fexofenadine and fexofenadine impurity A are not more than 2.0 per cent and 3.0 per cent respectively.

Inject the reference solution and test solution (a). In the chromatogram obtained with test solution (a) the area due to fexofenadine impurity A is not more than 0.8 times the area of the peak due to fexofenadine impurity A in the chromatogram obtained with the reference solution (0.4 per cent), the area of the peak due to decarboxilated degradant [(+)-4-[1-hydroxy-4-[4-(hydroxydi-phenylmethyl)-1-piperidinyl]-butyl]-isopropylbenzene having a relative retention time of 3.2 is not more than 0.03 times the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent), the area of any other individual impurity is not more than 0.03 times the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent), and the sum of all the impurities is not more than 0.5 per cent.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances.

Inject the reference solution and test solution (b).

Calculate the content of $C_{32}H_{39}NO_4$, HCl in the capsules.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Fexofenadine Tablets

Fexofenadine Hydrochloride Tablets

Fexofenadine Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of fexofenadine hydrochloride, $C_{32}H_{39}NO_4$,HCl.

Usual strengths. 120 mg; 180 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.001 M hydrochloric acid*,
Speed and time. 50 rpm and 10 and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution (a). Dissolve a weighed quantity of *fexofenadine hydrochloride IPRS* in the dissolution medium to obtain a solution having a known concentration similar to that expected for the solution under test.

NOTE — A small amount of methanol, not exceeding 0.5 per cent of the total volume, can be used to dissolve fexofenadine hydrochloride.

Reference solution (b). A 0.044 per cent w/v solution of *benzene acetic acid,-4-[1-oxy-4(4-(hydroxydiphenylmethyl)-1-piperidinyl]butyl)-α,α-dimethyl IPRS (fexofenadine impurity A IPRS)* in *water*. To 1.0 ml of the solution add 40 ml of reference solution (a).

NOTE — A small amount of acetic acid, not exceeding 5 per cent of the total volume, can be used to dissolve fexofenadine impurity A.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 30 volumes of a buffer solution prepared by dissolving 1.0 g of *monobasic sodium phosphate*, 0.5 g of *sodium perchlorate*, and 0.3 ml of *orthophosphoric acid* in 300 ml of *water* and 70 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject reference solution (b). The resolution between fexofenadine and fexofenadine impurity A is not less than 2.0.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution (a) and the test solution (a).

Q. Not less than 60 per cent in 10 minutes and not less than 80 per cent in 30 minutes, of the stated amount of $C_{32}H_{39}NO_4$,HCl.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 75 volumes of *acetonitrile* and 25 volumes of a 0.17 per cent v/v solution of *glacial acetic acid*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 120 mg of Fexofenadine Hydrochloride, disperse in 20 ml of 0.17 per cent v/v solution of *glacial acetic acid*, with vigorous shaking for 30 minutes and dilute to 100.0 ml with *acetonitrile*, shake vigorously for 60 minutes, filter.

Reference solution (a). A solution containing 0.025 per cent w/v of *fexofenadine hydrochloride IPRS* and 0.005 per cent w/v of *fexofenadine impurity A IPRS* in the solvent mixture. Dilute 3 ml and 4.5 ml, respectively, of the solutions to 50.0 ml with the mobile phase.

Reference solution (b). A 0.025 per cent w/v solution of *fexofenadine hydrochloride IPRS* in the solvent mixture. Dilute 4 ml of the solution to 100.0 ml with the mobile phase. Dilute 6 ml of the solution to 100.0 ml with the mobile phase.

Use the chromatographic system described under Assay.

Inject reference solution (b). The test is not valid unless the relative standard deviation for replicate injections is not more than 6.0 per cent.

Inject reference solution (a). The relative retention time with respect to fexofenadine for fexofenadine impurity A is about 1.6. The resolution between fexofenadine and fexofenadine impurity A is not less than 7, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent and not more than 3.0 per cent for fexofenadine and fexofenadine impurity A, respectively.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of the peak due to fexofenadine impurity A is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.4 per cent), the area of any individual impurity is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent), the area of the peak due to decarboxilated degradant [(+)-4-[1-hydroxy-4-[4-(hydroxydiphenylmethyl)-1-piperidinyl]-butyl]-isopropylbenzene having a relative retention time of 6.7 is not more than 0.12 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent) and the sum of all the impurities is not more than 0.5 per cent. Ignore any peak with an area less than 0.04 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 75 volumes of *acetonitrile* and 25 volumes of 0.17 per cent v/v *glacial acetic acid* in *water*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 150 mg of Fexofenadine Hydrochloride, disperse in 20 ml of a 0.17 per cent v/v solution of *glacial acetic acid*, with vigorous shaking for 30 minutes and dilute to 100.0 ml with *acetonitrile*, shake vigorously for 60 minutes and filter. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution. A 0.025 per cent w/v solution of *fexofenadine hydrochloride IPRS* in the solvent mixture. Dilute 3 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with phenyl groups chemically bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: a mixture of 64 volumes of a buffer solution prepared by diluting 7.5 ml of *acetonitrile* and 7.5 ml of *triethylamine* to 1000 ml with 0.17 per cent v/v *glacial acetic acid* in *water*, adjusted to pH 5.2 with *orthophosphoric acid* and 36 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{32}H_{39}NO_4$, HCl in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Fexofenadine Hydrochloride and Pseudoephedrine Hydrochloride Prolonged-release Tablets

Fexofenadine Hydrochloride and Pseudoephedrine Hydrochloride Sustained-release Tablets; Fexofenadine Hydrochloride and Pseudoephedrine Hydrochloride Extended-release Tablets

Fexofenadine Hydrochloride and Pseudoephedrine Hydrochloride Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Fexofenadine Hydrochloride and Pseudoephedrine Hydrochloride Prolonged-release Tablets contain not less than 93.0 per cent and not more than 107.0 per cent of the stated amounts of fexofenadine hydrochloride, $C_{32}H_{39}NO_4$, HCl and pseudoephedrine hydrochloride, $C_{10}H_{15}NO$, HCl.

Usual strength. Fexofenadine Hydrochloride, 60 mg and Pseudoephedrine Hydrochloride, 120 mg.

Identification

A. In the Assay, the principal peaks in the chromatogram obtained with test solution (b) correspond to the principal peaks in the chromatogram obtained with reference solution (f).

B. Determine by thin-layer chromatography (2.4.17), coating the plate with silica gel G.

Mobile phase. A mixture of 50 volumes of *toluene*, 45 volumes of *ethanol* and 5 volumes of *ammonium hydroxide*.

Test solution. Transfer a quantity of the powdered tablets containing 30 mg of Fexofenadine Hydrochloride to a 10-ml volumetric flask, add 5.0 ml of *methanol* and shake vigorously for 2 minutes, filter.

Reference solution. Dissolve suitable quantities of *fexofenadine hydrochloride IPRS* and *pseudoephedrine hydrochloride IPRS* in *methanol* to obtain a solution having concentration similar to that of the test solution.

Apply to the plate 10 µl of each solutions. After development, dry the plate in air. Heat the plate at 105° until the odour of ammonia disappears. Allow the plate to cool and examine under ultraviolet light at 254 nm. The Rf value of the principal spots in the chromatogram obtained with the test solution correspond to the spots in the chromatogram obtained with the reference solution.

NOTE —The Rf values of fexofenadine and pseudoephedrine are 0.17 and 0.39 respectively.

Tests

Dissolution (2.5.2).

For Fexofenadine hydrochloride —

Apparatus No. 2 (Paddle)

Medium. 900 ml of *0.001M hydrochloric acid,*

Speed and time. 50 rpm, 15 minutes and 45 minutes for fexofenadine hydrochloride and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary with the dissolution medium.

Reference solution. Dissolve suitable quantities of *fexofenadine hydrochloride IPRS* and *pseudoephedrine hydrochloride IPRS* in the dissolution medium to obtain a solution of known concentration similar to the expected concentration of the test solution.

NOTE — A small amount of methanol, not more than 0.5 per cent of the total volume, can be used to dissolve fexofenadine hydrochloride IPRS.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with sulphonated fluorocarbon polymer coated on a solid spherical core (strong cation- exchange packing) (10 µm) (Such as partisil 10 SCX),
- mobile phase: a mixture of 45 volumes of a buffer solution prepared by dissolving 7.0 g of *monobasic sodium phosphate* in 1000 ml of *water*, adjusted to pH 2.0 with *orthophosphoric acid* and 55 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to fexofenadine and pseudoephedrine is not less than 3.0, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent, for both the peaks.

Inject the reference solution and the test solution.

Calculate the content of $C_{32}H_{39}NO_4$, HCl and $C_{10}H_{15}NO$, HCl in the medium.

Q. After 15 minutes, not less than 65 per cent and at 45 minutes, not less than 80 per cent of the stated amount of $C_{32}H_{39}NO_4$,HCl.

For Pseudoephedrine hydrochloride — Complies with the test stated under Tablets.

Related substances. Determine by liquid chromatography (2.4.14),

Buffer solution. A solution prepared by dissolving 6.8 g of *sodium acetate* and 16.22 g of *sodium octanesulphonate* in 1000 ml of *water,* adjusted to pH 4.6 with *glacial acetic acid.*

Solvent mixture. 60 volumes of *methanol* and 40 volumes of the buffer solution.

Test solution (a). Disperse a sufficient quantity of the intact tablets containing 0.6 g of Fexofenadine Hydrochloride in 300 ml of *methanol,* with the aid of mechanical shaker for 60 minutes. Add 150 ml of the buffer solution and sonicate for 60 minutes at 40°, with intermittent shaking, cool to room temperature and dilute to 500.0 ml with the buffer solution, filter.

Test solution (b). Dilute 2.0 ml of test solution (a) to 50.0 ml with mobile phase.

Reference solution (a). Weigh and transfer 40 mg of *pseudoephedrine hydrochloride IPRS* to a 50-ml volumetric flask, add 5 ml of *tert-butyl hydroperoxide solution,* sonicate to dissolve. Cover the flask opening with aluminium foil and place the flask in an oven at 90° for 60 minutes, Remove from the oven and allow to cool, dilute to volume with the mobile phase (to generate ephedrine impurity).

Reference solution (b). Dissolve 20 mg, each of, *fexofenadine related compound A IPRS* and decarboxylated degradant in 60 ml of *methanol* and dilute to 100.0 ml with the buffer solution. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (c). A 0.048 per cent w/v solution of *fexofenadine hydrochloride IPRS* in the mobile phase.

Reference solution (d). A 0.12 per cent w/v solution of *pseudoephedrine hydrochloride IPRS* in the mobile phase.

Reference solution (e). Dilute 15.0 ml of reference solution (b), 5.0 ml of reference solution (c) and 4.0 ml of reference solution (d) to 50.0 ml with the mobile phase.

Reference solution (f). Dilute suitable volumes of reference solution (c) and reference solution (d) with the mobile phase to obtain a solution having similar concentration to that of test solution (b).

Chromatographic system

- a stainless steel column 5 cm x 4.6 mm, packed with a sulphonated fluorocarbon polymer coated on spherical core (strong cation exchange packing) (5 µm) (Such as Adsorbosphere XL SCX) connected in series to a column 25 cm x 4.6 mm, packed with phenyl group bonded to porous silica (5 µm) (Such as Zorbax SB phenyl),
- column temperature: 35°,
- mobile phase: a mixture of 35 volumes of a buffer solution prepared by dissolving 6.8 g of *sodium acetate* and 16.22 g of *sodium 1-octanesulfonate* in 1000 ml of *water,* adjusted to pH 4.6 with *glacial acetic acid,* and 65 volumes of *methanol,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set 215 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Fexofenadine	1.0	—
Pseudoephedrine	1.0	—
Ephedrone[a]	1.2	2.54
Fexofenadine related compound A[1b]	1.2	—
Tertiary dehydrated impurity[2b]	1.8	—
Decarboxylated degradant[3b]	3.1	—

[a]Relative retention time with reference to pseudoephedrine.

[b]Relative retention time with reference to fexofenadine.

[1]2-(4{4-[4-(hydroxydephenyl methyl)piperidin-1-yl]butanoxyl]-2-methyl propanoic acid,

[2]4-[4{4-(Diphenylmethylene)-1-piperidinyl}-1-hydroxybutyl]-2, 2-dimethyl phenyl acetic acid,

[3](±)-4-(1-Hydroxy-4-[4-(hydroxydiphenylmethyl)-1-piperidinyl]-butyl]-isopropylbenzene.

Inject reference solution (a) and (e). The test is not valid unless the resolution between the peaks due to pseudoephedrine and ephedrone is not less than 1.7 and the relative standard deviation for replicate injections is not more than 1.0 per cent for pseudoephedrine peak in the chromatogram obtained with reference solution (a), the resolution between the peaks due to fexofenadine and fexofenadine related compound A is not less than 2.0, the relative standard deviation for replicate injections is not more than 1.0 per cent for fexofenadine peak and not more than 3.0 per cent for fexofenadine related compound A and decarboxylated degradant in the chromatogram obtained with reference solution (e).

Inject reference solution (e) and test solution (a). In the chromatogram obtained with test solution (a), the area of any peak corresponding to fexofenadine related compound A is not more than 0.8 times the area of the corresponding peak in the chromatogram obtained with reference solution (e) (0.4 per cent), the area of any peak corresponding to decarboxylated degradant is not more than 0.4 times the area of the corresponding peak in the chromatogram obtained with reference solution (e) (0.2 per cent), the area of any peak corresponding to ephedone is not more than 0.05 times the area of the pseudoephedrine peak in the chromatogram obtained with reference solution (e) (0.2 per cent), the area of any other secondary peak is not more than 0.05 times the area of fexofenadine peak in the chromatogram obtained with reference solution (e) (0.2 per cent). Ignore any peak with an

area less than 0.0125 times the area of fexofenadine peak in the chromatogram obtained with reference solution (e) (0.05 per cent).

The sum of all the impurities is not more than 0.8 per cent.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances.

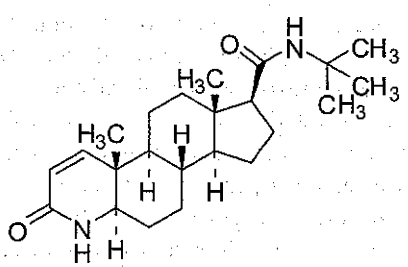
Inject reference solution (a) and (e). The test is not valid unless the resolution between the peaks due to pseudoephedrine and ephedrone is not less than 1.5 and the relative standard deviation for replicate injections is not more than 1.0 per cent for pseudoephedrine peak in the chromatogram obtained with reference solution (a), the resolution between the peaks due to fexofenadine and fexofenadine related compound A is not less than 2.0 and the relative standard deviation for replicate injection is not more than 1.0 per cent for fexofenadine peak in the chromatogram obtained with reference solution (e).

Inject reference solution (f) and test solution (b).

Calculate the content of $C_{32}H_{39}NO_4$, HCl and $C_{10}H_{15}NO$, HCl in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Finasteride



$C_{23}H_{36}N_2O_2$ Mol. Wt. 372.6

Finasteride is 17*β*-(*N-tert*-butylcarbamoyl)-4-aza-5α-androst-1-en-3-one.

Finasteride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{23}H_{36}N_2O_2$, calculated on the dried basis.

Category. Antiandrogen.

Description. A white or almost white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *finasteride IPRS* or with the reference spectrum of finasteride.

Tests

Specific optical rotation (2.4.22). +12.0° to +14.0°, determined in a 1.0 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture: Equal volumes of *acetonitrile* and *water*.

Test solution (a). Dissolve 25.0 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Test solution (b). Dissolve 100.0 mg of the substance under examination in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution (a). Dissolve 25.0 mg of *finasteride IPRS* in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (b). Dissolve 10 mg of *finasteride for peak identification IPRS* (containing impurities A and C) in 1.0 ml of the solvent mixture.

Reference solution (c). Dilute 1.0 ml of test solution (b) to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with base deactivated end capped octadecylsilane bonded to porous silica or ceramic microparticles (5 µm),
- column temperature: 60°,
- mobile phase: a mixture of 10 volumes *acetonitrile*, 10 volumes of *tetrahydrofuran* and 80 volumes of *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 15 µl.

Name	Relative retention time	Correction factor
Finasteride impurity A[1]	0.9	2.4
Finasteride	1.0	—
Finasteride impurity C[2]	1.3	0.72

[1] *N*-(1,1-dimethylethyl)-3-oxo-4-aza-5α-androstane-17β-cabroxamide carboxamide (Δ-1,5-aza amide)

[2] *N*-(1,1-dimethylethyl)-3-oxo-4-azaandrosta-1,5-diene-17β-(dihydrofinasteride).

Inject reference solution (b) and (c). The test is not valid unless the signal to noise ratio is not less 40 for the principal peak in the chromatogram obtained with reference solution (c) and the peak to valley ratio is not less than 5.0 where Hp = height above the baseline of the peak due to impurity A and Hv = height above the baseline of the lowest point of the curve separating this peak from the peak due to finasteride in the chromatogram obtained with reference solution (b).

Inject reference solution (c) and test solution (b). Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution (b) the area of secondary peak corresponding to finasteride impurity A and finasteride impurity C is not more than 3 times the area of the principal peak in the chromatogram obtained with the reference solution (c) (0.3 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent). Ignore any peak with an area less than 0. 5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances.

Inject reference solution (a) and test solution (a).

Calculate the content of $C_{23}H_{36}N_2O_2$.

Storage. Store protected from light.

Finasteride Tablets

Finasteride Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of finasteride, $C_{23}H_{36}N_2O_2$.

Usual strength. 5 mg.

Identification

In the test for Dissolution, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. The filtrate obtained as given above.

Reference solution. Dissolve a weighed quantity of *finasteride IPRS* in a mixture of 3 volumes of *water* and 7 volumes of *acetonitrile* and dilute with the same mixture to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Chromatographic system
- a stainless steel column 5.0 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature: 45°,
- mobile phase: a mixture of 42 volumes of *water* and 58 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 200 µl.

Inject the reference solution. The test is not valid unless the tailing factor of the principal peak is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{23}H_{36}N_2O_2$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{23}H_{36}N_2O_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of *acetonitrile* and 50 volumes of *water.*

Test solution. Dissolve a quantity of powdered tablets containing 100 mg of Finasteride in 30 ml of the solvent mixture and dilute to 50.0 ml with the solvent mixture, centrifuge and filter the supernatant liquid.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Spherisorb ODS 2),
- column temperature: 60°,
- mobile phase: a mixture of 10 volumes of *acetonitrile*, 10 volumes of *tetrahydrofuran* and 80 volumes of *water,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Finasteride impurity A[1]	0.9	2.4
Finasteride (Retention time about: 28 minutes)	1.0	—
Finasteride impurity B[2]	1.2	—
Finasteride impurity C[3]	1.3	0.72

[1] *N*-(1,1-dimethylethyl)-3-oxo-4-aza-5a-androstane-17b-carboxamide,
[2] Methyl 3-oxo-4-aza-5a-androst-1-ene-17b-carboxylate,
[3] *N*-(1,1-dimethylethyl)-3-oxo-4-azaandrosta-1,5-diene-17b-carboxamide.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any peak corresponding to finasteride impurities A, B and C is not more than 0.3 times the area of the principal peak in the chromatogram obtained with the reference solution (0.3 per cent). The area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of the areas of all other secondary peaks is not more than 0.6 times the area of the principal peak in the chromatogram obtained with the reference solution (0.6 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), using the chromatographic conditions and reference solution as described under Assay.

Test solution. Transfer one tablet to a suitable volumetric flask, add 5 ml of a mixture of 3 volumes of *water* and 7 volumes of *acetonitrile,* disperse with the aid of ultrasound for 20 minutes. Dilute, as necessary with the solvent mixture with intermittent shaking to produce a solution containing 0.01 per cent w/v of finasteride, mix and filter.

Calculate the content of $C_{23}H_{36}N_2O_2$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 50 mg of Finasteride with 25 ml of *water*. Add 350 ml of a mixture of 3 volumes of *water* and 7 volumes of *acetonitrile,* mix with the aid of ultrasound for 30 minutes, dilute to 500 ml with *acetonitrile*, centrifuge and filter the supernatant liquid.

Reference solution. A 0.01 per cent w/v solution of *finasteride IPRS* in a mixture of 3 volumes of *water* and 7 volumes of *acetonitrile*.

Chromatographic system

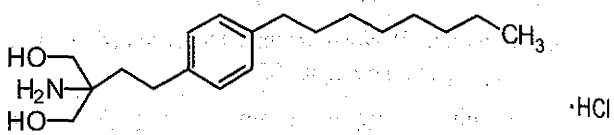
- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- column temperature: 45°,
- mobile phase: a mixture of equal volumes of *acetonitrile* and *0.0025 M* of *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor of the principal peak is less than 2.0 and the relative standard deviation for replicate injections is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{23}H_{36}N_2O_2$ in the tablets.

Fingolimod Hydrochloride



$C_{19}H_{33}NO_2$, HCl Mol Wt. 343.9

Fingolimod Hydrochloride is 2-amino-2-[2-(4-octylphenyl) ethyl] propane-1,3-diol hydrochloride.

Fingolimod Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{19}H_{33}NO_2$,HCl, calculated on the anhydrous basis.

Category. Immunomodulator

Description. A white to off-white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fingolimod hydrochloride IPRS* or with the reference spectrum of fingolimod hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. It gives reaction (A) of chlorides (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of *water* and 50 volumes of 0.1 per cent w/v solution of *orthophosphoric acid*.

Test solution. Dissolve 60 mg of the substance under examination in 100.0 ml of the solvent mixture.

Reference solution (a). A 0.0003 per cent w/v solution of *fingolimod hydrochloride IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 of reference solution (a) to 10.0 ml with the solvent mixture.

Reference solution (c). A 0.06 per cent w/v solution of *fingolimod hydrochloride system suitability mixture IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 3.0 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature: 40°,
- mobile phase: A. 0.1 per cent w/v solution of *orthophosphoric acid* in *water*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 5 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)

[5]2-amino-2-[4-octyl-3-(4-octylphenethyl)phenethyl]propane-1,3-diol,

[6]2-amino-2-[4-octyl-2-(4-octylphenethyl)phenethyl]propane-1,3-diol.

The relative retention time with reference to fingolimod for O-acetyl fingolimod (2-amino-2-(hydroxymethyl)-4-(4-octylphenyl)butyl acetate) is about 1.11.

Inject reference solution (a), (b) and (c). The test is not valid unless the resolution between the peaks due to O-acetyl fingolimod and fingolimod nonyl homolog is not less than 1.2 and peaks due to 2-phenethyl fingolimod analog and 3-phenethyl fingolimod is not less than 0.8 in the chromatogram obtained with reference solution (c), the relative standard deviation for replicate injections is not more than 10 per cent in the chromatogram obtained with reference solution (a) and signal-to-noise ratio is not less than 10 in the chromatogram obtained with reference solution (b).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to fingolimod hexyl homolog and fingolimod decyl homolog, each of, is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent), the area of any peak corresponding to fingolimod heptyl homolog, fingolimod nonyl homolog, 3-phenehyl fingolimod analog and 2-phenethyl finolimd analog, each of, is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method A (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 0.3 g.

Microbial contamination (2.2.9). The total aerobic viable count is not more than 10^3 CFU per g. The total combined molds and yeasts count is not more than 10^2 CFU per g.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modification.

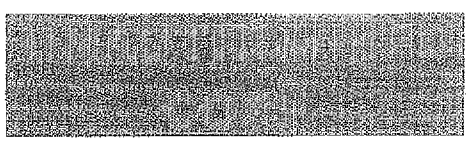
Reference solution. A 0.06 per cent w/v solution of *fingolimod hydrochloride IPRS* in the solvent mixture.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 5 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

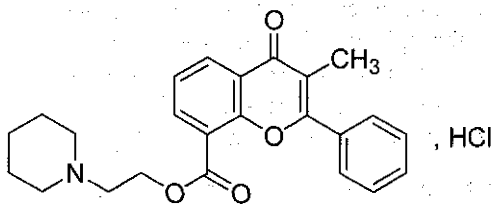
Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{33}NO_2,HCl$.

Storage. Store protected from moisture and at a temperature not exceeding 30°.



Flavoxate Hydrochloride



$C_{24}H_{25}NO_4,HCl$ Mol. Wt.427.9

Flavoxate Hydrochloride is 2-Piperidinoethyl 3-methyl-4-oxo-2-phenyl-4*H*-chromene-8-carboxylate hydrochloride.

Flavoxate Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{24}H_{25}NO_4,HCl$, calculated on the dried basis.

Category. Anticholinergic.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *flavoxate hydrochloride IPRS* or with the reference spectrum of flavoxate hydrochloride.

B. It gives reaction (A) of chlorides (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Use freshly prepared solutions.

Solvent mixture. 20 volumes of a 0.04 per cent w/v solution of *potassium dihydrogen phosphate,* adjusted to pH 3.0 with *orthophosphoric acid* and 80 volumes of *acetonitrile.*

Test solution. Dissolve 10 mg of the substance under examination in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the solvent mixture.

Reference solution (c). A solution containing 0.006 per cent w/v of *flavoxate impurity A IPRS* and 0.003 per cent w/v of *flavoxate impurity B IPRS* and 0.002 per cent w/v of the substance under examination in the solvent mixture. Dilute 1.0 ml of the solution to 20.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. 0.044 per cent w/v solution of *dipotassium hydrogen phosphate,* adjusted to pH 7.5 with *orthophosphoric acid,*
  B. *acetonitrile,*
- a gradient programme using the conditions given below,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	20	80
10	20	80
20	10	90
25	10	90
28	20	80

Name	Relative retention time
Flavoxate impurity A[1]	0.2
Flavoxate impurity B[2]	0.8
Flavoxate (Retention time: about 10 minutes)	1.0

[1]3-methyl-4-oxo-2-phenyl-4*H*-1-benzopyran-8-carboxylic acid,

[2]ethyl 3-methyl-4-oxo-2-phenyl-4*H*-1-benzopyran-8-carboxylate.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to fluvoxate impurity B and flavoxate is not less than 4.0.

Inject reference solution (a), (b), (c) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to fluvoxate impurity A is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.3 per cent), the area of any peak corresponding to fluvoxate impurity B is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.15 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all other secondary peaks is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. *(NOTE — In order to avoid overheating, mix thoroughly throughout and stop the titration immediately after the end-point has been reached).*

Dissolve 0.35 g in 10 ml of *anhydrous formic acid* and add 40 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04279 g of $C_{24}H_{25}NO_4,HCl$.

Storage. Store protected from light.

Flavoxate Tablets

Flavoxate Tablets contain Flavoxate Hydrochloride. The tablets are coated.

Flavoxate Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of flavoxate hydrochloride, $C_{24}H_{25}NO_4,HCl$.

Usual strength. 200 mg.

Identification

A. Extract a quantity of the powdered tablets containing 0.2 g of Flavoxate Hydrochloride with 10 ml of *dichloromethane*, filter and evaporate the filtrate to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *flavoxate hydrochloride IPRS* or with the reference spectrum of flavoxate hydrochloride.

B. In the test for Related substances, by applying 10 µl of each solution, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (c).

Tests

Dissolution (2.5.2).

Apparatus No.1 (Basket),

Medium. 900 ml of *0.1 M hydrochloric acid,*

Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with the medium, if necessary, at the maxima at about 294 nm (2.4.7). Calculate the content of $C_{24}H_{25}NO_4,HCl$ in the medium from the absorbance obtained from a solution of known concentration of *flavoxate hydrochloride IPRS* prepared by dissolving in minimum amount of *methanol* and diluted with the dissolution medium.

Q. Not less than 70 per cent of the stated amount of $C_{24}H_{25}NO_4,HCl$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 1 volume of *18 M ammonia*, 80 volumes of *propan-2-ol* and 200 volumes of *ethyl acetate*.

Test solution (a). Disperse a quantity of the powdered tablets containing 0.2 g of Flavoxate Hydrochloride with 10 ml of *chloroform* and filter.

Test solution (b). Dilute 1.0 ml of test solution (a) to 20.0 ml with *chloroform*.

Reference solution (a). A 0.015 per cent w/v solution of *3- methylflavone-8-carboxylic acid ethyl ester IPRS* in *chloroform*.

Reference solution (b). Dilute 1.0 ml of test solution (a) to 500.0 ml with *chloroform*.

Reference solution (c). A 0.1 per cent w/v solution of *flavoxate hydrochloride IPRS* in *chloroform*.

Reference solution (d). A 0.03 per cent w/v solution of *3-methylflavone-8-carboxylic acid IPRS* in *chloroform*.

Apply 10 µl of reference solution (a), (c), (d), test solution (b), 25 µl of reference solution (b) and 50 µl of test solution (a). After removal of the plate, allow it to dry in air and examine under ultraviolet light at 254 nm. Any spot corresponding to 3-methylflavone-8-carboxylic acid ethyl ester in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.15 per cent) and any other secondary spot in the chromatogram obtained with test solution (a), other than the spot corresponding to 3-methyflavone-8-carboxylic acid is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.1 per cent).

3-Methylflavone-8-carboxylic acid. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 4 volumes of *glacial acetic acid*, 25 volumes of *ethyl acetate* and 70 volumes of *cyclohexane*.

Test solution. Disperse a quantity of the powdered tablets containing 0.2 g of Flavoxate Hydrochloride with 10 ml of *chloroform* and filter.

Reference solution. A 0.01 per cent w/v solution of *3-methylflavone-8-carboxylic acid IPRS* in *chloroform*.

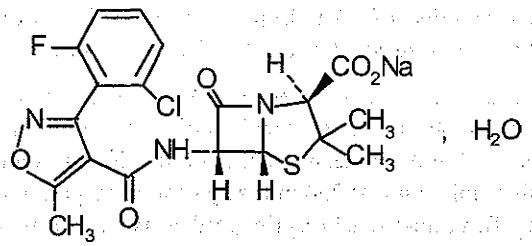
Apply 50 µl of each solution. After removal of the plate, allow it to dry in air and spray with *dilute potassium iodobismuthate solution*. Any spot corresponding to 3-methylflavone-8-carboxylic acid in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of powder containing 1 g of Flavoxate Hydrochloride with 600 ml of *0.1 M hydrochloric acid* with the aid of ultrasound for 10 minutes. Place in a water-bath at 70° for 90 minutes, cool and dilute to 1000 ml with *0.1 M hydrochloric acid*. Dilute 5.0 ml to 250.0 ml with *0.1 M hydrochloric acid* and measure the absorbance at 293 nm (2.4.7). Calculate the content of $C_{24}H_{25}NO_4$,HCl from the absorbance obtained by using a 0.002 per cent w/v solution of *flavoxate hydrochloride IPRS* in *0.1M hydrochloric acid*.

Storage. Store protected from light.

Flucloxacillin Sodium



$C_{19}H_{16}ClFN_3NaO_5S,H_2O$ Mol. Wt. 493.9

Flucloxacillin is sodium (2*S*,5*R*,6*R*)-6-[[[3-(2-chloro-6-fluorophenyl)-5-methylisoxazol-4- yl]carbonyl] amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2- carboxylate monohydrate.

Flucloxacillin contains not less than 95.0 per cent and not more than 102.0 per cent of $C_{19}H_{16}ClFN_3NaO_5S$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white or almost white hygroscopic, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and, C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum obtained with *flucloxacillin sodium IPRS* or with the reference spectrum of flucloxacillin sodium.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel*.

Mobile phase. A mixture of 30 volumes of *acetone* and 70 volumes of 15.4 per cent w/v solution of *ammonium acetate* adjusted to pH 5.0 with *glacial acetic acid*.

Test solution. Dissolve 25 mg of the substance under examination in 5 ml of *water*.

Reference solution (a). A 0.5 per cent w/v solution of *flucloxacillin sodium IPRS* in *water*.

Reference solution (b). A solution containing 0.5 per cent w/v each of *flucloxacillin sodium IPRS*, *cloxacillin sodium IPRS* and *dicloxacillin sodium IPRS* in *water*.

Apply to the plate 1 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and expose to iodine vapour until the spots appear and examine in day light. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.

C. Place 2 mg in a test-tube, moist with 0.05 ml of *water* and add 2 ml of *sulphuric acid-formaldehyde reagent*. Mix the contents of the tube by swirling; the colour of the solution is slightly greenish-yellow. Place the test-tube in a water-bath for 1 minute; the solution becomes yellow.

D. It gives reaction (A) of sodium (2.3.1).

Tests

Solution A. A 10.0 per cent w/v solution in *carbon dioxide-free water*.

Appearance of solution. Solution A is clear (2.4.1) and its absorbance at 430 nm (2.4.7) is not more than 0.04.

pH (2.4.24). 5.0 to 7.0, determined in solution A.

Specific optical rotation (2.4.22). + 158° to + 168°, determined in a 1.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 50.0 ml of the mobile phase.

Reference solution (a). A 0.001 per cent w/v solution of *flucloxacillin sodium IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.01 per cent w/v each of *flucloxacillin sodium IPRS* and *cloxacillin sodium IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 25 volumes of *acetonitrile* and 75 volumes of a 0.27 per cent w/v solution of

potassium dihydrogen phosphate, adjusted to pH 5.0 with *sodium hydroxide solution*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to cloxacillin (1st peak) and flucloxacillin (2nd peak) is not less than 2.5.

Inject reference solution (a) and the test solution. Run the chromatogram 6 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (5.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

***N,N*-Dimethylaniline** (2.3.21). Not more than 20 ppm, determined by method B.

2-Ethylhexanoic acid (2.3.51). Not more than 0.8 per cent.

Water (2.3.43). 3.0 per cent to 4.5 per cent, determined on 0.3 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *flucloxacillin sodium IPRS* in the mobile phase.

Use chromatographic system as described under test for Related substances.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{16}ClFN_3NaO_5S$.

Flucloxacillin sodium intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.2 Endotoxin Unit per mg of flucloxacillin sodium.

Storage. Store protected from moisture, at a temperature not exceeding 30°. If it is intended for use in manufacture of parenteral preparation, the container should be sterile, airtight and tamper proof.

Flucloxacillin Capsules

Flucloxacillin Sodium Capsules

Flucloxacillin Capsules contain Flucloxacillin Sodium.

Flucloxacillin Capsules contain not less than 92.5 per cent and not more than 110.0 per cent of the stated amount of flucloxacillin, $C_{19}H_{17}ClFN_3O_5S$.

Usual strengths: 250 mg and 500 mg equivalent to flucloxacillin.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *flucloxacillin sodium IPRS* or with the reference spectrum of flucloxacillin sodium.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the contents of capsules containing 0.1 g of flucloxacillin with 80 ml of the mobile phase for 15 minutes and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution *(b)*. A solution containing 0.01 per cent w/v each of *flucloxacillin sodium IPRS* and *cloxacillin sodium IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 25 volumes of *acetonitrile* and 75 volumes of a 0.27 per cent w/v solution of *potassium dihydrogen orthophosphate*, adjusted to pH 5.0 with *2 M sodium hydroxide*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to cloxacillin and flucloxacillin is not less than 2.5.

Inject reference solution (a) and the test solution. Run the chromatogram 6 times the retention time of the principal peak. In the chromatogram obtained with test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (5.0 per cent). Ignore any peak with an area less than

0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the contents of capsules containing 50 mg of Flucloxacillin in about 40 ml of the mobile phase with the aid of ultrasound for 15 minutes and dilute to 50 ml with the mobile phase. Further dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (a). A 0.011 per cent w/v solution of *flucloxacillin sodium IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.01 per cent w/v each of *flucloxacillin sodium IPRS* and *cloxacillin sodium IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to cloxacillin (1st peak) and flucloxacillin (2nd peak) is not less than 2.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{19}H_{17}ClFN_3O_5S$ in the capsules.

Labelling. The label states the quantity of the active ingredient in terms of the equivalent amount of flucloxacillin.

Flucloxacillin Oral Solution

Flucloxacillin Oral Solution is a mixture consisting of Flucloxacillin Sodium with buffering agents and other excipients and a suitable flavoring agent. It is filled in a sealed container.

The suspension is constituted by dispersing the contents of the sealed container in the specified volume of *water* just before use.

Flucloxacillin Oral Solution contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of flucloxacillin, $C_{19}H_{17}ClFN_3O_5S$.

When stored at the temperature and for the period stated on the label during which the constituted suspension may be expected to be satisfactory for use, it contains not less than 80.0 per cent of the stated amount of flucloxacillin.

Usual strengths. 125 mg per 5 ml; 250 mg per 5 ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.24). 4.0 to 7.0.

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Transfer an accurately weighed quantity of the oral suspension containing 50 mg of Flucloxacillin to a 50.0 ml volumetric flask, add 40 ml of mobile phase, shake for 15 minutes, dilute to volume with mobile phase and filter. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (a). A 0.011 per cent w/v solution of *flucloxacillin sodium IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.01 per cent w/v each of *flucloxacillin sodium IPRS* and *cloxacillin sodium IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 25 volumes of *acetonitrile* and 75 volumes of a 0.27 per cent w/v solution of *potassium dihydrogen orthophosphate*, adjusted to pH 5.0 with *2 M sodium hydroxide*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to cloxacillin (first peak) and flucloxacillin (second peak) is not less than 2.5 in the chromatogram obtained with reference solution (b) and in the chromatogram obtained with reference solution (a), the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

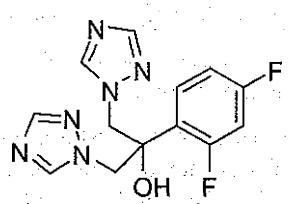
Inject reference solution (a) and the test solution.

Determine the weight per ml of the oral solution (2.4.29) and calculate the content of $C_{19}H_{17}ClFN_3O_5S$, weight in volume.

1 mg of $C_{19}H_{16}ClFN_3NaO_5S$ is equivalent to 0.9538 mg of $C_{19}H_{17}ClFN_3O_5S$.

Labelling. The quantity of active ingredient is stated in terms of the equivalent amount of flucloxacillin.

Fluconazole



$C_{13}H_{12}F_2N_6O$ Mol. Wt. 306.3

Fluconazole is 2-(2,4-difluorophenyl)-1,3-bis(1*H*-1,2,4-triazol-1-yl)propan-2-ol.

Fluconazole contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{13}H_{12}F_2N_6O$, calculated on the dried basis.

Category. Antifungal.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fluconazole IPRS* or with the reference spectrum of fluconazole.

B. When examined in the range 200 nm to 350 nm (2.4.7), a 0.025 per cent w/v solution in *methanol* shows absorption maxima at about 266 nm and 261 nm.

Tests

Appearance of solution. A 5.0 per cent w/v solution in *methanol* is clear (2.4.1) and colourless (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 300 mg of the substance under examination in 100 ml of the mobile phase.

Reference solution. A 0.003 per cent w/v solution of *fluconazole IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3.5 µm),
- column temperature: 40°,
- mobile phase: 80 volumes of *water* and 20 volumes of *acetonitrile*,
- flow rate: 0.5 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 20 µl.

The relative retention time with reference to fluconazole for 2-(2-fluoro-4-(1*H*-1,2,4-triazol-1-yl)phenyl]-1,3-bis(1*H*-1,2,4-triazol-1-yl)-propan-2-ol (fluconazole impurity A) is about 0.49, for 2-(4-fluorophenyl)-1,3-bis(1*H*-1,2,4-triazol-1-yl)-propan-2-ol (fluconazole impurity B) is about 0.81 and for 1',1' - (1,3-phenylene)di(1*H*-1,2,4-triazole) (fluconazole impurity C) is about 0.86.

The correction factor of fluconazole impurity A is 0.08, for fluconazole impurity B is 1.29 and for fluconazole impurity C is 0.05.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution the area of impurity peak at relative retention time about 0.6 is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent), the area of secondary peak due to fluconazole impurity A or fluconazole impurity C is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (0.2 per cent); the area of any peak corresponding to fluconazole impurity B is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (0.1 per cent), the area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent).

Iron (2.3.14). Dissolve 2.0 g in 20 ml of *ethanol* and 20 ml of *water* and mix; the resulting solution complies with the limit test for iron (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Dissolve 0.2 g in 100 ml of *glacial acetic acid*. Titrate with *0.1 M perchloric acid*. Determine the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01531 g of $C_{13}H_{12}F_2N_6O$.

Storage. Store protected from moisture.

Fluconazole Capsules

Fluconazole Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of fluconazole, $C_{13}H_{12}F_2N_6O$.

Usual strengths. 50 mg; 150 mg; 200 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter disc with an average pore diameter not more than 1.0 µm, rejecting the first few ml of the filtrate.

Determine by liquid chromatography (2.4.14), using the chromatographic system as described under Assay.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a weighed quantity of *fluconazole IPRS* in the dissolution medium and dilute with the dissolution medium to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Q. Not less than 80 per cent of the stated amount of $C_{13}H_{12}F_2N_6O$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the powder containing 100 mg of Fluconazole, disperse in 100.0 ml of the mobile phase and filter.

Reference solution (a). A 0.1 per cent w/v solution of *fluconazole IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 80 volumes of *water* and 20 volumes of *acetonitrile*,
- flow rate: 0.5 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 50 µl.

Name	Relative retention time	Correction factor
Fluconazole impurity A[1]	0.49	0.08
Fluconazole impurity B[2]	0.81	1.29
Fluconazole impurity C[3]	0.86	0.05
Fluconazole	1.0	---

[1]2-(2-fluoro-4-(1*H*-1,2,4-triazol-1-yl)phenyl]-1,3-bis(1*H*-1,2,4-triazol-1-yl)-propan-2-ol,

[2]2-(4-fluorophenyl)-1,3-bis(1*H*-1,2,4-triazol-1-yl)-propan-2-ol,

[3]1',1'- (1,3-phenylene)di(1*H*-1,2,4-triazole).

Inject reference solution (b). The test is not valid unless the column efficiency is not less than 1000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. Run the chromatogram four times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the peak in the chromatogram obtained with reference solution (b) (2.0 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the powder containing 50 mg of Fluconazole, add 70 ml of the mobile phase, sonicate for 15 minutes and dilute to 100.0 ml with the mobile phase and filter.

Reference solution. A 0.05 per cent w/v solution of *fluconazole IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water* and 40 volumes of *methanol*, adjusted to pH 3.6 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 261 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{13}H_{12}F_2N_6O$ in the capsules.

Storage. Store protected from moisture.

Fluconazole Oral Suspension

Fluconazole Oral Suspension is a mixture consisting of fluconazole with buffering agents and other excipients. It contains a suitable flavouring agent. It is filled in a sealed container.

The suspension is constituted by dispersing the contents of the sealed container in the specified volume of *water*.

Fluconazole Oral Suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of fluconazole, $C_{13}H_{12}F_2N_6O$.

Usual strengths. 50 mg per 5 ml; 200 mg per 5 ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

Tests

pH (2.4.24). 3.0 to 5.0.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 13 volumes of *acetonitrile* and 87 volumes of *ammonium formate* solution prepared by dissolving 630 mg of *ammonium formate* in 1000.0 ml *water.*

Test solution. Disperse a quantity of suspension containing 300 mg of fluconazole in 40 ml of the solvent mixture, mix with the aid of ultrasound. Dilute the resulting solution to 100.0 ml with the solvent mixture.

Reference solution (a). A 0.03 per cent w/v solution of *fluconazole IPRS*, 0.0003 per cent w/v solution each of *fluconazole impurity B IPRS*, and *fluconazole impurity C IPRS* in the solvent mixture.

Reference solution (b). A 0.0006 per cent w/v solution of *fluconazole IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 12.5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature: 40°,
- mobile phase: A. a 0.063 per cent w/v solution of *ammonium formate* in *water,*
  B. *acetonitrile,*
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	87	13
20	87	13
35	60	40
50	60	40
52	87	13
60	87	13

Name	Relative retention time
Fluconazole impurity A[1]	0.45
Fluconazole isomer[2]	0.51
Fluconazole impurity B[3]	0.71
Fluconazole impurity C[4]	0.78
Fluconazole	1.0

[1] 2-[2-Fluoro-4-(1*H* -1,2,4-triazol-1-yl)phenyl]-1,3-bis(1*H* -1,2,4-triazol-1-yl)-propan-2-ol, this is a process impurity,

[2] 2-(2,4-Difluorophenyl)-1-(1*H* -1,2,4-triazol-1-yl)-3-(4*H* -1,2,4-triazol-4-yl)propan-2-ol, this is a process impurity,

[3] 2-(4-Fluorophenyl)-1,3-bis (1*H* -1,2,4-triazol-1-yl)propan-2-ol, this is a process impurity,

[4] 1, 1'-(1,3-Phenylene) di (1*H* -1,2,4-triazole), this is a process impurity.

Inject reference solution (a). The test is not valid unless the resolution between peaks due to fluconazole impurity B and fluconazole impurity C is not less than 1.5, the resolution between the fluconazole impurity C and fluconazole is not less than 4.0, and the tailing factor for fluconazole peak is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with test solution, the area of any secondary peak is not more than the area of principal peak in the chromatogram obtained with the reference solution (b) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 1.5 times the area of principal peak in the chromatogram obtained with the reference solution (b) (0.3 per cent).

Microbial contamination (2.2.9). Total aerobic microbial count is not more than 100 CFU per g and total combined molds and yeasts is not more than 50 CFU per g. 1 g is free from *Escherichia coli*.

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determined by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *methanol* and *water*.

Test solution. Transfer a quantity of suspension containing 10 mg of fluconazole in 70 ml of the solvent mixture and mix with the aid of ultrasound. Dilute the resulting solution to 100.0 ml with the solvent mixture.

Reference solution (a). A 0.01 per cent w/v solution of *fluconazole IPRS* and 0.0024 per cent w/v solution of *sodium benzoate IPRS* in the solvent mixture.

Reference solution (b). A 0.01 per cent w/v solution of *fluconazole IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 20 volumes of *acetonitrile* and 80 volumes of buffer solution prepared by dissolving 2.72 g *potassium dihydrogen orthophosphate* in 1000 ml *water*, adjusted to pH 2.5 with *dilute orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 50 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to fluconazole and sodium benzoate is not less than 5.0, the tailing factor for fluconazole peak is not more than 2.0 and relative standard deviation for replicate injections of fluconazole peak is not more than 2.0 per cent.

Inject reference solution (b) and the test solution.

Determine the weight per ml (2.4.29) of the oral suspension.

Calculate the content of $C_{13}H_{12}F_2N_6O$.

Storge. Store protected from moisture at a temperature not exceeding 30°.

Fluconazole Tablets

Fluconazole Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of fluconazole, $C_{13}H_{12}F_2N_6O$.

Usual strengths. 50 mg; 100 mg; 150 mg; 200 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter disc with an average pore diameter not more than 1.0 µm, rejecting the first few ml of the filtrate.

Determine by liquid chromatography (2.4.14), using the chromatographic system as described under Assay.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a weighed quantity of *fluconazole IPRS* in the dissolution medium and dilute with the dissolution medium to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Q. Not less than 80 per cent of the stated amount of $C_{13}H_{12}F_2N_6O$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the powdered tablets containing 100 mg of Fluconazole, disperse in 100.0 ml of the mobile phase and filter.

Reference solution (a). A 0.1 per cent w/v solution of *fluconazole IPRS* in the mobile phase.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 80 volumes of *water* and 20 volumes of *acetonitrile*,
- flow rate: 0.5 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 50 µl.

Name	Relative retention time	Correction factor
Fluconazole impurity A[1]	0.49	0.08
Fluconazole impurity B[2]	0.81	1.29
Fluconazole impurity C[3]	0.86	0.05
Fluconazole	1.0	—

[1]2-(2-fluoro-4-(1*H*-1,2,4-triazol-1-yl)phenyl]-1,3-bis(1*H*-1,2,4-triazol-1-yl)-propan-2-ol,

[2]2-(4-fluorophenyl)-1,3-bis(1*H*-1,2,4-triazol-1-yl)-propan-2-ol,

[3]1',1' - (1,3-phenylene)di(1*H*-1,2,4-triazole).

Inject reference solution (b). The test is not valid unless the column efficiency is not less than 1000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. Run the chromatogram 4 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the peak in the chromatogram obtained with reference solution (b) (2.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 50 mg of Fluconazole with 70 ml of the mobile phase, sonicate for 15 minutes and dilute to 100.0 ml with the mobile phase, filter.

Reference solution. A 0.05 per cent w/v solution of *fluconazole IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water* and 40 volumes of *methanol*, adjusted to pH 3.6 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 261 nm,
- injection volume: 20 µl.

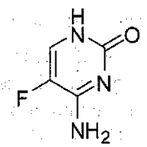
Inject the reference solution. The test is not valid unless the column efficiency is not less than 1000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{13}H_{12}F_2N_6O$.

Storage. Store protected from moisture.

Flucytosine



$C_4H_4FN_3O$ Mol. Wt. 129.1

Flucytosine is 4-amino-5-fluoro-2-(1*H*)-pyrimidinone.

Flucytosine contains not less than 98.5 per cent and not more than 101.0 per cent of $C_4H_4FN_3O$, calculated on the dried basis.

Category. Antifungal.

Dose.50 to 150 mg per kg body weight daily, in divided doses every 6 hours.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *flucytosine IPRS* or with the reference spectrum of flucytosine.

B. In the test for Related Substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to the peak in the chromatogram obtained with reference solution (a).

C. Mix about 5 mg with 45 mg of *heavy magnesium oxide* and ignite in a crucible until an almost white residue is obtained (usually less than 5 minutes). Allow to cool, add 1 ml of *water*, 0.05 ml of *phenolphthalein solution* and about 1 ml of *dilute hydrochloric acid* to render the solution colourless. Filter and add to the filtrate a freshly prepared mixture of 0.1 ml of *alizarin solution* and 0.1 ml of *zirconyl nitrate solution*. Mix, allow to stand for 5 minutes and compare the colour of the solution with that of a blank prepared in the same manner. The colour of the solution changes from red to yellow.

D. To 5 ml of solution A, add 0.15 ml of *bromine water* and shake. The colour of the solution is discharged.

Tests

Appearance of solution. A 1.0 per cent w/v solution in *carbon dioxide-free water* (solution A) is clear (2.4.1) and not more intensely coloured than reference solution BYS7 (2.4.1).

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. 40 volumes of *water* and 60 volumes of *methanol*.

Mobile phase. A mixture of 1 volume of *anhydrous formic acid*, 15 volumes of *water*, 25 volumes of *methanol* and 60 volumes of *ethyl acetate*.

Test solution (a). Dissolve 50 mg of the substance under examination in 5.0 ml of the solvent mixture.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with the solvent mixture.

Reference solution (a). A 0.1 per cent w/v solution of *flucytosine IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of test solution (b) to 100.0 ml with the solvent mixture.

Reference solution (c). Dissolve 5 mg of *fluorouracil IPRS* in 5.0 ml of reference solution (a).

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of cold air, heat at 110° for 10 minutes, place the plate, while hot, in a tank of chlorine vapours for 5 minutes, prepared by adding a mixture of 2 volumes of a 1.5 per cent w/v solution of *potassium permanganate*, 1 volume of *hydrochloric acid* and 1 volume of *water* contained in a beaker placed at the bottom of tank and allow the plate to stand for 15 minutes. Remove the plate from the tank and dry it in a current of cold air until the excess of chlorine is removed and an area of the plate below the line of application gives not more than a faint blue colour with a drop of *potassium iodide and starch solution*; avoid prolonged exposure to cold air. Spray the plate with *potassium iodide and starch solution* and examine the plate in daylight. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.1 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated principal spots.

Fluoride. Not more than 200 ppm.

NOTE—Prepare and store all solutions in plastic containers.

Buffer solution. Dissolve 58 g of *sodium chloride* in 500 ml of *water*. Add 57 ml of *glacial acetic acid* and 200 ml of a 10.0 per cent w/v solution of *cyclohexylenedinitrilotetra-acetic acid* in *1 M sodium hydroxide*. Adjusted to pH 5.0 to 5.5 with a

20.0 per cent w/v solution of *sodium hydroxide* and dilute to 1000.0 ml with *water*.

Test solution. Dissolve 1.0 g of the substance under examination in *water* and dilute to 100.0 ml with the same solvent.

Reference solution. Dissolve 4.42 g of *sodium fluoride*, previously dried at 120° for 2 hours, in 300 ml of *water* and dilute to 1000.0 ml with the same solvent (0.19 per cent w/v of fluoride). Prepare three reference solutions by diluting 1 ml in 100 ml, 1 ml in 1000 ml and 1 ml in 10000 ml.

To 20.0 ml of each reference solution, add 10.0 ml of the buffer solution and stir with a magnetic stirrer. Introduce the electrodes into the solution and allow to stand for 5 minutes with constant stirring, determining the end point potentiometrically (2.4.25) for fluoride ion, using a fluoride-selective indicator electrode and a silver-silver chloride reference electrode. Determine the potential difference between the electrodes. Plot on semi-logarithmic graph paper the potential difference obtained for each solution as a function of concentration of fluoride. Using exactly the same conditions, determine the potential difference obtained with the test solution and calculate the content of fluoride.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent, using platinum crucible.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.1 g, dissolve in 40 ml of *anhydrous acetic acid* and add 100 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01291 g of $C_4H_4FN_3O$.

Storage. Store protected from light.

Flucytosine Capsules

Flucytosine Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of flucytosine, $C_4H_4FN_3O$.

Usual strengths. 250 mg; 500 mg.

Identification

A. When examined in the range 200 nm to 400 nm (2.4.7), a 0.002 per cent w/v solution shows absorption maxima at about 260 nm and 350 nm.

B. Shake a portion of the contents of capsules containing about 500 mg of Flucytosine with 10 ml of *water* and filter. To 2 ml of the filtrate, add 1 ml of *sodium pentacyanoaminoferrate reagent* prepared by dissolving 100 mg of *sodium (tri)pentacyanoaminoferrate* in 20 ml of 1 per cent w/v solution of *sodium carbonate solution* and 1 ml of 3 per cent v/v *hydrogen peroxide*; a darker green colour is produced.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 75 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter. Use the filtrate, dilute if necessary, with the same solvent. Measure the absorbance at the maximum at about 276 nm (2.4.7). Calculate the content of $C_4H_4FN_3O$ in the medium from the absorbance obtained from a solution of known concentration of *flucytosine IPRS*.

Q. Not less than 80 per cent of the stated amount of $C_4H_4FN_3O$.

Other tests. Comply with the tests stated under Capsules.

Assay. Weigh a quantity of the contents of 20 capsules containing about 250 mg of Flucytosine, add about 50 ml of *0.1 M hydrochloric acid*, shake for 30 minutes, then dilute with *0.1 M hydrochloric acid* to produce 250.0 ml. Mix, and filter, discard the first 20 ml of the filtrate and dilute 10.0 ml of the filtrate to 250.0 ml with *0.1 M hydrochloric acid*. Further dilute 10.0 ml of the solution to 50.0 ml. with *0.1 M hydrochloric acid*. Measure the absorbance of the resulting solution at the maximum at about 285 nm (2.4.7). Calculate the content of $C_4H_4FN_3O$ from the absorbance obtained with 0.0008 per cent w/v solution of *flucytosine IPRS* in the same medium.

Storage. Store protected from light.

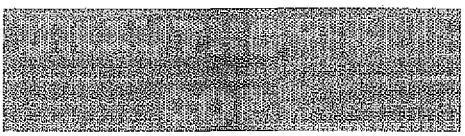
Flucytosine Oral Suspension

Flucytosine Oral Suspension is a suspension of Flucytosine in a suitable flavoured vehicle.

The suspension is constituted by dispersing the contents of the sealed container in the specified volume of water just before use.

Flucytosine Oral Suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of flucytosine, $C_4H_4FN_3O$.

When stored at the temperature and for the period stated on the label during which the constituted suspension may be expected to be satisfactory for use, it contains not less than 80.0 per cent of the stated amount of flucytosine $C_4H_4FN_3O$.



Usual strength. 10 mg per ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 4.0 to 5.0.

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the oral suspension containing about 5 mg of Flucytosine with 100.0 ml of the mobile phase.

Reference solution. A 0.005 per cent w/v solution of *flucytosine IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of *methanol* and 50 volumes of buffer solution prepared by dissolving 1 g of *ammonium acetate* and 1.0 ml of *di-isopropylamine* in 1000 ml of *water*, adjusted to pH 7.5 with *glacial acetic acid* ,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_4H_4FN_3O$ in the suspension.

Determine the weight per ml of the suspension (2.4.29) and calculate the content of $C_4H_4FN_3O$, weight in volume.

Storage. Store protected from light and moisture.

Labelling. The label states (1) the quantity of flucytosine per ml; (2) the temperature of storage and the period during which the constituted suspension may be expected to be satisfactory for use.

Flucytosine Tablets

Flucytosine Tablets contains not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of flucytosine, $C_4H_4FN_3O$.

Usual strengths. 250 mg; 500 mg.

Identification

A. Extract a quantity of the powdered tablets containing 0.5 g of flucytosine with 100 ml of *methanol* for 30 minutes, filter and evaporate the filtrate to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *flucytosine IPRS* or with the reference spectrum of flucytosine.

B. When examined in the range 230 to 350 nm (2.4.7), the solution obtained in the Assay shows absorption maxima only at about 286 nm.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 75 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter. Dilute the filtrate, if necessary, with the same solvent. Measure the absorbance at the maximum at about 276 nm (2.4.7). Calculate the content of $C_4H_4FN_3O$ in the medium from the absorbance obtained from a solution of known concentration of *flucytosine IPRS*.

Q. Not less than 80 per cent of the stated amount of $C_4H_4FN_3O$.

Related substances. Determine by thin layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 1 volume of *anhydrous formic acid* , 15 volumes of *water*, 25 volumes of *methanol* and 60 volumes of *ethyl acetate*.

Test solution. Shake a quantity of the powdered tablets containing 0.1 g of Flucytosine with 10.0 ml of a mixture of equal volumes of *13.5 M ammonia* and *methanol*, filter.

Reference solution (a). Dilute 1.0 ml of test solution to 10.0 ml with *methanol (60 per cent)*. Dilute 1.0 ml of the solution to 100.0 ml with *methanol (60 per cent)*.

Reference solution (b). Dilute 1.0 ml of test solution to 10.0 ml and dissolve 5 mg of *fluorouracil IPRS* in 5.0 ml of the resulting solution.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of cold air, heat at 110° for 10 minutes, place the plate, while hot, in a tank of chlorine gas prepared by adding *hydrochloric acid* to a 5 per cent w/v solution of *potassium permanganate* contained in a beaker placed in the tank and allow to stand for 15 minutes. Dry it in a current of cold air until an area of the plate below the line of application gives at most a very faint blue colour with a 0.5 per cent w/v solution of *potassium iodide* in *starch solution*; avoid prolonged exposure to cold air. Spray the plate with *potassium iodide* and *starch solution* and examine the

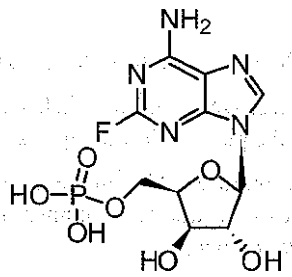
plate in daylight. Any secondary spot in the chromatogram obtained with test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.1 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated principal spots.

Other tests. Comply with the tests stated under tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.1 g of Flucytosine add 80 ml of *0.1 M hydrochloric acid*, shake for 15 minutes and Dilute to 100 .0 ml with *0.1 M hydrochloric acid* and filter. Dilute 10.0 ml of the filtrate to 100.0 ml with *0.1 M hydrochloric acid*. Further dilute 10.0 ml of the solution to 100.0 ml with *0.1 M hydrochloric acid*. Measure the absorbance of the resulting solution at the maximum at about 286 nm (2.4.7). Calculate the content of $C_4H_4FN_3O$ taking 709 as the specific absorbance at 286 nm.

Storage. Store protected from light.

Fludarabine Phosphate



$C_{10}H_{13}FN_5O_7P$ Mol. Wt. 365.2

Fludarabine Phosphate is [(2*R*,3*R*,4*S*,5*R*)-5-(6-Amino-2-fluoro-9-purinyl)-3,4-dihydroxy-2-oxolanyl]methoxyphosphonic acid.

Fludarabine Phosphate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{10}H_{13}FN_5O_7P$, calculated on the anhydrous and solvent free basis.

CAUTION: Fludarabine Phosphate is cytotoxic; Extra care required to prevent inhaling and exposing the skin to it.

Category. Antineoplastic.

Description. A white to off-white crystalline hygroscopic powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fludarabine phosphate IPRS* or with the reference spectrum of fludarabine phosphate.

Tests

Specific optical rotation (2.4.22). +10° to +14°, determined in a 0.5 per cent w/v solution.

Related substances. A. *For impurities eluting before fludarabine* —

Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). A 0.002 per cent w/v solution of *fludarabine phosphate IPRS* in the mobile phase.

Reference solution (b). Dissolve 10 mg of the substance under examination in 10 ml of *0.1M hydrochloric acid*. Heat the solution at 80° in a water-bath for 15 minutes

Use chromatographic system as described under Assay.

Name	Relative retention time	Correction factor
Iso-ara-guanine-monophosphate[1]	0.26	4.0
Isoguanine[2]	0.34	2.5
3',5'-Diphosphate analog[3]	0.42	1.9
Fludarabine phosphate	1.0	—

[1]6-Amino-9-β-D-arabinofuranosyl-2-oxo-1*H*-purine 5'-(dihydrogen phosphate)

[2]6-Amino-1*H*-purin-2(9*H*)-one

[3]9-β-D-arabinofuranosyl-2-fluoroadenine3'5'-bis(dihydrogen phosphate)

Inject reference solution (a) and (b). The test is not valid unless the resolution between the iso-ara-guanine monophosphate peak and the isoguanine peak is not less than 2.0 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of the peak due to iso-ara-guanine-monophosphate is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.8 per cent), the area of the peak due to isoguanine is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of the peak due to 3',5'-diphosphate analog is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent) and the area of the any other secondary peak that eluting before fludarabine phosphate is not more than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

B. *For impurities eluting after fludarabine* —

Determine by liquid chromatography (2.4.14), as described under test A with the following modifications.

- mobile phase: a mixture of 80 volumes of *10 mM monobasic potassium phosphate* and 20 volumes of *methanol*,

Name	Relative retention time	Correction factor
Fludarabine phosphate	1.0	—
2-Fluoroadenine[1]	1.5	0.5
2-Fluoro-ara-adenine[2]	1.9	0.6
2-Ethoxyphosphate analog[3]	2.5	1.8

[1] 2-fluoro-9*H*-purin-6-amine

[2] 9-β-D-Arabinofuranosyl-2-fluoroadenine

[3] 2-Ethoxy-9- β-D-arabinofuranosyladenine 5'-(dihydrogen phosphate)

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to 2-fluoroadenine is not more than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent), the area of any peak corresponding to 2-fluoro-ara-adenine is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any peak corresponding to 2-ethoxyphosphate analog is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any other secondary peak is not more than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

The sum of other secondary peaks obtained in test A and B is not more than 0.5 per cent and the sum of all the secondary peaks obtained in test A and B is not more than 1.5 per cent.

Chlorides (2.3.12). Dissolve 0.125 g in 15 ml of *water*. The solution complies with the limit test for chlorides (0.2 per cent).

Ethanol. Not more than 1.0 per cent.

Determine by gas chromatography (2.4.13).

Test solution. Dissolve 0.5 g of the substance under examination in *dimethylformamide* and dilute to 10.0 ml with *dimethylformamide*.

Reference solution. A 0.05 per cent w/v solution of *ethanol* in *dimethylformamide*.

Chromatographic system

- a capillary column 30 m x 0.25 mm, coated with 6 per cent cyanopropylphenyl- 94 per cent dimethylpolysiloxane (film thickness 1.4 µm),
- temperature:
  column. 40° for 10 minutes, then raised at the rate of 5° per minute to 70°, followed by an increase at a rate of 30° per minute to 220°,
- inlet port at 160° and detector at 250°,
- flame ionization detector,
- linear velocity: 27 cm per second, using nitrogen as the carrier gas.

Inject the reference solution. The test is not valid unless and the relative standard deviation for replicate injections is not more than 4.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of C_2H_5OH.

Free phosphate content. Not more than 0.1 per cent.

Test solution. Dissolve 10 mg of Fludarabine Phosphate in 2.0 ml of *water*, heat gently in a test-tube.

Reference solution. A 0.072 per cent w/v solution of *potassium dihydrogen phosphate* in *water*. Dilute 1.0 ml of the solution to 100 ml with *water*.

Molybdovanadic reagent. In a 150-ml beaker, mix 4 g of finely powdered *ammonium molybdate* and 0.1 g of finely powdered *ammonium vanadate*. Add 70 ml of *water* and grind the particles using a glass rod. A clear solution is obtained within a few minutes. Add 20 ml of *nitric acid* and dilute to 100.0 ml with *water*.

In 2.0 ml of the reference solution and the test solution in test tubes, add 2.0 ml *molybdovanadic reagent*. The yellow coloration of the test solution is not more intense than that of the reference solution.

Sodium. Determine by flame photometry (2.4.4).

Test solution. Dissolve 50 mg of the substance under examination in *water* and dilute to 100 ml with *water*.

Reference solution. Dissolve a quantity of *sodium chloride*, previously dried at 105° for 2 hours in *water* and dilute to 250.0 ml with *water* to obtain a solution having a concentration of 2.54 mg of sodium chloride per ml. Dilute the solution with *water* to obtain a solution containing 0.0001 per cent w/v of sodium.

Determine the atomic emission of the solutions at the sodium emission line at 589.0 nm. The emission response obtained with the test solution is not more than the reference solution (0.2 per cent).

Microbial contamination (2.2.9). The total aerobic microbial count is not more than 1000 CFU per g.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Water (2.3.43). Not more than 3.0 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 250.0 ml with the mobile phase.

Reference solution. A 0.002 per cent w/v solution of *fludarabine phosphate IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 94 volumes of *10 mM monobasic potassium phosphate* and 6 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{13}FN_5O_7P$.

Storage. Store protected from light and moisture, at a temperature between 2° to 8°.

Fludarabine Phosphate Injection

Fludarabine Phosphate Injection is a sterile solution of Fludarabine Phosphate in Water for Injections.

Fludarabine Phosphate Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of fludarabine phosphate, $C_{10}H_{13}FN_5O_7P$.

CAUTION: Fludarabine Phosphate is cytotoxic; Extra care required to prevent inhaling and exposing the skin to it.

Usual strength. 25 mg per ml.

Identification

A. A 0.0027 per cent w/v solution in *0.1 M hydrochloric acid* gives absorption maximum at 254 nm (2.4.7).

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 6.0 to 7.1.

Related substances. A. *For impurities eluting before fludarabine—*

Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of Fludarabine Phosphate in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). A 0.002 per cent w/v solution of *fludarabine phosphate IPRS* in the mobile phase.

Reference solution (b). Dissolve 10 mg of Fludarabine Phosphate in 10 ml of *0.1 M hydrochloric acid.* Heat the solution at 80° in a water-bath for 15 minutes.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 94 volumes of *10 mM monobasic potassium phosphate* in *water* and 6 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Iso-ara-guanine-monophosphate[1]	0.26	4.0
Isoguanine[2]	0.34	2.5
3',5'-Diphosphate analog[3*]	0.42	—
Fludarabine phosphate	1.0	—

*process impurity included for identification only and to be controlled in drug substance.

[1]6-Amino-9-β-D-arabinofuranosyl-2-oxo-1*H*-purine 5'-(dihydrogen phosphate),

[2]6-Amino-1*H*-purin-2(9*H*)-one,

[3]9-β-D-arabinofuranosyl-2-fluoroadenine3'5'-bis(dihydrogen phosphate).

Inject reference solution (a) and (b). The test is not valid unless the resolution between the iso-ara-guanine monophosphate peak and the isoguanine peak is not less than 2.0 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of the peak due to iso-ara-guanine-monophosphate is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent), the area of the peak due to isoguanine is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). The area of the any other secondary peak that eluting before to fludarabine phosphate is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent).

B. For impurities eluting after fludarabine —

Determine by liquid chromatography (2.4.14), as described in test A with the following modifications.

- mobile phase: a mixture of 80 volumes of *10 mM monobasic potassium phosphate* in *water* and 20 volumes of *methanol*,

Name	Relative retention time	Correction factor
Fludarabine phosphate	1.0	—
2-Fluoroadenine[1]	1.5	0.5
2-Fluoro-ara-adenine[2]	1.9	0.6
2-Ethoxyphosphate analog[3]*	2.5	—

*process impurity included for identification only and to be controlled in drug substance.

[1]2-fluoro-9*H*-purin-6-amin,

[2]9-β-D-Arabinofuranosyl-2-fluoroadenine,

[3]2-Ethoxy-9- β-D-arabinofuranosyladenine 5'-(dihydrogren phosphate).

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of the peak due to 2-fluoroadenine is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of the peak due to 2-fluoro-ara-adenine is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). The area of the any other secondary peak that elutes after fludarabine phosphate is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). The sum of areas of all the secondary peaks found in test A and B is not more than 2.0 per cent.

Bacterial endotoxins (2.2.3). Not more than 7.7 Endotoxin Units per mg of Fludarabine Phosphate.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Solution A. A 0.69 per cent w/v solution of *monobasic sodium phosphate monohydrate* in *water*, adjusted to pH 4.5 with *1 M sodium hydroxide*.

Test solution. Dilute a volume of injection containing 10 mg of Fludarabine Phosphate in 100.0 ml of solution A.

Reference solution. A 0.01 per cent w/v solution of *fludarabine phosphate IPRS* in solution A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 94 volumes of solution A and 6 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 20 µl.

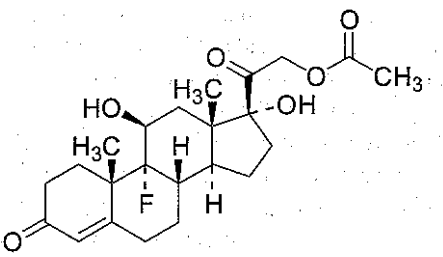
Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.8 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{13}FN_5O_7P$ in the injection.

Storage. Store protected from moisture and light, preferably of type I glass at a temperature 2° to 8°.

Fludrocortisone Acetate



$C_{23}H_{31}FO_6$ Mol. Wt. 422.5

Fludrocortisone Acetate is 9α-fluoro-11β,17α,21-trihydroxypregn-4-ene-3,20-dione 21-acetate.

Fludrocortisone Acetate contains not less than 96.0 per cent and not more than 104.0 per cent of $C_{23}H_{31}FO_6$, calculated on the dried basis.

Category. Mineralocorticoid.

Description. A white or almost white, crystalline powder; hygroscopic.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fludrocortisone acetate IPRS* or with the reference spectrum of fludrocortisone acetate.

B. To a warm 1 per cent w/v solution in *methanol* add an equal volume of *potassium cupri-tartrate solution*; a red precipitate is produced.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. A mixture of 90 volumes of *acetone* and 10 volumes of *formamide*.

Mobile phase. A mixture of 30 volumes of *toluene* and 10 volumes of *chloroform*.

Test solution. Dissolve 25 mg of the substance under examination in 10 ml of the solvent mixture.

Reference solution (a). Dissolve 25 mg of *fludrocortisone acetate IPRS* in 10 ml of the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

Tests

Specific optical rotation (2.4.22). +148° to +156°, determined in a 1.0 per cent w/v solution in *dioxan*.

Light absorption (2.4.7). Absorbance of a 0.001 per cent w/v solution in *ethanol* at the maximum at about 240 nm, 0.39 to 0.42.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 2 mg of *fludrocortisone acetate IPRS* and 2 mg of *hydrocortisone acetate IPRS* in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of *tetrahydrofuran* and 65 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Equilibrate the column with the mobile phase for about 30 minutes.

Inject reference solution (a). The retention times are: hydrocortisone acetate, about 8.5 minutes and fludrocortisone acetate about 10 minutes. The test is not valid unless the resolution between the peaks corresponding to hydrocortisone acetate and fludrocortisone acetate is at least 1.0. If this is not achieved, adjust the concentration of tetrahydrofuran in the mobile phase. Increasing the concentration of tetrahydrofuran reduces the retention times.

Inject reference solution (b) and the test solution. Continue the chromatography for twice the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak other than the principal peak is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of the areas of all such peaks is not greater than 0.75 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent). Ignore any peak due to the solvent and any peak with an area less than 0.025 times that of the principal peak in the chromatogram obtained with reference solution (b).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 10 mg, dissolve in 50 ml of *ethanol* and add sufficient *ethanol* to produce 100.0 ml. Dilute 5.0 ml of the solution to 50.0 ml with *ethanol* and mix. Measure the absorbance of the resulting solution (2.4.7) at the maximum at about 238 nm. Calculate the content of $C_{23}H_{31}FO_6$ taking 405 as the specific absorbance at 238 nm.

Storage. Store protected from light at a temperature not exceeding 30°.

Fludrocortisone Tablets

Fludrocortisone Acetate Tablets

Fludrocortisone Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of fludrocortisone acetate, $C_{23}H_{31}FO_6$.

Usual strength. 100 µg.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. 90 volumes of *acetone* and 10 volumes of *formamide*.

Mobile phase. A mixture of 30 volumes of *toluene* and 10 volumes of *chloroform*.

Test solution. Shake a quantity of the powdered tablets containing 1 mg of Fludrocortisone Acetate with 20 ml of *chloroform* for 5 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 4 ml of a mixture of 90 volumes of *chloroform* and 10 volumes of *methanol*.

Reference solution (a). Dissolve 25 mg of *fludrocortisone acetate IPRS* in 10 ml of the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 20 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 500 ml of *0.01M hydrochloric acid*,
Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *fludrocortisone acetate IPRS* in minimum amount of *acetonitrile* and dilute with the dissolution medium to obtain a solution of known concentration similar to the expected concentration of the test solution.

Chromatographic system
- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 45 volumes of *acetonitrile* and 55 volumes of *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 100 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injection is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{23}H_{31}FO_6$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{23}H_{31}FO_6$.

Uniformity of content. Complies with the test stated under Tablets.

Powder one tablet, disperse in 10 ml of *water* and extract with three quantities, each of 5 ml, of *chloroform*. Filter the extracts through a plug of cotton wool moistened with *chloroform*. Evaporate the chloroform on a water-bath just to dryness. Cool and dissolve the residue in 10.0 ml of *ethanol*. Measure the absorbance of the resulting solution at the maximum at about 240 nm (2.4.7). Calculate the content of $C_{23}H_{31}FO_6$ taking 405 as the specific absorbance at 240 nm.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution (a). Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.5 mg of Fludrocortisone Acetate with 2 ml of *water* for one minute, add 8 ml of *acetonitrile* and shake on a mechanical shaker for 40 minutes. Dilute the mixture to 20.0 ml with *acetonitrile*, centrifuge and use the supernatant liquid.

Test solution (b). Prepare in the same manner as test solution (a) but using 4.0 ml of a solution containing 0.01 per cent w/v of *norethisterone IPRS* (internal standard) in *acetonitrile* and 4.0 ml of *acetonitrile* in place of 8 ml of *acetonitrile*.

Reference solution. Mix 20.0 ml of internal standard, 25.0 ml of a 0.01 per cent w/v solution of *fludrocortisone acetate IPRS* in *acetonitrile* and 10 ml of *water* and dilute to 100.0 ml with *acetonitrile*.

Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (Such as Spherisorb ODS 1),

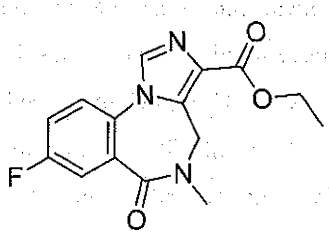
- mobile phase: a mixture of 40 volumes of *acetonitrile* and 60 volumes of *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject the reference solution and test solution (b).

Calculate the content of $C_{23}H_{31}FO_6$ in the tablets.

Storage. Store protected from light.

Flumazenil



$C_{15}H_{14}FN_3O_3$ Mol. Wt. 303.3

Flumazenil is 4*H*-imidazo[1,5-*a*][1,4]benzodiazepine-3-carboxylic acid, 8-fluoro-5,6-dihydro-5-methyl-6-oxo-, ethyl ester.

Flumazenil contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{15}H_{14}FN_3O_3$, calculated on the dried basis.

Category. Benzodiazepine toxcity antidote.

Description. A white to off-white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *flumazenil IPRS* or with the reference spectrum of flumazenil.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

N,N-dimethylformamide diethyl acetal. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 75 volumes of *chloroform*, 15 volumes of *glacial acetic acid*, 7.5 volumes of *ethanol* and 2.5 volumes of *water*.

Solvent mixture. Equal volumes of *ethanol* and *chloroform*.

Test solution. Disperse 250 mg of the substance under examination with the solvent mixture and dilute to 5.0 ml with the solvent mixture.

Reference solution (a). A solution containing 0.05 per cent w/v of *flumazenil IPRS* and 0.6 µl per ml of *flumazenil impurity C IPRS (N,N-dimethylformamide diethyl acetal IPRS)* in the solvent mixture.

Reference solution (b). Dilute 2.0 ml of reference solution (a) to 10.0 ml with the solvent mixture.

Apply to the plate 10 µl of each solution. After development, dry the plate in cold air and examine under ultraviolet light at 254 nm. Spray the plate with *ninhydrin solution* and heat at 105° for 15 minutes. Any spot at an Rf value 0.04 corresponding to flumazenil impurity C in the chromatogram obtained from the test solution is not more intense than the corresponding spot in the chromatogram obtained with reference solution (b) (0.2 per cent).

Related substances. Determine by liquid chromatography (2.4.14) as described under Assay with the following modifications.

Reference solution (c). A 0.0001 per cent w/v solution of *flumazenil IPRS* in the mobile phase.

Name	Relative retention time	Correction factor
Flumazenil impurity A[1]	0.4	0.91
Flumazenil impurity C[2]	0.5	0.67
Flumazenil impurity D[3]	0.7	0.77
Flumazenil impurity B[4]	0.8	0.91
Flumazenil	1.0	—
Flumazenil impurity E[5]	2.2	0.91

[1]8-fluoro-5,6-dihydro-5-methyl-6-oxo-4*H*-imidazol-[1,5-*a*][1,4]benzodiazepine-3-carboxylic acid,

[2]7-fluoro-4-methyl-3,4-dihydro-2,5*H*-1,4-benzodiazepine-2,5-dione,

[3]ethyl 5,6-dihydro-5-methyl-6-oxo-4*H*-imidazo-[1,5- *a*][1,4] benzodiazepine-3-carboxylate,

[4]ethyl 8-hydroxy-5,6-dihydro-5-methyl-6-oxo-4*H*-imidazol-[1,5-][1,4] benzodiazepine-3-carboxylate,

[5]ethyl 8-chloro-5,6-dihydro-5-methyl-6-oxo-4*H*-imidazo-[1,5-*a*][1,4] benzodiazepine-3-carboxylate.

Inject reference solution (c) and the test solution. Run the chromatograms 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak due to flumazenil impurities A, B, C, D and E is not more than twice the area of the principal peak in the chromatogram obatined with reference solution (c) (0.2 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of

the principal peak in the chromatogram obatined with reference solution (c) (0.5 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Bacterial endotoxins (2.2.3). Not more than 25.0 Endotoxin Units per mg of flumazenil.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse 25 mg of the substance under examination with the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). A 0.1 per cent w/v solution of *flumazenil IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.00064 per cent w/v each of *flumazenil IPRS* and *flumazenil impurity B IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 80 volumes of 800 ml of *water*, adjusted to pH 2.0 with *orthophosphoric acid*, 13 volumes of *methanol* and 7 volumes of *tetrahydrofuran*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 5 µl.

Inject reference solution (a) and (b). The test is not valid the resolution between the peak due to flumazenil impurity B and flumazenil is not less than 4.0, the column efficiency is not less than 1500 theoretical plates for the principal peak and the tailing factor is not more than 1.5 for the principal peak in the chromatogram obtained with reference solution (b) and in the chromatogram obtained with reference solution (a), the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{15}H_{14}FN_3O_3$.

Storage. Store protected from moisture.

Flumazenil Injection

Flumazenil Injection is a sterile solution of Flumazenil.

Flumazenil Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of $C_{15}H_{14}FN_3O_3$.

Usual strength. 0.1 mg per ml.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 90 volumes of *ethyl acetate* and 10 volumes of *methanol*.

Test solution. Dilute a volume of injection containing 10 mg of Flumazenil to 100.0 ml with *water*.

Reference solution. A 0.01 per cent w/v solution of *flumazenil IPRS* in a mixture of 9 volumes of *water* and 1 volume of *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 3.4 to 4.6.

Related substances. Determine by liquid chromatography (2.4.14) as described under Assay with the following modifications.

Name	Relative retention time	Coprrection factor
Flumazenil impurity A[1]	0.71	1.1
Flumazenil impurity B[2]	0.85	—
Flumazenil	1.0	—

[1]8-fluoro-5,6-dihydro-5-methyl-6-oxo-4*H*-imidazol-[1,5-*a*][1,4]benzodiazepine-3-carboxylic acid,

[2]ethyl 8-hydroxy-5,6-dihydro-5-methyl-6-oxo-4*H*-imidazol-[1,5-*a*][1,4]benzodiazepine-3-carboxylate.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of the peak due to flumazenil impurity A is not more than 1.0 per cent and the area of any other secondary peak is not more than 0.5 per cent. The sum of areas of all the secondary peaks other than flumazenil impurity A is not more than 1.0 per cent and the sum of areas of all the secondary peaks is not more than 2.0 per cent, calculated by area normalization.

Bacterial endotoxins (2.2.3). Not more than 100 Endotoxin Units per mg of flumazenil.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 75 volumes of *water*, 20 volumes of *tetrahydrofuran* and 5 volumes of *methanol*.

Test solution. Dilute a volume of injection to obtain a 0.01 per cent w/v solution of Flumazenil in the solvent mixture.

Reference solution. A 0.01 per cent w/v solution of *flumazenil IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with nitrile groups chemically bonded to porous silica (5 µm),
- mobile phase: a mixture of 75 volumes of 0.02 M phosphate buffer prepared by adding *0.02 M orthophosphoric acid* to *0.02 M monobasic potassium phosphate* to obtain a solution pH 2.7, 20 volumes of *tetrahydrofuran* and 5 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

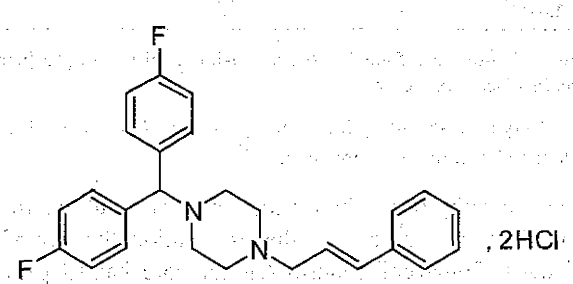
Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{14}FN_3O_3$ in the injection.

Storage. Store protected from moisture in single-dose containers, preferably of Type I glass and at controlled room temperature.

Flunarizine Dihydrochloride



$C_{26}H_{28}Cl_2F_2N_2$ Mol. Wt. 477.4

Flunarizine Dihydrochloride is 1-[Bis(4-fluorophenyl)methyl]-4-[(2E)-3-phenylprop-2-enyl]piperazine dihydrochloride.

Flunarizine Dihydrochloride contains not less than 99.0 per cent and not more than 101.5 per cent of $C_{26}H_{28}Cl_2F_2N_2$ calculated on the dried basis.

Category. Antimigraine, Anti-vertigo.

Description. A white or almost white powder, hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *flunarizine dihydrochloride IPRS* or with the reference spectrum of flunarizine dihydrochloride.

B. Dissolve 25 mg in 2 ml of *methanol* and add 0.5 ml of *water*, it gives reaction (A) of chlorides (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use and protect from light.

Test solution. Dissolve 100 mg of the substance under examination in *methanol* and dilute to 10.0 ml with the same solvent.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with *methanol*. Dilute 5.0 ml of the solution to 20.0 ml with the same solvent.

Chromatographic system
- a stainless steel column 10 cm × 4.6 mm, packed with base deactivated octadecylsilane bonded to porous silica (3 µm),
- mobile phase: A. a mixture of 2.38 per cent w/v solution of *tetrabutylammonium hydrogen sulphate* and 0.7 per cent w/v solution of *ammonium acetate*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
12	40	60
15	40	60
16	80	20
20	80	20

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than twice the area of the principal

peak in the chromatogram obtained with the reference solution (0.5 per cent), the area of not more than one other secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.25 per cent), the area of any other secondary peak is not more than 0.4 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of areas of all the secondary peaks is not more than the 4 times the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent, using platinum crucible.

Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

Assay. Dissolve 0.2 g of the substance under examination in 70 ml of *ethanol*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Read the volume added at the second point of inflexion. Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.02387 g of $C_{26}H_{28}Cl_2F_2N_2$.

Storage. Store protected from light and moisture.

Flunarizine Tablets

Flunarizine Dihydrochloride Tablets

Flunarizine Tablets contain flunarizine dihydrochloride equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of flunarizine, $C_{26}H_{26}F_2N_2$.

Usual strengths. 5 mg; 10 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 500 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with the medium if necessary, at the maximum at about 253 nm (2.4.7). Calculate the content of $C_{26}H_{26}F_2N_2$ in the medium from the absorbance obtained from a solution of known concentration of *flunarizine dihydrochloride IPRS* in the same medium.

Q. Not less than 75 per cent of the stated amount of $C_{26}H_{26}F_2N_2$.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14) as described under Assay with the following modification.

Test solution. Disperse one intact tablet in 5 ml of *water* with the aid of ultrasound, until tablet is completely dispersed and dilute with *methanol* to obtain a solution containing 0.001 per cent w/v solution of Flunarizine.

Inject the reference solution and the test solution.

Calculate the content of $C_{26}H_{26}F_2N_2$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powdered tablets containing 20 mg of Flunarizine in 5 ml of *water* with the aid of ultrasound. Add 70 ml of *methanol* and further sonicate to dissolve, dilute to 100.0 ml with *methanol*. Dilute 5.0 ml of the solution to 100.0 ml with *methanol*.

Reference solution. A 0.0012 per cent w/v solution of *flunarizine dihydrochloride IPRS* in *methanol*.

Chromatographic system

- a stainless steel column 12.5 cm × 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Lichrospher 100 RP 18-E),
- mobile phase: a mixture of 20 volumes of a buffer solution prepared by dissolving 1.13 g of *1- hexane sulphonic acid sodium salt (anhydrous)* in 200 ml of *water* and 80 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

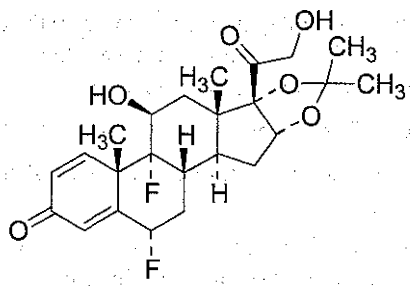
Inject the reference solution and the test solution.

Calculate the content of $C_{26}H_{26}F_2N_2$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of flunarizine.

Fluocinolone Acetonide



$C_{24}H_{30}F_2O_6$ Mol. Wt. 452.5

Fluocinolone Acetonide is 6α,9α-difluoro-11β,21-dihydroxy-16α,17α -isopropylidenedioxypregna-1,4-diene-3,20-dione.

Fluocinolone Acetonide contains not less than 96.0 per cent and not more than 104.0 per cent of $C_{24}H_{30}F_2O_6$, calculated on the dried basis.

Category. Adrenocortical steroid.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if tests A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fluocinolone acetonide IPRS* or with the reference spectrum of fluocinolone acetonide.

B. In the related substances test, the principlal peak in the chromatogram obtained with reference solution (b) is similar in retention time to the peak due to *fluocinolone acetonide IPRS* in the chromatogram obtained with reference solution (a).

C. Heat 0.5 ml of *chromic-sulphuric acid* in a test-tube (5 cm x about 6 mm) in a naked flame until white fumes are evolved; the solution wets the sides of the tube readily and there is no greasiness. Add 2 or 3 mg of the substance under examination and again heat in a naked flame until white fumes appear; the solution does not wet the sides of the tube and does not pour easily from the tube.

Tests

Specific optical rotation (2.4.22). +92.0° to +96.0°, determined in a 1.0 per cent w/v solution in *dioxan*.

Light absorption. Dissolve 15 mg in about 50 ml of *ethanol* and dilute to 100.0 ml with *ethanol*. Dilute 10.0 ml of the solution to 100.0 ml with *ethanol*. Absorbance of the resulting solution at the maximum at about 239 nm, 0.52 to 0.56 (2.4.7).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in *acetonitrile* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 2.5 mg of *fluocinolone acetonide IPRS* and 2.5 mg of *triamcinolone acetonide IPRS* in 45 ml of *acetonitrile* and dilute to 100 ml with *water*.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *acetonitrile*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with base-deactivated end-capped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 450 ml of *acetonitrile* and 500 ml of *water*, allowed to equilibrate, the volume adjusted to 1000 ml with *water* and mixed again,
- flow rate: 1 ml per minute,
- spectrophotometer set at 238 nm,
- injection volume: 20 µl.

Inject reference solution (a). The retention times are: triamcinolone acetonide about 8.5 minutes and fluocinolone acetonide about 10 minutes. The test is not valid unless the resolution between the peaks corresponding to triamcinolone acetonide and fluocinolone acetonide is not less than 3.0.

Inject reference solution (b) and the test solution. Continue the chromatography for 4 times the retention time of fluocinolone acetonide. In the chromatogram obtained with the test solution the area of any peak other than the principal peak is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent); not more than one such peak is more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of the areas of all such peaks is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.5 per cent). Ignore any peak due to the solvent and any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Dissolve 50 mg in *ethanol*, add sufficient *ethanol* to produce 50.0 ml and mix. Dilute 2.0 ml of the solution to 100.0 ml with *ethanol*. Measure the absorbance of the resulting solution at the maximum at about 238 nm. Calculate the content of $C_{24}H_{30}F_2O_6$, taking 355 as the specific absorbance at 238 nm.

Storage. Store protected from light.

Fluocinolone Cream

Fluocinolone Acetonide Cream

Fluocinolone Cream contains Fluocinolone Acetonide in a suitable cream base.

Fluocinolone Cream contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of fluocinolone acetonide, $C_{24}H_{30}F_2O_6$.

Usual strengths. 0.0025 per cent; 0.00625 per cent; 0.01 per cent; 0.025 per cent; 0.2 per cent w/w.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 60 volumes of *n-hexane*, 40 volumes of *chloroform*, 10 volumes of *methanol* and 1 volume of *triethylamine*.

Test solution. Disperse, by shaking a quantity of the cream containing 0.25 mg of Fluocinolone Acetonide in 2 ml of *chloroform*, add 10 ml of *methanol*, shake vigorously, cool in ice for 15 minutes, centrifuge at 3000 rpm for 15 minutes, decant the clear supernatant liquid, evaporate to dryness on a water-bath in a current of nitrogen and dissolve the residue in 1 ml of *chloroform*.

Reference solution. A 0.025 per cent w/v solution of *fluocinolone acetonide IPRS* in *chloroform*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air until the odour of the solvent is no longer detectable, heat at 105° for 5 minutes and spray whilst hot with *blue tetrazolium solution*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution (a) has the same retention time as that of the peak due to Fluocinolone Acetonide in the chromatogram obtained with the reference solution.

Tests

Other tests. Comply with the tests stated under Creams.

Assay. Determine by liquid chromatography (2.4.14).

For creams containing 0.025 per cent to 0.2 per cent w/w of fluocinolone acetonide—

Test solution (a). Weigh a quantity of the cream containing about 2.5 mg of Fluocinolone Acetonide, add 60 ml of a solution prepared by adding 80 ml of *methanol* to 20 ml of a 25 per cent w/v solution of *lithium chloride* and disperse by shaking vigorously. Add 100 ml of *cyclohexane*, shake gently for 2 minutes and separate the lower, aqueous methanolic layer, taking care to exclude any solid matter that separates at the interface. Repeat the extraction using a further 25 ml of the *lithium chloride solution*. To the combined extracts add a solution containing 11 g of *alum* in 214 ml of *water* followed by 50 ml of *chloroform*, shake vigorously for about 3 minutes, allow the layers to separate and filter the chloroform extract through filter paper (such as Whatman No 1), previously moistened with *chloroform*, again excluding any solid matter at the interface. Repeat the extraction with 50 ml and 10 ml quantities of *chloroform*, filtering the extracts as before. Evaporate the combined extracts to dryness on a water-bath in a current of nitrogen, dissolve the residue in 5 ml of *chloroform*, transfer to a 10-ml volumetric flask with the aid of *chloroform* and add sufficient *chloroform* to produce 10.0 ml.

Test solution (b). Prepare in the same manner as test solution (a) but adding 1.0 ml of a 0.05 per cent w/v solution of *phenacetin* (internal standard) to the chloroform solution before dilution to 10.0 ml.

Reference solution. A solution containing 0.025 per cent w/v of *fluocinolone acetonide IPRS* and 0.005 per cent w/v of *phenacetin* in *chloroform*.

For creams containing 0.01 per cent w/w of fluocinolone acetonide—

Test solution (a). Prepare as described above but using a quantity of the cream containing about 1 mg of Fluocinolone Acetonide.

Test solution (b). Prepare in the same manner as test solution (a) but adding 1.0 ml of a 0.02 per cent w/v solution of *phenacetin* (internal standard) to the chloroform solution before diluting to 10.0 ml.

Reference solution. A solution containing 0.01 per cent w/v of *fluocinolone acetonide IPRS* and 0.002 per cent w/v of *phenacetin* in *chloroform*.

For creams containing 0.00625 per cent w/w of fluocinolone acetonide—

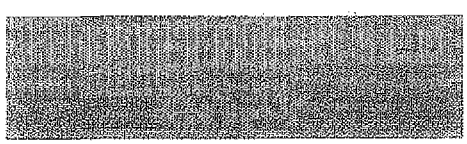
Test solution (a). Prepare as described above but using a quantity of the cream containing about 0.625 mg of Fluocinolone Acetonide.

Test solution (b). Prepare in the same manner as test solution (a) but adding 1.0 ml of a 0.0125 per cent w/v solution of *phenacetin* (internal standard) to the chloroform solution before diluting to 10.0 ml.

Reference solution. A solution containing 0.00625 per cent w/v of *fluocinolone acetonide IPRS* and 0.00125 per cent w/v of *phenacetin* in *chloroform*.

For creams containing 0.0025 per cent w/w of fluocinolone acetonide—

Test solution (a). Prepare as described above but using a quantity of the cream containing about 0.25 mg of Fluocinolone Acetonide.



Test solution (b). Prepare in the same manner as test solution (a) but adding 1.0 ml of a 0.005 per cent w/v solution of *phenacetin* (internal standard) to the chloroform solution before diluting to 10.0 ml.

Reference solution. A solution containing 0.0025 per cent w/v of *fluocinolone acetonide IPRS* and 0.0005 per cent w/v of *phenacetin* in *chloroform*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with porous silica particles (5 µm),
- mobile phase: a mixture of 58 volumes of *n-hexane*, 40 volumes of *chloroform*, 2 volumes of *methanol* and 0.1 volume of *glacial acetic acid*,
- flow rate: 1.8 ml per minute,
- spectrophotometer set at 243 nm,
- injection volume: 20 µl.

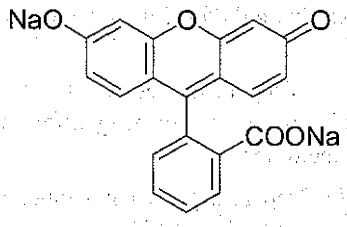
The assay is not valid unless the resolution between the peaks due to fluocinolone acetonide and phenacetin is more than 2, and the capacity factors of fluocinolone acetonide and phenacetin are about 3 and 2, respectively. If these conditions are not achieved, adjust the concentration of methanol and chloroform in the mobile phase. Repeat the adjustment of chloroform and methanol concentration until correct values for both resolution and capacity factors have been obtained.

Calculate the content of $C_{24}H_{30}F_2O_6$ in the cream.

Storage. Store at a temperature not exceeding 30°.

Fluorescein Sodium

Soluble Fluorescein



$C_{20}H_{10}Na_2O_5$ Mol. Wt. 376.3

Fluorescin Sodium is disodium 2-(3-oxo-6-oxido-3*H*-xanthen-9-yl)benzoate.

Fluorescein Sodium contains not less than 98.5 per cent and not more than 100.5 per cent of $C_{20}H_{10}Na_2O_5$, calculated on the dried basis.

Category. Diagnostic aid (dye for detection of corneal lesions and foreign bodies).

Description. An orange-red powder; hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fluorescein sodium IPRS* or with the reference spectrum of fluorescein sodium.

B. A solution is strongly fluorescent, even in extreme dilutions. The fluorescence disappears when the solution is made acidic and reappears when it is made alkaline.

C. A drop of a 0.05 per cent w/v solution, absorbed on a piece of filter paper, colours the paper yellow. On exposing the moist paper to the vapours of bromine for 1 minute and then to the vapours of ammonia, the yellow colour becomes deep pink.

D. The residue after incineration gives the reactions of sodium salts (2.3.1).

Tests

pH (2.4.24). 7.0 to 9.0, determined in a 2.0 per cent w/v solution.

Related substances. Determine by thin-layer chromatography (2.4.17), using a silica gel GF254 precoated plate (such as Merck silica gel 60 GF254 plate).

Mobile phase. A mixture of 80 volumes of *chloroform* and 20 volumes of *methanol*.

Test solution. Dissolve 0.1 g of the substance under examination in 10.0 ml of *0.1 M methanolic hydrochloric acid*.

Reference solution. A 0.002 per cent w/v solution of the substance under examination in 100.0 ml of *0.1 M methanolic hydrochloric acid*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 365 nm. Expose the plate to iodine vapour for 30 minutes. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Chloroform-soluble matter. Dissolve 0.2 g in 10 ml of *0.1 M sodium hydroxide* and extract with 10 ml of *chloroform*. Dry the chloroform layer with *anhydrous sodium sulphate* and filter. Absorbance of the resulting solution at about 480 nm, using *chloroform* as the blank, not more than 0.10 (2.4.7).

Zinc. Dissolve 0.1 g in 10 ml of *water*, add 2 ml of *hydrochloric acid*, filter and add 0.1 ml of *potassium ferrocyanide solution*; no turbidity or precipitate is produced immediately.

Chlorides (2.3.12). Dissolve 75 mg in 20 ml of *water*, add 2 ml of *nitric acid* and filter; the filtrate complies with the limit test for chlorides (0.33 per cent).

Sulphates (2.3.17). Dissolve 62.5 mg in 100 ml of *water*. To 20 ml add 2.5 ml of *dilute hydrochloric acid* and filter; the filtrate complies with the limit test for sulphates (1.2 per cent).

Dimethylformamide. Determine by gas chromatography (2.4.13).

Test solution (a). Dissolve 1.0 g of the substance under examination in 10 ml of *water*, add with stirring, 10 ml of *0.6 M hydrochloric acid*, allow to stand for 15 minutes and centrifuge. To 5 ml of the supernatant liquid add 0.1 g of *trisodium phosphate* and shake to dissolve.

Test solution (b). Prepare in the same manner as test solution (a) but using 10 ml of a 0.02 per cent w/v solution of *dimethylacetamide* (internal standard) in place of *water*.

Reference solution. Mix 10 ml of a 0.02 per cent w/v solution of *dimethylformamide IPRS* with 10 ml of the internal standard.

Chromatographic system
- a glass column 1.5m x 4 mm, packed with acid-washed, silanised diatomaceous support (80 to 100 mesh) coated with 10 per cent w/w of *polyethylene glycol 1000*,
- temperature:
  column 120°,
  inlet port and detector. 180°,
- flame ionisation detector,
- flow rate: 30 ml per minute of the carrier gas (nitrogen).

In the chromatogram obtained with test solution (b) the ratio of the area of any peak corresponding to dimethylformamide to the area of the peak due to the internal standard is not greater than the corresponding ratio in the chromatogram obtained with the reference solution.

Resorcinol. Determine by thin-layer chromatography (2.4.17), using a silica gel GF254 precoated plate (such as Merck silica gel 60 GF254 plate).

Mobile phase. A mixture of 60 volumes of *hexane* and 40 volumes of *ethyl acetate*.

Test solution. Dissolve 1 g of the substance under examination in 10 ml of *water*, add slowly with constant stirring, 10 ml of *0.6 M hydrochloric acid*, allow to stand for 15 minutes, centrifuge and use the supernatant liquid.

Reference solution. A 0.025 per cent w/v solution of *resorcinol* in *water*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and expose to iodine vapour for 30 minutes. Any spot corresponding to *resorcinol* in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Acriflavin. Dissolve 10 mg in 5 ml of *water*, and add a few drops of *sodium salicylate solution*; no precipitate is formed.

Loss on drying (2.4.19). Not more than 10.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.5 g, dissolve in 20 ml of *water*, add 5 ml of *dilute hydrochloric acid*, and extract with four quantities, each of 20 ml, of a mixture of equal volumes of *2-methyl-1-propanol* and *chloroform*. Wash the combined extracts with 10 ml of *water*, extract the washings with 5 ml of the mixture of *2-methyl-1-propanol* and *chloroform* and add to the combined extracts. Evaporate the combined extracts to dryness on a water-bath in a current of air, dissolve the residue in 10 ml of *ethanol (95 per cent)*, evaporate to dryness on a water-bath and dry to constant weight at 105°.

1 g of the residue is equivalent to 1.132 g of $C_{20}H_{10}Na_2O_5$.

Storage. Store protected from light.

Fluorescein Eye Drops

Fluorescein Sodium Eye Drops

Fluorescein Eye Drops are a sterile solution of Fluorescein Sodium in Purified Water.

Fluorescein Eye Drops contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of fluorescein sodium, $C_{20}H_{10}Na_2O_5$.

Usual strengths. 1 per cent w/v; 2 per cent w/v.

Identification

A. Evaporate a volume of the eye drops containing 20 mg of Fluorescein Sodium and dry at 105° for 30 minutes. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fluorescein sodium IPRS* or with the reference spectrum of fluorescein sodium.

B. Dilute the eye drops with *water* to produce a solution containing 0.05 per cent w/v of Fluorescein Sodium. One drop of the solution, absorbed by a piece of filter paper, colours the paper yellow. On exposing the moist paper to the vapours of bromine for 1 minute and then to vapours of ammonia, the yellow colour becomes deep pink.

C. The eye drops are strongly fluorescent, even in extreme dilution. The fluorescence disappears when the solution is made acidic and reappears when it is made alkaline.

Tests

pH (2.4.24). 7.0 to 9.0.

Related substances. Determine by thin-layer chromatography (2.4.17), using a silica gel *GF254* precoated plate (such as Merck silica gel 60 GF254 plate).

Mobile phase. A mixture of 80 volumes of *chloroform* and 20 volumes of *methanol*.

Test solution. Dilute a suitable volume of the eye drops, if necessary, with an equal volume of *0.1 M methanolic hydrochloric acid* so as it give a concentration of 1.0 per cent w/v of fluorescein sodium.

Reference solution. Dilute 1.0 ml of the test solution to 500.0 ml with *0.1 M methanolic hydrochloric acid*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 365 nm. Expose the plate to iodine vapour for 30 minutes. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Chloroform-soluble matter. To a volume of the eye drops containing 0.1 g of Fluorescein Sodium add 1 ml of *2 M sodium hydroxide*, extract with 10 ml of *chloroform*, dry the chloroform layer with *anhydrous sodium sulphate* and filter; absorbance of the resulting solution at about 480 nm, using *chloroform* as the blank, not more than 0.05 (2.4.7).

Dimethylformamide. Determine by gas chromatography (2.4.13).

Test solution (a). Dilute the eye drops with *water*, if necessary, to produce a solution containing 1.0 per cent w/v of Fluorescein Sodium. To 5 ml of the solution add, with stirring, 0.3 ml of *1 M hydrochloric acid*, allow to stand for 15 minutes and centrifuge; dissolve 10 mg of *trisodium phosphate* in 2 ml of the supernatant liquid.

Test solution (b). Prepare in the same manner as test solution (a) but adding 1.0 ml of a 0.01 per cent v/v solution of *dimethylacetamide* (internal standard) before the *hydrochloric acid*.

Reference solution. A solution containing 0.002 per cent v/v of *dimethylformamide* and 0.002 per cent v/v of the internal standard.

Chromatographic system

- a glass column 1.5 m x 4 mm, packed with acid-washed, silanised diatomaceous support (80 to 100 mesh) coated with 10 per cent w/w of *polyethylene glycol 1000*,
- temperature:
  column 120°,
  inlet port and detector. 180°,
- flame ionisation detector,
- flow rate: 30 ml per minute, using nitrogen as the carrier gas.

In the chromatogram obtained with test solution (b) the ratio of the area of any peak corresponding to dimethylformamide to the area of the peak due to the internal standard is not greater than the corresponding ratio in the chromatogram obtained with the reference solution.

Resorcinol. Determine by thin-layer chromatography (2.4.17), using a silica gel *GF254* precoated plate (such as Merck silica gel 60 GF254 plate).

Mobile phase. A mixture of 60 volumes of *hexane* and 40 volumes of *ethyl acetate*.

Test solution. Dilute the eye drops with *water*, if necessary, to produce a solution containing 1.0 per cent w/v of Fluorescein Sodium and to 10 ml add, with stirring, 2.5 ml of *0.25 M hydrochloric acid*. Allow to stand for 15 minutes, centrifuge and dissolve 0.1g of *trisodium phosphate* in 5ml of the supernatant liquid.

Reference solution. A 0.004 per cent w/v solution of *resorcinol* in *water*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and expose to iodine vapour for 30 minutes. Any spot corresponding to resorcinol in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Other tests. Comply with the tests stated under Eye Drops.

Assay. Dilute a measured volume of the eye drops containing about 0.1 g of Fluorescein Sodium to 20 ml with *water*. Add 5 ml of *dilute hydrochloric acid* and extract with four quantities, each of 20 ml, of a mixture of equal volumes of *2-methyl-1-propanol* and *chloroform*. Wash the combined extracts with 10 ml of *water*, extract the washings with 5 ml of the mixture of *2-methyl-1-propanol* and *chloroform* and add to the combined extracts. Evaporate the combined extracts to dryness on a water-bath in a current of air, dissolve the residue in 10 ml of *ethanol (95 per cent)*, evaporate to dryness on a water-bath and dry to constant weight at 105°.

1 g of the residue is equivalent to 1.132 g of $C_{20}H_{10}Na_2O_5$.

Storage. Store protected from light.

Labelling. The label states that the eye drops should be discarded after use on a single occasion.

Fluorescein Injection

Fluorescein Sodium Injection

Fluorescein Injection is a sterile solution of Fluorescein Sodium in Water for Injections.

Fluorescein Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of fluorescein sodium, $C_{20}H_{10}Na_2O_5$.

Usual strengths. 100 mg per ml; 200 mg per ml.

Identification

A. Evaporate 1 ml of the injection to dryness on a water bath and dry the residue at 105° for 30 minutes. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fluorescein sodium IPRS* or with the reference spectrum of fluorescein sodium.

B. The injection is strongly fluorescent, even in extreme dilution. The fluorescence disappears when the solution is made acidic and reappears when it is made alkaline.

C. One drop of the solution containing 0.05 per cent w/v of Fluorescein Sodium, absorbed by a piece of filter paper, colours the paper yellow. On exposing the moist paper to bromine vapour for 1 minute and then to ammonia vapour the yellow colour becomes deep pink.

Tests

pH (2.4.24). 8.0 to 9.8.

Chloroform-soluble matter. Dilute a volume of injection containing about 0.5 g of Fluorescein Sodium in 10 ml of *water*. To 4 ml of the solution add 1 ml of *1 M sodium hydroxide*, dilute to 10 ml with *water*, extract with 10 ml of *chloroform* and dry the chloroform layer over *anhydrous sodium sulphate*. The absorbance of the solution at 480 nm (2.4.7) is not more than 0.1.

Dimethylformamide. Determine by gas chromatography (2.4.13).

Test solution (a). Dilute a volume of injection containing about 0.5 g of fluorescein sodium to 10.0 ml with *water*. To this solution add, with stirring, 1 ml of *3 M hydrochloric acid*, allow to stand for 15 minutes and centrifuge; dissolve 0.1 g of *trisodium orthophosphate* in 5 ml of the supernatant liquid.

Test solution (b). Dilute a volume of injection containing 0.5 g of fluorescein sodium to 10.0 ml with *water*. To this solution add, with stirring, 1.0 ml of a 0.10 per cent v/v solution of *dimethylacetamide* (internal standard) and 1 ml of *3 M hydrochloric acid*, allow to stand for 15 minutes and centrifuge; dissolve 0.1 g of *trisodium orthophosphate* in 5 ml of the supernatant liquid.

Reference solution. A solution containing 0.002 per cent v/v each of *dimethylformamide* and *dimethylacetamide* (internal standard).

Chromatographic system

- a glass column 1.5 m x 4 mm, packed with *acid-washed, silanised diatomaceous support* (80 to 100 mesh) coated with 10 per cent w/w of *polyethylene glycol 1000*,
- temperature :
  column 120°,
  inlet port and detector at 120°,
- flow rate: 30 ml per minute, using nitrogen as the carrier gas.

Inject the reference solution, test solution (a) and (b). In the chromatogram obtained with test solution (b) the ratio of the area of any peak corresponding to *dimethylformamide* to the area of the peak due to the internal standard is not more than the corresponding ratio in the chromatogram obtained with the reference solution (0.2 per cent).

Related substances and resorcinol. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 10 volumes of *methanol* and 90 volumes of *dichloromethane*.

Test solution. Dilute a volume of injection containing about 1 g of Fluorescein Sodium with *0.1 M methanolic hydrochloric acid*.

Reference solution (a). A 5.0 per cent w/v solution of *fluorescein sodium IPRS* in *water*. To 5 ml of the solution add 2 ml of *phosphate buffer pH 8.0*, 3 ml of *water* and 2.5 g of *sodium chloride*, shake to dissolve the *sodium chloride* and extract with two 25-ml quantities of *peroxide-free ether*. Dry the combined extracts over *anhydrous sodium sulphate*, evaporate to dryness under reduced pressure and dissolve the residue in 10 ml of *0.1 M methanolic hydrochloric acid*.

Reference solution (b). Dilute 1.0 ml of the test solution to 200.0 ml *with 0.1 M methanolic hydrochloric acid*.

Reference solution (c). Dilute 2.0 ml of reference solution (b) to 5.0 ml with *0.1 M methanolic hydrochloric acid*.

Reference solution (d). A 0.0125 per cent w/v solution of *resorcinol* in *0.1 M methanolic hydrochloric acid*.

Reference solution (e). A mixture of 9 ml of reference solution (d) and 1 ml of the test solution.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and expose the plate to iodine vapour for 30 minutes and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (d) (0.2 per cent). On examination in daylight, any spot corresponding to resorcinol in the chromatogram obtained with reference solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (d) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (e) shows two clearly separated spots in daylight.

Other tests. Comply with the tests stated under Parenteral Preparation (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of injection containing about 1.0 per cent w/v of Fluorescein Sodium. Dilute 1.0 ml of the solution to 200.0 ml with the mobile phase.

Reference solution. Dissolve 55 mg of *diacetylfluorescein IPRS* in a mixture of 5 ml of *ethanol (95 per cent)* and 1 ml of

2.5 M sodium hydroxide, heat on a water bath for 20 minutes, mixing frequently, cool and add sufficient *water* to produce 50 ml. Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with endcapped octadecylsilane bonded to porous silica (5 µm) (Such as Spherisorb ODS 2),
- mobile phase: a mixture of 5 volumes of *triethylamine*, 400 volumes of *acetonitrile* and 595 volumes of *water*, adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution. The test is not valid unless the relative standard deviation for replicate injections is not less than 2.0 per cent.

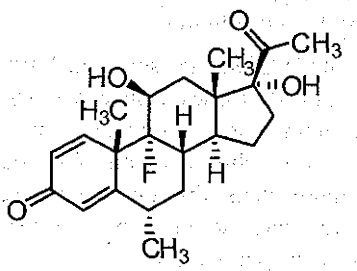
Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{10}Na_2O_5$ in the injection.

1 mg of anhydrous diacetylfluorescein is equivalent to 0.9037 mg of $C_{20}H_{10}Na_2O_5$.

Storage. Store protected from light.

Fluorometholone



$C_{22}H_{29}FO_4$ Mol. Wt. 376.5

Fluorometholone is 9α-Fluoro-11β,17α-dihydroxy-6 α-methylpregna-1,4-diene-3,20-dione

Fluorometholone contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{22}H_{29}FO_4$, calculated on the dried basis.

Category. Glucocorticoid.

Description. A white to yellowish white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6).Compare the spectrum with that obtained with *fluorometholone IPRS* or with the reference spectrum of fluorometholone.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Specific optical rotation (2.3.22). +52.0° to +60.0°, determined on 1.0 per cent w/v solution in *pyridine*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of the substance under examination in *methanol* and dilute to 100.0 ml with *methanol*.

Reference solution (a). A 0.00005 per cent w/v solution of the substance under examination in *methanol*.

Reference solution (b). A solution containing 0.00005 per cent w/v each of *deltamedrane IPRS* and *fluorometholone IPRS* in *methanol*.

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 40 volumes of *water* and 60 volumes of *methanol*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to deltamedrane and fluorometholone is not less than 1.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1 g by drying at 60° at 0.7 kPa for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 5 mg of the substance under examination in *methanol* and dilute to 100.0 ml with *methanol*.

Reference solution (a). A 0.005 per cent w/v solution of *fluorometholone IPRS* in *methanol*.

Reference solution (b). A solution containing 0.00005 per cent w/v, each of, *deltamedrane IPRS* and *fluorometholone IPRS* in *methanol*.

Use chromatographic system as described under Related substances.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to deltamedrane and fluorometholone is not less than 1.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{22}H_{29}FO_4$.

Fluorometholone Eye Drops

Fluorometholone Eye Drops are a sterile suspension of Fluorometholone in Purified Water.

Fluorometholone Eye Drops contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of fluorometholone, $C_{22}H_{29}FO_4$.

Usual strength. 0.1 per cent w/v.

Identification

A. Shake a quantity of the eye drops containing 5 mg of Fluorometholone with 20 ml of *acetone*, filter and evaporate the filtrate to dryness. Dissolve the residue in 10 ml of *acetone*, filter and evaporate the filtrate to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fluorometholone IPRS* or with the reference spectrum of fluorometholone.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.24). 6.0 to 7.5.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *methanol* and *water*.

Test solution. Dilute a volume of the eye drops containing 1 mg of Fluorometholone to 10.0 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 20 ml with *methanol*. Further dilute 1.0 ml of the solution to 10.0 ml with *methanol*.

Reference solution (b). A solution containing 0.00005 per cent w/v each of *deltamedrane IPRS* and *fluorometholone IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 40 volumes of *water* and 60 volumes of *methanol*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to deltamedrane and fluorometholone is not less than 1.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent).

Other tests. Comply with the tests stated under Eye Drops.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *methanol* and *water*.

Test solution. Dilute a volume of eye drops containing 1 mg of Fluorometholone to 25.0 ml with the solvent mixture.

Reference solution (a). Dilute 4.0 ml of a 0.05 per cent w/v solution of *fluorometholone IPRS* in *methanol* to 50.0 ml with the solvent mixture.

Reference solution (b). A solution containing 0.00005 per cent w/v each of *deltamedrane IPRS* and *fluorometholone IPRS* in the solvent mixture.

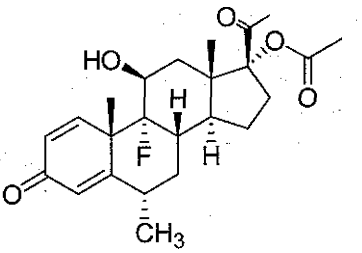
Use chromatographic system as described under Related substances.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to deltamedrane and fluorometholone is not less than 1.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{22}H_{29}FO_4$ in the eye drops.

Fluorometholone Acetate



$C_{24}H_{31}FO_5$ Mol. Wt. 418.5

Fluorometholone Acetate is Pregna-1,4-diene-3,20-dione, 17-(acetyloxy)-9-fluoro-11-hydroxy-6-methyl-(6α,11β); 9-fluoro-11β,17-dihydroxy-6α-methylpregna-1,4-diene-3,20-dione, 17 acetate.

Fluorometholone Acetate contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{24}H_{31}FO_5$, calculated on the dried basis.

Category. Adrenocortical steroid.

Description. A white to yellowish crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fluorometholone acetate IPRS* or with the reference spectrum of fluorometholone acetate.

B. When examined in the range 200 nm to 400 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* shows absorption maxima as obtained with *fluorometholone acetate IPRS* of the same concentration.

Tests

Specific optical rotation (2.4.22). +25.0° to +31.0°, determined in a 2.0 per cent w/v solution in *chloroform*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 50.0 ml of *acetonitrile*.

Reference solution (a). A 0.003 per cent w/v solution of *fluorometholone IPRS* in minimum quantity of *methanol* and dilute to volume with *acetonitrile*.

Reference solution (b). A 0.1 per cent w/v solution of *fluorometholone acetate IPRS* in *acetonitrile*.

Reference solution (c). Mix a suitable quantity of reference solution (a) and reference solution (b) to obtain a 0.003 per cent w/v solution each of *fluorometholone IPRS* and *fluorometholone acetate IPRS* in *acetonitrile*.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of a *water* and 40 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Fluorometholone	0.6	1.0
Compound 5OX[1]	0.89	1.0
Fluorometholone Acetate	1.0	—
Fluorometholone Diacetate	1.39	2.2
Fluorometholone Acetate, epoxy analog[2]	1.58	1.0
Fluorometholone Acetate, Delta 9(11)[3]	1.82	1.0
Fluorometholone Acetate, 7,9(11) Diene[4]	1.77	0.55

[1]19b,11b-Epoxy-17-hydroxy-6a-methylpregna-1,4-dien-3,20-dione,

[2]17-Acetoxy-9b,11b-epoxy-6a-methylpregna-1,4-dien-3,20-dione,

[3]17a-Acetoxy-6a-methylpregna-1,4,9(11)-trien-3,20-dione,

[4]17a-Acetoxy-6a-methylpregna-1,4,7,9(11)-tetraen-3,20-dione,

a relative to fluorometholone.

Inject reference solution (b) and (c). The test is not valid unless the resolution between fluorometholone acetate and fluorometholone peaks is not less than 10.0 in the chromatogram obtained with reference solution (c), the column efficiency is not less than 10000 theoretical plates, the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (b).

Inject the test solution. Run the chromatogram at least 2.5 times of the retention time of the principal peak. The area of any peak corresponding to fluorometholone and fluorometholone diacetate is not more than 1.0 per cent, the area of any peak corresponding to compound 5OX, fluorometholone acetate and epoxy analog is not more than 0.5 per cent, fluorometholone acetate, delta 9(11) is not more than 0.2 per cent, fluorometholone acetate, 7,9(11) diene is not more than 0.3 per cent. The area of any other secondary peak is not more than 0.1 per cent, and the sum of areas of all the secondary peaks is not more than 1.5 per cent calculated by area normalization.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 60° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 50.0 ml of *acetonitrile*.

Reference solution (a). A 0.1 per cent w/v solution of *fluorometholone acetate IPRS* in *acetonitrile*.

Reference solution (b). A 0.1 per cent w/v solution of *fluorometholone IPRS* in minimum quantity of *methanol* and dilute in *acetonitrile* and mix equal volume of the solution and the reference solution (a), dilute with *acetonitrile* to a final concentration of about 0.003 per cent w/v solution each for *fluorometholone IPRS* and *fluorometholone acetate IPRS*.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of a *water* and 40 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject reference solution (a) and (b). The test is not valid unless the resolution between fluorometholone acetate and fluorometholone peaks is not less than 10.0 with reference solution (b), the column efficiency is not less than 10000

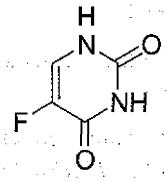
theoretical plates, the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0 per cent with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_{24}H_{31}FO_5$.

Storage. Store protected from moisture.

Fluorouracil



$C_4H_3FN_2O_2$ Mol. Wt. 130.1

Fluorouracil is 5-fluoro-1*H*,3*H*-pyrimidine-2,4-dione.

Fluorouracil contains not less than 98.0 per cent and not more than 101.0 per cent of $C_4H_3FN_2O_2$, calculated on the dried basis.

Category. Anticancer.

Description. A white or almost white, crystalline powder.

CAUTION - Great care should be taken to avoid inhaling particles of Fluorouracil and exposing the skin to it.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fluorouracil IPRS* or with the reference spectrum of fluorouracil.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *acetate buffer pH 4.7* shows an absorption maximum only at about 266 nm.

C. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

D. To 5 ml of a 1 per cent w/v solution add 1 ml of *bromine water*; the colour of bromine is discharged.

Tests

Appearance of solution. A 1.0 per cent w/v solution in carbon *dioxide-free water* is clear (2.4.1), and not more intensely coloured than reference solution YS7 or BYS7 (2.4.1).

pH (2.4.24). 4.5 to 5.0, determined in a 1.0 per cent w/v solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 70 volumes of *ethyl acetate*, 15 volumes of *methanol* and 15 volumes of *water*.

Test solution (a). Dissolve 0.1 g of the substance under examination in 10 ml of *methanol (50 per cent)*.

Test solution (b). Dilute 5.0 ml of the test solution to 25.0 ml with *methanol (50 per cent)*.

Reference solution (a). A 0.2 per cent w/v solution of *fluorouracil IPRS* in *methanol (50 per cent)*.

Reference solution (b). A 0.0025 per cent w/v solution of *fluorouracil IPRS* in *methanol (50 per cent)*.

Reference solution (c). A 0.0025 per cent w/v solution of *5-hydroxyuracil* in *methanol (50 per cent)*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b). Spray the plate with a freshly prepared 0.5 per cent w/v solution of *fast blue B salt* and then with *0.1 M sodium hydroxide*. Any spot corresponding to 5-hydroxyuracil in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (c). Ignore any secondary spot on or near the line of application.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent, determined on 1.0 g in a platinum crucible.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* in an oven at 80° at a pressure of 1.5 to 2.5 kPa for 4 hours.

Assay. Weigh 0.2 g, dissolve in 80 ml of *dimethylformamide* with the aid of gentle heat and cool. Titrate with *0.1 M tetrabutylammonium hydroxide* in *methanol*, using 0.25 ml of a 1 per cent w/v solution of *thymol blue* in *dimethylformamide* as indicator. Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.01301 g of $C_4H_3FN_2O_2$.

Storage. Store protected from light.

Fluorouracil Injection

Fluorouracil Injection is a sterile solution in Water for Injections of fluorouracil sodium, prepared by the interaction of Fluorouracil and Sodium Hydroxide.

Fluorouracil Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of fluorouracil, $C_4H_3FN_2O_2$.

Usual strengths. 25 mg per ml; 50 mg per ml.

Description. A colourless or almost colourless solution.

Identification

A. Acidify carefully a volume of the injection containing 0.1 g of Fluorouracil with *glacial acetic acid*, stir, cool and filter. Wash the precipitate with 1 ml of *water* and dry over *phosphorus pentoxide* at 80° at a pressure of 2 kPa for 4 hours. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fluorouracil IPRS* or with the reference spectrum of fluorouracil.

B. When examined in the range 230 nm to 360 nm (2.4.7), the final solution obtained in the Assay shows an absorption maximum only at about 266 nm.

C. To a volume of the injection containing 50 mg of Fluorouracil add 1 ml of *bromine water*; the colour of bromine is discharged.

Tests

pH (2.4.24). 8.5 to 9.5.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 70 volumes of *ethyl acetate*, 15 volumes of *methanol* and 15 volumes of *water*.

Test solution. Dilute a suitable quantity of the injection with *water* to produce a solution containing the equivalent of 2 per cent w/v of Fluorouracil.

Reference solution (a). Dilute 1 volume of test solution to 400 volumes with *methanol (50 per cent)*.

Reference solution (b). A 0.005 per cent w/v solution of *5-hydroxyuracil* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a). Spray with a freshly prepared solution containing 0.5 per cent w/v of *fast blue B salt* and then with *0.1 M sodium hydroxide*. Any spot corresponding to 5-hydroxyuracil in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b). Ignore any secondary spot on or near the line of application.

Urea. Carry out the method described under Related substances applying separately to the plate 20 µl of the following solutions. For the test solution dilute a suitable quantity of the injection with *water* to produce a solution containing the equivalent of 0.5 per cent w/v of Fluorouracil. The reference solution contains 0.02 per cent w/v of *urea* in *water*. After development, dry the plate in air, spray with a mixture of 10 volumes of a 1 per cent w/v solution of *4-dimethylaminobenzaldehyde* in *ethanol (95 per cent)* and 1 volume of *hydrochloric acid* and heat at 105° until maximum intensity of the spots is obtained. Any spot corresponding to urea in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Bacterial endotoxins (2.2.3). Not more than 0.33 Endotoxin Unit per mg of fluorouracil.

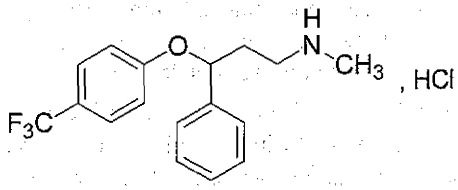
Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. To a measured volume containing about 50 mg of Fluorouracil add 20 ml of *1 M hydrochloric acid* and sufficient *water* to produce 250.0 ml. Dilute 5.0 ml to 100.0 ml with *0.1 M hydrochloric acid* and measure the absorbance of the resulting solution at the maximum at about 266 nm (2.4.7). Calculate the content of $C_4H_3FN_2O_2$ taking 552 as the specific absorbance at 266 nm.

Storage. Store protected from light in single dose containers at a temperature not exceeding 30°. The injection should not be allowed to freeze.

Labelling. The label states (1) the strength in terms of the equivalent amount of Fluorouracil in a suitable dose-volume; (2) that, if separation has occurred, the injection should be heated to 60°, shaken vigorously and allowed to cool to body temperature prior to use.

Fluoxetine Hydrochloride



$C_{17}H_{18}F_3NO,HCl$ Mol. Wt. 345.8

Fluoxetine Hydrochloride is (*RS*)-*N*-methyl-3-phenyl-3-[4-trifluoromethyl)phenoxy]propylamine hydrochloride.

Fluoxetine Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{17}H_{18}F_3NO,HCl$, calculated on the anhydrous basis.

Category. Antidepressant.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fluoxetine hydrochloride IPRS* or with the reference spectrum fluoxetine hydrochloride.

B. It gives the reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. Dissolve 2.0 g in a mixture of 15 volumes of *water* and 85 volumes of *methanol* and dilute to 100 ml with the same solvent mixture (solution A). Solution A is clear (2.4.1) and colourless (2.4.1).

pH (2.4.24). 4.5 to 6.5. determined in a solution of 0.2 g in sufficient *carbon dioxide-free water* to produce 20 ml.

Optical rotation (2.4.22). –0.05° to +0.05°, determined in solution A.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution (a). Dissolve 0.055 g of the substance under examination in the mobile phase and dilute to 10.0 ml with the mobile phase.

Test solution (b). Dilute 2.0 ml of test solution (a) to 10.0 ml with the mobile phase.

Reference solution. Dissolve 0.022 g of *fluoxetine hydrochloride IPRS* in 10.0 ml of *0.5 M sulphuric acid*. Heat at about 85° for 3 hours. Allow to cool. The resulting solution contains mainly of (1*RS*)-3-(methylamino)-1-phenylpropan-1-ol (fluoxetine impurity A) and some 4-trifluoromethylphenol. To 0.4 ml of the solution add 28 mg of *fluoxetine hydrochloride IPRS*, about 1 mg of *N-methyl-3-phenylpropan-1-amine IPRS* (*fluoxetine impurity B IPRS*) and about 1 mg of *(3RS)-N-methyl-3-phenyl-3-[3-(trifluoromethyl) phenoxy]propan-1-amine IPRS* (*fluoxetine impurity C IPRS*) and dilute to 25.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 8 volumes of *methanol*, 30 volumes of *tetrahydrofuran* and 62 volumes of a solution of *triethylamine* prepared by adding 980 ml of *water* to 10 ml of *triethylamine*, mixing and adjusted to pH 6.0 with *orthophosphoric acid* and diluting to 1000 ml with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 10 µl.

Inject the reference solution. The relative retention time with respect to fluoxetine for fluoxetine impurity A is about 0.24, for fluoxetine impurity B is about 0.27 and for fluoxetine impurity C is about 0.94.

The test is not valid unless the retention time of the peak due to fluoxetine is 10-18 minutes; the retention time of the peak due to 4-trifluoromethylphenol is not greater than 35 minutes (if no peak due to 4-trifluoromethylphenol is seen in the chromatogram, inject a 0.02 per cent solution of *4-trifluoromethylphenol* in the mobile phase); the peak to valley ratio for fluoxetine impurity C is not less than 11. If the ratio is less than 11, reduce the volume of methanol and increase the volume of the solution of triethylamine in the mobile phase.

Inject test solution (a) and (b). Continue the chromatography for 3 times the retention time of fluoxetine. In the chromatogram obtained with test solution (b), the area of any peak due to fluoxetine impurity C is not greater than 0.0015 times the area of the principal peak in the chromatogram obtained with test solution (b) (0.15 per cent).

In the chromatogram obtained with test solution (a) the areas of any peaks due to fluoxetine impurity A and fluoxetine impurity B are not greater than 0.0125 times the area of the principal peak in the chromatogram obtained with test solution (b) (0.25 per cent); none of the peaks other than the principal peak and the peaks due to fluoxetine impurity A and fluoxetine impurity B, has an area greater than 0.005 times the area of the principal peak in the chromatogram obtained with test solution (b) (0.1 per cent);the sum of the areas of all the peaks, other than the principal peak, is not greater than 0.025 times the area of the principal peak obtained with test solution (b) (0.5 per cent). Ignore any peak with an area less than 0.0025 times that of the principal peak in the chromatogram obtained with test solution (b) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 1.0 g.

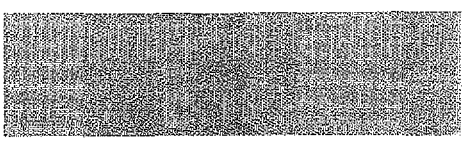
Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh 0.055 g of the substance under examination, dissolve in the mobile phase and add sufficient mobile phase to produce 50.0 ml. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution. Weigh 0.055 g of *fluoxetine hydrochloride IPRS* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Use the chromatographic system described under test for Related substances and set the spectrophotometer at 227 nm.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with the reference solution is at least 50 per cent of the full scale of the recorder.



Adjust the volumes of methanol and the solution of triethylamine in the mobile phase so that the retention time of fluoxetine is between 10 minutes and 18 minutes.

The assay is not valid unless the symmetry factor calculated at 10 per cent of the height of the peak due to fluoxetine is at most 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{18}F_3NO,HCl$.

Fluoxetine Capsules

Fluoxetine Hydrochloride Capsules

Fluoxetine Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of fluoxetine, $C_{17}H_{18}F_3NO$.

Usual strengths. 10 mg; 20 mg.

Identification

A. Shake a quantity of the contents of the capsules containing 10 mg of fluoxetine with 10 ml of *methanol*, centrifuge for 10 minutes and filter. Evaporate the filtrate to dryness with the aid of a current of air and mild heat. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fluoxetine hydrochloride IPRS* or with the reference spectrum of fluoxetine hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Diethylamine phosphate suspension. To 250 ml of *acetonitrile*, add 1.0 ml of *diethylamine*, mix, and adjusted to pH 3.5 with *orthophosphoric acid*.

NOTE — Keep the suspension well-mixed.

Test solution. To 5.0 ml of the filtrate obtained as given above, add 2.0 ml of the diethylamine phosphate suspension and mix well.

Reference solution. Dissolve 0.022 g of *fluoxetine hydrochloride IPRS* in sufficient *0.1 M hydrochloric acid* to produce 100.0 ml and mix. Dilute 10.0 ml of the solution to 100.0 ml with *0.1 M hydrochloric acid*. To 5.0 ml of the resulting solution, add 2.0 ml of the diethylamine phosphate suspension and mix well.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with particles of silica the surface of which has been modified with chemically-bonded cyano groups (5 µm),
- mobile phase: a mixture of 0.4 volume of *diethylamine*, 40 volumes of *acetonitrile* and 60 volumes of *water*, adjusted to pH 3.5 with *orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 226 nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Q. Not less than 70 per cent of the stated amount of $C_{17}H_{18}F_3NO$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the contents of the capsules containing 20 mg of fluoxetine, disperse in 10.0 ml of the mobile phase, mix and centrifuge.

Reference solution. A solution of *fluoxetine hydrochloride IPRS* equivalent to 0.001 per cent w/v of fluoxetine in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with particles of silica the surface of which has been modified with chemically-bonded cyano groups (5 µm),
- mobile phase: a mixture of 35 volumes of *acetonitrile* and 65 volumes of a solution of *triethylamine*, prepared by adding 10 ml of *triethylamine* to 980 ml of *water*, mixing, adjusted to pH 6.0 with *orthophosphoric acid* (about 4.5 ml) and diluting to 1000 ml with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1100 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with reference solution (0.5 per cent)

and the sum of areas of all secondary peaks is not more than twice the area of the peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peaks with an area 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (0.05 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the contents of the capsules containing about 20 mg of fluoxetine, disperse in 200.0 ml of the mobile phase, mix and filter.

Reference solution. A 0.011 per cent w/v solution of *fluoxetine hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 7.5 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 33 volumes of a solution containing 0.3 per cent w/v of *glacial acetic acid* and 0.64 per cent w/v of *sodium pentanesulphonate*, adjusted to pH 5.0 with *5 M sodium hydroxide*, and 67 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 227 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{18}F_3NO$ in the capsules.

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the equivalent amount of fluoxetine.

Fluoxetine Oral Solution

Fluoxetine Oral Liquid; Fluoxetine Hydrochloride Oral Solution

Fluoxetine Oral Solution is a solution of Fluoxetine Hydrochloride in a suitable aqueous vehicle. It may contain one or more preservatives.

Fluoxetine Oral Solution contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of fluoxetine, $C_{17}H_{18}F_3NO$.

Usual strength. 20 mg per 5 ml.

Identification

Transfer a volume of the oral solution containing about 20 mg of fluoxetine, to a separating funnel, add 5 ml of *water* and 0.5 ml of *1 M sodium hydroxide;* extract with 5 ml of *chloroform* and discard the aqueous layer. Evaporate the chloroform layer to dryness. The residue dissolved in 0.4 ml of *chloroform* complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fluoxetine hydrochloride IPRS* treated in the same manner.

Tests

pH (2.4.24). 2.5 to 4.5.

Related substances. Determine by liquid chromatography (2.4.14).

Ion pair solution. Dissolve about 4.3 g of *sodium 1-octanesulphonate* and 13.8 g of *monobasic sodium phosphate* in 1000 ml of *water*, and adjusted to pH 3.0 with *orthophosphoric acid*.

Solvent mixture. 60 volumes of *ion pair solution*, 30 volumes of *methanol* and 10 volumes of *acetonitrile*.

Test solution (a) Weigh a quantity of the oral solution containing 19 mg of fluoxetine and dilute to 10.0 ml with the solvent mixture.

Test solution (b). Dilute 1.0 ml of test solution (a) to 25.0 ml with the solvent mixture.

Reference solution. A 0.2 per cent w/v solution of *fluoxetine hydrochloride IPRS* in *1 M sulphuric acid*. Heat this solution at 85° for 1 hour. To 1.0 ml of the solution add about 10 mg *fluoxetine hydrochloride IPRS*, dissolve in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 to 10 µm),
- mobile phase : A. a mixture of 53 volumes of *ion-pair solution*, 26 volumes of *methanol* and 21 volumes of *acetonitrile*,

  B. a mixture of 43 volumes of *ion-pair solution*, 35 volumes of *acetonitrile* and 22 volumes of *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
13	100	0
15	0	100
29	0	100
30	100	0

Inject the reference solution. The retention time of any secondary peak is not more than 13 minutes.

Inject test solution (a) and (b). In the chromatogram obtained with test solution (a), the area of any secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with test solution (b) (0.4 per cent) and the sum of the areas of the peaks, other than the principal peak, is not more than 0.2 times the area of the principal peak in the chromatogram obtained with test solution (b) (0.8 per cent).

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the oral solution containing 4.0 mg of fluoxetine and dilute to 100.0 ml with the mobile phase.

Reference solution. A 0.0045 per cent w/v solution of *fluoxetine hydrochloride IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with nitrile groups chemically bonded to porous silica (10 µm),
- mobile phase: a mixture of equal volumes of a buffer solution prepared by adding 10 ml of *triethylamine* to 980 ml with *water* and adjusted to pH 6.0, and *acetonitrile,*
- flow rate 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Inject the reference solution. The tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Determine the weight per ml (2.4.29) of the oral solution and calculate the content of $C_{17}H_{18}F_3NO$, weight in volume.

Storage. Store protected from light.

Labelling. The label states the strength in terms of the equivalent amount of fluoxetine.

Fluoxetine Tablets

Fluoxetine Hydrochloride Tablets

Fluoxetine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of fluoxetine, $C_{17}H_{18}F_3NO$.

Usual strengths. 10 mg; 20 mg.

Identification

A. Shake a quantity of the contents of the tablets containing 10 mg of fluoxetine with 10 ml of *methanol*, centrifuge for 10 minutes and filter. Evaporate the filtrate to dryness with the aid of a current of air and mild heat. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fluoxetine hydrochloride IPRS* or with the reference spectrum of fluoxetine hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Diethylamine phosphate suspension. To 250 ml of *acetonitrile* add 1.0 ml of *diethylamine*, mix, and adjusted to pH 3.5 with *orthophosphoric acid.*

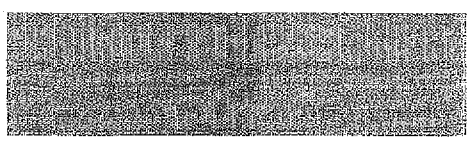
NOTE—Keep the suspension well-mixed.

Test solution. To 5.0 ml of the filtrate obtained as given above, add 2.0 ml of the diethylamine phosphate suspension and mix well.

Reference solution. Dissolve 0.022 g of *fluoxetine hydrochloride IPRS* in sufficient *0.1 M hydrochloric acid* to produce 100.0 ml and mix. Dilute 10.0 ml of the solution to 100.0 ml with *0.1 M hydrochloric acid.* To 5.0 ml of the resulting solution, add 2.0 ml of the diethylamine phosphate suspension and mix well.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with particles of silica the surface of which has been modified with chemically-bonded cyano groups (5 µm),
- mobile phase: a mixture of 0.4 volume of *diethylamine*, 40 volumes of *acetonitrile* and 60 volumes of *water*, adjusted to pH 3.5 with *orthophosphoric acid,*
- flow rate: 2 ml per minute,
- spectrophotometer set at 226 nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.



Inject the reference solution and the test solution.

Q. Not less than 70 per cent of the stated amount of $C_{17}H_{18}F_3NO$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 20 mg of fluoxetine, disperse in 10.0 ml of the mobile phase, mix and centrifuge.

Reference solution. A solution of *fluoxetine hydrochloride IPRS* containing the equivalent of 0.001 per cent w/v of fluoxetine in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with particles of silica the surface of which has been modified with chemically-bonded cyano groups (5 µm),
- mobile phase: a mixture of 35 volumes of *acetonitrile* and 65 volumes of a solution of *triethylamine*, prepared by adding to 10 ml of *triethylamine* 980 ml of *water*, mixing, adjusted to pH 6.0 with *orthophosphoric acid* (about 4.5 ml) and diluting to 1000 ml with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1100 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of areas of all secondary peaks is not more than twice the area of the peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peaks with an area 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 20 mg of fluoxetine, disperse in 200.0 ml of the mobile phase, mix and filter.

Reference solution. A 0.011 per cent w/v solution of *fluoxetine hydrochloride IPRS* in the mobile phase

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 33 volumes of a solution containing 0.3 per cent w/v of *glacial acetic acid* and 0.64 per cent w/v of *sodium pentanesulphonate*, adjusted to pH 5.0 with *5 M sodium hydroxide*, and 67 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 227 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

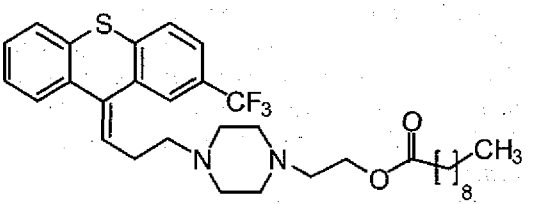
Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{18}F_3NO$ in the tablets.

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the equivalent amount of fluoxetine.

Flupentixol Decanoate



$C_{33}H_{43}F_3N_2O_2S$ Mol. Wt. 588.8

Flupentixol Decanoate is (*Z*)-2-{4-[3-(2-Trifluoromethyl thioxanthen-9-ylidene)propyl]piperazin-1-yl}ethyl decanoate

Flupentixol Decanoate contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{33}H_{43}F_3N_2O_2S$, calculated on the dried basis.

Category. Antipsychotic (Neuroleptic).

Description. A yellow, viscous oil.

Identification

A. When examined in the range 210 nm to 350 nm (2.4.7), a 0.0015 per cent w/v solution in *ethanol (95 per cent)* exhibits two maxima at 230 nm and 264 nm and the absorbances at the maxima are about 0.85 and about 0.35 respectively.

B. Determine by infrared absorption spectrophotometry (2.4.6).Compare the spectrum with that obtained with *flupentixol decanoate IPRS* or with the reference spectrum of flupentixol decanoate.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light.

Test solution. Dissolve 0.25 g of the substance under examination in 100.0 ml of *acetonitrile*.

Reference solution (a). A 0.000625 per cent w/v solution of cis-*flupentixol IPRS* in *acetonitrile*.

Reference solution (b). A 0.000625 per cent w/v solution of *2-trifluoromethylthioxanthone IPRS* in *acetonitrile*.

Reference solution (c). A 0.0025 per cent w/v solution of trans-*flupentixol decanoate dihydrochloride IPRS* in *acetonitrile*.

Reference solution (d). A solution containing 0.25 per cent w/v of the substance under examination and 0.000625 per cent w/v each of cis-*flupentixol IPRS* and *2-trifluoromethyl-thioxanthone IPRS* and 0.0025 per cent w/v of *trans-flupentixol decanoate dihydrochloride IPRS* in *acetonitrile*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 0.1 volume of *orthophosphoric acid*, 25 volumes of a 20 mM solution of *dioctyl sodium sulphosuccinate* prepared by dissolving 8.89 g of *dioctyl sodium sulphosuccinate* in 500 ml of *water*, stirring for 6 to 8 hours and diluting to 1000 ml with *water* and 75 volumes of *ethanol (95 per cent)*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 20 µl.

The substances are eluted in the following order: 2-trifluoromethylthioxanthone, *cis*-flupentixol (free alcohol), flupentixol decanoate and *trans*-flupentixol decanoate.

Inject reference solution (d). The test is not valid unless the peaks due to 2-trifluoromethylthioxanthone, *cis*-flupentixol, flupentixol decanoate and *trans*-flupentixol decanoate are clearly separated.

Inject reference solution (a), (b), (c) and the test solution. Run the chromatogram 1.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to *cis*-flupentixol is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent). The area of any peak corresponding to 2-trifluoromethyl-thioxanthone is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent). The area of any peak corresponding to *trans*-flupentixol decanoate dihydrochloride is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on1.0 g by drying at 60° at a pressure of 0.7 kPa for 3 hours.

Assay. Dissolve 0.2 g in 50 ml of *anhydrous acetic acid* and determining the end point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02944 g of $C_{33}H_{43}F_3N_2O_2S$.

Storage. Store protected from light and at a temperature below –15°.

Flupentixol Injection

Flupentixol Decanoate Injection

Flupentixol Injection is a sterile solution of Flupentixol Decanoate in a suitable vegetable oil.

Flupentexol Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of flupentixol decanoate, $C_{33}H_{43}F_3N_2O_2S$.

Usual strength. 20 mg per ml.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel F254*.

Mobile phase. A mixture of 3 volumes of *diethylamine* and 90 volumes of *cyclohexane*.

Test solution. Dilute the injection to obtain a solution containing 0.4 per cent w/v of Flupentixol Decanoate with *ethanol (95 per cent)*.

Reference solution. A 0.4 per cent w/v solution of *flupentixol decanoate dihydrochloride IPRS* in *ethanol (95 per cent)*.

Apply to the plate 5 µl of each solution. After removal of the plate, allow it to dry in air, spray with a 1.0 per cent w/v solution of *sodium molybdate* in *sulphuric acid*, heat at 110° for 20 minutes and examine in daylight. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Store protected from light.

Test solution. Dilute the injection to obtain a solution containing 0.2 per cent w/v of Flupentixol Decanoate in *acetonitrile*.

Reference solution (a). A 0.006 per cent w/v solution of *cis-flupentixol IPRS* in *acetonitrile.*

Reference solution (b). A 0.001 per cent w/v solution of *2- trifluoromethylthioxanthone IPRS* in *acetonitrile.*

Reference solution (c). A 0.002 per cent w/v solution of *trans-flupentixol decanoate IPRS* in *acetonitrile.*

Reference solution (d). A solution containing 0.006 per cent w/v of *cis-flupentixol IPRS* and 0.001 per cent w/v each of *2-trifluoromethylthioxanthone IPRS* and *trans-flupentixol decanoate IPRS* in the test solution.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecysilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 0.1 volume of *orthophosphoric acid*, 25 volumes of a 20 mM solution of *dioctyl sodium sulphosuccinate* prepared by dissolving 8.89 g of *dioctyl sodium sulphosuccinate* in 500 ml of *water*, stirring for 6 to 8 hours and diluting to 1000 ml with *water* and 75 volumes of *ethanol (95 per cent)*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 20 µl.

The substances are eluted in the following order: 2-trifluoromethylthioxanthone, *cis*-flupentixol (free alcohol), flupentixol decanoate and *trans*-flupentixol decanoate.

Inject reference solution (d). The test is not valid unless the chromatogram shows clearly separated peaks.

Inject reference solution (a), (b), (c) and the test solution. Run the chromatogram 1.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to *cis*-flupentixol is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (3.0 per cent), the area of any peak corresponding to 2- trifluoro-methylthioxanthone is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the area of any peak corresponding to *trans*-flupentixol decanoate is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent).

Other tests. Comply with the tests stated under Parenteral preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light.

Test solution. Dilute a volume of the injection to obtain a solution containing 0.2 per cent w/v of Flupentixol Decanoate in *acetonitrile.*

Reference solution. A 0.22 per cent w/v solution of *flupentixol decanoate dihydrochloride IPRS* in *acetonitrile.*

Use chromatographic system as described under Related substances.

Inject the reference solution and the test solution.

Calculate the content of $C_{33}H_{43}F_3N_2O_2S$ in the injection.

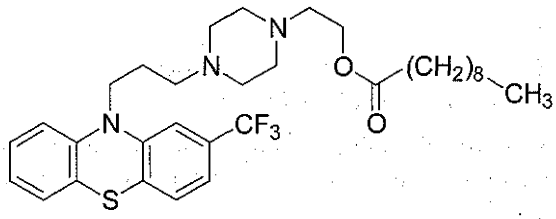
1 mg of flupentixol decanoate dihydrochloride is equivalent to 0.8897 mg of flupentixol decanoate.

Storage. Store protected from light.

Labelling. The label states that the injection is for intramuscular use.

Fluphenazine Decanoate

Fluphenazine Decanoate Ester



$C_{32}H_{44}F_3N_3O_2S$ Mol. Wt. 591.8

Fluphenazine Decanoate is 2-{4-[3-(2-trifluoro-methylphenothiazin-10-yl)propyl]piperazin-1-yl}ethyl decanoate.

Fluphenazine Decanoate contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{32}H_{44}F_3N_3O_2S$, calculated on the dried basis.

Category. Antipsychotic.

Description. A pale yellow, viscous liquid or yellow, crystalline, oily solid.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fluphenazine decanoate IPRS* or with the reference spectrum of fluphenazine decanoate.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *ethanol* shows an absorption maximum at about 261 nm and a less well-defined maximum at about 310 nm; absorbance at about 261 nm, about 0.60.

C. Determine in subdued light by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*. Impregnate the dry plate by placing it in a tank containing a 5 per cent

v/v solution of *n-tetradecane* in *n-hexane*, allowing the impregnating solvent to ascend to the top and allowing to dry.

Mobile phase. Methanol (90 per cent).

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of *ethanol (95 per cent)*.

Reference solution. A 2.0 per cent w/v solution of *fluphenazine decanoate IPRS* in *ethanol (95 per cent)*.

Apply to the plate 1 µl of each solution. After development, dry the plate dry in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

D. Dissolve 5 mg in 2 ml of *sulphuric acid* and allow to stand for 5 minutes; a reddish-brown colour is produced.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Carry out the test protected from light and prepare the solutions immediately before use.

Test solution. Dissolve 10 mg of the substance under examination in *acetonitrile* and dilute to 50.0 ml with *acetonitrile*.

Reference solution (a). A solution containing 0.01 per cent w/v each of *fluphenazine impurity D IPRS* and *fluphenazine impurity C IPRS* in *acetonitrile*.

Reference solution (b). Dilute 5.0 ml of the test solution to 100.0 ml with a mixture of 5 volumes of mobile phase A and 95 volumes of mobile phase B. Dilute 1.0 ml of the solution to 10.0 ml with the same solvent mixture.

Reference solution (c). A solution containing 0.00024 per cent w/v of *fluphenazine dihydrochloride IPRS* and 0.0001 per cent w/v of *fluphenazine sulphoxide IPRS* in a mixture of 5 volumes of *water* and 95 volumes of *acetonitrile*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a 1.0 per cent w/v solution of *ammonium carbonate*, adjusted to pH 7.5 with *dilute hydrochloric acid*,
  B. a mixture of 7.5 volumes of mobile phase A, 45 volumes of *acetonitrile* and 45 volumes of *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	20	80
7	20	80
17	0	100
80	0	100
82	20	80

Name	Relative retention time
Fluphenazine impurity A[1]	0.13
Fluphenazine impurity B[2]	0.33
Fluphenazine impurity C[3]	0.76
Fluphenazine impurity D[4]	0.82
Fluphenazine decanoate (Retention time: about 34 minutes)	1.0

[1]fluphenazine S-oxide,

[2]fluphenazine,

[3]fluphenazine enantate,

[4]fluphenazine octanoate.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to fluphenazine impurity C and fluphenazine impurity D is not less than 6.0.

Inject reference solution (b), (c) and the test solution. In the chromatogram obtained with the test solution, the area of peak corresponding to fluphenazine impurity A is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.5 per cent) and the area of peak corresponding to fluphenazine impurity B is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (1.0 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 60° at a pressure not exceeding 0.7 kPa for 3 hours.

Assay. Weigh 0.6 g and dissolve in 50 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02959 g of $C_{32}H_{44}F_3N_3O_2S$.

Storage. Store protected from light.

Fluphenazine Decanoate Injection

Fluphenazine Decanoate Injection is a sterile solution of Fluphenazine Decanoate in Sesame Oil.

Fluphenazine Decanoate Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of fluphenazine decanoate, $C_{32}H_{44}F_3N_3O_2S$.

Usual strengths. 25 mg per ml; 100 mg per ml.

Identification

A. Determine in subdued light by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. *Chloroform* for the first development and *methanol (90 per cent)* for the second development.

Test solution. Dilute a suitable volume of the injection with *ethanol (95 per cent)* to produce a solution containing 2.5 mg of Flufenazine Decanoate per ml.

Reference solution. A 0.25 per cent w/v solution of *fluphenazine decanoate IPRS* in *ethanol (95 per cent)*.

Apply to the bottom right-hand corner of the plate 10 µl of the test solution. After development, dry the plate in air, turn the plate through 90° in a clockwise direction, impregnate the coating with a 5 per cent v/v solution of *n-tetradecane* in *n-hexane* and allow it to dry in air. Apply to the bottom right-hand corner of the plate, to the right of the solvent front of the first development, 10 µl of the reference solution. After the second development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. Shake a volume of the injection containing 5 mg of Fluphenazine Decanoate with 1 ml of a 1 per cent w/v solution of *sucrose* in *hydrochloric acid* and allow to stand for 5 minutes; a red colour is produced in the acid layer.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Protect the solutions from light.

Test solution. Dilute a volume of the injection containing about 0.5 g Fluphenazine Decanoate in sufficient *chloroform* and dilute to 100.0 ml with *chloroform*. Dilute 1.0 ml of the solution to 25.0 ml with *acetonitrile*.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *acetonitrile*.

Reference solution (b). Add 0.05 ml of *10 M sodium hydroxide* to 2 ml of the test solution and allow to stand for 48 hours before use (generates fluphenazine impurity).

Reference solution (c). Add 0.05 ml of *hydrogen peroxide solution (200 volumes)* to 5 mg of *fluphenazine decanoate IPRS*, allow to stand for 10 minutes, add sufficient *chloroform* to produce 1 ml, mix and dilute to 100 ml with *acetonitrile* (generates mono- and di-*N*-oxide impurities).

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- mobile phase: add 450 ml of *acetonitrile* to a mixture of 75 volumes of a 1.0 per cent w/v solution of *ammonium carbonate* and 450 volumes of *methanol*, adjusted to pH 7.5 with *1 M acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to mono-*N*- oxide and di-*N*-oxide is not less than 2.0.

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with the test solution, the area of peak corresponding to fluphenazine impurity in the chromatogram obtained with reference solution (b) is not more than 4 times the area of the peak in the chromatogram obtained with reference solution (a) (4.0 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent) and the sum of areas of all the secondary peaks excluding the peak of fluphenazine impurity is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent). Ignore any peak with a relative retention time with reference to fluphenazine decanoate of 0.2 or less.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. *Carry out the following procedure protected from light.*

Measure a volume of the injection containing 0.25 g of Fluphenazine Decanoate and dilute with 75 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

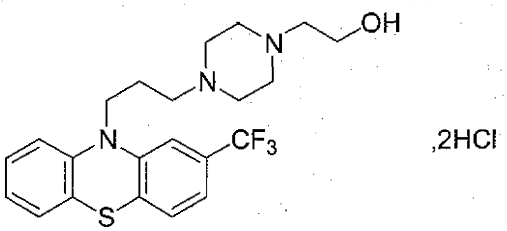
1 ml of *0.1 M perchloric acid* is equivalent to 0.02959 g of $C_{32}H_{44}F_3N_3O_2S$.

Storage. Store protected from light.

Labelling. The label states that the injection is for intramuscular injection only.

Fluphenazine Hydrochloride

Fluphenazine Dihydrochloride



$C_{22}H_{26}F_3N_3OS,2HCl$ Mol. Wt. 510.5

Fluphenazine Hydrochloride is 2-{4-[3-(2-trifluoromethylphenothiazin-10-yl)propyl]piperazin-1-yl}ethanol dihydrochloride.

Fluphenazine Hydrochloride contains not less than 98.5 per cent and not more than 101.0 per cent w/v of $C_{22}H_{26}F_3N_3OS,2HCl$, calculated on the dried basis.

Category. Antipsychotic.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B, C and D may be omitted if tests A and E are carried out.

A. Dissolve 0.1 g in 10 ml of *water*, make alkaline with *1 M sodium hydroxide*, extract with 5 ml of *chloroform*, filter through *anhydrous sodium sulphate* and evaporate the solvent in a current of nitrogen. The oily residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fluphenazine hydrochloride IPRS* treated in the same manner or with the reference spectrum of fluphenazine.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* shows an absorption maximum at about 258 nm and a less well-defined maximum at about 310 nm; absorbance at about 258 nm, between 0.63 and 0.70.

C. Determine in subdued light by thin-layer chromatography (2.4.17), coating the plate with *kieselguhr G*. Impregnate the dry plate by placing in a tank containing a shallow layer of a mixture of 36 volumes of *acetone*, 3 volumes of *formamide* and 1 volume of *2-phenoxyethanol*. Allow the impregnating solvent to ascend to the top, remove the plate from the tank and use it immediately.

Mobile phase. A mixture of 100 volumes of *light petroleum (40° to 60°)* saturated with *2-phenoxyethanol* and 2 volumes of *diethylamine*.

Test solution. Dissolve 0.2 g of the substance under examination in 100 ml of *methanol*.

Reference solution. A 0.2 per cent w/v solution of *fluphenazine hydrochloride IPRS* in *methanol*.

Apply to the plate 2 µl of each solution. After development, dry the plate in air, examine under ultraviolet light at 365 nm and observe the fluorescence produced after about 2 minutes. Heat the plate at 120° for 20 minutes, cool, spray with *ethanolic sulphuric acid (20 per cent)* and observe the colour produced. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

D. Mix about 5 mg with 45 mg of *heavy magnesium oxide* and ignite in a crucible until an almost white residue is obtained (usually less than 5 minutes). Allow to cool, add 1 ml of *water*, 0.05 ml of *dilute phenolphthalein solution* and about 1 ml of *2 M hydrochloric acid* to render the solution colourless and filter. To a freshly prepared mixture of 0.1 ml of *alizarin red S solution* and 0.1 ml of *zirconyl nitrate solution*, add 1 ml of the filtrate. Mix, allow to stand for 5 minutes and examine the colour of the solution as well as of a blank prepared in the same manner. The colour of the test solution is yellow and that of the blank is red.

E. It gives the reactions of chlorides (2.3.1).

Tests

pH (2.4.24). 1.9 to 2.3, determined in a 5.0 per cent w/v solution in *carbon dioxide-free water*.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Carry out the test protected from light and prepare the solutions immediately before use.

Solvent mixture. 4 volumes of *acetic acid* and 996 volumes of a 0.43 per cent w/v solution of *sodium octanesulphonate*.

Test solution. Dissolve 25 mg of the substance under examination in mobile phase A and dilute to 50.0 ml with mobile phase A.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A.

Reference solution (b). Dilute 5.0 ml of the solution to 25.0 ml with mobile phase A.

Reference solution (c). A 0.0001 per cent w/v solution of *fluphenazine impurity A IPRS* in mobile phase A.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 2 volumes of *acetic acid*, 150 volumes of *methanol*, 400 volumes of *acetonitrile* and 450 volumes of solvent mixture, ,

B. *methanol*,

- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm and 274 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
15	100	0
35	30	70
50	30	70
55	100	0

Name	Relative retention time	Correction factor
Fluphenazine impurity A[1]	0.2	—
Fluphenazine impurity B[2]	0.3	0.3
Fluphenazine (Retention time: about 19 minutes)	1.0	---
Fluphenazine impurity C[3]	2.2	0.6
Fluphenazine impurity D[4]	2.3	0.6

[1]fluphenazine sulphoxide,

[2]fluphenazine *S,S*-dioxide,

[3]2-[4-[3-[2',8-bis(trifluoromethyl)-10*H*-3,10'-biphenothiazin-10-yl]propyl]piperazin-1-yl]ethanol,

[4]10,10'-[piperazine-1,4-diylbis(propane-3,1-diyl)]bis[2-(trifluoromethyl)-10*H*-phenothiazine].

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and tailing factor is not more than 2.0.

Inject reference solution (b), (c) and the test solution. In the chromatogram obtained with the test solution, the area of peak corresponding to fluphenazine impurity A at 274 nm is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.2 per cent). The area of peak corresponding to fluphenazine impurity B at 274 nm is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent). The area of peak corresponding to fluphenazine impurities C and D at 260 nm is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any other secondary peak at 260 nm is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks other than fluphenazine impurities A and B at 260 nm and fluphenazine impurities A and B at 274 nm is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak at 260 nm with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Weigh 0.25 g and dissolve in a mixture of 10 ml of *anhydrous formic acid* and 40 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02552 g of $C_{22}H_{26}F_3N_3OS,2HCl$.

Storage. Store protected from light.

Fluphenazine Hydrochloride Injection

Fluphenazine Hydrochloride Injection is a sterile solution of Fluphenazine Hydrochloride in Water for Injection.

Fluphenazine Hydrochloride Injection contains not less than 95.0 per cent and not more than 110.0 per cent of the stated amount of fluphenazine hydrochloride, $C_{22}H_{26}F_3N_3OS,2HCl$.

Usual strengths. 2.5 mg per ml; 10 mg per ml.

Description. A clear, colourless solution.

Identification

A. Determine in subdued light by thin-layer chromatography (2.4.17), coating the plate with *kieselguhr G*. Impregnate the dry plate by placing in a tank containing a shallow layer of a mixture of 36 volumes of *acetone*, 3 volumes of *formamide* and 1 volume of *2-phenoxyethanol*. Allow the impregnating solvent to ascend to the top, remove the plate from the tank and use it immediately.

Mobile phase. A mixture of 100 volumes of *light petroleum (40° to 60°)* saturated with *2-phenoxyethanol* and 2 volumes of *diethylamine*.

Test solution. Use a quantity of the injection containing 2 mg of Fluphenazine Hydrochloride and dilute it to 1 ml with *methanol*.

Reference solution. A 0.2 per cent w/v solution of *fluphenazine hydrochloride IPRS* in *methanol*.

After development, dry the plate in air, examine under ultraviolet light at 365 nm and observe the fluorescence produced after about 2 minutes. Heat the plate at 120° for 20 minutes, cool, spray with *ethanolic sulphuric acid (20 per cent)* and observe the colour produced. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. To a quantity of the injection containing 5 mg of Fluphenazine Hydrochloride add 2 ml of *sulphuric acid* and allow to stand for 5 minutes; an orange colour is produced.

Tests

pH (2.4.24). 4.8 to 5.2.

Related substances. Determine in subdued light by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 80 volumes of *acetone*, 30 volumes of *cyclohexane* and 5 volumes of *strong ammonia solution*.

Test solution. Dilute a quantity of the injection containing about 20 mg of Fluphenazine Hydrochloride with sufficient *0.1 M methanolic sodium hydroxide* to make 10 ml.

Reference solution (a). Dilute 1 volume of the test solution to 50 volumes with *0.1 M methanolic sodium hydroxide*.

Reference solution (b). Dilute 1 volume of the test solution to 100 volumes with *0.1 M methanolic sodium hydroxide*.

Apply to the plate 50 µl of the test solution and 25 µl of reference solution (a) and (b). After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than two such spots are more intense than the spot in the chromatogram obtained with reference solution (b). Ignore any spot remaining on the line of application.

Bacterial endotoxins (2.2.3). Not more than 166.7 Endotoxin Units per mg of fluphenazine hydrochloride.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. *Carry out the following procedure protected from light.*

To a measured quantity of the injection containing 5 mg of Fluphenazine Hydrochloride add a mixture of 1 volume of *1 M hydrochloric acid* and 99 volumes of *ethanol* (*90 per cent*) to produce 50.0 ml. Dilute 10.0 ml of the solution to 100.0 ml with the acid-ethanol mixture and measure the absorbance of the resulting solution at the maximum at about 258 nm (2.4.7). Calculate the content of $C_{22}H_{26}F_3N_3OS,2HCl$ taking 620 as the specific absorbance at 258 nm.

Storage. Store protected from light.

Fluphenazine Tablets

Fluphenazine Hydrochloride Tablets

Fluphenazine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of fluphenazine hydrochloride, $C_{22}H_{26}F_3N_3OS,2HCl$. The tablets are coated.

Usual strengths. 1 mg; 2.5 mg; 5 mg.

Identification

A. Determine in subdued light by thin-layer chromatography (2.4.17), coating the plate with *kieselguhr G*. Impregnate the dry plate by placing in a tank containing a shallow layer of a mixture of 36 volumes of *acetone*, 3 volumes of *formamide* and 1 volume of *2-phenoxyethanol*. Allow the impregnating solvent to ascend to the top, remove the plate from the tank and use it immediately.

Mobile phase. A mixture of 100 volumes of *light petroleum (40° to 60°)* saturated with *2-phenoxyethanol* and 2 volumes of *diethylamine*.

Test solution. Shake a quantity of the powdered tablets with sufficient *methanol* to produce a solution containing 0.2 per cent w/v of Fluphenazine Hydrochloride, centrifuge and use the supernatant liquid.

Reference solution. A 0.2 per cent w/v solution of *fluphenazine hydrochloride IPRS* in *methanol*.

After development, dry the plate in air, examine under ultraviolet light at 365 nm and observe the fluorescence produced after about 2 minutes. Heat the plate at 120° for 20 minutes, cool, spray with *ethanolic sulphuric acid (20 per cent)* and observe the colour produced. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. Extract a quantity of the powdered tablets containing 5 mg of Fluphenazine Hydrochloride with 5 ml of *acetone*, filter and evaporate the filtrate to dryness. Add 2 ml of *sulphuric acid* to the residue and allow to stand for 5 minutes; an orange colour is produced.

C. Extract a quantity of the powdered tablets containing 10 mg of Fluphenazine Hydrochloride with 10 ml of *ethanol* containing 0.2 per cent v/v of *strong ammonia solution* and evaporate the extract to dryness. Heat 0.5 ml of *chromic-sulphuric acid mixture* in a small test-tube in a water-bath for 5 minutes; the solution wets the sides of the tube readily and there is no greasiness. Add 2 or 3 mg of the residue and again heat in a water-bath for 5 minutes; the solution does not wet the sides of the tube and does not pour easily from the tube.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),

Medium. 900 ml of *0.01M hydrochloric acid*,

Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Buffer solution. 0.05 M monobasic potassium phosphate, adjusted to pH 2.5 with *orthophosphoric acid.*

Solvent mixture. 30 volumes of *acetonitrile* and 30 volumes of *methanol* and 40 volumes of the buffer solution.

Test solution. Dilute the filtrate with an equal volume of the mobile phase.

Reference solution. Dissolve a suitable quantity of *fluphenazine hydrochloride IPRS* in the dissolution medium and dilute with an equal volume of the mobile phase to obtain a solution of known concentration similar to the expected concentration of the test solution.

Chromatographic system

- a stainless steel column 12.5 cm × 4.0 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: 0.3 per cent w/v solution of *triethylamine* in the solvent mixture,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 100 µl.

Inject the reference solution. The test is not valid unless column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{26}F_3N_3OS$, 2HCl, in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{22}H_{26}F_3N_3OS$, 2HCl.

Related substances. Determine in subdued light by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 80 volumes of *acetone*, 30 volumes of *cyclohexane* and 5 volumes of *strong ammonia solution.*

Test solution. Remove the coating from a suitable quantity of tablets; shake a quantity of the powdered tablet cores containing 20 mg of Fluphenazine Hydrochloride with 10 ml of *0.1 M methanolic sodium hydroxide* for 5 minutes, centrifuge and use the supernatant liquid.

Reference solution (a). Dilute 1 volume of the test solution to 50 volumes with *0.1 M methanolic sodium hydroxide.*

Reference solution (b). Dilute 1 volume of the test solution to 100 volumes with *0.1 M methanolic sodium hydroxide.*

Apply to the plate 50 µl of the test solution and 25 µl of reference solution (a) and (b). After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than two such spots is more intense than the spot in the chromatogram obtained with reference solution (b). Ignore any spot remaining on the line of application.

Uniformity of content. Complies with the test stated under Tablets.

NOTE — Carry out the procedure protected from light.

Powder 1 tablet and dissolve the powder as completely as possible in a mixture of 99 volumes of *ethanol (80 per cent)* and 1 volume of *1 M hydrochloric acid.* Add sufficient of the acid-ethanol mixture to produce 100.0 ml and filter. Dilute suitably, if necessary with the acid-ethanol mixture and measure the absorbance of the resulting solution at the maximum at about 258 nm (2.4.7). Calculate the content of $C_{22}H_{26}F_3N_3OS$,2HCl taking 620 as the specific absorbance at 258 nm.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14), as described under Dissolution with the following modifications.

Test solution. Disperse 5 intact tablets in the solvent mixture, with intermittent shaking for 1 hour and sonicate until a fine suspension is obtained and dilute with the solvent mixture to obtain a solution containing 0.005 per cent w/v of Fluphenazine Hydrochloride.

Reference solution. A 0.005 per cent w/v solution of *fluphenazine hydrochloride IPRS* in the solvent mixture.

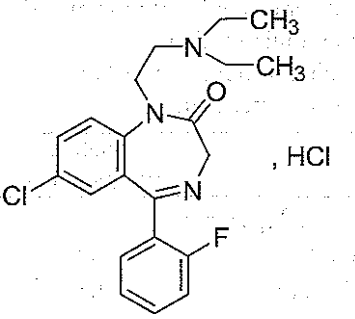
- mobile phase: 0.2 per cent w/v solution of *triethylamine* in the solvent mixture,
- flow rate: 1 ml per minute,
- injection volume: 25 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{26}F_3N_3OS$,2HCl in the tablets.

Storage. Store protected from light.

Flurazepam Hydrochloride



$C_{21}H_{23}ClFN_3O$,HCl Mol. Wt. 424.3

Flurazepam Hydrochloride is 7-Chloro-1-[2-(diethylamino)ethyl]-5-(2-fluorophenyl)-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one monohydrochloride.

Flurazepam Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{21}H_{23}ClFN_3O,HCl$, calculated on the dried basis.

Category. Sedative; anxiolytic; anticonvulsant and skeletal muscle relaxant.

Description. A white to off-white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *flurazepam hydrochloride IPRS* or with the reference spectrum of flurazepam hydrochloride.

B. It gives reaction (A) of chlorides (2.3.1).

Tests

pH (2.4.24). 5.0 to 6.0, determined on 5.0 per cent w/v solution in *carbon dioxide-free water*.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg each of the substance under examination and *oxazepam* in 10 m of *acetonitrile* and dilute to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of *acetonitrile* and 65 volumes of a 1.05 per cent w/v solution of *potassium dihydrogen phosphate*, adjusted to pH 6.1 with 4.0 per cent w/v solution of *sodium hydroxide*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 239 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Flurazepam (Retention time: about 7 minutes)	1.0	—
Flurazepam impurity C[1]	1.5	0.65
Flurazepam impurity B[2]	1.9	0.61
Flurazepam impurity A[3]	2.4	—

[1]7-chloro-5-(2-fluorophenyl)-1-[(1*RS*)-1-hydroxyethyl]-1,3-dihydro-2H-1,4-benzodiazepin-2-one,

[2]7-chloro-5-(2-fluorophenyl)-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one,

[3][5-chloro-2-[[2-(diethylamino)ethyl]amino]phenyl](2-fluorophenyl) methanone.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to flurazepam and oxazepam is not less than 4.5.

Inject reference solution (a) and the test solution. Run the chromatogram 6 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). The sum of areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Fluorides (2.3.55). 0.1 g complies with the limit test for fluorides (500 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

Assay. Dissolve 0.35 g in a mixture of 1.0 ml of *0.1 M hydrochloric acid* and 50 ml of *ethanol*. Titrate with *0.1 M sodium hydroxide*. Read the volume added between 2 points of inflection.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.04243 g of $C_{21}H_{24}Cl_2FN_3O$.

Storage. Store protected from light.

Flurazepam Capsules

Flurazepam Capsules contain Flurazepam Hydrochloride.

Flurazepam Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of flurazepam, $C_{21}H_{23}ClFN_3O$.

Usual strengths. 5 mg; 10 mg; 15 mg.

Identification

A. Shake a quantity of the capsules containing 0.15 g of Flurazepam with 3 ml of *chloroform* and filter. On the filtrate, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *flurazepam hydrochloride IPRS* or with the reference spectrum of flurazepam hydrochloride.

B. When examined in the range 220 nm to 350 nm (2.4.7), the solution obtained in the Assay exhibits two maxima at 240 nm and 284 nm.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 2.5 volumes of *diethylamine* and 97.5 volumes of *ether*.

Solvent mixture. 2 volumes of *13.5 M ammonia* and 98 volumes of *methanol*.

Test solution. Disperse a quantity of the contents of capsules containing 0.1 g of flurazepam with 2 ml of the solvent mixture and centrifuge.

Reference solution. Dilute 1.0 ml of the test solution to 200.0 ml with the solvent mixture.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

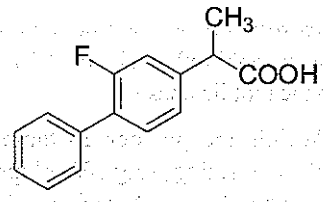
Other tests. Comply with the tests stated under Capsules.

Assay. *Carry out the following procedure protected from light.*

Disperse a quantity of the capsule contents containing 0.1 g of flurazepam in 150 ml of *1 M methanolic sulphuric acid* with the aid of ultrasound for 10 minutes and dilute to 250 ml with *1 M methanolic sulphuric acid*. Further dilute the solution with *1 M methanolic sulphuric acid* to obtain a solution containing 0.002 per cent w/v of flurazepam and measure the absorbance of the resulting solution at the maximum at 284 nm (2.4.7). Calculate the content of $C_{21}H_{23}ClFN_3O$ taking 319 as the value of specific absorbance at the maximum at 284 nm.

Labelling. The label states that the strength in terms of the equivalent amount of Flurazepam.

Flurbiprofen



$C_{15}H_{13}FO_2$ Mol. Wt. 244.3

Flurbiprofen is (*RS*)-2-(2-fluorobiphenyl-4-yl)propionic acid.

Flurbiprofen contains not less than 99.0 per cent and not more than 100.5 per cent of $C_{15}H_{13}FO_2$, calculated on the dried basis.

Category. Antiinflammatory; analgesic.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *flurbiprofen IPRS* or with the reference spectrum of flurbiprofen.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *0.1 M sodium hydroxide* shows an absorption maximum only at about 247 nm, about 0.8.

C. Heat 0.5 ml of *chromic-sulphuric acid mixture* in a small test-tube in a water-bath for 5 minutes; the solution wets the sides of the tube readily and there is no greasiness. Add 2 or 3 mg of the substance under examination and heat in a water-bath for 5 minutes; the solution does not wet the sides of the tube and does not pour easily from the tube.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 45 volumes of *acetonitrile* and 55 volumes of *water*.

Test solution (a). Dissolve 0.2 g of the substance under examination in 100.0 ml with solvent mixture.

Test solution (b). Dissolve 0.2 g of the substance under examination and 1 mg of *2-(biphenyl- 4-yl) propionic acid IPRS* in 100.0 ml of the solvent mixture.

Reference solution. A 0.001 per cent w/v solution of *2-(biphenyl-4-yl) propionic acid IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of *water*, 35 volumes of *acetonitrile* and 5 volumes of *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Adjust the sensitivity of the instrument so that with the reference solution the height of the peak due to 2-(biphenyl-4-yl)propionic acid is about 40 per cent of the full-scale deflection on the recorder.

In the chromatogram obtained with test solution (a) the area of any secondary peak is not greater than the area of the peak in the chromatogram obtained with the reference solution and the sum of the areas of any such peaks is not greater than

twice the area of the peak in the chromatogram obtained with the reference solution.

The test is not valid unless a peak due to 2-(biphenyl-4-yl) propionic acid appears immediately before the principal peak in the chromatogram obtained with test solution (b) and the height of the trough separating the two peaks is less than 4 per cent of the full-scale deflection on the chart paper.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying. Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 60° at a pressure not exceeding 0.7 kPa.

Assay. Weigh 0.5 g, dissolve in 100 ml of *ethanol (95 per cent)* previously neutralised to *phenolphthalein solution* and titrate with *0.1 M sodium hydroxide* using *phenolphthalein solution* as indicator.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.02443 g of $C_{15}H_{13}FO_2$.

Flurbiprofen Tablets

Flurbiprofen Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of flurbiprofen, $C_{15}H_{13}FO_2$. The tablets are coated.

Usual strengths. 50 mg; 100 mg.

Identification

Extract a quantity of the powdered tablets containing 0.5 g of Flurbiprofen with 25 ml of *acetone*, filter, evaporate the filtrate to dryness with the aid of a current of air without heating and dry at 60° at a pressure of 2 kPa. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *flurbiprofen IPRS* or with the reference spectrum of flurbiprofen.

B. Heat 0.5 ml of *chromic-sulphuric acid mixture* in a small test-tube in a water-bath for 5 minutes; the solution wets the sides of the tube readily and there is no greasiness. Add 2 or 3 mg of the substance under examination and heat in a water-bath for 5 minutes; the solution does not wet the sides of the tube and does not pour easily from the tube.

Tests

Dissolution (2.5.2).
Apparatus No. 2 (Paddle),
Medium. 900 ml of a buffer solution prepared by dissolving 6.8 g of *monobasic potassium phosphate* and 1.4 g of *sodium hydroxide* in 900 ml of *water*, adjusted to pH 7.2 with *5M sodium hydroxide* or *orthophosphoric acid* and dilute to 1000 ml with *water*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with medium, if necessary, at the maximum at about 247 nm (2.4.7). Calculate the content of $C_{15}H_{13}FO_2$ in the medium from the absorbance obtained from a solution of known concentration of *flurbiprofen IPRS* in dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_{15}H_{13}FO_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 0.5 g of Flurbiprofen in 50 ml of *water*, add 200 ml of *acetonitrile*, mix and centrifuge. Use the supernatant liquid.

Reference solution. A 0.001 per cent w/v solution of *2-(biphenyl-4-yl)propionic acid IPRS* in the test solution.

Chromatographic system
- a stainless steel column 15 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of *water*, 35 volumes of *acetonitrile* and 5 volumes of *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Adjust the sensitivity of the instrument so that with the reference solution the height of the peak due to 2-(biphenyl-4-yl) propionic acid is about 40 per cent of the full-scale deflection on the recorder.

In the chromatogram obtained with the test solution the area of any secondary peak is not greater than the area of the peak in the chromatogram obtained with the reference solution and the sum of the areas of any such peaks is not greater than twice the area of the peak in the chromatogram obtained with the reference solution.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14),

Internal standard solution. A 0.008 per cent w/v solution of *acetophenone* in the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 0.3 g of Flurbiprofen in internal standard solution, with the aid of mechanical shaking for 15 minutes and dilute to 100.0 ml with internal standard solution. Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution. A 0.3 per cent w/v solution of *flurbiprofen IPRS* in internal standard solution. Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 57 volumes of buffer solution prepared by dissolving 2.5 g of *sodium dihydrogen orthophosphate* in 1000 ml of *water*, and 43 volumes of *acetonitrile* and adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

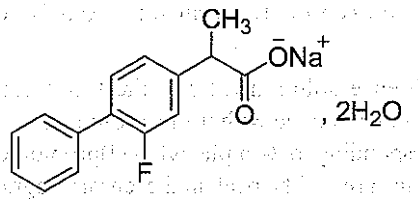
The relative retention time with reference to flurbiprofen for acetophenone is about 0.4.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to acetophenone and flurbiprofen is not less than 8.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{13}FO_2$ in the tablets.

Flurbiprofen Sodium



$C_{15}H_{12}FNaO_2,2H_2O$ Mol. Wt. 302.3

Flurbiprofen Sodium is Sodium (*RS*)-2-(2-fluorobiphenyl-4-yl) propionate dihydrate.

Flurbiprofen Sodium contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{15}H_{12}FNaO_2$, calculated on the dried basis.

Category. Analgesic; anti-inflammatory.

Description. A white to creamy-white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *flurbiprofen sodium IPRS* or with the reference spectrum of flurbiprofen sodium.

B. Heat 0.2 g over a flame until charred and then heat at 600° for 2 hours. The residue gives thse reactions of sodium salts (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 25 volumes of *water* and 50 volumes of *methanol*.

Test solution. Dissolve 100 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). A 0.0002 per cent w/v solution of the substance under examination in the solvent mixture.

Reference solution (b). A 0.0005 per cent w/v solution of *2-(biphenyl-4-yl)propionic acid IPRS* in the solvent mixture.

Reference solution (c). A solution containing 0.0005 per cent w/v each of the substance under examination and *2-(biphenyl-4-yl)propionic acid IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 5 volumes of *glacial acetic acid*, 35 volumes of *acetonitrile* and 60 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless the resolution between the two principal peaks is not less than 1.5.

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to 2-(biphenyl-4-yl)propionic acid is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the peak in the chromatogram obtained with reference solution (a) (1.0 per cent).

Heavy metals (2.3.13). 12 ml of a 20.0 per cent w/v solution in *methanol* complies with the limit test for Heavy metals, Method D (10 ppm), using 10.0 ml of *lead standard solution (2 ppm Pb)*.

Loss on drying (2.4.19). 11.3 per cent to 12.5 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* at 60° at a pressure of 2 kPa for 18 hours.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 25 volumes of *water* and 50 volumes of *methanol*.

Test solution. Dissolve 15 mg of the substance under examination in 100.0 ml of the solvent mixture.

Reference solution (a). A 0.015 per cent w/v solution of *flurbiprofen sodium IPRS* in the solvent mixture.

Reference solution (b). A solution contanining 0.00075 per cent w/v each of the substance under examination and *2-(biphenyl-4-yl)propionic acid IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 1.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{15}H_{12}FNaO_2$.

Flurbiprofen Eye Drops

Flurbiprofen Eye Drops is a sterile solution of Flurbiprofen Sodium in Purified Water.

Flurbiprofen Eye Drops contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of flurbiprofen sodium dihydrate, $C_{15}H_{12}FNaO_2.2H_2O$.

Usual strengths. 0.03 per cent w/v; 0.3 per cent w/v.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Solvent mixture. 25 volumes of *water* and 50 volumes of *methanol*.

Mobile phase. A mixture of 5 volumes of *propan-2-ol* and 95 volumes of *dichloromethane* as the mobile phase.

Test solution. Dilute a volume of eye drops to obtain a 0.01 per cent w/v solution of Flurbiprofen Sodium in the solvent mixture.

Reference solution. A 0.01 per cent w/v solution of *flurbiprofen sodium IPRS* in the solvent mixture.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.24). 6.0 to 7.0.

2-(biphenyl-4-yl)propionic acid. Determine by liquid chromatography (2.4.14).

Solvent mixture. 25 volumes of *water* and 50 volumes of *methanol*.

Test solution. Dilute a volume of eye drops to obtain 0.03 per cent w/v solution of Flurbiprofen Sodium in the solvent mixture.

Reference solution (a). A 0.00015 per cent w/v solution of *2-(biphenyl- 4-yl)propionic acid IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.0005 per cent w/v each of *flurbiprofen sodium IPRS* and *2-(biphenyl-4-yl)propionic acid IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 5 volumes of *glacial acetic acid*, 35 volumes of *acetonitrile* and 60 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 1.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to 2-(biphenyl-4-yl)propionic acid is not more than the area of the peak in the chromatogram obtained with reference solution (a) (0.5 per cent).

Other tests. Comply with the tests stated under Eye Drops.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 25 volumes of *water* and 50 volumes of *methanol*.

Test solution. Dilute a volume of eye drops to obtain a 0.015 per cent w/v solution of Flurbiprofen Sodium in the solvent mixture.

Reference solution (a). A 0.015 per cent w/v solution of *flurbiprofen sodium IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.0005 per cent w/v each of *flurbiprofen sodium IPRS* and *2-(biphenyl-4-yl)propionic acid IPRS* in the solvent mixture.

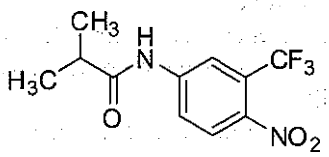
Use chromatographic system as described under test for 2-(Biphenyl-4- yl)propionic acid.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 1.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{15}H_{12}FNaO_2.2H_2O$ in the eye drops.

Flutamide



$C_{11}H_{11}F_3N_2O_3$ Mol. Wt. 276.2

Flutamide is 2-methyl-*N*-[4-nitro-3-(trifluoromethyl)phenyl] propanamide.

Flutamide contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{11}H_{11}F_3N_2O_3$, calculated on the dried basis.

Category. Antiandrogen.

Description. A pale yellow crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *flutamide IPRS* or with the reference spectrum of flutamide.

B. Melting point (2.4.21). About 112°.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in 20.0 ml of the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 2.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (b). Dissolve 2 mg of *flutamide IPRS* and 2 mg of *N-[4-nitro-3-(trifluoromethyl)phenyl]propanamide IPRS (flutamide impurity C IPRS)* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of equal volumes of *acetonitrile* and *water*,
- flow rate: 0.5 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to flutamide impurity C and flutamide is not less than 10.5. The relative retention time with reference to flutamide for flutamide impurity C is about 0.72.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of secondary peak corresponding to flutamide impurity C is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of all secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 60° for 3 hours.

Assay. Weigh 25 mg, dissolve in *methanol* and dilute to 25.0 ml with the *methanol*. Dilute 2.0 ml of the solution to 100.0 ml with *methanol* and measure the absorbance of the resulting solution at the maximum at about 295 nm (2.4.7). Calculate the content of $C_{11}H_{11}F_3N_2O_3$ taking 295 as the specific absorbance at 295 nm.

Storage. Store protected from light.

Flutamide Capsules

Flutamide Capsules contain not less than 93.0 per cent and not more than 107.0 per cent of the stated amount of flutamide, $C_{11}H_{11}F_3N_2O_3$.

Usual strength. 125 mg.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with silica gel *GF254*.

Solvent mixture. 50 volumes of *chloroform* and 10 volumes of *methanol*.

Mobile phase. A mixture of 30 volumes of *chloroform* and 10 volumes of *ethyl acetate*.

Test solution. Dissolve the content of the capsules containing about 30 mg of Flutamide in 10.0 ml of the solvent mixture.

Reference solution. A 0.3 per cent w/v solution of *flutamide IPRS* in the solvent mixture.

Apply to the plate 20 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 1000 ml of 2.0 per cent w/v solution of *sodium lauryl sulphate*,

Speed and time. 75 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter. Measure the absorbance of the filtrate, suitably diluted if necessary, at the maximum at about 306 nm (2.4.7). Calculate the content of $C_{11}H_{11}F_3N_2O_3$ in the medium form a known concentration of *flutamide IPRS* prepared by initially dissolving in *methanol* and further diluting with the dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_{11}H_{11}F_3N_2O_3$.

Chromatographic purity. Determine by liquid chromatography (2.4.14), as described under Assay using the following modifications.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 10 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of the secondary peak having relative retention time of 0.45 is not more than 0.2 per cent the area of the principal peak in the chromatogram obtained with the reference solution, the area of any other secondary peak is not more than 0.1 per cent the area of the principal peak in the chromatogram obtained with the reference solution and the sum of all the secondary peaks is not more than 0.3 per cent the area of the principal peak in the chromatogram obtained with the reference solution.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and of *water*.

Test solution. Mix the content of 20 Capsules. Disperse the content of the capsules containing about 125 mg of Flutamide in 250 ml of the solvent mixture, filter. Dilute 10.0 ml of the filtrate to 25 ml with *water*.

Reference solution. A 0.05 per cent w/v solution of *flutamide IPRS* in the solvent mixture. Dilute 10.0 ml of the solution to 25 ml with *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil),
- mobile phase: a mixture 55 volumes of *water* and 45 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.5 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{11}H_{11}F_3N_2O_3$.

Storage. Store protected from light.

Flutamide Tablets

Flutamide Tablets contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of flutamide $C_{11}H_{11}F_3N_2O_3$.

Usual strength. 250 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 1000 ml of 2.0 per cent w/v solution of *sodium lauryl sulphate*,

Speed and time. 75 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate suitably diluted if necessary, with the dissolution medium at 306 nm (2.4.7). Calculate the

content of $C_{11}H_{11}F_3N_2O_3$ in the medium from the absorbance obtained from a solution of known concentration of *flutamide IPRS* prepared by dissolving in *methanol* and diluted with the dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_{11}H_{11}F_3N_2O_3$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—All the solutions should be prepared under subdued light.

Test solution. Disperse a quantity of powdered tablets containing 100 mg of Flutamide in *acetonitrile* and dilute to 50.0 ml with *acetonitrile* and filter.

Reference solution. A 0.002 per cent w/v solution of *flutamide IPRS* in *acetonitrile*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 25°,
- sample temperature: 5°,
- mobile phase: a mixture of 50 volumes of *water* and 50 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent).

Other tests. Comply with the test stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

NOTE—All the solution should be prepared under subdued light.

Test solution. Disperse a quantity of powdered tablets containing 100 mg of Flutamide in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 50.0 ml with mobile phase.

Reference solution. A 0.02 per cent w/v solution of *flutamide IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of *water* and 65 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

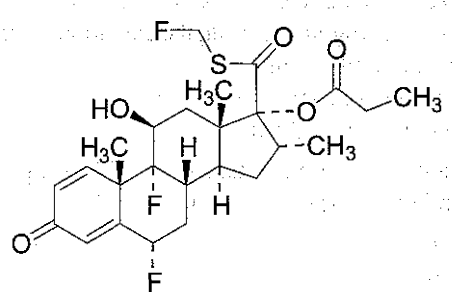
Inject the reference solution and the test solution.

Calculate the content of $C_{11}H_{11}F_3N_2O_3$ in the tablets.

Storage. Store protected from moisture not exceeding 30°.

Labelling. The label states the strength in terms of the amount of Flutamide.

Fluticasone Propionate



$C_{25}H_{31}F_3O_5S$ Mol. Wt. 500.6

Fluticasone Propionate is *S*-fluoromethyl 6α,9α-difluoro-11β-hydroxy-16α-methyl-17α-propionyloxy-3-oxoandrosta-1,4-diene-17β-carbothioate.

Fluticasone Propionate contains not less than 96.0 per cent and not more than 102.0 per cent of fluticasone, $C_{25}H_{31}F_3O_5S$, calculated on the anhydrous basis.

Category. Corticosteroid.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fluticasone propionate IPRS* or with the reference spectrum of fluticasone propionate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). +32.0° to +36.0°, determined in a 0.5 per cent w/v solution in *dichloromethane*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of mobile phase A and 50 volumes of mobile phase B.

Test solution. Dissolve 20 mg of the substance under examination in 100.0 ml of the solvent mixture.

Reference solution. A 0.02 per cent w/v solution of *fluticasone propionate IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. 0.05 per cent v/v *orthophosphoric acid* and 3.0 per cent v/v *methanol* in *acetonitrile*.
  B. 0.05 per cent v/v *orthophosphoric acid* and 3.0 per cent v/v *methanol* in *water*.
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 239 nm,
- injection volume: 50 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	43	57
40	55	45
60	90	10
70	90	10
75	43	57
85	43	57

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the column efficiency in not less than 20,000 theoretical plates.

Inject the test solution. Any individual impurity is not more than 0.5 per cent and sum of all the impurities is not more than 2.0 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 0.25 g, using *methanol* as solvent.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 40 mg of the substance under examination in 100.0 ml of the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution. A 0.004 per cent w/v solution of *fluticasone propionate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 15 volumes of *acetonitrile*, 35 volumes of a buffer solution prepared by dissolving 1.15 g of *ammonium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 3.5 with *orthophosphoric acid* and 50 volumes of methanol,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 239 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{25}H_{31}F_3O_5S$.

Storage. Store protected from light.

Fluticasone Cream

Fluticasone Cream contains Fluticasone Propionate in a suitable cream base.

Fluticasone Cream contains not less than 95.0 per cent and not more than 105.0 per cent of fluticasone propionate, $C_{25}H_{31}F_3O_5S$.

Usual strengths. 0.05 per cent w/w; 0.5 per cent w/w.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel F254*.

Mobile phase. A mixture of 1 volume of *glacial acetic acid*, 8 volumes of *ethyl acetate* and 30 volumes of *dichloromethane*.

Test solution. Transfer a quantity of the cream containing 1 mg of Fluticasone Propionate to a separating funnel, add 25 ml of *acetonitrile* and 25 ml of *n-hexane*, shake for 3 minutes and allow to separate. Filter the lower layer through an absorbent cotton plug, previously washed with *acetonitrile*, into a 50-ml graduated flask, repeat the extraction with one 5-ml and then one 2-ml quantity of *acetonitrile*, filter and add the extracts to the filtered layer; wash the absorbent cotton plug with 2 ml of *acetonitrile*, add the washings to the filtered layer and dilute the combined extracts to 50 ml with *acetonitrile*. Evaporate 4 ml of the resulting solution to

dryness using a rotary evaporator at a temperature of 40° and dissolve the residue in 0.2 ml of *acetonitrile*.

Reference solution. A 0.04 per cent w/v solution of *fluticasone propionate IPRS* in *acetonitrile*.

Apply to the plate 40 µl of each solution. Allow the plate to rise 12 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Other tests. Comply with the tests stated under Creams.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light.

Test solution. Transfer a quantity of the cream containing 1 mg of Fluticasone Propionate to a separating funnel, add 25 ml of *ethanol (65 per cent)*, stopper and shake until the cream is completely dispersed. Add 25 ml of *n-hexane*, shake for 3 minutes and allow to separate, filter the lower aqueous layer through an absorbent cotton plug, previously washed with *ethanol (65 per cent)*, into a graduated flask and repeat the extraction with one 5-ml and then one 2-ml quantity of *ethanol (65 per cent)*, filtering the aqueous ethanol extracts into the same graduated flask. Wash the absorbent cotton plug with *ethanol (65 per cent)*, collecting the washings in the flask and dilute the combined extracts to 50 ml with *ethanol (65 per cent)*.

Reference solution (a). A 0.002 per cent w/v solution of *fluticasone propionate IPRS* in *methanol (80 per cent)*.

Reference solution (b). A solution containing 0.0004 per cent w/v of *fluticasone* S-*methyl impurity IPRS* and 0.002 per cent w/v of *fluticasone propionate IPRS* in *methanol (80 per cent)*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 50°,
- mobile phase: a mixture of 15 volumes of *acetonitrile*, 35 volumes of *0.01 M ammonium dihydrogen orthophosphate* previously adjusted to pH 3.5 with *orthophosphoric acid* and 50 volumes of *methanol*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to fluticasone S-methyl impurity and fluticasone propionate is not less 1.6.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{25}H_{31}F_3O_5S$ in the cream.

Fluticasone Propionate Inhalation

Fluticasone Propionate Inhalation is a suspension of microfine Fluticasone Propionate in a suitable liquid filled in a suitable pressurized container. It may contain suitable pharmaceutical aids such as surfactants, stabilizing agents.

Fluticasone Propionate Inhalation delivers not less than 80.0 per cent and not more than 120.0 per cent of the stated amount of fluticasone propionate, $C_{25}H_{31}F_3O_5S$, per inhalation by actuation of the valve.

Usual strengths. 50 µg per metered dose; 125 µg per metered dose; 250 µg per metered dose.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

Tests

Other tests. Comply with the tests stated under Inhalation Preparations (Pressurised Metered-dose Preparations).

Follow the procedure described under Assay with suitable dilution of the reference solution wherever the amount of active substance is to be determined in any test.

Assay. Carry out the test for Content of active ingredient delivered per actuation stated under Inhalation Preparations (Pressurised Metered-dose Preparations).

Determine by liquid chromatography (2.4.14).

Test solution. Prepare using the mobile phase as described under the test for Content of active ingredient delivered per actuation stated under Inhalation Preparations (Pressurised Metered-dose Preparations).

Reference solution (a). A 0.05 per cent w/v solution of *fluticasone propionate IPRS* in *acetonitrile*.

Reference solution (b). Dilute reference solution (a) with the mobile phase to obtain a solution containing 25 µg of fluticasone propionate per ml.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 40 volumes of a buffer solution prepared by dissolving 1.3 g of *diammonium hydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 7.0

with *orthophosphoric acid* and 60 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 238 nm,
- inject volume: 200 µl or 100 µl.

Inject the reference solution (b). The test is not valid unless the column efficiency is not less than 1500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (b) and the test solution.

Calculate the content of $C_{25}H_{31}F_3O_5S$ in the solution and the content of $C_{25}H_{31}F_3O_5S$ delivered per actuation of the valve.

Determine the content of active ingredient a second and third time by repeating the procedure on the middle ten and on the last ten successive combined actuations of the valve. For each of the three determinations the average content of $C_{25}H_{31}F_3O_5S$ delivered per actuation of the valve meets the requirements.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Labelling. The label states the amount of active ingredient delivered per inhalation.

Fluticasone Propionate Powder for Inhalation

Fluticasone Propionate Powder for Inhalation consists of Fluticasone propionate in microfine powder either alone or admixed with Lactose in a pre-metered unit for use in a suitable powder inhaler.

Fluticasone Propionate Powder for Inhalation contains not less than 90.0 per cent and not more than 125.0 per cent of the stated amount of fluticasone propionate, $C_{25}H_{31}F_3O_5S$ per unit dose.

Usual strengths. 50 mcg; 100 mcg; 250 mcg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Other tests. Comply with the tests stated under Inhalation Preparations (Powders for Inhalation).

Follow the procedure described under Assay with suitable dilution of the reference solution wherever the amount of active substance is to be determined in any test.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve a quantity of the mixed contents of 20 capsules in sufficient of the mobile phase to get a solution containing 25 µg of Fluticasone Propionate per ml.

Reference solution. A solution containing 0.5 mg of fluticasone propionate per ml prepared by dissolving 10 mg of *fluticasone propionate IPRS* in 10 ml *acetonitrile* and adding sufficient of the mobile phase to produce 20 ml and further dilute with mobile phase to obtain a solution containing 25 µg of Fluticasone Propionate per ml.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 40 volumes of a buffer solution prepared by dissolving 1.3 g of *diammonium hydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 7.0 with *orthophosphoric acid* and 60 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 238 nm,
- injection volume: 200 µl or 100 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1500 theoretical plates and the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{25}H_{31}F_3O_5S$ per unit.

Storage. Store protected from moisture, at temperature not exceeding 30°.

Labelling. The label states the quantity of active ingredient per pre-metered unit.

Fluticasone Nasal Spray

Fluticasone Nasal Spray is a suspension of Fluticasone Propionate in a suitable liquid in a container fitted with an appropriate nasal delivery system.

Fluticasone Nasal Spray contains not less than 80.0 per cent and not more than 120.0 per cent of fluticasone propionate, $C_{25}H_{31}F_3O_5S$ of the amount stated to be delivered by actuation of the valve.

Usual strengths. 50 µg; 100 µg; 125 µg.

NOTE — Carry out all the following procedures in the dark or under long-wavelength light at more than 420 nm and prepare solutions immediately before use and protect them from light.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel F254*.

Mobile phase. A mixture of 1 volume of *glacial acetic acid*, 8 volumes of *ethyl acetate* and 30 volumes of *dichloromethane*.

Test solution. Dilute a quantity of the nasal spray containing 2 mg of Fluticasone Propionate to 5 ml with *acetonitrile*, shake for 3 minutes and filter.

Reference solution. A 0.04 per cent w/v solution of *fluticasone propionate IPRS* in *acetonitrile*.

Apply to the plate 40 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of mobile phase A and mobile phase B.

Test solution. Dilute a quantity of the nasal spray containing 1 mg of Fluticasone Propionate to 5.0 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with the solvent mixture.

Reference solution (b). A solution containing 0.02 per cent w/v of *fluticasone propionate IPRS* and 0.00004 per cent w/v of 6α,9-difluoro-17-[(methylsulfanyl)carbonyl]-11β-hydroxy-16α-methyl-3- oxoandrosta-1,4-dien-17α-yl propanoate (*fluticasone S-methyl impurity IPRS*) in the solvent mixture.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. a solution containing 0.05 per cent v/v of *orthophosphoric acid* and 3.0 per cent v/v of *methanol* in *acetonitrile*,
  B. a solution containing 0.05 per cent v/v of *orthophosphoric acid* and 3.0 per cent v/v of *methanol* in *water*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 50 µl.

Time (in min.)	Mobile phase A (per cent w/v)	Mobile phase B (per cent w/v)
0	43	57
40	55	45
60	90	10
70	90	10
75	43	57
85	43	57

Inject reference solution (b) and (c). The test is not valid unless the resolution between the peaks due to fluticasone *S*-methyl impurity and fluticasone propionate is not less than 1.5 in the chromatogram obtained with reference solution (b) and the peak due to fluticasone propionate has a signal-to-noise ratio not less than 10 in the chromatogram obtained with reference solution (c).

Inject reference solution (a), (c) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of the areas of any such peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Other tests. Comply with the tests stated under Nasal Preparations.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. After priming the pump, discharge the container a sufficient number of times to obtain 1 mg of Fluticasone Propionate, add 25 ml of *ethanol (65 per cent)*, shake with the aid of ultrasound for 10 minutes and dilute to 50.0 ml with *ethanol (65 per cent)* and filter.

Reference solution (a). Dilute 2.0 ml of a 0.05 per cent w/v solution of *fluticasone propionate IPRS* in *methanol (80 per cent)* to 50 ml with *ethanol (65 per cent)*.

Reference solution (b). A solution containing 0.0004 per cent w/v of *fluticasone S-methyl impurity IPRS* and 0.002 per cent w/v of *fluticasone propionate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,

- mobile phase: a mixture of 15 volumes of *acetonitrile*, 35 volumes of *0.01 M ammonium dihydrogen orthophosphate* previously adjusted to pH 3.5 with *orthophosphoric acid* and 50 volumes of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to fluticasone *S*-methyl impurity and fluticasone propionate is not less than 1.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{25}H_{31}F_3O_5S$ in the nasal spray.

Labelling. The label states that the amount of active ingredient delivered by each actuation of the valve and the number of deliveries available from the container.

Fluticasone Ointment

Fluticasone Ointment contains Fluticasone Propionate in a suitable base.

Fluticasone Ointment contains not less than 95.0 per cent and not more than 105.0 per cent of fluticasone propionate, $C_{25}H_{31}F_3O_5S$.

Usual strength. 0.005 per cent w/w.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel F254*.

Mobile phase. A mixture of 1 volume of *glacial acetic acid*, 8 volumes of *ethyl acetate* and 30 volumes of *dichloromethane*.

Test solution. Transfer a quantity of the ointment containing 0.1 mg of Fluticasone Propionate to a separating funnel, add 10 ml of *acetonitrile* and 50 ml of *n-hexane*, shake for 5 minutes and allow to separate. Filter the lower layer through an absorbent cotton plug previously washed with *acetonitrile*, extract the hexane layer with two 5-ml quantities of *acetonitrile*, filter each extract through the absorbent cotton plug and wash the absorbent cotton plug with 2 ml of *acetonitrile*. Add the washings to the combined filtrates, evaporate the resulting solution to dryness using a rotary evaporator at a temperature of 40° and dissolve the residue in 0.5 ml of *acetonitrile*.

Reference solution. A 0.02 per cent w/v solution of *fluticasone propionate IPRS* in *acetonitrile*.

Apply to the plate 20 µl of each solution. Allow the plate to rise 12 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Other tests. Comply with the tests stated under Ointment.

Assay. Determine by liquid chromatography (2.4.14).

NOTE— Protect the solutions from light.

Test solution. Transfer a quantity of the ointment containing 0.1 mg of Fluticasone Propionate to a separating funnel, add 45 ml of *n-hexane*, previously heated to 60° in a water-bath, stopper the funnel and shake until the ointment is dispersed, venting frequently. Wash the stopper and neck of the funnel with 5-ml of *n-hexane* collecting the washings in the funnel, allow the funnel to cool to room temperature, add 10 ml of *methanol (80 per cent)*, stopper, shake for 1 minute and allow to separate. Filter the lower aqueous layer through an absorbent cotton plug, previously washed with *methanol (80 per cent)*, into a graduated flask; repeat the extraction with two 5-ml quantities of *methanol (80 per cent)*, filtering the aqueous methanol extracts into the same graduated flask. Wash the absorbent cotton plug with 2 ml of *methanol (80 per cent)*, collecting the washings in the flask and dilute the extract to 25 ml with *methanol (80 per cent)*.

Reference solution (a). A 0.0004 per cent w/v solution of *fluticasone propionate IPRS* in *methanol (80 per cent)*.

Reference solution (b). A solution containing 0.0004 per cent w/v of *fluticasone* S-*methyl impurity IPRS* and 0.002 per cent w/v of *fluticasone propionate IPRS* in *methanol (80 per cent)*.

Chromatographic system

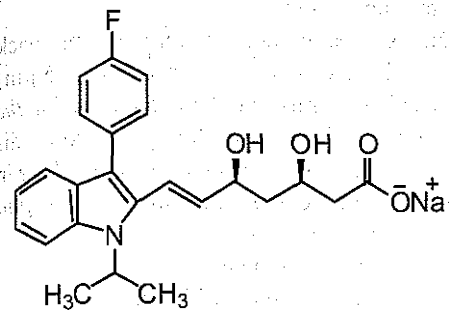
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 15 volumes of *acetonitrile*, 35 volumes of *0.01 M ammonium dihydrogen orthophosphate* previously adjusted to pH 3.5 with *orthophosphoric acid* and 50 volumes of *methanol*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to fluticasone *S*-methyl impurity and fluticasone propionate is not less than 1.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{25}H_{31}F_3O_5S$ in the ointment.

Fluvastatin Sodium



$C_{24}H_{25}FNNaO_4$ Mol. Wt. 433.5

Fluvastatin Sodium is Sodium (3*R**,5*S**,6*E*)-7-[3-(4-fluorophenyl)-1-(propan-2-yl)-1*H*-indol-2-yl]-3,5-dihydroxy-6-heptenoate.

Fluvastatin Sodium contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{24}H_{25}FNNaO_4$, calculated on the dried basis.

Category. Antihyperlipidemic.

Description. A white or almost white, or pale yellow to pale reddish-yellow, very hygroscopic, crystalline powder. It shows polymorphism (2.5.11).

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fluvastatin sodium IPRS* or with the reference spectrum of fluvastatin sodium.

B. A 5.0 per cent w/v solution in *carbon dioxide-free water* (solution A) gives reaction (A) of sodium (2.3.1).

Tests

pH (2.4.24). 8.0 to 10.0, determined in solution A.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Carry out the test protected from light.

Test solution. Dissolve 25 mg of the substance under examination in 20 ml of mobile phase B and dilute to 50.0 ml with mobile phase A.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with mobile phase A.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 50.0 ml with mobile phase A.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. add 20 ml of a 25 per cent w/v solution of *tetramethylammonium hydroxide* to 880 ml of *water*, adjusted to pH 7.2 with *orthophosphoric acid*, mix with 100 ml of a mixture of 40 volumes of *acetonitrile* and 60 volumes of *methanol*,

  B. add 20 ml of a 25 per cent w/v solution of *tetramethylammonium hydroxide* to 80 ml of *water*, adjusted to pH 7.2 with *orthophosphoric acid* mix with 900 ml of a mixture of 40 volumes of *acetonitrile* and 60 volumes of *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 2 ml per minute,
- spectrophotometer at 305 nm and at 365 nm.
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	70	30
3	70	30
23	10	90
25	70	30
30	70	30

Name	Relative retention time
Fluvastatin (Retention time: about 14 minutes)	1.0
Fluvastatin impurity A[1]	1.05
Fluvastatin impurity D[2]	1.1
Fluvastatin impurity B[3]	1.6

[1](3*RS*,5*RS*,6*E*)-7-[3-(4-fluorophenyl)-1-(1-methylethyl)-1*H*-indol-2-yl]-3,5-dihydroxyhept-6-enoic acid,

[2] (6*E*)-7-[3-(4-fluorophenyl)-1-(1-methylethyl)-1*H*-indol-2-yl]-3-hydroxy-5-oxohept-6-enoic acid,

[3]1,1-dimethylethyl (3*R*,5*S*,6*E*)-7-[3-(4-fluorophenyl)-1-(1-methylethyl)-1*H*-indol-2-yl]-3,5-dihydroxyhept-6-enoate.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to fluvastatin impurity A at 305 nm is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.8 per cent), the area of any peak due to fluvastatin impurity B at 305 nm is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any peak due to fluvastatin impurity D at 365 nm is not more than 0.75 times the area of the principal peak in the chromatogram obtained with reference solution (b) at 305 nm (0.15 per cent), the area of any other secondary peak at 305 nm

is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent) and the sum of areas of all the secondary peaks at 305 nm is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent).Ignore any peak at 305 nm with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). Dissolve 1.0 g in a mixture of 15 volumes of *water* and 85 volumes of *methanol* and dilute to 20 ml with the same solvent mixture. 12 ml of the solution complies with the limit test for heavy metals, Method D (20 ppm), using 10.0 ml of *lead standard solution (1 ppm Pb)* in the same solvent mixture.

Loss on drying (2.4.19). Not more than 4.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.325 g in 50 ml of *glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04335 g of $C_{24}H_{25}FNNaO_4$.

Storage. Store protected from light and moisture.

Fluvastatin Capsules

Fluvastatin Sodium Capsules

Fluvastatin Capsules contain fluvastatin sodium equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of fluvastatin, $C_{24}H_{26}FNO_4$.

Usual strengths. 20 mg; 40 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 500 ml of *water*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary with the dissolution medium.

Reference solution. Dissolve a weighted quantity of *fluvastatin sodium IPRS* in dissolution medium to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of *methanol* and 30 volumes of buffer solution prepared by dissolving 1.534 g of *monobasic ammonium phosphate* in 800 ml of *water*, adjusted to pH 3.5 with *orthophosphoric acid* or *ammonium hydroxide*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 1.5 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{24}H_{26}FNO_4$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{24}H_{26}FNO_4$.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

NOTE— Protect all solutions from light.

Solvent mixture. 54 volumes of buffer solution pH 7.2 prepared as solution containing 40 ml of 25 per cent aqueous *tetramethylammonium hydroxide* in 1000 ml of *water* and adjusted to pH 7.2 with *orthophosphoric acid* and 46 volumes of a mixture of 3 volumes of *methanol* and 2 volumes of *acetonitrile*.

Test solution. Disperse the content of 10 capsules with 100 ml *methanol* with the aid of ultrasound for 45 minutes. Centrifuge of the solution at 4000 rpm for 20 minutes. Dilute a volume of the solution pH 7.2 containing about 20 mg of Fluvastatin to 50.0 ml with the solvent mixture.

Reference solution. A 0.042 per cent w/v solution of *fluvastatin sodium IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 87.5 volumes of buffer solution prepared by dissolving 40 ml of 25 per cent aqueous *tetramethylammonium hydroxide* in 1000 ml of *water*, adjusted to pH 7.2 with *orthophosphoric acid* and 12.5 volumes of a mixture of 3 volumes of *methanol* and 2 volumes of *acetonitrile*,

  B. a mixture of 87.5 volumes of a mixture of 3 volumes of *methanol* and 2 volumes of *acetonitrile* and 12.5 volumes of buffer solution pH 7.2,
- a gradient programme using the conditions given below,

- flow rate: 2 ml per minute,
- spectrophotometer set at 305 nm,
- injection volume: 25 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	54	46
6	54	46
17	17	83
20	17	83
20.1	54	46
26.1	54	46

The relative retention time for fluvastatin anti-isomer with reference to fluvastatin is about 1.2.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 1.5 per cent.

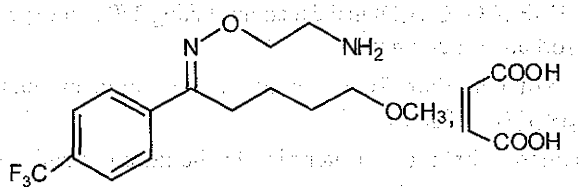
Inject the reference solution and the test solution.

1 mg of $C_{24}H_{25}FNNaO_4$ is equivalent to 0.95 mg of $C_{24}H_{26}FNO_4$.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of fluvastatin.

Fluvoxamine Maleate



$C_{19}H_{25}F_3N_2O_6$ Mol. Wt. 434.4

Fluvoxamine Maleate is Fluvoxamine maleate is (*E*)-5-methoxy-1-[4-(trifluoromethyl)phenyl]-1-pentanone *O*-(2-aminoethyl) oxime maleate.

Fluvoxamine Maleate contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{19}H_{25}F_3N_2O_6$, calculated on the dried basis.

Category. Antidepressant.

Description. A white to off-white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum obtained with that of *fluvoxamine maleate IPRS* or with the reference spectrum of fluvoxamine maleate.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the test solution immediately before use.

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). A 0.2 per cent w/v solution of *fluvoxamine maleate IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 37 volumes of *acetonitrile* and 63 volumes of a buffer solution containing 0.11 per cent w/v of *potassium dihydrogen phosphate* and 0.19 per cent w/v of *sodium pentanesulphonate* in *water*, previously adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 234 nm,
- injection volume: 20 µl.

Name	Relative retention time
Maleic acid	0.15
Fluvoxamine impurity F[1]	0.5
Fluvoxamine impurity G[2]	0.5
Fluvoxamine impurity C[3]	0.6
Fluvoxamine impurity B[4]	0.8
Fluvoxamine (Retention time: about 15 minutes)	1.0
Fluvoxamine impurity A[5]	2.5
Fluvoxamine impurity D[6]	5.4

[1]*N*-[2-[[[(1*E*)-5-methoxy-1-[4-(trifluoromethyl)phenyl]pentylidene] amino]oxy]ethyl]ethane-1,2-diamine,

[2](5*E*)-5-[(2-aminoethoxy)imino]-5-[4-(trifluoromethyl)phenyl] pentan-1-ol,

[3](2*RS*)-2-[[2-[[[(1*E*)-5-methoxy-1-[4-trifluoromethyl)phenyl] pentylidene] amino]oxy] ethyl]amino]butanedioic acid,

[4]2-[[[(1*Z*)-5-methoxy-1-[4-(trifluoromethyl)phenyl]pentylidene] amino]oxy]ethanamine,

[5]2-[[[(1*E*)-1-[4-(trifluoromethyl)phenyl]pentylidene]amino] oxy]ethanamine,

[6]5-methoxy-1-[4-(trifluoromethyl)phenyl]pentan-1-one.

Inject reference solution (b). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. Run the chromatogram 6 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak due to fluvoxamine impurity B is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any peak due to fluvoxamine impurity C is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of the peak due to fluvoxamine impurity A is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any peak due to fluvoxamine impurity D is not more than 0.15 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent) and the sum of areas of any peaks due to fluvoxamine impurities F and G is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent). The area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent) and the peak due to maleic acid.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in vacuum at 80° for 2 hours.

Assay. Dissolve 0.35 g in 50 ml of *anhydrous acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out the blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04344 g of $C_{19}H_{25}F_3N_2O_6$.

Fluvoxamine Tablets

Fluvoxamine Maleate Tablets

Fluvoxamine Tablets contains not less than 92.5 per cent and not more than 105.0 per cent of the stated amount of fluvoxamine maleate, $C_{15}H_{21}F_3N_2O_2,C_4H_4O_4$.

Usual strengths. 25 mg; 50 mg; 100 mg.

Identification

A. Shake a quantity of the powdered tablets containing 50 mg of Fluvoxamine Maleate with 10 ml of *acetonitrile* for 10 minutes, centrifuge and evaporate the supernatant liquid to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum obtained with *fluvoxamine maleate IPRS* or with the reference spectrum of fluvoxamine maleate.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254*.

Mobile phase. A mixture of 5 volumes of *13.5 M ammonia* and 95 volumes of *ethanol (95 per cent)*.

Test solution. Shake a quantity of the powdered tablets containing 50 mg of Fluvoxamine Maleate with 5 ml of *methanol* for 10 minutes, centrifuge and use the supernatant liquid.

Reference solution. A 1.0 per cent w/v solution of *fluvoxamine maleate IPRS* in *methanol*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. The two principal spots in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *water*,

Speed and time. 50 rpm and 20 minutes.

Withdraw a suitable volume of the medium and centrifuge. Measure the absorbance of the clear centrifuge liquid, suitably diluted if necessary with dissolution medium at 244 nm (2.4.7). Calculate the content of fluvoxamine maleate, $C_{15}H_{21}F_3N_2O_2,C_4H_4O_4$ in the medium taking 270 as the specific absorbance at 244 nm.

Q. Not less than 70 per cent of the stated amount of $C_{15}H_{21}F_3N_2O_2,C_4H_4O_4$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing 0.25 g of Fluvoxamine Maleate with 125 ml of the mobile phase for 10 minutes and dilute to 250.0 ml with the mobile phase. Centrifuge and use the supernatant liquid.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Add 1.0 ml of *1 M hydrochloric acid* to 10.0 ml of the test solution and heat on a water-bath for 10 minutes.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octylsilane bonded to porous silica (5 µm),
- column temeperature: 35°,
- mobile phase: a mixture of 40 volumes of a solution containing 1.25 per cent w/v of *diammonium hydrogen*

orthophosphate and 0.275 per cent w/v of *sodium heptanesulphonate monohydrate* and 60 volumes of *methanol*, adjusted to pH 3.5 with *orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The relative retention time with reference to fluvoxamine maleate (retention time: about 7 to 9 minutes) for addition product is about 0.65.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to 'addition product' is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (3.0 per cent). The area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore the peak due to maleic acid which elutes immediately after the solvent front and any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.25 g of Fluvoxamine Maleate with 125 ml of the mobile phase for 10 minutes and dilute to 250.0 ml with the mobile phase, centrifuge. Dilute 1.0 ml the supernatant liquid to 10.0 ml with the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *fluvoxamine maleate IPRS* in the mobile phase.

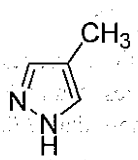
Use chromatographic system as described under Related substances.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{21}F_3N_2O_2,C_4H_4O_4$ in the tablets.

Storage. Store protected from light.

Fomepizole



$C_4H_6N_2$ Mol Wt. 82.1

Fomepizole is 4-methyl-1*H* pyrazole.

Fomepizole contains not less than 98.0 per cent and not more than 102.0 per cent of $C_4H_6N_2$, calculated on the anhydrous basis.

Category. Antidote to methanol poisoning.

Description. A clear colourless liquid.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fomepizole IPRS* or with the reference spectrum of fomepizole.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Hydrazine hydrate. Not more than 0.001 per cent.

Determine by gas chromatography (2.4.13).

Test solution. Dissolve 1.0 g of the substance under examination in *acetone* and dilute to 10.0 ml with *acetone*.

Reference solution. Dissolve 1.25 µl *hydrazine hydrate IPRS* in *acetone* and dilute to 10.0 ml with *acetone*. Dilute 0.1 ml of the solution to 10.0 ml with *acetone*.

Chromatographic system
- a fused silica capillary column 30 m x 0.53 mm, packed with 6.0 per cent cyanopropyl phenyl and 94 per cent dimethyl polysiloxane (Such as DB-624)(film thickness 3.0 µm),
- temperature:
  column. 150° for 10 minutes, then raised at the rate of 50° per minute to 220°,hold for 3 minutes,
  inlet port at 200° and detector at 250°,
- flame ionisation detector,
- split ratio :25:1,
- flow rate: 1.2 ml per minute, using nitrogen as the carrier gas.
- injection volume: 1.0 µl.

Inject the reference solution and the test solution.

Calculate the content of hydrazine hydrate.

Related substances. Determine by gas chromatography (2.4.13).

Test solution. Dissolve 20 µl of the substance under examination in *ethyl acetate* and dilute to 10.0 ml with *ethyl acetate*.

Chromatographic system
- a fused silica capillary column 30 m x 0.32 mm, packed with 5 per cent phenyl and 95 per cent methyl polysiloxane (Such as HP-5) (film thickness 0.25 µm),
- temperature:
  column. 70° for 3 minutes then raised to 250 ° at the rate of 20° per minute and hold for 15 minutes,

inlet port. at 250° and detector port at 270°,
- split ratio :50:1,
- flow rate:1.0 ml per minute, using nitrogen as the carrier gas,
- injection volume: 1.0 µl.

Inject the test solution. The area of any secondary peak at relative retention time 0.78 is not more than 0.1 per cent ,the area of any other secondary peak is not more than 0.2 per cent and the sum of the areas of all the secondary peaks is not more than 0.5 per cent, calculated by area normalization.

Water (2.3.43). Not more than 1.0 per cent, determined on 0.1 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in *methanol* and diluted to100.0 ml with *methanol*. Dilute 5.0 ml of the solution to 50.0 ml with *methanol*.

Reference solution. A 0.01 per cent w/v solution of *fomepizole IPRS* in *methanol*.

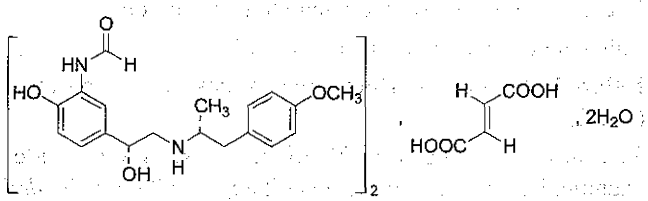
Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 90 volumes of buffer solution prepared by dissolving 0.5ml of *trifluoroacetic acid* in 1000 ml of *water* and 10 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 5 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates , the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_4H_6N_2$.

Formoterol Fumarate Dihydrate



$(C_{19}H_{24}N_2O_4)_2, C_4H_4O_4, 2H_2O$ Mol. Wt. 840.9

Formoterol Fumarate Dihydrate is dihydrate salt of fumaric acid with (*RS*)-2′-hydroxy-5′-[(*RS*)-1-hydroxy-2-[[(*RS*)-*p*-methoxy-α-methylphenethyl]amino]ethyl]formanilide.

Formoterol Fumarate Dihydrate contains not less than 98.5 per cent and not more than 101.5 per cent of formoterol fumarate, $C_{42}H_{52}N_4O_{12}$, calculated on the anhydrous basis.

Category. Bronchodilator.

Description. A white or almost white or slightly yellow powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *formoterol fumarate dihydrate IPRS* or with the reference spectrum of formoterol fumarate dihydrate.

Tests

pH (2.4.24). 5.5 to 6.5, determined in a 0.1 per cent w/v solution in *carbon dioxide-free water*.

Optical rotation (2.4.22). – 0.10° to + 0.10°, determined in a 1.0 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 84 volumes of a buffer solution prepared by dissolving 6.10 g of *sodium dihydrogen phosphate monohydrate* and 1.03 g of *disodium hydrogen phosphate dihydrate* in 1000 ml *water*, and 16 volumes of *acetonitrile*.

Test solution. Dissolve 20 mg of the substance under examination in 100 ml of the solvent mixture.

Reference solution. A 0.00004 per cent w/v solution of *formoterol fumarate IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with spherical octylsilane bonded to porous silica (5 µm),
- mobile phase: A. *acetonitrile*,
  B. a buffer solution prepared by dissolving 3.73 g of *sodium dihydrogen phosphate monohydrate* and 0.35 g of *orthophosphoric acid* in 1000 ml of *water*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 214 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	16	84
10	16	84
37	70	30
40	16	84
55	16	84

Inject the reference solution. The test is not valid unless the column efficiency in not less than 4000 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution. Any individual impurity is not more than 0.5 per cent and the sum of all the impurities is not more

than 1.0 per cent. Ignore the peak corresponding to fumaric acid.

Water (2.3.43). Not more than 5.0 per cent, determined on 0.1 g.

Assay. Weigh 0.35 g and dissolve in 50 ml of *anhydrous acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04024 g of $C_{42}H_{52}N_4O_{12}$.

Storage. Store protected from light and moisture.

Formoterol Fumarate and Budesonide Powder for Inhalation

Formoterol Fumarate and Budesonide Powder for Inhalation consists of Formoterol Fumarate and Budesonide in microfine powder either alone or admixed with Lactose in a pre-metered unit for use in a suitable powder inhaler.

Formoterol Fumarate and Budesonide Powder for Inhalation contains not less than 90.0 per cent and not more than 125.0 per cent of the stated amounts of formoterol fumarate $C_{42}H_{52}N_4O_{12}$ and budesonide $C_{25}H_{34}O_6$ per pre-metered unit.

Usual Strengths. Formoterol Fumarate 6 µg and Budesonide 100 µg; Formoterol Fumarate 6 µg and Budesonide 200 µg; Formoterol Fumarate 6 µg and Budesonide 400 µg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with reference solution (c).

Tests

Other tests. Comply with the tests stated under the Inhalation Preparations (Powders for Inhalation).

Follow the procedure described under Assay with suitable dilution of the reference solution wherever the amount of active substance is to be determined in any test.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve a quantity of the mixed contents of 20 capsules in sufficient of the mobile phase to get a solution containing 0.6 µg of Formoterol Fumarate per ml.

Reference solution (a). A 0.06 mg per ml solution of *formoterol fumarate IPRS* prepared by initially dissolving in 5 ml *acetonitrile* and then making up to volume with the mobile phase.

Reference solution (b). A 0.2 mg per ml solution of *budesonide IPRS* prepared by initially dissolving in 5 ml *acetonitrile* and then making up to volume with the mobile phase.

Reference solution (c). Dilute suitable volumes of reference solution (a) and reference solution (b) with the mobile phase to obtain a solution containing 0.6 µg of Formoterol Fumarate and 40 µg per ml of Budesonide per ml.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of a buffer solution prepared by dissolving 0.138 g *sodium dihydrogen orthophosphate monohydrate* and 0.122 g of *decane sulphonic acid sodium salt* in 100 ml of *water* and adjusted to pH 3.0 with *orthophosphoric acid*, and 35 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 200 µl.

Inject reference solution (c). The order of elution is formoterol fumarate, budesonide epimer B and epimer A. The test is not valid unless the column efficiency determined from the formoterol fumarate and both the epimer peaks of Budesonide is not less than 1800 and 4000 theoretical plates respectively, the resolution between budesonide epimer peaks is not less than 1.5 and the relative standard deviation for formoterol fumarate and sum of peaks of budesonide epimer A and epimer B in replicate injections is not more than 2.0 per cent.

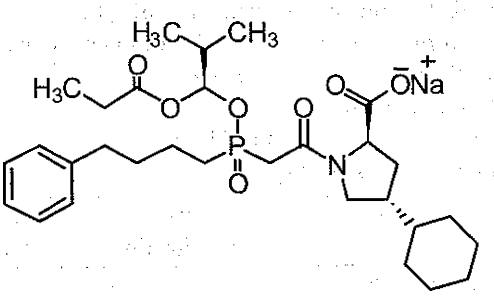
Inject reference solution (c) and the test solution.

Calculate the contents of $C_{42}H_{52}N_4O_{12}$ and $C_{25}H_{34}O_6$ per unit.

Storage. Store protected from moisture, at temperature not exceeding 30°.

Labelling. The label states the quantities of active ingredients per pre-metered unit.

Fosinopril Sodium



$C_{30}H_{45}NNaO_7P$ Mol. Wt. 585.7

Fosinopril Sodium is (4*S*)-4-Cyclohexyl-1-{[(*RS*)-2-methyl-1-(propionyloxy)propoxy]-(4-phenylbutyl)phosphinylacetyl}-*L*-proline sodium salt.

Fosinopril Sodium contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{30}H_{45}NNaO_7P$, calculated on the anhydrous basis.

Category. Antihypertensive.

Description. A white or almost white, crystalline powder. It shows polymorphism (2.5.11).

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fosinopril sodium IPRS* or with the reference spectrum of fosinopril sodium.

B. It gives reaction (A) of sodium salts (2.3.1).

Tests

Specific optical rotation (2.4.22). – 6.7° to – 4.7°, determined in 2.0 per cent w/v solution in *methanol.*

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). A solution containing 0.004 per cent w/v each of *fosinopril IPRS, fosinopril impurity A IPRS, fosinopril impurity B IPRS, fosinopril impurity I IPRS* and *fosinopril impurity K IPRS* in the mobile phase. Dilute 1.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (c). Dilute 5.0 ml of reference solution (b) to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm packed with silica (5 µm),
- column temperature: 33°,
- mobile phase: a mixture of 0.5 volume of *orthophosphoric acid*, 3.5 volumes of *water* and 1000 volumes of *acetonitrile*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 214 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Fosinopril impurity K[1]	0.3	—
Fosinopril impurity I[2]	0.5	1.3
Fosinopril impurity B[3]	0.7	—
Fosinopril impurity E[4]	0.7	—
Fosinopril impurity H[5]	0.7	—
Fosinopril (Retention time: about 5 minutes)	1.0	—
Fosinopril impurity A[6]	2.0	—

[1](2*S*,4*S*)-4-cyclohexyl-1-(2,2-dimethyl-1-oxopropyl)pyrrolidine-2-carboxylic acid,

[2][(*RS*)-[(1*SR*)-2-methyl-1-(1-oxopropoxy)propoxy](4-phenylbutyl) phosphoryl]acetic acid,

[3](2*RS*,4*RS*)-4-cyclohexyl-1-[[(*RS*)-[(1*SR*)-2-methyl-1-(1-oxopropoxy)propoxy](4-phenylbutyl)phosphoryl]acetyl]pyrrolidine-2-carboxylic acid,

[4](2*S*,4*S*)-1-[[(*R*)-[(1*S*)-2-methyl-1-(1-oxopropoxy)propoxy](4-phenylbutyl)phosphoryl]acetyl]-4-phenylpyrrolidine-2-carboxylic acid,

[5](2*R*,4*S*)-4-cyclohexyl-1-[[(*R*)-[(1*S*)-2-methyl-1-(1-oxopropoxy) propoxy] (4-phenylbutyl)phosphoryl]acetyl]pyrrolidine-2-carboxylic acid,

[6](2*S*,4*S*)-4-cyclohexyl-1-[[(*R*)-hydroxy(4-phenylbutyl) phosphoryl]acetyl]-pyrrolidine-2-carboxylic acid.

Inject reference solution (a) and (c). The test is not valid unless the resolution between the peaks corresponding to fosinopril impurity B and fosinopril is not less than 2.0 in the chromatogram obtained with reference solution (a). In the chromatogram obtained with reference solution (c) signal-to-noise ratio for the principal peak is not less than 40.

Inject reference solution (b) and the test solution. Run the chromatogram 4 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the sum of the area of peaks corresponding to fosinopril impurities B, E and H is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent), the area of any peak corresponding to fosinopril impurity A is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any peak corresponding to fosinopril impurities I and K is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent). The area of any other secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Impurities C and D. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). A solution containing 0.005 per cent w/v of *fosinopril IPRS* and *fosinopril impurity C IPRS* in the mobile phase. Dilute 10.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 50.0 ml with the mobile phase.

Reference solution (c). A 0.005 per cent w/v solution of *fosinopril impurity D IPRS* in the mobile phase. Dilute 10.0 ml of the solution to 50.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with strongly basic anion exchange resin (5 µm),
- column temperature: 45°,
- mobile phase: a mixture of 0.2 volume of *orthophosphoric acid*, 1.5 volumes of *water* and 400 volumes of *acetonitrile*,
- flow rate: 0.9 ml per minute,
- spectrophotometer set at 214 nm,
- injection volum: 20 µl.

Name	Relative retention time
Fosinopril (Retention time: about 10 minutes)	1.0
Fosinopril impurity C[1]	1.2
Fosinopril impurity D[2]	1.3

[1]mixture of (2*S*,4*S*)-4-cyclohexyl-1-[[(*S*)-[(1*S*)-2-methyl-1-(1-oxopropoxy)-propoxy](4-phenylbutyl)phosphoryl]acetyl]pyrrolidine-2-carboxylic acid and (2*S*,4*S*)-4-cyclohexyl-1-[[(*R*)-[(1*R*)-2-methyl-1-(1-oxopropoxy)propoxy] (4-phenylbutyl)phosphoryl] acetyl] pyrrolidine-2-carboxylic acid,

[2](2*S*,4*R*)-4-cyclohexyl-1-[[(*R*)-[(1*S*)-2-methyl-1-(1-oxopropoxy) propoxy] (4-phenylbutyl)phosphoryl]acetyl]pyrrolidine-2-carboxylic acid.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to fosinopril and impurity C is not less than 1.5.

Inject reference solution (b), (c) and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to fosinopril impurity C is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of any peak corresponding to fosinopril impurity D is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.3 per cent).

Impurities E and F. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 20.0 ml with the mobile phase.

Reference solution (c). Dissolve the contents of a vial of *fosinopril impurity mixture IPRS* (fosinopril impurity E and F) in 1.0 ml of reference solution (a).

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with phenylsilane bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: a mixture of 44 volumes of 0.2 per cent v/v of *orthophosphoric acid* and 56 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 205 nm,
- injection volum: 20 µl.

Name	Relative retention time	Correction factor
Fosinopril impurity E[1]	0.8	0.7
Fosinopril impurity F[2]	0.9	---
Fosinopril (Retention time: about 8 minutes)	1.0	---

[1](2*S*,4*S*)-1-[[(*R*)-[(1*S*)-2-methyl-1-(1-oxopropoxy)propoxy](4-phenylbutyl)phosphoryl]acetyl]-4-phenylpyrrolidine-2-carboxylic acid,

[2](2*S*,4*S*)-4-cyclohexyl-1-[[(*R*)-(4-phenylbutyl)[(1*S*)-1-(1-oxopropoxy)-propoxy]phosphoryl]acetyl]pyrrolidine-2-carboxylic acid.

Inject reference solution (c). The test is not valid unless the resolution between the peaks corresponding to fosinopril and fosinopril impurity F is not less than 1.5.

Inject reference solution (b) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to fosinopril impurity F is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of any peak corresponding to fosinopril impurity E is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent).

2-Ethylhexanoic acid (2.3.51). Not more than 0.2 per cent.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method C (20 ppm).

Water (2.3.43). Not more than 0.2 per cent, determined on 1.0 g.

Assay. Dissolve 0.45 g in 50 ml of *water*. Titrate with *0.1 M hydrochloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M hydrochloric acid* is equivalent to 0.05857 g of $C_{30}H_{45}NNaO_7P$.

Fosinopril Sodium Tablets

Fosinopril Sodium Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of fosinopril sodium, $C_{30}H_{45}NNaO_7P$.

Usual strengths. 10 mg; 20 mg.

Identification

A. Transfer a quantity of the powdered tablets containing 25 mg of Fosinopril Sodium in 100 ml beaker, add 40 ml of *water*, heat at 25° for 5 minutes with stirring, filter and centrifuge at 2500 rpm for 30 minutes. Adjusted to pH 3.0 with *orthophosphoric acid* and pass through a fritted-disc funnel. Dissolve the precipitate by passing *chloroform* through filter, and evaporate the chloroform solution to dryness in air. On the oily residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fosinopril sodium IPRS*, treated in the same manner or with the reference spectrum of fosinopril.

B. In the Assay, the retention time of principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *water*,

Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution (a). Dissolve a quantity of *fosinopril sodium IPRS* in minimum amount of *methanol* and dilute with the dissolution medium to produce a solution of a known concentration similar to the expected concentration of the test solution.

Reference solution (b). A solution containing 0.002 per cent w/v each *fosinopril sodium IPRS* and *fosinopril impurity G IPRS ((4-phenylbutyl)phosphinylacetic acid disodium IPRS)* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 36 volumes of 0.2 per cent w/v of *orthophosphoric acid* and 64 volumes of *acetonitrile*,
- flow rate: 3 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 50 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to fosinopril sodium and fosinopril impurity G is not less than 1.7 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{30}H_{45}NNaO_7P$ in the tablet.

Q. Not less than 80 per cent of the stated amount of $C_{30}H_{465}NNaO_7P$.

Impurity A. Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Reference solution. A 0.1 per cent w/v solution of *fosinopril impurity A IPRS* in *methanol* and dilute with the solvent mixture to obtain a solution containing 0.00025 per cent w/v of fosinopril impurity A.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to fosinopril impurity A is not more than 4.0 per cent, calculated by area normalization.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of *0.2 M urea solution* and 20 volumes of *acetonitrile*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 50 mg of Fosinopril Sodium in 40.0 ml of the solvent mixture with the aid of ultrasound for 40 minutes. Dilute to 500.0 ml with the solvent mixture, mix, and centrifuge.

Reference solution (a). A 0.01 per cent w/v solution of *fosinopril sodium IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.007 per cent w/v of *fosinopril sodium IPRS* and 0.003 per cent w/v of *fosinopril impurity A IPRS((4S)-4-cyclohexyl-[(4-phenyl butyl)phosphinyl]acetyl-L-proline IPRS)* in the solvent mixture.

Chromatographic system

- a stainless steel column 30 cm × 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 22 volumes of *0.2 per cent orthophosphoric acid* and 78 volumes of *methanol*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 50 µl.

The relative retention time with reference to fosinopril for fosinopril impurity A is about 0.4.

Inject reference solution (b). The test is not valid unless the the resolution between the peaks due to fosinopril sodium and fosinopril impurity A is not less than 2.0 and the relative

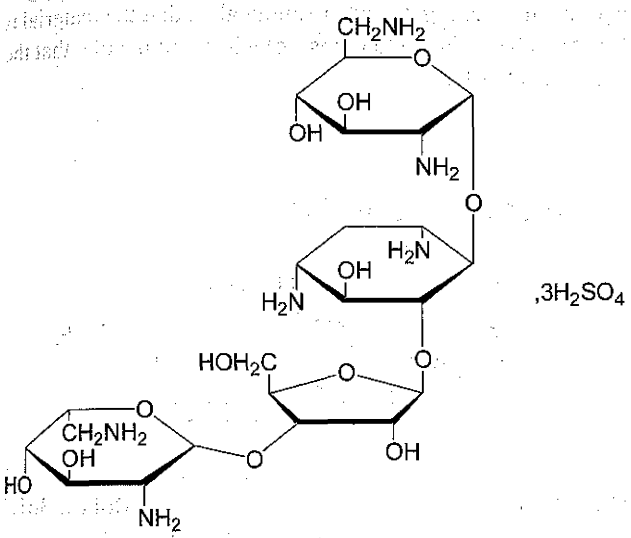
standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{30}H_{45}NNaO_7P$ in the tablets.

Storage. Store protected from moisture.

Framycetin Sulphate



$C_{23}H_{46}N_6O_{13},3H_2SO_4$ Mol. Wt. 908.9

Framycetin Sulphate is 2-deoxy-4-*O*-(2,6-diamino-2,6-dideoxy-α-D-glucopyranosyl)-5-*O*-[3-*O*-(2,6-diamino-2,6-dideoxy-β-L-idopyranosyl)-β-D-ribofuranosyl]-D-streptamine (neomycin B) sulphate. The base is produced by the growth of selected strains of *Streptomyces fradiae* or *Streptomyces decaris* or by any other means.

Framycetin Sulphate contains an amount of framycetin sulphate equivalent to not less than 630 IU of neomycin B per mg, calculated on the dried basis.

Category. Antibacterial (topical).

Description. A white or yellowish-white powder; hygroscopic.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate in the following manner. Mix 0.3 g of *carbomer* with 240 ml of *water*, allow to stand for 1 hour with moderate shaking, adjusted to pH 7 by the gradual addition, with shaking, of *2 M sodium hydroxide* and add 30 g of *silica gel H*. Spread a uniform layer of the suspension 0.75 mm thick, heat at 110° for 1 hour and allow to cool. Use the plate immediately.

Mobile phase. A 10 per cent w/v solution of *potassium dihydrogen phosphate*.

Test solution. A 0.1 per cent w/v solution of the substance under examination.

Reference solution (a). A 0.1 per cent w/v solution of *framycetin sulphate IPRS*.

Reference solution (b). A solution containing 0.1 per cent w/v each of *framycetin sulphate IPRS*, *kanamycin sulphate IPRS* and *streptomycin sulphate IPRS*.

Apply to the plate 10 µl of each solution. After development, dry the plate in a current of warm air, spray with a mixture of equal volumes of a 46 per cent w/v solution of *sulphuric acid* and of a 0.2 per cent w/v solution of *1,3-naphthalenediol* in *ethanol (95 per cent)* and heat at 150° for about 10 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.

B. Dissolve 10 mg in 5 ml of *water*, add 0.1 ml of *pyridine* and 2 ml of a 0.1 per cent w/v solution of *ninhydrin* and heat in a water-bath at 65° to 70° for 10 minutes; an intense violet colour is produced.

C. A 5 per cent w/v solution gives the reactions of sulphates (2.3.1).

Tests

pH (2.4.24). 6.0 to 7.0, determined in a 1.0 per cent w/v solution.

Specific optical rotation (2.4.22). +52.0° to +55.5°, determined at 20° in a 10.0 per cent w/v solution.

Neamine. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H*.

Mobile phase. A mixture of 30 volumes of *methanol*, 20 volumes of *strong ammonia solution* and 10 volumes of *dichloromethane*.

Test solution. Dissolve 0.25 g of the substance under examination in *water* and dilute to 10 ml with *water*.

Reference solution. Dissolve 0.5 mg of *neamine IPRS* in 2 ml of *water*.

Apply 5 µl of each solution. Allow the mobile phase to rise 8 cm. Dry the plate at 105° for 10 minutes. Spray it with *ninhydrin and stannous chloride reagent* and heat at 110° for 15 minutes. Spray the plate again with the same reagent and heat at 110° for 15 minutes. Any band corresponding to neamine in the chromatogram obtained with the test solution is not more intense than the band in the chromatogram obtained with the reference solution (1 per cent).

Neomycin C. Determine by thin-layer chromatography (2.4.17), coating the plate with silica gel of a suitable grade.

Mobile phase. A mixture of 80 volumes of a 20 per cent w/v solution of *sodium chloride* and 20 volumes of *methanol.*

Test solution. Dissolve 40 mg of the substance under examination in *water* and dilute to 5 ml with *water.*

Reference solution (a). Dissolve 40 mg of *framycetin sulphate IPRS* in *water* and dilute to 5 ml with *water.*

Reference solution (b). Dissolve 30 mg of *framycetin sulphate IPRS* in *water* and dilute to 25 ml with *water.* Dilute 5 ml of the solution to 25 ml with *water.*

Reference solution (c). Dissolve 40 mg of *neomycin sulphate IPRS* in *water* and dilute to 5 ml with *water.*

Apply 10 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate at 100° to 105° for 10 minutes. In the chromatogram obtained with the test solution, the principal band corresponds to the principal band in the chromatogram obtained with reference solution (a) and the band for neomycin C with Rf value slightly less than that of the principal band is not more intense than the band in the chromatogram obtained with reference solution (b) (3 per cent).

The test is not valid unless in the chromatogram obtained with reference solution (c), a band appears with R_f value slightly less than that of the principal band.

Sulphate. 27.0 to 31.0 per cent of SO_4, calculated on the dried basis, determined by the following method. Weigh 0.25 g, dissolve in 100 ml of *water,* adjusted to pH 11 with *strong ammonia solution* and add 10.0 ml of *0.1 M barium chloride.* Titrate with *0.1 M disodium edetate* using 0.5 mg of *metalphthalein* as indicator; add 50 ml of *ethanol (95 per cent)* when the colour of the solution begins to change and continue the titration until the violet-blue colour disappears.

1 ml of *0.1 M barium chloride* is equivalent to 0.009606 g of SO_4.

Sulphated ash (2.3.18). Not more than 1.0 per cent.

Loss on drying (2.4.19). Not more than 8.0 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* at 60° at a pressure not exceeding 0.7 kPa for 3 hours.

Assay. Determine by the microbiological assay of antibiotics (2.2.10), and express the results in µg of neomycin B per mg.

Framycetin Sulphate intended for administration into internal body cavities without a further appropriate procedure for removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 1.3 Endotoxin Units per mg.

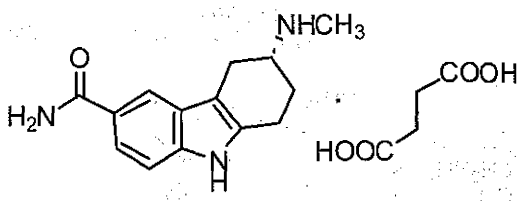
Framycetin Sulphate intended for administration into internal body cavities without a further appropriate sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from light and moisture at a temperature not exceeding 30°. If the material is sterile, the container should be tamper-evident and sealed so as to exclude micro-organisms.

Labelling. The label states (1) the strength in terms of µg of neomycin B per mg; (b) where applicable, that the material is free from bacterial endotoxins; (c) where applicable, that the material is sterile.

Frovatriptan Succinate



$C_{18}H_{25}N_3O_5$ Mol wt. 361.4

Frovatriptan Succinate is (*R*)-5,6,7,8-Tetrahydro-6-methylaminocarbazole-3-carboxamide succinate.

Frovatriptan Succinate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{18}H_{25}N_3O_5$, calculated on the anhydrous basis.

Category. Antimigraine.

Description. A white or off white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *frovatriptan succinate IPRS* or with the reference spectrum of frovatriptan succinate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 90 volumes of *water,* 5 volumes of *methanol* and 5 volumes of *acetonitrile.*

Test solution. Dissolve 25 mg of the substance under examination in the solvent mixture and dilute to 50 ml with the solvent mixture .

Reference solution. A 0.00025 per cent w/v solution of *frovatriptan Succinate IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: A. *0.05 M ammonium acetate* in *water*, B. a mixture of 50 volumes of *acetonitrile* and 50.0 volumes of *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
30	90	10
45	60	40
50	60	40
52	90	10
60	90	10

Inject the reference solution .The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution. The area of any secondary peak is not more than 0.5 per cent and the sum of the areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalization.

Succinic acid. Dissolve 0.2 g in 50.0 ml of *water*. Titrate with *0.1 M sodium hydroxide*, using *phenolphthalein* as an indicator. Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.0011809 g of succinic acid.

Water (2.3.43). Not more than 7.0 per cent , determined on 0.2 g.

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 90 volumes of *water*, 5 volumes of *methanol* and 5 volumes of *acetonitrile*.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 50 ml with the solvent mixture . Dilute 5.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution. A 0.005 per cent w/v solution of *frovatriptan succinate IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 85 volumes of *0.05 M ammonium acetate* in *water* and 15 volumes of a mixture of 50 volumes of *acetonitrile* and 50 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume: 10 µl.

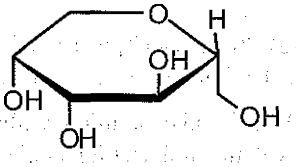
Inject the reference solution .The test is not valid unless the column efficiency is not less than 3000 theoretical plates , the tailing factor is not more than 2.0. and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{25}N_3O_5$.

Fructose

D-Fructose



$C_6H_{12}O_6$ Mol. Wt. 180.2

Fructose is D-(-)-fructopyranose.

Category. Nutrient; fluid replenisher.

Description. A white, crystalline powder with a very sweet taste.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with fructose *IPRS* or with the reference spectrum of fructose.

B. Dissolve 0.1 g in 10 ml of *water*, add 3 ml of *potassium cupri-tartrate solution*; the solution remains blue and clear. Heat to boiling, a copious red precipitate is formed.

C. Dissolve 5 g in *water* and dilute to 10 ml with the same solvent. To 0.5 ml of the solution add 0.2 g of *resorcinol* and 9 ml of *dilute hydrochloric acid* and heat on a water-bath for 2 minutes; a red colour is produced.

Tests

Appearance of solution. Dissolve 5.0 g in *water* and dilute to 10 ml with the same solvent. The solution is clear (2.4.1). Add 10 ml of *water*. The solution is colourless (2.4.1).

Specific optical rotation (2.4.22). – 93.5° to – 91.0°, calculated on the anhydrous basis and determined on a solution prepared by dissolving 10.0 g in 80 ml of *water*, adding 0.2 ml of *5 M ammonia*, mixing well, allowing to stand for 30 minutes and diluting to 100.0 ml with *water*.

Acidity or alkalinity. Dissolve 6.0 g in 25 ml of *carbon dioxide-free water* and add 0.3 ml of *phenolphthalein solution*. The solution is colourless. Not more than 0.15 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution to pink.

5-Hydroxymethylfurfural and related compounds. To 5 ml of solution A add 5 ml of *water* and measure the absorbance (2.4.7) of the resulting solution at the maximum at about 284 nm; absorbance at about 284 nm, not more than 0.32).

Arsenic (2.3.10). Dissolve 10.0 g in 50 ml of *water* and add 10 ml of *stannated hydrochloric acid*. The resulting solution complies with the limit test for arsenic (1 ppm).

Heavy metals (2.3.13). A solution of 4.0 g in 10 ml of *water*, 2 ml of *dilute acetic acid* and sufficient *water* to produce 25.0 ml complies with the limit test for heavy metals, Method A (5 ppm).

Chlorides (2.3.12). 20 ml of a 10 per cent w/v solution (solution A) complies with the limit test for chlorides (125 ppm).

Sulphates (2.3.17). 7.5 ml of solution A diluted to 15 ml with *water* complies with the limit test for sulphates (200 ppm).

Foreign sugars. Dissolve 5.0 g in *water* and dilute to 10 ml with the same solvent. To 1 ml of the solution add 9 ml of *ethanol (95 per cent)*. Any opalescence in the solution is not more intense than that in a mixture of 1 ml of the initial solution and 9 ml of *water*.

Barium. To 10 ml of solution A add 1 ml of *1 M sulphuric acid*. Examine exactly after 1 hour; any opalescence in the solution is not more intense than that in a mixture of 10 ml of solution A and 1 ml of *water*.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 1.0 g.

Fructose intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml of a 5 per cent w/v solution in Water for Injections.

Storage. Store protected from moisture.

Labelling. The label states whether or not the contents are intended for use in the manufacture of parenteral preparations.

Fructose Injection

Fructose Intravenous Infusion

Fructose Injection is a sterile solution of Fructose in Water for Injections.

Fructose Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of fructose, $C_6H_{12}O_6$. It contains no antimicrobial agent.

Usual strength. 10 per cent w/v.

Description. A clear, colourless solution.

Identification

A. The solution prepared as directed in the Assay is laevorotatory.

B. To 1 ml add 0.05 ml of *potassium cupri-tartrate solution*; the solution remains blue and clear. Heat to boiling, a copious red precipitate is formed.

Tests

pH (2.4.24). 3.0 to 6.0, determined in a solution diluted, if necessary, with Water for Injections to contain not more than 5.0 per cent w/v of Fructose and to which 0.30 ml of a saturated solution of *potassium chloride* has been added for each 100 ml of solution.

5-Hydroxymethylfurfural and Related substances. Dilute a volume containing 1.0 g of Fructose to 500.0 ml with *water* and measure the absorbance (2.4.7) of the resulting solution at the maximum at about 284 nm; absorbance at about 284 nm, not more than 0.50.

Heavy metals (2.3.13). A volume of the injection containing 4.0 g of fructose that has been evaporated to a volume of about 10 ml, cooled and diluted to 25 ml with *water* complies with the limit test for heavy metals, Method A (5 ppm).

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Units per ml.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. To a measured volume containing about 5.0 g of Fructose, add 0.2 ml of *5 M ammonia* and sufficient *water* to produce 100.0 ml. Mix well, allow to stand for 30 minutes and determine the optical rotation in a 2-dm tube

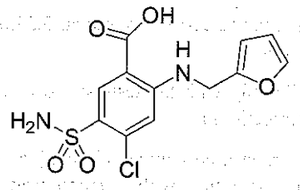
(2.4.22). The observed rotation in degrees multiplied by 0.5427 represents the weight, in g, of fructose, $C_6H_{12}O_6$, in the volume taken for Assay.

Storage. Store in single dose containers at a temperature not exceeding 30°.

Labelling. The label states (1) the strength as the percentage w/v of fructose, $C_6H_{12}O_6$; (2) that the injection should not be used if it contains visible particles.

Frusemide

Furosemide



$C_{12}H_{11}ClN_2O_5S$ Mol. Wt. 330.7

Frusemide is 4-chloro-*N*-furfuryl-5-sulphamoylanthranilic acid.

Frusemide contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{12}H_{11}ClN_2O_5S$, calculated on the dried basis.

Category. Diuretic.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *frusemide IPRS* or with the reference spectrum of frusemide.

B. When examined in the range 220 nm to 360 nm (2.4.7), a 0.0005 per cent w/v solution in *0.1 M sodium hydroxide* shows three absorption maxima at about 228 nm, 271 nm and 333 nm. The ratio of the absorbance at the maximum at about 271 nm to that at the maximum at about 228 nm is 0.52 to 0.57.

C. Dissolve about 5 mg in 10 ml of *methanol*. Transfer 1 ml of the solution to a flask, add 10 ml of *dilute hydrochloric acid* and boil under a reflux condenser on a water-bath for 15 minutes. Cool, add 15 ml of *1 M sodium hydroxide* and 5 ml of a 0.1 per cent w/v solution of *sodium nitrite*. Allow to stand for 3 minutes, add 5 ml of a 0.5 per cent w/v solution of *ammonium sulphamate*, mix and add 5 ml of a 0.1 per cent w/v solution of *N-(1-naphthyl)ethylenediamine dihydrochloride*; a red-violet colour is produced.

Tests

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Chlorides (2.3.12). Shake 1 g with 40 ml of *water* for 5 minutes and filter. The filtrate complies with the limit test for chlorides (250 ppm).

Sulphates (2.3.17). Shake 1.0 g with a mixture of 30 ml of *distilled water* and 0.2 ml of *5 M acetic acid* for 5 minutes and filter. 15 ml of the filtrate complies with the limit test for sulphates (300 ppm).

Related substances. Determine by liquid chromatography (2.4.14).

Note—Prepare the solutions immediately before use.

Test solution. Dissolve 50 mg of the substance under examination in 50.0 ml of the mobile phase.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of solution prepared by dissolving 0.2 g of *potassium dihydrogen phosphate* and 0.25 g of *cetrimide* in 70 ml of *water* adjusted to pH 7.0 with *ammonia* and 30 volumes of *propanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 238 nm,
- injection volume: 20 µl.

Inject the reference solution. Adjust the sensitivity so that the height of the peak is not less than 20 per cent of the full scale of the recorder.

Inject the reference solution and the test solution. Run the chromatogram three times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area any secondary peak is not more than 0.25 times the area of the peak obtained with the reference solution (0.25 per cent) and sum of areas of all the secondary peaks is not more than 0.5 times the area of the peak in the chromatogram obtained with the reference solution (0.5 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.5 g, dissolve in 40 ml of *dimethylformamide* and titrate with *0.1 M sodium hydroxide* using *bromothymol blue solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.03307 g of $C_{12}H_{11}ClN_2O_5S$.

Storage. Store protected from light.

Frusemide Injection

Furosemide Injection

Frusemide Injection is a sterile solution of Frusemide in Water for Injections prepared with the aid of Sodium Hydroxide.

Frusemide Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of frusemide, $C_{12}H_{11}ClN_2O_5S$.

Usual strength. 10 mg per ml.

Description. A clear, colourless or almost colourless solution.

Identification

A. When examined in the range 220 nm to 360 nm (2.4.7), the final solution obtained in the Assay shows three absorption maxima at about 228 nm, 271 nm and 333 nm.

B. To a volume of the injection containing 5 mg of Frusemide add 10 ml of *dilute hydrochloric acid* and boil under a reflux condenser on a water-bath for 15 minutes. Cool, add 15 ml of *1 M sodium hydroxide* and 5 ml of a 0.1 per cent w/v solution of *sodium nitrite*. Allow to stand for 3 minutes, add 5 ml of a 0.5 per cent w/v solution of *ammonium sulphamate*, mix and add 5 ml of a 0.1 per cent w/v solution of *N- (1-naphthyl) ethylenediamine dihydrochloride*; a red-violet colour is produced.

Tests

pH (2.4.24). 8.0 to 9.3.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use.

Test solution. Dilute a volume of injection containing about 0.1 g of Frusemide to 100.0 ml with the mobile phase.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as ChromSpher C8),
- mobile phase: mixture of 70 volumes of solution prepared by dissolving 0.2 g of *potassium dihydrogen phosphate* and 0.25 g of *cetrimide* in 70 ml of *water* adjusted to pH 7.0 with *ammonia* and 30 volumes of *propanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 238 nm,
- injection volume: 100 µl.

Inject the reference solution and the test solution. Run the chromatogram three times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak obtained with the reference solution (1 per cent), and sum of areas of all the secondary peaks is not more than 1.5 times the area of the peak in the chromatogram obtained with the reference solution (1.5 per cent).

Bacterial endotoxins (2.2.3). Not more than 3.5 Endotoxin Units per mg of frusemide.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Dilute a measured volume of the injection containing about 20 mg of Frusemide with *water* to produce 100.0 ml. Dilute 5.0 ml to 100.0 ml with *0.1 M sodium hydroxide*. Measure the absorbance of the resulting solution at the maximum at about 271 nm (2.4.7). Calculate the content of $C_{12}H_{11}ClN_2O_5S$ taking 580 as the specific absorbance at 271 nm.

Storage. Store protected from light.

Frusemide Tablets

Furosemide Tablets

Frusemide Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of frusemide, $C_{12}H_{11}ClN_2O_5S$.

Usual strengths. 20 mg; 40 mg.

Identification

A. When examined in the range 220 nm to 360 nm (2.4.7), the final solution obtained in the Assay shows three absorption maxima at about 228 nm, 271 nm and 333 nm.

B. Shake a quantity of the powdered tablets containing 80 mg of Frusemide with 10 ml of *ethanol (95 per cent)*, filter and evaporate the filtrate to dryness. Dissolve 25 mg of the residue obtained in 2.5 ml of *ethanol (95 per cent)* and add 2 ml of *4-dimethylaminobenzaldehyde reagent*; a green colour is produced which changes to deep red.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *phosphate buffer pH 5.8*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the medium if necessary, at the maximum at about 277 nm (2.4.7). Calculate the content of $C_{12}H_{11}ClN_2O_5S$, in the medium from the absorbance obtained by using a solution of known concentration of *furosemide IPRS*.

Q. Not less than 70 per cent of the stated amount of $C_{12}H_{11}ClN_2O_5S$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use.

Test solution. Disperse a quantity of powdered tablets containing about 20 mg of Frusemide in 50.0 ml of the mobile phase.

Reference solution. Dilute 1.0 ml of the test solution to 100 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as ChromSpher C8),
- mobile phase: a mixture of 70 volumes of solution prepared by dissolving 0.2 g of *potassium dihydrogen phosphate* and 0.25 g of *cetrimide* in 70 ml of *water* adjusted to pH 7.0 with *ammonia* and 30 volumes of *propanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 238 nm,
- injection volume: 100 µl.

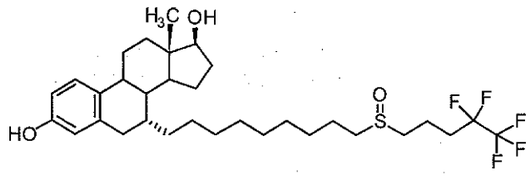
Inject the reference solution and the test solution. Run the chromatogram three times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak obtained with the reference solution (1 per cent), and sum of areas of all the secondary peaks is not more than 1.5 times the area of the peak in the chromatogram obtained with the reference solution (1.5 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.1 g of Frusemide and shake with 150 ml of *0.1 M sodium hydroxide* for 10 minutes. Add sufficient *0.1 M sodium hydroxide* to produce 250.0 ml and filter. Dilute 5.0 ml to 200.0 ml with *0.1 M sodium hydroxide* and measure the absorbance of the resulting solution at the maximum at about 271 nm (2.4.7). Calculate the content of $C_{12}H_{11}ClN_2O_5S$ taking 580 as the specific absorbance at 271 nm.

Storage. Store protected from light.

Fulvestrant



$C_{32}H_{47}F_5O_3S$ Mol. Wt. 607.0

Fulvestrant is 7α-[9-[(*RS*)-(4,4,5,5,5-pentafluoropentyl) sulfinyl]nonyl]estra-1,3,5(10)-triene-3,17β-diol.

Fulvestrant contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{32}H_{47}F_5O_3S$, calculated on the anhydrous basis.

Category. Oestrogen receptor antagonist.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fulvestrant IPRS* or with the reference spectrum of fulvestrant.

B. Enantiomeric purity (See Test).

Tests

Appearance of solution. A 1.0 per cent w/v solution in *ethanol (95 per cent)* is clear (2.4.1).

Specific optical rotation (2.4.22). + 108.0° to + 115.0°, determined at 365 nm in a 2.0 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in *methanol* and dilute to 5.0 ml with *methanol*.

Reference solution (a). A 1.0 per cent w/v solution of *fulvestrant IPRS* in *methanol*.

Reference solution (b). Dilute 1.0 ml of the reference solution (a) to 100.0 ml with *methanol*. Dilute 1.0 ml of the solution to 10.0 ml with *methanol*.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with endcapped octaylsilane bonded to porous silica (3.5 µm),

- column temperature: 40°,
- mobile phase: A. a mixture of 27 volumes of *methanol*, 32 volumes of *acetonitrile* and 41 volumes of *water*,
  B. a mixture of 10 volumes of *water*, 41 volumes of *methanol* and 49 volumes of *acetonitrile*,
- a gradient program using the conditions given below,
- flow rate: 2 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
25	100	0
55	0	100
65	0	100
70	100	0

Name	Relative retention time	Correction factor
Fulvestrant impurity F[1]	0.4	0.3
Fulvestrant (Retention time: about 23 minutes)	1.0	—
Fulvestrant impurity A[2]	1.1	—
Fulvestrant impurity B[3]	1.2	—
Fulvestrant impurity C[4]	1.7	—
Fulvestrant impurity D[5]	1.9	0.7

[1]7-[9-[(4,4,5,5,5-pentafluoropentyl)sulfinyl]nonyl]-3,17â-dihydroxyestra-1,3,5(10)-trien-6-one (6-keto-fulvestrant).

[2]7β-[9-[(*RS*)-(4,4,5,5,5-pentafluoropentyl)sulfinyl]nonyl]estra-1,3,5(10)-triene-3,17β-diol(7β-fulvestrant),

[3]7α-[9-[(4,4,5,5,5-pentafluoropentyl)sulfonyl]nonyl]estra-1,3,5(10)-triene-3,17β - diol,

[4]7-[9-[[9-[(4,4,5,5,5-pentafluoropentyl)sulfinyl]nonyl]sulfinyl]nonyl] estra-1,3,5(10)-triene-3,17β-diol,

[5]7'-nonane-1,9-diylbis[estra-1,3,5(10)-triene-3,17β -diol].

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to fulvestrant impurity D is not more than 6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.6 per cent.), the area of any peak corresponding to fulvestrant impurity C is not more than 3 times the area of principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of any peak corresponding to fulvestrant impurity B is not more than twice the area of principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any peak corresponding to fulvestrant impurity F is not more than 1.5 times the area of principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent), Ignore any peak with an area less than 0.5 times that of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Enantiomeric purity. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in the mobile phase and dilute to 20.0 ml with the mobile phase.

Reference solution. Dissolve 5 mg of *fulvestrant IPRS* in the mobile phase and dilute to 5.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with silica gel AD for chiral separation (10 µm),
- mobile phase: a mixture of 12 volumes of *ethanol* and 88 volumes of *2-methylpentane*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 10 µl.

The relative retention time with reference to fulvestrant epimer B (retention time: about 26 minutes) for fulvestrant epimer A is about 1.1.

Inject the reference solution. The test is not valid unless the resolution between the fulvestrantepimer B and fulvestrant epimer A is not less than 1.3.

Inject the reference solution and the test solution. Run the chromatogram 1.75 times the retention time of fulvestrantepimer B. Fulvestrantepimer A/ fulvestrantepimer B ratio: 42:58 to 48:52.

Heavy metals (2.3.13). Dissolve 1.0 g of substance under examination in 20.0 ml of *ethanol (95 per cent)*. 12 ml of the solution complies with the limit test for heavy metals, Method D (20 ppm), using 10 ml of *lead standard solution (1 ppm Pb)*.

Water (2.3.43). Not more than 0.5 per cent.

Sulphated ash (2.3.18). Not more than 0.1 per cent, determined in a platinum crucible.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modifications.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{32}H_{47}F_5O_3S$.

Fulvestrant intended for use in the manufacture of parenteral preparations without further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirements.

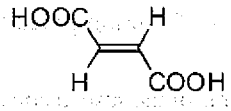
Bacterial endotoxins (2.2.3). Not more than 1.25 Endotoxin Unit per mg of fulvestrant.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from light and moisture at a temperature between 2° to 8°. If the material is intended for use in the manufacture of parenteral preparations, the container should be sterile, tamper-evident and sealed so as to exclude micro-organisms.

Labelling. The label states whether or not the material is intended for use in the manufacture of parenteral preparations.

Fumaric Acid



$C_4H_4O_4$ Mol. Wt. 116.1

Fumaric acid is (2*E*)-butanedioic acid.

Fumaric Acid contains not less than 99.5 per cent and not more than 100.5 per cent of $C_4H_4O_4$, calculated on the anhydrous basis.

Category. Pharmaceutical aid.

Description. A white granules or crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fumaric acid IPRS* or with the reference spectrum of fumaric acid.

Tests

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 1 g.

Maleic acid. Not more than 0.1 per cent.

Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 100 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). A 0.0001 per cent w/v solution of *maleic acid IPRS* in the mobile phase.

Reference solution (b). A 0.001 per cent w/v solution of *fumaric acid IPRS* and 0.0005 per cent w/v solution of *maleic acid IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 22 cm x 4.6 mm, strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the hydrogen form (7 to 11µm),
- mobile phase. *0.0025 M sulphuric acid,*
- flow rate: 0.3 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 5 µl.

Inject reference solution (b). The test is not valid unless the resolution obtained with reference solution (b), between the peaks corresponding to maleic acid and fumaric acid is not less than 2.5 and relative standard deviation for replicate injections obtained with reference solution (a) is not more than 2.0 per cent. The relative retention time with reference to fumaric acid for maleic acid is about 0.5.

Inject reference solution (a) and the test solution.

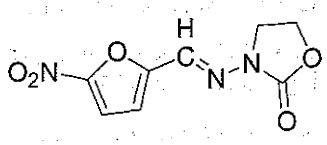
Calculate the content of maleic acid, $C_4H_4O_4$.

Assay. Weigh 1 g of Fumaric Acid and dissolve in 50 ml of *methanol,* warm gently on a steam bath to effect solution, cool. Titrate with *0.5 M sodium hydroxide*, using *phenolphthalein solution* as indicator. Carry out a blank titration.

1 ml of *0.5 M sodium hydroxide* is equivalent to 0.02902 g of $C_4H_4O_4$.

Storage. Store protected from moisture.

Furazolidone



$C_8H_7N_3O_5$ Mol. Wt. 225.2

Furazolidone is 3-(5-nitrofurfurylideneamino)oxazolidin-2-one.

Furazolidone contains not less than 97.0 per cent and not more than 103.0 per cent of $C_8H_7N_3O_5$, calculated on the dried basis.

Category. Antibacterial; antiprotozoal.

Description. A yellow, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *furazolidone IPRS* or with the reference spectrum of furazolidone.

B. Dissolve 1 mg in 1 ml of *dimethylformamide* and add 0.05 ml of *1 M ethanolic potassium hydroxide*; a deep blue colour is produced.

Tests

pH (2.4.24). 4.5 to 7.0, determined in a solution prepared by shaking 1.0 g for 15 minutes with 100 ml of *carbon dioxide-free water* and filtering.

Nitrofurfural diacetate. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 95 volumes of *toluene* and 5 volumes of *dioxan*.

Test solution. Dissolve 50 mg of the substance under examination in 5 ml of *dimethylformamide* by heating on a water-bath for a few minutes, allow to cool and dilute to 10 ml with *acetone*.

Reference solution. A solution containing 0.01 per cent w/v of *nitrofurfural diacetate IPRS* in a mixture of equal volumes of *dimethylformamide* and *acetone*.

Apply to the plate 10 µl of the reference solution and 20 µl of the test solution. After development, dry the plate in air and heat it at 105° for 5 minutes. Spray with a solution prepared by dissolving 0.75 g of *phenylhydrazine hydrochloride* in 10 ml of *ethanol (95 per cent)*, diluting to 50 ml with *water*, adding *activated charcoal*, filtering and then adding 25 ml of *hydrochloric acid* and sufficient *water* to produce 200 ml. Any spot corresponding to nitrofurfural diacetate in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. *Carry out the following procedure protected from light.*

Weigh 80 mg, add 150 ml of *dimethylformamide*, swirl to dissolve and add sufficient *water* to produce 500.0 ml. Dilute 5.0 ml to 100.0 ml with *water* and mix. Measure the absorbance of the resulting solution at the maximum at about 367 nm (2.4.7). Calculate the content of $C_8H_7N_3O_5$ taking 750 as the specific absorbance at 367 nm.

Storage. Store protected from light.

Furazolidone Oral Suspension

Furazolidone Oral Suspension is a suspension of Furazolidone in a suitable aqueous flavoured vehicle.

Furazolidone Oral Suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of furazolidone, $C_8H_7N_3O_5$.

Usual strength. 25 mg per 5 ml.

Identification

Add a quantity of the suspension containing 50 mg of Furazolidone to 10 ml of a freshly prepared mixture of 9 volumes of *dimethylformamide* and 1 volume of *1 M ethanolic potassium hydroxide*. The solution turns purple, immediately changes to deep blue and on standing for about 10 minutes, again turns purple.

Tests

pH (2.4.24). 6.0 to 8.5.

Other tests. Comply with the tests stated under Oral Liquids.

Assay. *Carry out the following procedure protected from light.*

To a measured volume of the suspension containing 50 mg of Furazolidone add 5 ml of *water* and mix. Transfer this mixture to a 250-ml volumetric flask with the aid of *dimethylformamide*. Add about 150 ml of *dimethylformamide*, shake by mechanical means for 10 minutes, dilute to volume with *dimethylformamide* and mix. Dilute 5.0 ml of the solution to 100.0 ml with *water* and mix well. Measure the absorbance of the resulting solution at the maximum at about 367 nm (2.4.7), using *dimethylformamide solution (5 per cent v/v)* as the blank. Calculate the content of $C_8H_7N_3O_5$ taking 750 as the specific absorbance at 367 nm.

Storage. Store protected from light at a temperature not exceeding 30°.

Furazolidone Tablets

Furazolidone Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of furazolidone, $C_8H_7N_3O_5$.

Usual strengths. 100 mg; 200 mg.

Identification

To a quantity of the powdered tablets containing 50 mg of Furazolidone add 10 ml of a freshly prepared mixture of 9 volumes of *dimethylformamide* and 1 volume of *1 M ethanolic potassium hydroxide*. The solution turns purple,

immediately changes to deep blue and on standing for 10 minutes, again turns purple.

Tests

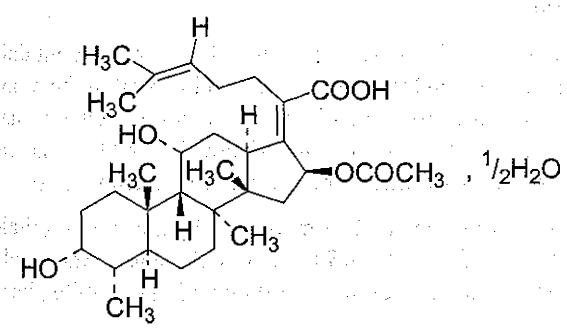
Other tests. Comply with the tests stated under Tablets.

Assay. *Carry out the following procedure protected from light.*

Weigh and powder 20 tablets. Disperse a quantity of the powder containing 80 mg of Furazolidone into a 200-ml volumetric flask, add 100 ml of *dimethylformamide*, warm to about 50° and shake well. Cool, dilute to volume with *dimethylformamide*, mix and centrifuge a small quantity of the mixture. Dilute 5.0 ml of the clear, supernatant liquid to 250.0 ml with *water* and mix. Measure the absorbance of the resulting solution at the maximum at about 367 nm (2.4.7), using *dimethylformamide* diluted 50 times with *water* as the blank. Calculate the content of $C_8H_7N_3O_5$ taking 750 as the specific absorbance at 367 nm.

Storage. Store protected from light at a temperature not exceeding 30°.

Fusidic Acid



$C_{31}H_{48}O_6,½H_2O$ Mol. Wt. 525.7

Fusidic Acid is *ent*-16α-acetyloxy-3β,11β-dihydroxy-4β,8β,14β-trimethyl-18-nor-5β,10α-cholesta(17*Z*)-17(20),24-dien-21-oic acid hemihydrate, an antimicrobial substance produced by the growth of certain strains of *Fusidium coccineum* or by any other means.

Fusidic Acid contains not less than 97.5 per cent and not more than 101.0 per cent of $C_{31}H_{48}O_6$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fusidic acid IPRS* or with the reference spectrum of fusidic acid.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G254*.

Mobile phase. A mixture of 80 volumes of *chloroform*, 10 volumes of *glacial acetic acid*, 10 volumes of *cyclohexane* and 2.5 volumes of *methanol*.

Test solution. Dissolve 0.2 g of the substance under examination in 100.0 ml of *ethanol (95 per cent)*.

Reference solution. A 0.24 per cent w/v solution of *diethanolamine fusidate IPRS* in *ethanol (95 per cent)*.

Apply to the plate 5 µl of each solution. After development, dry the plate at 105° for 10 minutes and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.17).

Test solution. Dissolve 0.5 g of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). Dissolve 5 mg of *3-ketofusidic acid IPRS* in 5 ml of the mobile phase. To 1.0 ml of the solution add 0.2 ml of the test solution and dilute to 20.0 ml with the mobile phase.

Reference solution (b). Dilute 20 µl of the test solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 12.5 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of *acetonitrile*, 20 volumes of *water*, 20 volumes of a 1 per cent w/v solution of *phosphoric acid* and 10 volumes of *methanol*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 20 µl.

Continue the chromatography for at least 3.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution the sum of the areas of any secondary peaks is not greater than 4 times the area of the peak corresponding to fusidic acid in the chromatogram obtained with reference solution (a). Ignore any peak with an area less than that of the principal peak in the chromatogram obtained with reference

solution (b). The test is not valid unless the resolution factor between the peaks corresponding to 3-ketofusidic acid and fusidic acid in the chromatogram obtained with reference solution (a) is not less than 2.5 and unless the principal peak in the chromatogram obtained with reference solution (b) has a signal-to-noise ratio of not less than 3.

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). 1.4 to 2.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 250 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.05 per cent w/v solution of *fusidic acid IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of *acetonitrile*, 20 volumes of *water*, 20 volumes of a 1.0 per cent w/v solution of *orthophosphoric acid* and 10 volumes of *methanol*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 20 µl.

The retention time of the principal peak is about 6.0 minutes.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{31}H_{48}O_6$.

Storage. Store protected from light.

Fusidic Acid Cream

Fusidic Acid Cream contains fusidic acid in a suitable cream base.

Fusidic Acid Cream contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of fusidic acid, $C_{31}H_{48}O_6$.

Usual strength. 2 per cent w/w.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 2.5 volumes of *methanol*, 10 volumes of *glacial acetic acid*, 10 volumes of *cyclohexane* and 80 volumes of *chloroform*.

Test solution. Disperse a quantity of the cream with shaking containing about 40 mg of anhydrous fusidic acid in 10 ml of *ethanol (95 per cent)*, filter. Use the filtrate.

Reference solution (a). A 0.5 per cent w/v solution of *diethanolamine fusidate IPRS* in *ethanol (95 per cent)*.

Reference solution (b). A 0.05 per cent w/v solution of *potassium sorbate* in *water*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 12.5 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with reference solution (a) and is well separated from any spot corresponding to the spot in the chromatogram obtained with reference solution (b).

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 4.5 to 6.0.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the cream containing about 15 mg of anhydrous fusidic acid in 25 ml of the mobile phase, heat the mixture until the cream has melted and shake for 15 minutes. Cool the mixture to below 10° and filter. Discard the first few ml of filtrate and warm to room temperature.

Reference solution (a). To 1 ml of a 0.06 per cent w/v solution of *3-ketofusidic acid IPRS* in the mobile phase. Add 1 ml of the test solution and dilute to 100 ml with the mobile phase.

Reference solution (b). Dilute 30 µl of the test solution to 100.0 ml with the mobile phase.

Reference solution (c). A 0.004 per cent w/v solution of *potassium sorbate* in the mobile phase.

Chromatographic system
- a stainless steel column 12.5 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Lichrospher 100 RP-18),
- mobile phase: a mixture of 10 volumes of *methanol*, 40 volumes of *0.05M orthophosphoric acid* and 50 volumes of *acetonitrile*,
- flow rate: 2.5 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to 3-ketofusidic acid and fusidic acid is not less than 3.5.

Inject reference solution (a), (b), (c) and the test solution. Run the chromatogram 3.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (5.0 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.03 per cent) and any peak with the same retention time as that of the principal peak in the chromatogram obtained with reference solution (c).

Other tests. Comply with the tests stated under Cream.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the cream containing about 15 mg of anhydrous fusidic acid in 50 ml of the mobile phase, heat until the cream has melted and shake for 15 minutes. Cool the mixture to below 10° and filter. Discarding the first few ml of filtrate and warm to room temperature.

Reference solution. A 0.0375 per cent w/v solution of *diethanolamine fusidate IPRS* in the mobile phase.

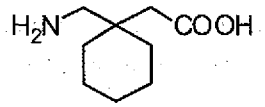
Chromatographic system as described under Related substances.

Inject the reference solution and the test solution.

Calculate the content of $C_{31}H_{48}O_6$ in the cream.

G

Gabapentin



$C_9H_{17}NO_2$ Mol. Wt. 171.2

Gabapentin is [1-(aminomethyl) cyclohexyl] acetic acid

Gabapentin contains not less than 98.0 per cent and not more than 102.0 per cent of $C_9H_{17}NO_2$, calculated on the anhydrous basis.

Category. *Antiepileptic.*

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *gabapentin IPRS* or with the reference spectrum of gabapentin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.24). 6.5 to 8.0, determined in a 2.0 per cent solution.

Related substances. A. Determine by liquid chromatography (2.4.14).

Diluent. Dissolve 2.32 g of *ammonium dihydrogen phosphate* in 950 ml of *water*, and adjusted to pH 2.0 with *orthophosphoric acid*, and dilute to 1000 ml with *water*.

Test solution. Dissolve 140 mg of the substance under examination in the diluent and dilute to 10.0 ml with the diluent.

Reference solution (a). A solution containing 1.4 per cent of *gabapentin IPRS*, 0.0014 per cent *gabapentin impurity A IPRS* and 0.00084 per cent *gabapentin impurity B IPRS* in the diluent.

Reference solution (b). A 0.00084 per cent w/v solution of *gabapentin impurity E IPRS* in the diluent.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 24 volumes of *acetonitrile* and 76 volumes of buffer solution prepared by dissolving 0.58 g of *ammonium dihydrogen phosphate* and 1.83 g of *sodium perchlorate* in 950 ml of *water* and adjusted to pH 1.8 with *perchloric acid* and diluted to 1000 ml with *water*,
- flow rate: 1.0 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Gabapentin	1.0	---
Gabapentin impurity E[1]	2.9	—
Gabapentin impurity A[2]	3.5	0.188
Gabapentin impurity B[3]	3.8	2.86

[1]carboxymethyl-cyclohexanecarboxylic acid,

[2]2-aza-spiro [4.5] decan-3-one,

[3](1-cyano-cyclohexyl)-acetic acid.

NOTE—The relative response factor are calculated in response of gabapentin impurity E due to low absorptivity of gabapentin at 254 nm.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to gabapentin impurity A and gabapentin impurity B is not less than 2.3.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of peak corresponding to gabapentin impurity E is not more than 1.6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),the area of peak corresponding to gabapentin impurity A is not more than 1.6 times the area of principal peak obtained with reference solution (b) (0.1 per cent) and the area of peak corresponding to gabapentin impurity B is not more than the area of principal peak obtained with reference solution (b) (0.06 per cent), the area of any other secondary peak multiplied with a correction factor of 2.43 is not more than 1.6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

B. Determine by liquid chromatography (2.4.14) as described in test A of related substances with the following modifications.

Reference solution. A 0.00028 per cent w/v solution of *gabapentin impurity D IPRS (1-(3-oxo-2-aza-spiro[4.5]dec-2-ylmethyl)-cyclohexyl)-acetic acid* in the diluent.

Use chromatographic systems as described in related substances test A with the following modifications.

- mobile phase: a mixture of 30 volumes of *methanol*, 35 volumes of *acetonitrile* and 35 volumes of buffer solution prepared by dissolving 0.58 g of *ammonium dihydrogen phosphate* and 1.83 g of *sodium perchlorate* in 950 ml of *water* and adjusted to pH 1.8 with *perchloric acid* and dilute to 1000 ml with *water*.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 13,600 theoretical plates.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak other than impurity D is not more than 5 times the area of principal peak obtained with the reference solution (0.1 per cent).

The total impurity for test A and B is not more than 0.5 per cent.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Water (2.3.43). Not more than 0.5 per cent.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Determine by liquid chromatography (2.4.14), as described under the test A of Related substances with the following modifications.

Reference solution (a). A 1.4 per cent w/v solution of *gabapentin IPRS* in the diluent.

Reference solution (b). A 0.23 per cent w/v solution of *gabapentin IPRS* from reference solution (a) in the diluent.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (b). The test is not valid unless the column efficiency is not less than 1900 theoretical plates.

Inject reference solution (a) and the test solution.

Calculate the content of $C_9H_{17}NO_2$.

Storage. Store protected from moisture.

Gabapentin Capsules

Gabapentin Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of gabapentin $C_9H_{17}NO_2$.

Usual strengths. 100 mg; 300 mg; 400 mg; 450 mg.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *gabapentin IPRS* or with the reference spectrum of gabapentin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.06 M hydrochloric acid*,
Speed and time. 50 rpm and 20 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *gabapentin IPRS* in the dissolution medium to obtain a solution of known concentration similar to the expected concentration of the test solution.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 940 ml of the buffer solution prepared by dissolving 1.2 g of *potassium dihydrogen orthophosphate* adjusted to pH 6.9 with *5 M potassium hydroxide* and 60 ml of *acetonitrile*,
  B. a mixture of 700 ml of the buffer solution prepared by dissolving 1.2 g of *potassium dihydrogen orthophosphate* adjusted to pH 6.9 with *5 M potassium hydroxide* and 300 ml of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 50 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
4	100	0
45	0	100
45.1	100	0
50	100	0

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 for the principal peak.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of peak corresponding to gabapentin impurity A is not more than twice the area of peak due to gabapentin impurity A in the chromatogram obtained with the reference solution (0.4 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent), and the sum of the area of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Diluent. Dissolve 1.2 g of *potassium dihydrogen orthophosphate* in 1000 ml *water* and adjusted to pH 6.9 with *5 M potassium hydroxide*.

Test solution. Weigh a quantity of mixed content of 20 capsules. Disperse a quantity of powder containing 400 mg gabapentin in the diluent, mix with the aid of ultrasound for 60 seconds and dilute to 100.0 ml with the diluent.

Reference solution. A 0.4 per cent w/v solution of *gabapentin IPRS* in the diluent.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 940 ml of buffer prepared by dissolving 1.2 g of *potassium dihydrogen orthophosphate* in *water* adjusted to pH 6.9 using *5 M potassium hydroxide* and 60 volumes of *acetonitrile*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 7000 theoretical plates and the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_9H_{17}NO_2$ in the capsule.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Gabapentin Tablets

Gabapentin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of gabapentin, $C_9H_{17}NO_2$.

Usual strengths. 100 mg; 300 mg; 400 mg; 600 mg; 800 mg.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *gabapentin IPRS* or with the reference spectrum of gabapentin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.06 M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, diluted if necessary, with the dissolution medium.

Reference solution. Dissolve a weighed quantity of *gabapentin IPRS* in dissolution medium to obtain a solution of known concentration similar to the test solution.

Use the chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_9H_{17}NO_2$.

Q. Not less than 80 per cent of the stated amount of $C_9H_{17}NO_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Diluent. Dissolve 1.2 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water* and adjusted to pH 6.9 with *5 M potassium hydroxide*.

Test solution. Weigh and powder 20 tablets. Dissolve a weighed quantity containing about 500 mg gabapentin in diluent, sonicate for 30 minutes, dilute to 25.0 ml with the diluent.

Reference solution. A solution containing 0.004 per cent w/v each of *gabapentin IPRS* and *gabapentin impurity A IPRS (2-Aza-spiro[4, 5] decan-3-one)* in the diluent.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 940 ml of buffer prepared by dissolving 1.2 g of *potassium dihydrogen orthophosphate* in *water* adjusted to pH 6.9 using *5 M potassium hydroxide* and 60 volumes of *acetonitrile*,
  B. a mixture of 700 ml of buffer prepared by dissolving 1.2 g of *potassium dihydrogen orthophosphate* in *water* adjusted to pH 6.9 using *5 M potassium hydroxide* and 300 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 50 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
4	100	0
45	0	100
45.1	100	0
50	100	0

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 for the principal peak.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of peak corresponding to gabapentin impurity A is not more than twice the area of peak due to gabapentin impurity A in the chromatogram obtained with the reference solution (0.4 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent), and the sum of the area of all the secondary peak in not more than 5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Diluent. Dissolve 1.2 g of *potassium dihydrogen orthophosphate* in 1000 ml *water* and adjusted to pH 6.9 with *5 M potassium hydroxide*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 400 mg gabapentin in the diluent, sonicate for 30 minutes, dilute to 100.0 ml with diluent.

Reference solution. A 0.4 per cent w/v solution of *gabapentin IPRS* in the buffer solution.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 940 volumes of buffer solution prepared by dissolving 1.2 g of *potassium dihydrogen orthophosphate* in *water* adjusted to pH 6.9 using *5 M potassium hydroxide* and 60 volumes of *acetonitrile*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 50 µl.

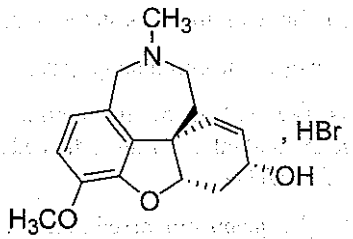
Inject the reference solution. The test is not valid unless the column efficiency is not less than 7000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_9H_{17}NO_2$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Galantamine Hydrobromide



$C_{17}H_{21}NO_3,HBr$ Mol Wt. 368.3

Galantamine Hydrobromide is (4a*S*,6*R*,8a*S*)- 5,6,9,10,11,12-Hexahydro- 3-methoxy- 11-methyl- 4a*H*- [1]benzofuro[3a,3,2-*ef*] [2] benzazepin- 6-ol hydrobromide.

Galantamine Hydrobromide contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{17}H_{21}NO_3,HBr$, calculated on the dried basis.

Category. Cholinesterase Inhibtor.

Description. A white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *galantamine hydrobromide IPRS* or with the reference spectrum of galantamine hydrobromide.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Galantamine Enantiomer. Not more than 0.1 per cent.

Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of substance under examination in *methanol* and dilute to 100.0 ml with *methanol*.

Reference solution. A solution containing 0.0005 per cent w/v each of (+) *galantamine IPRS* and *galantamine hydrobromide IPRS* in *methanol*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, such as chiral Pack-AD-H, (5 µm),
- mobile phase: a mixture of 85 volumes of *n-hexane*, 15 volumes of *isopropylalcohol*, 0.1 volume of *diethylamine* and 0.1 volume of *trifluoroacetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between the peak due to galantamine and (+) galantamine isomer is not less than 3.0.

Inject the reference solution and the test solution.

Calculate the content of Galantamine isomer by area normalisation.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 95 volumes of *water* and 5 volumes of *methanol*.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). A solution containing 0.1 per cent w/v each of *galantamine IPRS*, *galantamine N-oxide IPRS*, *lycoramine IPRS*, *epigalantamine IPRS and dehydroxyl galantamine IPRS* in the solvent mixture.

Reference solution (b). A 0.0005 per cent w/v solution of *galantamine hydrobromide IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3.5 µm),
- column temperature: 55°,
- mobile phase: A. a mixture of 95 volumes of a solution prepared by dissolving 0.79 g of *disodium hydrogen orthophosphate* and 2.46 g of *sodium dihydrogen orthophosphate anhydrous* into 1000 ml of *water* and 5 volumes of *methanol*.

  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
6	100	0
20	95	05
35	85	15
50	80	20
51	40	60
55	40	60
56	100	0
65	100	0

The relative retention time with reference to galantamine for norgalantamine is 0.27; for desmethyl galantamine is 0.35, for galantamine-N-oxide is 0.62; for lycoramine is 0.82; for epigalantamine is 1.17 and for dehydroxyl galantamine is 2.07.

Inject reference solution (a) and (b). The test is not valid unless the resolution between galantamine and epigalantamine is not less than 4.5 in the chromatogram obtained with reference solution (a) in the chromatogram obtained with reference solution (b), the column efficiency is not less than 3000 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution. The area of any peak due to, galantamine-N-oxide, epigalantamine, desmethyl galantamine is not more than 0.2 per cent, the area of any peak due to de hydroxyl galantamine and lycoramine, is not more than 0.4 per cent , the area of any other secondary peak is not more than 0.1 per cent and the sum of areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalisation.

Bromide content. 20.6 per cent to 22.8 per cent.

Dissolve 0.35 g in 40.0 ml of *water*, add 10.0 ml of *nitric acid*. Titrate with *0.1 M silver nitrate*, determining the end point potentiometrically (2.4.25), using combined electrode. Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.00799 g of bromide.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 60 volumes of *water* and 40 volumes of *methanol*.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with

the solvent mixture and further dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.005 per cent w/v solution of *galantamine hydrobromide IPRS* in the solvent mixture.

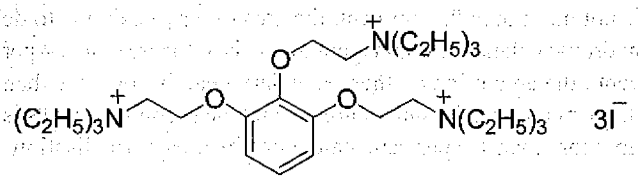
Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 90 volumes of a solution prepared by dissolving 2.64 g of *diammonium hydrogen orthophosphate* to 1000 ml of *water*, adjusted to pH 6.8 with *orthophosphoric acid* and 10 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{21}NO_3$,HBr.

Gallamine Triethiodide



$C_{30}H_{60}I_3N_3O_3$ Mol. Wt. 891.5

Gallamine Triethiodide is 2,2',2"-(benzene-1,2,3-triyltrioxy)tris(tetraethylammonium) triiodide.

Gallamine Triethiodide contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{30}H_{60}I_3N_3O_3$, calculated on the dried basis.

Category. Skeletal muscle relaxant.

Description. A white or almost white powder; hygroscopic.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *gallamine triethiodide IPRS*.

B. When examined in the range 220 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *0.01 M hydrochloric acid* shows an absorption maximum at about 225 nm is 0.50 to 0.55.

C. To 5 ml of a 1 per cent w/v solution add 1 ml of *potassium mercuri-iodide solution*; a yellow precipitate is produced.

D. Acidify 2 ml of a 0.5 per cent w/v solution with 0.2 ml of *2 M nitric acid*; the resulting solution gives reaction (A) of iodides (2.3.1).

Tests

Appearance of solution. A 2.0 per cent w/v solution is clear (2.4.1), and, when examined immediately after preparation, not more intensely coloured than reference solution YS7 (2.4.1).

Acidity or alkalinity. To 50 ml of *water* add 0.2 ml of *methyl red solution* and adjusted to pH 6.0 with *0.01 M sulphuric acid* or *0.02 M sodium hydroxide* until the colour is orange-yellow. Add 1 g of the substance under examination and shake to dissolve. Not more than 0.2 ml of *0.01 M sulphuric acid* or *0.02 M sodium hydroxide* is required to restore the orange-yellow colour.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 30 mg of the substance under examination in 50.0 ml of the mobile phase.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 1.4 g of *sodium perchlorate* in 85 ml of *phosphate buffer pH 3.0* and 15 ml of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 20 µl.

The relative retention time with reference to gallamine for 2,2',2"-[benzene-1,2,3-triyltris(oxy)]tris(*N,N*-diethylamine) (gallamine impurity A) is about 0.45, for 2,2'-[2-[2-(triethylammonio)ethyl]-1,3-phenylenebis(oxy)]bis(*N,N,N*-triethylethanaminium)triiodide (gallamine impurity B) is about 0.5, for 2,2'-[2-[2-(diethylmethylammonio)ethoxy]-1,3-phenylene bis(oxy)]bis(*N,N,N*-triethylethanaminium)triiodide (gallamine impurity C) is about 0.65, for 2,2'-[3-[2-(diethylmethylammonio)ethoxy]-1,2-phenylenebis(oxy)bis (*N,N,N*-triethylethanaminium)triiodide (gallamine impurity D) is about 0.75, for 2,2'-[3-[2-(diethylamino)ethoxy-1,2-phenylenebis (oxy)bis(*N,N,N*-triethylethanaminium)diiodide (gallamine impurity E) is about 0.85, for 2,2',2"-[4-[2-(triethylammonio) ethyl]benzene-1,2,3triyltris(oxy)tris(*N,N,N*-triethyl-ethanaminium)tetraidide (gallamine impurity F) is about 0.9.

Inject the reference solution and the test solution. Run the chromatogram 1.5 times the peak due to triethylgallamine as perchlorate. In the chromatogram obtained with the test solution the area of secondary peak corresponding to gallamine impurity A, B, C, D, E and F is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). The sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent). Ignore the peak due to iodide (non-retained peak).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.27 g and dissolve in a mixture of 40 ml of *acetone* and 15 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02972 g of $C_{30}H_{60}I_3N_3O_3$.

Storage. Store protected from light.

Gallamine Injection

Gallamine Triethiodide Injection

Gallamine Injection is a sterile solution of Gallamine Triethiodide in Water for Injections.

Gallamine Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of gallamine triethiodide, $C_{30}H_{60}I_3N_3O_3$.

Usual strength. 40 mg per ml.

Description. A clear, colourless or almost colourless solution.

Identification

A. When examined in the range 220 nm to 360 nm (2.4.7), the final solution obtained in the Assay shows an absorption maximum only at about 225 nm.

B. To 1 ml add 1 ml of iodinated *potassium iodide solution*; a brown precipitate is produced.

C. To 1 ml add 1 ml of *potassium mercuri-iodide solution*; a yellow precipitate is produced.

Tests

pH (2.4.24). 5.5 to 7.5.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of injection containing 60 mg of Gallamine Triethiodide in 100.0 ml of the mobile phase.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with silica whose surface is chemically modified with a mixture of chemically- bonded octylsilane and octadecylsilane groups (5µm) (Such as Hichrom RPB),
- column temperature: 40°,
- mobile phase: dissolve 14 g of *sodium perchlorate* in 850 ml of a solution prepared by diluting 0.7 ml of *orthophosphoric acid* to 900 ml with *water*, adjusted to pH 3.0 with *10 M sodium hydroxide* and dilute to 1000 ml with *water*, and add 130 ml of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution. Run the chromatogram 1.5 times the retention time of the principal peak obtained with the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principle peak in the chromatogram obtained with the reference solution (1.0 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent). Ignore the peak due to iodide (non-retained peak).

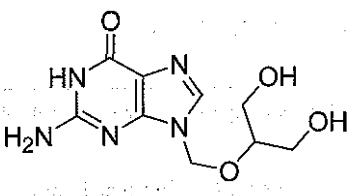
Bacterial endotoxins (2.2.3). Not more than 5.0 Endotoxin Units per mg of gallamine triethiodide.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Dilute a measured volume containing 40 mg of Gallamine Triethiodide with sufficient *0.01 M hydrochloric acid* to produce 200.0 ml. Dilute 5.0 ml of the solution to 100.0 ml with *0.01 M hydrochloric acid* and measure the absorbance of the resulting solution at the maximum at about 225 nm (2.4.7). Calculate the content of $C_{30}H_{60}I_3N_3O_3$ taking 525 as the specific absorbance at 225 nm.

Storage. Store protected from light.

Ganciclovir



$C_9H_{13}N_5O_4$ Mol Wt. 255.2

Ganciclovir is 2-amino-9-[[2-hydroxy-1-(hydroxymethyl) ethoxy]methyl]-1,9-dihydro-6H-purin-6-one.

Ganciclovir contains not less than 98.0 per cent and not more than 102.0 per cent of $C_9H_{13}N_5O_4$, calculated on the anhydrous basis.

Category. Antiviral.

Description. A white or almost white, powder; hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ganciclovir IPRS* or with the reference spectrum of ganciclovir.

B. When examined in the range 210 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* shows an absorption maximum at about 254 nm.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 11 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). A solution containing 0.01 per cent w/v each of *ganciclovir IPRS* and *ganciclovir related compound A IPRS* in the mobile phase.

Reference solution (b).A 0.022 per cent w/v solution of *ganciclovir IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with irregular or spherical, totally porous silica gel having a chemically bonded, strongly acidic cation-exchange coating, 3 to 10 µm in diameter,
- column temperature: 40°,
- mobile phase: a mixture of 50 volumes of *acetonitrile* and 50 volumes of a solution prepared by dissolving 0.5 ml of *trifluoroacetic acid* in 1000 ml of *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Name	Relative retention time
Ganciclovir related compound A[1]	0.9
Ganciclovir	1.0

[1] 2-Amino-9-[(2,3-dihydroxypropoxy)methyl]-1,9-dihydro-6*H*-purin-6-one (isoganciclovir).

Inject reference solution (a).The test is not valid unless the resolution between the ganciclovir related compound A and ganciclovir is not less than 1.4, the column efficiency is not less than 5000 theoretical plates, the tailing factor is not more than 1.4 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the test solution. The area of any peak corresponding to ganciclovir related compound A is not more than 0.5 per cent. The sum of areas of all secondary peaks is not more than 1.5 per cent, calculated by area normalization.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 6.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances.

Inject reference solution (a).The test is not valid unless the resolution between the ganciclovir related compound A and ganciclovir is not less than 1.4, the column efficiency is not less than 5000 theoretical plates, the tailing factor is not more than 1.4.

Inject reference solution (b). The relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject reference solution (b) and the test solution.

Calculate the content of $C_9H_{13}N_5O_4$.

Storage. Store in well-closed containers, protected from moisture at a temperature below 30°.

Ganciclovir Injection

Ganciclovir Injection is a sterile freeze dried material consisting of Ganciclovir with or without excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of sealed container in the requisite amount of sterile water for injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under parenteral preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Ganciclovir Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ganciclovir, $C_9H_{13}N_5O_4$.

Usual strength. 500 mg per vial.

Description. A white to off-white powder.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

In the Assay, the principal peak in the chromatogram obtained with test solution (b) corresponds to the peak in the chromatogram obtained with reference solution (b).

Tests

pH (2.4.24). 10.8 to 11.4, determined on the constituted solution.

Water (2.3.43). Not more than 3.0 per cent, using a mixture of *anhydrous formamide* and *methanol* (1:1) instead of *methanol*.

Bacterial endotoxins. (2.2.3). Not more than 0.84 Endotoxin Unit per mg of ganciclovir.

Assay. Determine by liquid chromatography (2.4.14).

Internal standard solution. A 0.015 per cent w/v solution of *hypoxanthine* in *water*.

Test solution (a). Determine the weight of the contents of 10 containers. Transfer a weighed quantity of the mixed contents of the 10 containers containing 100 mg of Ganciclovir to a 100.0 ml volumetric flask, add about 80 ml of the *water* and dissolve by shaking and mixing if necessary, with the aid of ultrasound. Cool and dilute to 100.0 ml with the *water*.

Test solution (b). Dilute 5.0 ml of test solution (a) and add 10.0 ml internal standard solution and dilute to 100.0 ml with mobile phase.

Reference solution (a). A 0.025 per cent w/v solution of *ganciclovir IPRS* in *water*.

Reference solution (b). Dilute 20.0 ml of reference solution (a) and add 10.0 ml internal standard solution to 100.0 ml with mobile phase.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: Dissolve 1.4 g of *monobasic ammonium phosphate* and 2.0 g of *phosphoric acid* in 1000 ml of *water* and mix,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject reference solution (b). The relative retention times of hypoxanthine and ganciclovir are about 0.7 and 1.0 respectively. The test is not valid unless the resolution between the peaks due to hypoxanthine and ganciclovir is not less than 3.0, the column efficiency is not less than 1000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections in not more than 2.0 per cent.

Inject reference solution (b) and test solution (b).

Calculate the content of $C_9H_{13}N_5O_4$ in the injection.

Storage. Store protected from moisture, in a sterile tamper evident container, sealed so as to exclude micro organisms, at a temperature not exceeding 30°.

Labelling. Label state that it is to be handled with great care because it is a potent cytotoxic agent and suspected carcinogen. The label states the quantity of ganciclovir in the sealed container and procedure for reconstitution.

Ganciclovir Oral Suspension

Ganciclovir Oral Suspension is a suspension of Ganciclovir in a suitable vehicle.

The suspension is constituted by dispersing the contents of the sealed container in the specified volume of water just before use.

Ganciclovir Oral Suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ganciclovir, $C_9H_{13}N_5O_4$.

The constituted suspension, when stored at the temperature and for the period stated on the label during which it may be expected to be satisfactory for use, contains not less than 80.0 per cent of the stated amount of ganciclovir, $C_9H_{13}N_5O_4$.

NOTE — Avoid skin contact or inhalation of ganciclovir by using protective gloves and a fume hood or surgical mask.

Usual strength. 100 mg per ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution (b) corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 4.0 to 5.0.

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Internal standard solution. A 0.04 per cent w/v solution of *hypoxanthine* in *water*.

Test solution (a). Mix the contents of not less than 2 constituted containers. Shake a quantity of oral suspension containing 100 mg of Ganciclovir with 100.0 ml with *water*. Dilute 10.0 ml of the solution to 100.0 ml with same solvent.

Test solution (b). Dilute 6.0 ml of test solution (a) and add 1.0 ml internal standard solution to 100.0 ml with *water*.

Reference solution. A solution containing 0.006 per cent w/v of *ganciclovir IPRS* in *water*. Mix 10.0 ml of the solution with 1.0 ml internal standard solution and dilute to 100.0 ml with *water*.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 2.5 volumes of *acetonitrile* and 97.5 volumes of *0.025M monobasic sodium phosphate* solution, adjusted to pH 2.5 with *orthophosphoric acid*, filter and degas,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

The relative retention time with respect to ganciclovir for hypoxanthine is 0.75.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 1.5 per cent.

Inject the reference solution and test solution (b).

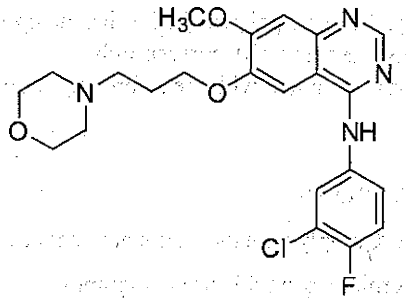
Calculate the content of $C_9H_{13}N_5O_4$ in the suspension.

Determine the weight per ml of the oral suspension (2.4.29) and calculate the content of $C_9H_{13}N_5O_4$, weight in volume.

Storage. Store protected from light and moisture.

Labelling. The constituted suspension should be used within 90 days.

Gefitinib



$C_{22}H_{24}O_3N_4FCl$ Mol. Wt. 446.9

Gefitinib is *N*-(3-chloro-4-fluorophenyl)-7-methoxy-6-[3-(4-morpholinyl)propoxy]-4-quinazolinoamine.

Gefitinib contains not less than 98.0 per cent and not more than 102.0 per cent $C_{22}H_{24}O_3N_4FCl$, calculated on the dried basis.

Category. Anticancer.

Description. A white or off white crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *gefitinib IPRS* or with the reference spectrum of gefitinib.

Tests

Melting range (2.4.21). 193° to 197°.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of the substance under examination in *methanol* and dilute to 100.0 ml with *methanol*.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with *methanol*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5µm),
- mobile phase: a mixture of 40 volumes of 1 per cent w/v solution of *ammonium acetate* and 60 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the principal peak obtained in the chromatogram obtained with reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent).

Heavy metals (2.3.13). 2 g complies with limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of the substance under examination in 100.0 ml of *methanol*.

Reference solution. A 0.01 per cent w/v solution of *gefitinib IPRS* in the *methanol*.

Chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{24}O_3N_4FCl$.

Storage. Store protected from light and moisture, at a temperature not exceeding 25°.

Gefitinib Tablets

Gefitinib Tablets contains not less than 90.0 per cent and not more than 110.0 per cent of stated amount of gefitinib, $C_{22}H_{24}O_3N_4FCl$.

Usual strength. 250 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *acetate buffer pH 4.0*,
Speed and time. 75 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter. Dilute a suitable volume of the filtrate with the same solvent, if necessary and measure the absorbance (2.4.7) of the resulting solution at the maximum at about 254 nm. Calculate the content of $C_{22}H_{24}O_3N_4FCl$ in the medium from the absorbance obtained from a solution of known concentration of *gefitinib IPRS* in the same medium.

Q. Not less than 75 per cent of the stated amount of $C_{22}H_{24}O_3N_4FCl$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 100 mg of Gefitinib, disperse in 100 ml of the *methanol*, filter. Dilute 5.0 ml of the filtrate to 50.0 ml with the mobile phase.

Reference solution. A 0.1 per cent w/v solution of *gefitinib IPRS* in *methanol*. Dilute 5 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of 1.0 per cent w/v solution of *ammonium acetate* and 60 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{24}O_3N_4FCl$ in the tablets.

Storage. Store protected from light and moisture.

Gelatin

Gelatin is a purified protein obtained by partial hydrolysis of animal collagen. Gelatin used in the manufacture of capsule shells or as a pharmaceutical aid in the manufacture of tablets may contain suitable antimicrobial agents.

Category. Pharmaceutical aid (encapsulating agent; suspending agent; tablet binding and coating agent).

Description. Light amber to faintly yellow, translucent flakes, sheets, shreds, powder or granules; slight. Stable in air but is subject to microbial decomposition when moist or in solution.

Identification

A. Dissolve 1 g in sufficient *carbon dioxide-free water* at about 55° to produce 100 ml and maintain the solution at this temperature until required for use (solution A). To 2 ml of solution A add 0.05 ml of *copper sulphate solution*, mix and add 0.5 ml of *2 M sodium hydroxide*; a violet colour is produced.

B. Add 10 ml of *water* to 0.5 g in a test-tube, allow to stand for 10 minutes, heat at 60° for 15 minutes, allow to stand upright at 0° for 6 hours and invert the test-tube; the contents do not immediately flow out.

Tests

Appearance of solution. Solution A is not more opalescent than opalescence standard OS4 (2.4.1), and not more intensely coloured than reference solution YS4 (2.4.1).

pH (2.4.24). 3.8 to 7.6, determined in solution A.

Conductivity (2.4.9). Not more than 1 mS·cm^{-1}, determined on a 1.0 per cent solution at 30 ± 1.0°.

Iron. Not more than 30 ppm.

Determine by atomic absorption spectrometry (2.4.2), Method A at 248.3 nm.

Test solution. To 5.0 g of the substance under examination, in a conical flask, add 10 ml of *hydrochloric acid*. Close the flask and place in a water-bath at 75°-80° for 2 hours. Allow to cool and adjust the content of the flask with *water* to 100.0 g

Iron standard solution (8 ppm). Dissolve 80 mg of *iron* in 50 ml of 22.0 per cent w/v solution of *hydrochloric acid* and dilute to 1000.0 ml with *water*. Prepare a 1:10 dilution with *water*, immediately before use, dilute with *water* as necessary.

Chromium. Not more than 10 ppm.

Determine by atomic absorption spectrometry (2.4.2), Method A at 357.9 nm,

Test solution. As described under test for iron.

Chromium standard solution (100 ppm). A 0.0283 per cent w/v solution of dried *potassium dichromate* in *water*, dilute with *water* as necessary.

Zinc. Not more than 30 ppm.

Determine by atomic absorption spectrometry (2.4.2)., Method A at 213.9 nm

Test solution. As described under test for iron.

Zinc standard solution (10 ppm). Dissolve 0.440 g of zinc sulphate heptahydrate and 1 ml of a 30 per cent w/v solution of *acetic acid* in *water*, and dilute to 100.0 ml with *water*. Prepare a 1:100 dilution in *water*, immediately before use, dilute with *water* as necessary.

Sulphur dioxide. Not more than 50 ppm, determined by the following method.

Add 150 ml of *water* to a 500-ml three-necked, round-bottomed flask fitted with a water-cooled reflux condenser 200 mm long the upper end of which is connected to an absorption tube. The flask is fitted with a 100-ml dropping funnel and a gas inlet tube that reaches nearly to the bottom of the flask. Pass a stream of carbon dioxide through the flask at a rate of 100 ml per minute for 15 minutes. Connect an absorption tube containing 10 ml of *hydrogen peroxide solution (10 vol)* previously neutralised to a 0.1 per cent w/v solution of *bromophenol blue* in *ethanol (20 per cent)* and without interrupting the flow of carbon dioxide, introduce through the funnel 25 g of the substance under examination and 80 ml of *2 M hydrochloric acid*. Boil for 1 hour, disconnect the absorption tube and stop the flow of carbon dioxide. Wash the contents of the absorption tube into a 250-ml conical flask, heat on a water-bath for 15 minutes and allow to cool. Titrate with *0.01 M sodium hydroxide* using a 0.1 per cent w/v solution of *bromophenol blue* in *ethanol (20 per cent)* as indicator, until the colour changes from yellow to violet-blue.

1 ml of *0.01 M sodium hydroxide* is equivalent to 0.0003203 g of sulphur dioxide.

Microbial contamination (2.2.9). Total microbial count is not more than 10^3 CFU per g. 1 g is free from *Escherichia coli* and 10 g is free from *Salmonella* and *Shigella*.

Loss on drying (2.4.19). Not more than 15.0 per cent, determined by the following method.

Weigh about 1.0 g in a stainless steel dish weighing about 25 g and with a diameter of 70 mm and a height of 15 mm, fitted with a cover. Add 10 ml of *water* and allow to soak. Heat on a water-bath to form a homogeneous solution and continue heating until most of the water has evaporated. Dry for 2 hours at 105° and for further periods of 30 minutes until two successive weighings do not differ by more than 1 mg (Do not powder sheet gelatin while preparing for this test).

Gelatin intended for use in the preparation of pessaries and suppositories complies with the following additional requirements.

Peroxides. Not more than 10 ppm, determined by using *peroxide test strips*.

Dip a test strip for 1 second into *hydrogen peroxide standard solution (10 ppm H_2O_2)*, such that the reaction zone is properly wetted. Remove the test strip, shake off excess liquid and compare the reaction zone after 15 seconds with the colour scale provided with the test strips used. The colour must match that of the 10 ppm concentration, otherwise the test is invalid.

Weigh 19.9 to 20.1 g of the substance under examination in a beaker and add 79.8 to 80.2 ml of *water*. Stir to moisten all gelatin and allow the sample to stand at room temperature for 1 to 3 hours. Cover the beaker with a watch-glass. Place the beaker for 15 to 25 minutes in a water bath at 63° to 67° to dissolve the sample. Stir the contents of the beaker with a glass rod to achieve a homogeneous solution. Dip a test strip for 1 second into the test solution, such that the reaction zone is properly wetted. Remove the test strip, shake off excess liquid and compare the reaction zone after 15 seconds with the colour scale provided with the test strips used. Multiply the concentration read from the colour scale by a factor of 5 to calculate the concentration in parts per million of peroxide in the test substance.

Jelly strength (2.4.18). 80.0 per cent to 120.0 per cent of the labeled nominal value.

Storage. Store protected from moisture.

Labelling. The label states the jelly strength.

Hard Gelatin Capsule Shells

Hard Gelatin Capsule Shells are soluble containers for incorporation of drugs, usually in the form of powders, pellets or granules, and are commonly intended for oral

administration. The shells are acted upon by digestive fluids and the filled contents are released. They are composed of gelatin, water and additives such as plasticizers, humectants, surfactants, dispersing agents, flavouring agents, antimicrobial agents, sweetening agents, opacifying agents and one or more colouring agents permitted under the Drugs and Cosmetics Rules, 1945. Ingredients other than colouring agents and opacifying agents comply with the standards of this Pharmacopoeia.

Category. Pharmaceutical aid.

Description. Hard Gelatin Capsule Shells (shells or cases) consist of two cylindrical, telescoping pieces (cap and body), one end of which is rounded and closed and the other, open. Shapes other than cylindrical can also be formed as per requirements. The two pieces are uncoloured or coloured; if coloured, of identical or different colours; transparent or opaque, partially or completely and printed or unprinted or bear other surface markings. The cap overlaps the body and maintains a tight friction closure. The closure may be strengthened by suitable means.

The shells are of various sizes, usually designated by different numbers, 5 being the smallest and 000 the biggest. Shells of sizes 0 to 4 are commonly used. Shells of special shapes, sizes, lengths and designations are also available. The shells are smooth and uniform in size, shape and colour. Guidelines on dimensions with respect to different sizes of commonly used capsules are given in chapter 5.8.

Identification

Boil one capsule shell with 20 ml of *water*, allow to cool and centrifuge. To 5 ml of the supernatant liquid add 1 ml of *picric acid solution* and to another 5 ml add 1 ml of *tannic acid solution*; a precipitate is produced in each case.

Tests

Odour. Keep 100 capsule shells in a well-closed bottle for 24 hours at a temperature between 30° and 40°; the shells do not develop any foreign odour.

NOTE — In order to ensure that the quality of the shells is not affected by temperature and humidity, the capsule shells should be conditioned at a temperature of 25° ± 2° and a relative humidity of 50 ± 5 per cent for not less than 12 hours before conducting the test for Average weight.

Average weight. Weigh 100 capsule shells and determine the average weight of a capsule. The average weight is within ±10 per cent of the target weight shown in Table 1. (As sizes 0 to 4 are commonly used, detailed requirements are included for these sizes only. Requirements for other sizes may be decided upon mutually between the manufacturer of the Hard Gelatin Capsule Shells and the user).

Table 1 - Target weight of capsules

Size	Target weight (mg)
0	96
1	76
2	63
3	50
4	40

Disintegration (2.5.1). 15 minutes, using discs (*NOTE — This test is not applicable to the capsules intended to use for inhalation preparations)*.

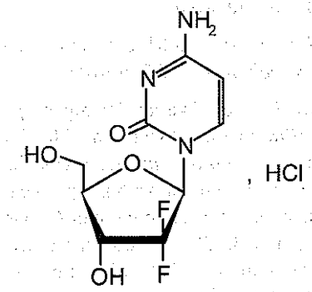
Microbial contamination (2.2.9). Total microbial count is not more than 10^3 CFU per g. 1 g is free from *Escherichia coli* and 10 g is free from *Salmonella* and *Shigella*.

Loss on drying (2.4.19). 12.5 to 16.0 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours or to constant weight.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Labelling. The label states (1) the size of the capsule shells; (2) that only permitted colours, if any, have been used; (3) the storage conditions.

Gemcitabine Hydrochloride



$C_9H_{11}F_2N_3O_4,HCl$ Mol Wt. 299.7

Gemcitabine Hydrochloride is Gemcitabine Hydrochloride is 2'-deoxy-2',2'-difluorocytidine hydrochloride.

Gemcitabine Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_9H_{11}F_2N_3O_4,HCl$, calculated on as is basis.

CAUTION — Gemcitabine Hydrochloride is cytotoxic; Extra care required to prevent inhaling and exposing the skin to it.

Category. Anticancer.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *gemcitabine hydrochloride IPRS* or with the reference spectrum of gemcitabine hydrochloride.

B. It gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 1.0 per cent w/v solution (Solution A) is clear (2.4.1) and not more intensely colored than reference solution BYS7 (2.4.1).

pH (2.4.24). 2.0 to 3.0, determined in solution A.

Specific optical rotation (2.4.22). +43.0° to +50.0°, determined in solution A.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution (a). Dissolve 50 mg of the substance under examination in *water* and dilute to 25.0 ml with *water.*

Test solution (b). Dilute 1.0 ml of test solution (a) to 20.0 ml with *water.*

Reference solution (a). A solution containing 0.02 per cent w/v, each of, *gemcitabine hydrochloride IPRS* and *gemcitabine impurity A IPRS* in *water.* Dilute 1.0 ml of the solution to 100.0 ml with *water.*

Reference solution (b). A 0.01 per cent w/v solution of *gemcitabine hydrochloride IPRS* in *water.*

Reference solution (c). Weigh 10 mg of *gemcitabine hydrochloride IPRS* in a small vial. Add 4.0 ml of a 16.8 per cent w/v solution of *potassium hydroxide* in *methanol*, sonicate for 5 minutes then seal with a cap. The mixture may be cloudy. Heat at 55 ° for a minimum of 6 hour to produce gemcitabine impurity B. Allow to cool, then transfer the entire contents of the vial to a 100-ml volumetric flask by successively washing with a 1.0 per cent v/v solution of *orthophosphoric acid.* Dilute to 100.0 ml with a 1.0 per cent v/v solution of *orthophosphoric acid* and mix.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: A. a buffer solution prepared by dissolving 13.8 g of *sodium dihydrogen phosphate monohydrate* in 900 ml of *water*, adjusted to pH 2.5 with *orthophosphoric acid* and dilute to 1000 ml with *water*,

B. *methanol*,

- a gradient programme using the conditions given below,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 275 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobil phase B (per cent v/v)
0	97	3
8	97	3
13	50	50
20	50	50
25	97	3

Name	Relative retention time
Gemcitabine impurity A[1]	0.4
Gemcitabine impurity B[2]	0.7
Gemcitabine (Retention time: about 8 minutes)	1.0

[1]cytosine,

[2]gemcitabine α-anomer.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to gemcitabine impurity B and gemcitabine is not less than 8.0.

Inject reference solution (a) and test solution (a). In the chromatogram obtained with test solution (a), the area of any secondary peak is not more than the area of the peak due to gemcitabine in the chromatogram obtained with reference solution (a) (0.1 per cent). The sum of areas of all the secondary peaks is not more than twice the area of the peak due to gemcitabine in the chromatogram obtained with reference solution (a) (0.2 per cent). Ignore any peak with an area less than 0.5 times the area of the peak due to gemcitabine in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). Dissolve 2.0 g in 20.0 ml of *water.* 12 ml of the solution complies with the limit test for heavy metals, Method D (10 ppm), using 10.0 ml of *lead standard solution (1 ppm).*

Sulphated ash (2.3.18). Not more than 0.1 per cent, determined on 1.0 g in a platinum crucible.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances with the following modifications.

- mobile phase: a buffer solution prepared by dissolving 13.8 g of *sodium dihydrogen phosphate monohydrate* in 900 ml of *water*, adjusted to pH 2.5 with *orthophosphoric acid* and dilute to 1000 ml with *water*,

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to gemcitabine impurity B and gemcitabine is not less than 8.0.

Inject reference solution (b) and test solution (b).

Calculate the content of $C_9H_{12}ClF_2N_3O_4$.

Gemcitabine Hydrochloride intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.05 Endotoxin Unit per mg of gemcitabine.

Storage. Store protected from moisture.

Gemcitabine Injection

Gemcitabine Injection is sterile material consisting of Gemcitabine Hydrochloride with or without auxiliary substances. It is filled in sealed container.

Gemcitabine Hydrochloride Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of gemcitabine, $C_9H_{11}F_2N_3O_4$.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

CAUTION: Gemcitabine Hydrochloride is cytotoxic; Extra care required to prevent inhaling and exposing the skin to it.

Usual strengths. 40 mg per ml.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powder for Injections) and with the following requirements.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution (b) corresponds to the peak in the chromatogram obtained with the reference solution (b).

Tests

pH (2.4.24). 2.7 to 3.3, determined in a 4.0 per cent w/v solution in 0.9 per cent w/v solution of *sodium chloride.*

Related substances. Determine by liquid chromatography (2.4.14).

Test solution (a). Dissolve a quantity of powder to obtain a solution containing 0.2 per cent w/v of gemcitabine in *water.*

Test solution (b). Dilute 1.0 ml of test solution (a) to 20.0 ml with *water.*

Reference solution (a). A solution containing 0.02 per cent w/v, each of, *gemcitabine hydrochloride IPRS* and *gemcitabine impurity A IPRS* in *water.* Dilute 1.0 ml of the solution to 100.0 ml with *water.*

Reference solution (b). A 0.01 per cent w/v solution of *gemcitabine hydrochloride IPRS* in *water.*

Reference solution (c). Weigh 10 mg of the *gemcitabine hydrochloride IPRS* in a small vial. Add 4.0 ml of a 16.8 per cent w/v solution of *potassium hydroxide* in *methanol*, sonicate for 5 minutes then seal with a cap. The mixture may be cloudy. Heat at 55° for a minimum of 6 hour to produce gemcitabine impurity B. Allow to cool, then transfer the entire contents of the vial to a 100.0 ml volumetric flask by successively washing with 1.0 per cent v/v solution of *orthophosphoric acid* and dilute to 100.0 ml with a 1.0 per cent *v/v* solution of *orthophosphoric acid.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: A. a buffer solution prepared by dissolving 13.8 g of *sodium dihydrogen phosphate monohydrate* in 900 ml of *water*, adjusted to pH 2.5 with *orthophosphoric acid* and dilute to 1000 ml with *water*,

B. *methanol*,

- a gradient programme using the conditions given below,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 275 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobil phase B (per cent v/v)
0	97	3
8	97	3
13	50	50
20	50	50
25	97	3

Name	Relative retention time
Gemcitabine impurity A[1]	0.4
Gemcitabine impurity B[2]	0.7
Gemcitabine (retention time: about 8 minutes)	1.0

[1]cytosine,

[2]gemcitabine α-anomer.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to gemcitabine impurity B and gemcitabine is not less than 8.0.

Inject reference solution (a) and test solution (a). In the chromatogram obtained with test solution (a), the area of any peak corresponding to gemcitabine impurities A and B is not more than the area of the peak due to gemcitabine in the

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Mix the contents of 20 capsules. Disperse a quantity of powder containing 0.15 g of Gemfibrozil with 50 ml of *methanol*, shake on a mechanical shaker for 10 minutes, add 20 ml of *water*, 1 ml of *glacial acetic acid* and dilute to 100.0 ml with *methanol*, filter. Dilute 1.0 ml of the filtrate to 5.0 ml with the mobile phase.

Reference solution (a). Dissolve 30 mg of *gemfibrozil IPRS* in 80 ml of *methanol*, add 1 ml of *glacial acetic acid* and dilute to 100.0 ml with *water*.

Referenc solution (b). A 0.01 per cent w/v solution of *gemfibrozil methyl ester IPRS* in a solution prepared by diluting 1 volume of the test solution to 3 volumes with the mobile phase.

Chromatographic system

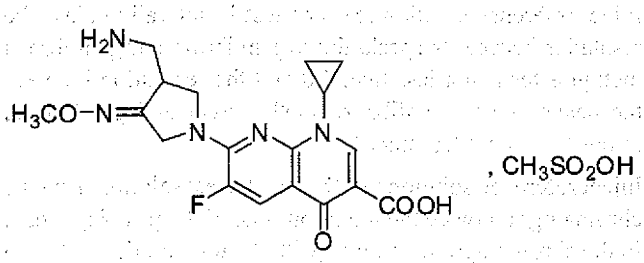
- a stainless steel column 10 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (3 µm),
- mobile phase: a mixture of 1 volume of *glacial acetic acid*, 19 volumes of *water* and 80 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 276 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to gemfibrozil and gemfibrozil methyl ester is not less than 4.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{15}H_{22}O_3$ in the capsules.

Gemifloxacin Mesylate



$C_{19}H_{24}FN_5SO_7$ Mol. Wt. 485.5

Gemifloxacin Mesylate is 7-[3-(aminomethyl)-4-(methoxyimino)-1-pyrrolidinyl]-1-cyclopropyl-6-fluoro-1,4-dihydro-4-oxo-1,8-naphthyridine-3-carboxylic acid methanesulphonate.

Gemifloxacin Mesylate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{19}H_{24}FN_5SO_7$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. An off white to light brown coloured powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *gemifloxacin mesylate IPRS* or with the reference spectrum of gemifloxacin mesylate.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of *water* and 20 volumes of *acetonitrile*.

Test solution. Dissolve 50 mg of the substance under examination in 100.0 ml of solvent mixture.

Reference solution. Dilute 5.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 25.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Cosmosil C18),
- column temperature: 45°,
- mobile phase: A. a solution containing 2.0 g of *ammonium acetate* and 3.5 g of *sodium perchlorate* in 650 ml of *water*, adjusted to pH 2.2 with *ortho-phosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	81	19
25	81	19
35	47	53
40	47	53
45	81	19
50	81	19

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution

(1.0 per cent) and the sum of areas of all the secondary peaks is not more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). 4.0 per cent to 7.0 per cent, determined on 0.4 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of *water* and 20 volumes of *acetonitrile.*

Test solution (a). Dissolve 50 mg of the substance under examination in 100.0 ml of the solvent mixture.

Test solution (b). Dilute 5.0 ml of test solution (a) to 100.0 ml with the solvent mixture.

Reference solution (a). A 0.05 per cent w/v solution of *gemifloxacin mesylate IPRS* in the solvent mixture.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Cosmosil C18),
- column temperature: 45°,
- mobile phase: a mixture of 70 volumes of buffer solution prepared by dissolving 2.0 g of *ammonium acetate* and 3.5 g of *sodium perchlorate* in 650 ml *water*, adjusted to pH 2.2 with *orthophosphoric acid*, and 30 volumes of *acetonitrile*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the theoretical plates is not less than 2000, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (b) and test solution (b).

Calculate the content of $C_{19}H_{24}FN_5SO_7$.

Storage. Store protected from light and moisture.

Gemifloxacin Tablets

Gemifloxacin Mesylate Tablets

Gemifloxacin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of gemifloxacin, $C_{18}H_{20}FN_5O_4$.

Usual strength. 320 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.01 M hydrochloric acid,*
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with *water.*

Reference solution. A 0.047 per cent w/v solution of *gemifloxacin mesylate IPRS* in the dissolution medium. Dilute 5 ml of the solution to 50 ml with *water.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 mm) (Such as Hypersil BDS C18),
- column temperature: 45°,
- mobile phase: a mixture of 75 volumes of a buffer solution prepared by dissolving 6.0 g of *ammonium acetate* and 10.5 g of *sodium perchlorate monohydrate* in 1950 ml of *water*, adjusted to pH 2.2 with *orthophosphoric acid* and 25 volumes of *acetonitrile,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 272 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the theoretical plates is not less than 2000, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injection is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{20}FN_5O_4$ in the tablet.

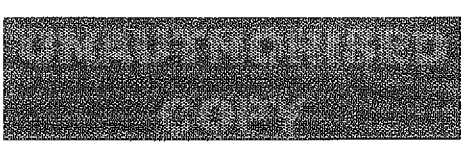
Q. Not less than 70 per cent of the stated amount of $C_{18}H_{20}FN_5O_4$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of *water* and 20 volumes of *acetonitrile.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 20 mg of the gemifloxacin with 100.0 ml of the solvent mixture, filter.

Reference solution (a). A 0.025 per cent w/v solution of *gemifloxacin mesylate IPRS* in the solvent mixture.



Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 mm) (Such as phenomenex Luna C18),
- mobile phase: A. buffer solution prepared by dissolving 6.0 g of *ammonium acetate* and 10.5 g of *sodium perchlorate monohydrate* in 1950 ml of *water*, adjusted to pH to 2.2 with *orthophosphoric acid*,

  B. *acetonitrile*,

  C. *tetrahydrofuran*,
- a gradient programme using the conditions given below,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 272 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)	Mobile phase C (per cent v/v)
0	92	5	3
30	42	55	3
32	92	5	3
40	92	5	3

Inject reference solution (b). The test is not valid unless the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent) and the sum of areas of all the secondary peaks is not more than three times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing about 100 mg of gemifloxacin, in *water* and dilute to 100.0 ml with *water* and filter. Dilute 10.0 ml of the filtrate to 100.0 ml with *water*.

Reference solution. A 0.01 per cent w/v solution of *gemifloxacin mesylate IPRS* in *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 mm) (Such as Hypersil BDS C18),
- column temperature: 45°,
- mobile phase: a mixture of 75 volumes of a buffer solution prepared by dissolving 6.0 g of *ammonium acetate* and 10.5 g of *sodium perchlorate monohydrate* in 1950 ml of *water*, adjusted to pH 2.2 with *orthophosphoric acid* and 25 volumes of *acetonitrile*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 272 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the theoretical plates is not less than 2000, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

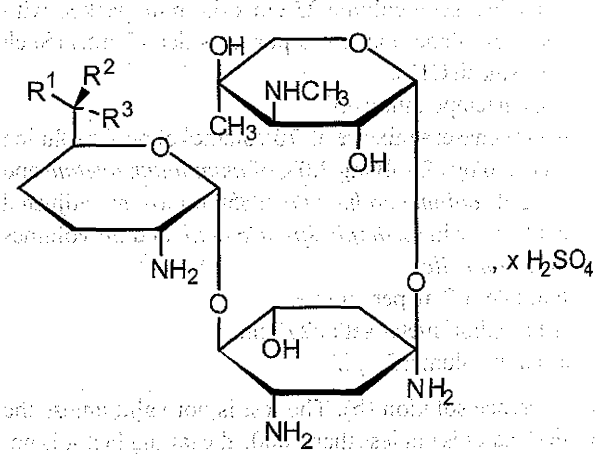
Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{20}FN_5O_4$ in the tablets.

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of the equivalent amount of Gemifloxacin.

Gentamicin Sulphate



Gentamycin	R^1	R^2	R^3
C_1	CH_3	$NHCH_3$	H
C_2	CH_3	NH_2	H
C_{1a}	H	NH_2	H
C_{2a}	H	NH_2	CH_3

Gentamicin Sulphate is a mixture of the sulphates of antimicrobial substances produced by *Micromonospora purpurea*.

Gentamicin Sulphate has a potency of not less than 590 µg of gentamicin per mg, calculated on the dried basis.

Category. Antibacterial.

Description. A white or almost white powder; hygroscopic.

Identification

Tests A and B may be omitted if tests C and D are carried out. Test C may be omitted if tests A, B and D are carried out.

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. The lower layer obtained by shaking together equal volumes of *strong ammonia solution*, *chloroform* and *methanol* and allowing to separate.

Test solution. Dissolve 0.5 g of the substance under examination in 100 ml of *water*.

Reference solution. A 0.5 per cent w/v solution of *gentamicin sulphate IPRS* in *water*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air, spray with *ethanolic ninhydrin solution* and heat at 110° for 5 minutes. The three principal spots in the chromatogram obtained with the test solution correspond to those in the chromatogram obtained with the reference solution.

B. Dissolve 10 mg in 1 ml of *water* and add 5 ml of a 40 per cent w/v solution of *sulphuric acid*. Heat on a water-bath for 10 minutes, cool and dilute to 25 ml with *water*. When examined in the range 240 nm to 330 nm (2.4.7), the resulting solution shows no absorption maximum.

C. In the test for Composition of gentamicin sulphate, the four principal peaks in the chromatogram obtained with the test solution correspond to the four peaks in the chromatogram obtained with the reference solution.

D. Gives reaction (A) of sulphates (2.3.1).

Tests

Appearance of solution. A 4.0 per cent w/v solution in *carbon dioxide-free water* (solution A) is clear (2.4.1), and not more intensely coloured than degree 6 of the appropriate range of reference solutions (2.4.1).

pH (2.4.24). 3.5 to 5.5, determined in solution A.

Specific optical rotation (2.4.22). +107° to +121°, determined in a 10.0 per cent w/v solution.

Composition of gentamicin sulphate. Determine by liquid chromatography (2.4.14).

Test solution. Add 5 ml of *methanol* and 4 ml of *phthalaldehyde reagent* to 10 ml of a 0.1 per cent w/v solution of the substance under examination in *water*, mix, add sufficient *methanol* to produce 25 ml, heat on a water-bath at 60° for 15 minutes and cool. If the solution is not used immediately, cool to 0° and use within 4 hours.

Reference solution. Prepare in the same manner as the test solution but using 10 ml of a 0.1 per cent w/v solution of *gentamicin sulphate IPRS* in place of the solution of the substance under examination.

Chromatographic system

- a stainless steel column 10 to 12.5 cm x 4.6 to 5 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a solution containing 0.55 per cent w/v of *sodium heptanesulphonate monohydrate* in a mixture of 70 volumes of *methanol*, 25 volumes of *water* and 5 volumes of *glacial acetic acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 330 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between any two peaks is not less than 1.25, the capacity factor determined from the gentamicin C_1 peak is between 2 and 7, the column efficiency determined from the gentamicin C_2 peak is not less than 1200 theoretical plates.

Inject the reference solution and the test solution. The elution order is gentamicin C_1, gentamicin C_{1a}, gentamicin C_{2a}, and gentamicin C_2. Calculate the content of gentamicin C_1, gentamicin C_{1a}, gentamicin C_{2a}, and gentamicin C_2 in the portion of gentamicin sulphate taken by the formula:

$$\frac{100 \times r_f}{r_s}$$

in which r_f is the peak area response corresponding to the particular gentamicin; and r_s is the sum of the area responses of all four peaks: the content of gentamicin C_1 is between 25 per cent and 50 per cent, the content of gentamicin C_{1a} is between 10 per cent and 35 per cent, and the sum of the contents of gentamicin C_{2a} and gentamicin C_2 is between 25 per cent and 55 per cent.

Sulphate. 32.0 to 35.0 per cent of SO_4, calculated on the dried basis, determined by the following method. Dissolve 0.25 g in 100 ml of *distilled water*, adjusted to pH 11 with *strong ammonia solution* and add 10 ml of *0.1 M barium chloride*. Titrate with *0.1 M disodium edetate* using 0.5 mg of *metalphthalein* as indicator; when the colour of the solution begins to change add 50 ml of *ethanol (95 per cent)* and continue the titration until the violet-blue colour disappears. Perform a blank determination and make any necessary correction.

1 ml of *0.1 M barium chloride* is equivalent to 0.009606 g of sulphate, SO_4.

Methanol. Not more than 1.0 per cent w/w. Determine by gas chromatography (2.4.13).

Test solution (a). A 25 per cent w/v solution of the substance under examination.

Test solution (b). A solution containing 25 per cent w/v of the substance under examination and 0.25 per cent v/v of *1-propanol* (internal standard).

Reference solution. A solution containing 0.25 per cent v/v of *methanol* and 0.25 per cent v/v of the internal standard.

Chromatographic system

- a column 1.5 m x 4 mm, packed with porous polymer beads (80 to 100 mesh)(Such as Porapak Q),
- temperature:
  column. constant at a point between 120° and 140°,
  inlet port and detector. 50° higher than column temperature,
- flow rate: constant at 30 to 40 ml per minute of the carrier gas.

Calculate the percentage w/w of methanol taking 0.792 g as its weight per ml (2.4.29) at 20°.

Sulphated ash (2.3.18). Not more than 1.0 per cent, determined on 0.5 g.

Loss on drying. Not more than 18.0 per cent, determined on 1.0 g by drying in an oven at 110°, at a pressure not exceeding 0.7 kPa for 3 hours.

Assay. Determine by the microbiological assay of antibiotics (2.2.10), and express the result in µg of gentamicin per mg.

Gentamicin Sulphate intented for use in the manufacture of parenteral preparations without a further appropriate procedure for removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 1.67 Endotoxin Units per mg of gentamicin.

Sterility. Complies with the test for sterility (2.2.11).

Storage. Store protected from moisture. If it is intended for use in the manufacture of parenteral or ophthalmic preparations, the container should be sterile and sealed so as to exclude micro-organisms.

Labelling. The label states (1) the potency in terms of µg of gentamicin per mg; (2) whether or not the contents are intended for use in the manufacture of parenteral or ophthalmic preparations.

Gentamicin Cream

Gentamicin Sulphate Cream

Gentamicin Cream is a viscous oil-in-water emulsion containing Gentamicin Sulphate dissolved in the aqueous phase.

Gentamicin Cream contains not less than 90.0 per cent and not more than120.0 per cent of the stated amount of gentamicin.

Usual strengths. 0.1 per cent w/w and 0.3 per cent w/w.

Identification

A. Determine by thin-layer chromatography (2.4.6), coating the plate with *silica gel G*.

Mobile phase. The lower layer obtained by shaking equal volumes of *strong ammonia solution*, *chloroform* and *methanol* and allowing to separate.

Test Solution. Disperse a quantity of the cream containing 7.5 mg of Gentamicin with 20 ml of *chloroform*, extract with 10 ml of *water* and use the aqueous layer.

Reference Solution. A 0.075 per cent w/v solution of *gentamicin sulphate IPRS* in *water*.

Apply to the plate 20 µl of each solution. After development, dry the plate in air, spray with *ethanolic ninhydin solution* and heat at 105° for 2 minutes. The three principal spots in the chromatogram obtained with the test solution correspond to those in the chromatogram obtained with the reference solution.

B. In the test for Composition of gentamicin sulphate, the four principal peaks in the chromatogram obtained with the test solution correspond to the four peaks in the chromatogram obtained with the reference solution.

Tests

Composition of Gentamicin Sulphate. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the cream containing 15 mg of Gentamicin in 10 ml of *chloroform*, add 10 ml of a 0.25 per cent w/v solution of *sodium tetraborate*, shake vigorously, centrifuge and separate the aqueous layer. Repeat the extraction with two quantities, each of 5 ml of *sodium tetraborate solution*, combined the aqueous extract and dilute to 25.0 ml with the same solution and filter. To 10 ml of the resulting solution add 5 ml of *methanol*, swirl and add 4 ml of *phthaladehyde reagent*, mix, add sufficient *methanol* to produce 25.0 ml, heat on a water-bath at 60° for 15 minutes and cool.

Reference solution. Prepare in the same manner as the test solution but using 10 ml of a 0.065 per cent w/v solution of *gentamicin sulphate IPRS* in place of the solution of the preparation under examination. To 10 ml of the resulting solution add 5 ml of *methanol* swirl and add 4 ml of *phthaladehyde reagent*, mix, add sufficient *methanol* to produce 25.0 ml, heat on a water-bath at 60° for 15 minutes and cool.

NOTE — If the solution is not used immediately, cool to 0° and use within 4 hours.

Chromatographic system
- a stainless steel column 10 to 12.5 cm x 4.6 to 5 mm, packed with octadecylsilane bonded to porous silica (5µm),
- mobile phase: *0.025 M sodium heptanesulphonate monohydrate* in a mixture of 70 volumes of *methanol*, 25 volumes of *water* and 5 volumes of *glacial acetic acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 330 nm,
- injection volume: 20 µl.

If necessary, adjust the *methanol* content of the mobile phase, so that in the chromatogram obtained with the reference solution, the retention time of the component C_2 is 10 to 20 minutes and the peaks are well separated with relative retention times of about 0.13 (reagent), 0.27 (component C_1), 0.65 (component C_{1a}), 0.85 (component C_{2a}) and 1.00 (component C_2).

Adjust the sensitivity and the volume of reference solution injected so that the height of the peak due to component C_1 is about 75 per cent of the full-scale deflection on the recorder. Plot a horizontal baseline on the chromatogram from the level portion of the curve immediately prior to the reagent peak. Measure the peak height above this baseline for each component. Repeat the procedure with the test solution. The test is not valid unless the resolution between the peaks due to C_{2a} and C_2 is not less than 1.3.

From the peak areas in the chromatogram obtained with the reference solution and the proportions of the components declared for *gentamicin sulphate IPRS*, calculate the response factors for components C_1, C_{1a}, C_{2a} and C_2. From these response factors and peak areas in the chromatogram obtained with the test solution, calculate the proportions of components C_1, C_{1a}, C_{2a} and C_2 in the cream. The proportion are with in the following limits C_1, 25.0 to 50.0 per cent; C_{1a}, 10.0 to 35.0 per cent; C_2+ C_{2a} 25.0 to 55.0 per cent.

Other tests. Complies with the tests stated under Cream.

Assay. Weigh a quantity of the cream containing 3 mg of Gentamicin, dissolve in 20 ml of *chloroform*, shake vigorously with 75 ml of *phosphate buffer pH 8.0* and allow to separate. Dilute 10 ml of the aqueous layer to 50 ml with *phosphate buffer pH 8.0*.

Carry out the microbiological assay of antibiotics (2.2.10).

Calculate the content of gentamicin in the cream, taking each 1000 Units found to be equivalent to 1 mg of gentamicin.

Labelling. The label states the quantity of active ingredient in terms of the equivalent amount of gentamicin.

Gentamicin Eye Drops

Gentamicin Sulphate Eye Drops

Gentamicin Eye Drops are a sterile solution of Gentamicin Sulphate in Purified Water.

Gentamicin Eye Drops contain not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of gentamicin.

Usual strength. 0.3 per cent w/v of gentamicin.

Identification

A. Determine by thin-layer chromatography (2.4.6), coating the plate with *silica gel G*.

Mobile phase. The lower layer obtained by shaking together equal volumes of *strong ammonia solution*, *chloroform* and *methanol* and allowing to separate.

Test solution. A volume of the eye drops containing 60 µg of gentamicin.

Reference solution. Dissolve 0.1 mg of *gentamicin sulphate IPRS* in a volume of *water* equivalent to the volume of the eye drops used.

Apply to the plate the specified volumes of each solution. After development, dry the plate in air, spray with *ethanolic ninhydrin solution* and heat at 110° for 5 minutes. The three principal spots in the chromatogram obtained with the test solution correspond to those in the chromatogram obtained with the reference solution.

B. In the test for Composition of gentamicin sulphate, the four principal peaks in the chromatogram obtained with the test solution correspond to the four peaks in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 6.5 to 7.5.

Composition of gentamicin sulphate. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a suitable volume of the eye drops with *water* to contain 0.045 per cent w/v of gentamicin. To 10 ml of the resulting solution add 5 ml of *methanol*, swirl and add 4 ml of *phthalaldehyde reagent*, mix, add sufficient *methanol* to produce 25 ml, heat on a water-bath at 60° for 15 minutes and cool.

Reference solution. Prepare in the same manner as the test solution but using 10 ml of a 0.065 per cent w/v solution of *gentamicin sulphate IPRS* in place of the solution of the preparation under examination.

Chromatographic system
- a stainless steel column 10 to 12.5 cm x 4.6 to 5 mm, packed with octadecylsilane bonded to porous silica (5 µm),

- mobile phase: *0.025 M sodium heptanesulphonate monohydrate* in a mixture of 70 volumes of *methanol*, 25 volumes of *water* and 5 volumes of *glacial acetic acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 330 nm,
- injection volume: 5 µl.

If necessary, adjust the methanol content of the mobile phase so that in the chromatogram obtained with the reference solution the retention time of component C_2 is 10 to 20 minutes and the peaks are well separated with relative retention times of about 0.13 (reagent), 0.27 (component C_1), 0.65 (component C_{1a}), 0.85 (component C_{2a}) and 1.00 (component C_2).

Adjust the sensitivity and the volume of reference solution injected so that the height of the peak due to component C_1 is about 75 per cent of the full-scale deflection on the recorder. Plot a horizontal baseline on the chromatogram from the level portion of the curve immediately prior to the reagent peak. Measure the peak height above this baseline for each component. Repeat the procedure with the test solution. The test is not valid unless the resolution between the peaks due to components C_{2a} and C_2 is not less than 1.3.

From the peak areas in the chromatogram obtained with the reference solution and the proportions of the components declared for *gentamicin sulphate IPRS*, calculate the response factors for components C_1, C_{1a}, C_{2a} and C_2. From these response factors and peak areas in the chromatogram obtained with the test solution, calculate the proportions of components C_1, C_{1a}, C_{2a} and C_2 in the eye drops. The proportion are within the following limits. C_1, 25.0 to 50.0 per cent; C_{1a}, 10.0 to 35.0 per cent; $C_2 + C_{2a}$, 25.0 to 55.0 per cent.

Other tests. Comply with the tests stated under Eye Drops.

Assay. Determine by the microbiological assay of antibiotics (2.2.10) on a solution prepared in the following manner.

Dilute a volume of the eye drops containing about 15 mg of gentamicin to 50.0 ml with sterile *phosphate buffer pH 8.0* and dilute 10.0 ml of the resulting solution to 50.0 ml with the same solvent.

Calculate the content of gentamicin in the eye drops, taking each 1000 Units found to be equivalent to 1 mg of gentamicin.

Labelling. The label states the quantity of active ingredient in terms of the equivalent amount of gentamicin.

Gentamicin Injection

Gentamicin Sulphate Injection

Gentamicin Injection is a sterile solution of Gentamicin Sulphate in Water for Injection.

Gentamicin Injection contains not less than 95.0 per cent and not more than 110.0 per cent of the stated amount of gentamicin.

Usual strengths. The equivalent of 10 mg per ml and 40 mg per ml of gentamicin.

Description. A clear, colourless to pale-yellow solution.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. The lower layer obtained by shaking together equal volumes of *13.5 M ammonia*, *chloroform* and *methanol* and allowing to separate.

Test solution. Dilute a volume of the injection with sufficient *water* to produce a solution containing 0.5 per cent w/v of gentamicin.

Reference solution. A 0.8 per cent w/v solution of *gentamicin sulphate IPRS* in *water*.

Apply to the plate 6 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air, spray with *ethanolic ninhydrin solution* and heat at 105° for 2 minutes. The three principal spots in the chromatogram obtained with the test solution correspond to those in the chromatogram obtained with the reference solution.

B. In the test for Composition of gentamicin sulphate, the four principal peaks in the chromatogram obtained with the test solution correspond to the four peaks in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 3.0 to 5.0.

Composition of gentamicin sulphate. Determine by liquid chromatography (2.4.14).

Test solution. Add 5 ml of *methanol* to 10 ml of a solution prepared by diluting a suitable volume of the injection with *water* to contain the equivalent of 0.045 per cent w/v of gentamicin, swirl and add 4 ml of *phthalaldehyde reagent*, mix, add sufficient *methanol* to produce 25 ml, heat on a water-bath at 60° and cool. If the solution is not used immediately, cool at 0° and use within 4 hours.

Reference solution. Prepare in the same manner as the test solution but using 10 ml of a 0.065 per cent w/v solution of *gentamicin sulphate IPRS* in place of the solution of the injection under examination.

Chromatographic system

- a stainless steel column 10 to 12.5 cm x 4.6 to 5 mm, packed with octadecylsilane bonded to porous silica (5 µm),

- mobile phase: *0.025 M sodium heptanesulphonate monohydrate* in a mixture of 70 volumes of *methanol*, 25 volumes of *water* and 5 volumes of *glacial acetic acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 330 nm,
- injection volume: 5 µl.

If necessary, adjust the methanol content of the mobile phase so that in the chromatogram obtained with the reference solution the retention time of component C_2 is 10 to 20 minutes and the peaks are well separated with relative retention times of about 0.13 (reagent), 0.27 (component C_1), 0.65 (component C_{1a}), 0.85 (component C_{2a}) and 1.00 (component C_2).

Adjust the sensitivity and the volume of reference solution injected so that the height of the peak due to component C_1 is about 75 per cent of full-scale deflection on the recorder. Plot a horizontal baseline on the chromatogram from the level portion of the curve immediately prior to the reagent peak. Measure the peak height above this baseline for each component. Repeat the procedure with the test solution. The test is not valid unless the resolution factor between the peaks due to components C_{2a} and C_2 is not less than 1.3.

From the peak areas in the chromatogram obtained with the reference solution and the proportions of the components declared for gentamicin sulphate RS, calculate the response factors for components C_1, C_{1a}, C_{2a} and C_2. From these response factors and peak areas in the chromatogram obtained with the test solution, calculate the proportions of components C_1, C_{1a}, C_{2a} and C_2 in the injection. The proportions are within the following limits. C_1, 25.0 to 50.0 per cent; C_{1a}, 10.0 to 35.0 per cent; $C_2 + C_{2a}$, 25.0 to 55.0 per cent.

Bacterial endotoxins (2.2.3). Not more than 1.67 Endotoxin Units per mg of gentamicin.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by the microbiological assay of antibiotics (2.2.10), and express the result in mg of gentamicin per ml.

Calculate the content of gentamicin in the injection, taking each 1000 Units found to be equivalent to 1 mg of gentamicin.

Labelling. The label states the strength in terms of the equivalent amount of gentamicin in a suitable dose-volume.

Gentamicin Ointment

Gentamicin Sulphate Ointment

Gentamicin Ointment is a dispersion of Gentamicin Sulphate in microfine powder in white soft paraffin or other suitable anhydrous greasy basis.

Gentamicin Ointment contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of gentamicin.

Usual strengths. 0.1 per cent w/w and 0.3 per cent w/w.

Identification

A. Determine by thin-layer chromatography (2.4.6), coating the plate with *silica gel G*.

Mobile phase. The lower layer obtained by shaking equal volumes of *strong ammonia solution*, *chloroform* and *methanol* and allowing to separate.

Test solution. Mix a quantity of the ointment containing 7.5 mg of Gentamicin with 20 ml of *chloroform*, extract with 10 ml of *water* and use the aqueous layer.

Reference solution. A 0.075 per cent w/v solution of *gentamicin sulphate IPRS* in *water*.

Apply to the plate 20 µl of each solution. After development, dry the plate in air, spray with *ethanolic ninhydin solution* and heat at 105° for 2 minutes. The three principal spots in the chromatogram obtained with the test solution correspond to those in the chromatogram obtained with the reference solution.

B. In the test for Composition of gentamicin sulphate, the four principal peaks in the chromatogram obtained with the test solution correspond to the four peaks in the chromatogram obtained with the reference solution.

Tests

Composition of Gentamicin Sulphate. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the ointment containing 20 mg of Gentamicin in 10 ml of *chloroform*, add 20 ml of a 0.25 per cent w/v solution of *sodium tetraborate*, shake vigorously, centrifuge and separate the aqueous layer. Filter and dilute to 50.0 ml with *water*. To 10 ml of the resulting solution add 5 ml of *methanol*, swirl and add 4 ml of *phthaladehyde reagent*, mix, add sufficient *methanol* to produce 25.0 ml, heat on a water-bath at 60° for 15 minutes and cool.

Reference solution. Prepare in the same manner as the test solution but using 10 ml of a 0.065 per cent w/v solution of *gentamicin sulphate IPRS* in place of the solution of the preparation under examination. To 10 ml of the resulting solution add 5 ml of *methanol*, swirl and add 4 ml of *phthaladehyde reagent*, mix, add sufficient *methanol* to produce 25.0 ml, heat on a water-bath at 60° for 15 minutes and cool.

NOTE — If the solution is not used immediately, cool to 0° and use within 4 hours.

Chromatographic system

- a stainless steel column 10 to 12.5 cm x 4.6 to 5 mm, packed with octadecylsilane bonded to porous silica (5µm),
- mobile phase: *0.025 M sodium heptanesulphonate monohydrate* in a mixture of 70 volumes of *methanol*, 25 volumes of *water* and 5 volumes of *glacial acetic acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 330 nm,
- injection volume: 20 µl.

If necessary, adjust the *methanol* content of the mobile phase, so that in the chromatogram obtained with the reference solution, the retention time of the component C_2 is 10 to 20 minutes and the peaks are well separated with relative retention times of about 0.13 (reagent), 0.27 (component C_1), 0.65 (component C_{1a}), 0.85 (component C_{2a}) and 1.00 (component C_2).

Adjust the sensitivity and the volume of reference solution injected so that the height of the peak due to component C_1 is about 75 per cent of the full-scale deflection on the recorder. Plot a horizontal baseline on the chromatogram from the level portion of the curve immediately prior to the reagent peak. Measure the peak height above this baseline for each component. Repeat the procedure with the test solution. The test is not valid unless the resolution between the peaks due to C_{2a} and C_2 is not less than 1.3.

From the peak areas in the chromatogram obtained with the reference solution and the proportions of the components declared for *gentamicin sulphate IPRS*, calculate the response factors for components C_1, C_{1a}, C_{2a} and C_2. From these response factors and peak areas in the chromatogram obtained with the test solution, calculate the proportions of components C_1, C_{1a}, C_{2a} and C_2 in the cream. The proportion are with in the following limits. C_1, 25.0 to 50.0 per cent; C_{1a}, 10.0 to 35.0 per cent; C_2+ C_{2a} 25.0 to 55.0 per cent.

Other tests. Complies with the tests stated under Ointments.

Assay. Weigh a quantity of the ointment containing 4 mg of Gentamicin, dissolve in 50 ml of *chloroform*, extract with three quantities, each of 20 ml, of *sterile phosphate buffer pH 8.0*, combine the extracts and dilute to 100.0 ml with *phosphate buffer pH 8.0*. Dilute 10.0 ml of the resulting solution to 50.0 ml with *phosphate buffer pH 8.0*.

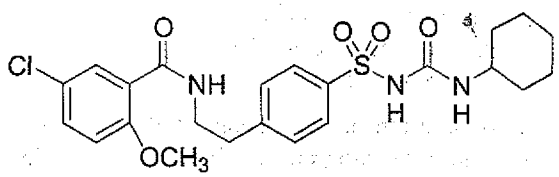
Carry out the microbiological assay of antibiotics (2.2.10).

Calculate the content of gentamicin in the ointment, taking each 1000 Units found to be equivalent to 1 mg of gentamicin.

Labelling. The label states the quantity of active ingredient in terms of the equivalent amount of gentamicin.

Glibenclamide

Glyburide



$C_{23}H_{28}ClN_3O_5S$ Mol. Wt. 494.0

Glibenclamide is 1-{4-[2-(5-chloro-2-methoxybenzamido) ethyl}benzenesulphonyl}-3-cyclohexylurea.

Glibenclamide contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{23}H_{28}ClN_3O_5S$, calculated on the dried basis.

Category. Hypoglycaemic.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *glibenclamide IPRS* or with the reference spectrum of glibenclamide

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.01 per cent w/v solution in *0.01 M methanolic hydrochloric acid* shows an absorption maximum at about 300 nm and a less intense maximum at about 275 nm; absorbance at about 300 nm, about 0.63 and at about 275 nm, about 0.29.

C. In the test for Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution.

D. Dissolve 20 mg in 2 ml of *sulphuric acid (96 per cent w/w)*; the solution is colourless and exhibits a blue fluorescence under ultraviolet light at 365 nm. Dissolve about 0.1 g of *chloral hydrate* in the solution; within 5 minutes the colour changes to deep yellow and after about 20 minutes a brownish tinge is produced.

Tests

Appearance of solution. A 1.0 per cent w/v solution in *ethanol (95 per cent)*, prepared with the aid of heat, is clear (2.4.1), and colourless (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Dissolve 25 mg of the substance under examination in 10 ml of *methanol.*

Reference solution. A 0.00125 per cent w/v solution of *glibenclamide IPRS* in *methanol.*

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3µm),
- column temperature: 35°,
- mobile phase: A. a mixture of a 20 volumes of 10.2 per cent v/v solution of freshly distilled *triethylamine* adjusted to pH 3.0 with *orthophosphoric acid* and 50 volumes of *acetonitrile*, dilute to 1000 ml with *water*,
  B. a mixture of 20 volumes of mobile phase A, 65 volumes of *water* and 915 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	45	55
15	45	55
30	5	95
40	5	95
41	45	55
55	45	55

The relative retention time with reference to glibenclamide for glibenclamide impurity A is about 0.5, for glibenclamide impurity B is about 0.6.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of areas of all the secondary peaks is not more than 4 times the area of peak in the chromatogram obtained with the reference solution (2.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained in the reference solution (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.4 g, dissolve in 100 ml of *ethanol (95 per cent)* with the aid of heat; titrate with *0.1 M sodium hydroxide* using 1 ml of *dilute phenolphthalein solution* as indicator until a pink colour is obtained. Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.0494 g of $C_{23}H_{28}ClN_3O_5S$.

Glibenclamide Tablets

Glibenclamide Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of glibenclamide, $C_{23}H_{28}ClN_3O_5S$.

Usual strengths. 2.5 mg; 5 mg.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the test for Related substances, the principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 45 volumes of *chloroform*, 45 volumes of *cyclohexane*, 5 volumes of *glacial acetic acid* and 5 volumes of *ethanol (95 per cent).*

Test solution. Extract a quantity of the powdered tablets containing 20 mg of Glibenclamide with four quantities, each of 5 ml, of a mixture of 20 volumes of *dichloromethane* and 10 volumes of *acetone*, evaporate the combined extracts to dryness at a pressure of 2 kPa and at a temperature not exceeding 40° and dissolve the residue in 4 ml of a mixture of equal volumes of *chloroform* and *methanol.*

Reference solution (a). A 0.5 per cent w/v solution of *glibenclamide IPRS* in the same solvent mixture.

Reference solution (b). Dilute 2 ml of reference solution (a) to 100 ml with the same solvent mixture.

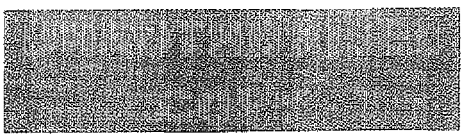
Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay using the following test solution.

Test solution. Disperse one tablet in a mixture of 2 ml of *water* and 20 ml of *methanol,* mix with the aid of ultrasound until fully dispersed and filter.

Other tests. Comply with the tests stated under Tablets.



Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 5 mg of Glibenclamide and disperse with the aid of ultrasound, with a mixture of 2.0 ml of *water* and 20.0 ml of *methanol*. Shake for further 10 minutes, filter, rejecting the first few ml of filterate.

Reference solution. Dissolve 50 mg of *glibenclamide IPRS* in 50 ml of *methanol*, sonicate for 20 minutes. Dilute 1.0 ml of the solution to 4.0 ml with *methanol*. To 20 ml of the solution add 2 ml *water* and mix.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5µm) (Such as Spherisorb ODS),
- mobile phase: a mixture of 47 volumes of *acetonitrile* and 53 volumes of a 1.36 per cent w/v solution of *potassium dihydrogen orthophosphate*, previously adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 300 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{23}H_{28}ClN_3O_5S$ in the tablets.

Glibenclamide and Metformin Tablets

Glibenclamide and Metformin Hydrochloride Tablets; Glyburide and Metformin Hydrochloride Tablets

Glibenclamide and Metformin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of glibenclamide, $C_{23}H_{28}ClN_3O_5S$ and metformin hydrochloride, $C_4H_{11}N_5,HCl$.

Usual strengths. Glibenclamide, 1.25 mg and Metformin hydrochloride, 250 mg; Glibenclamide, 2.5 mg and Metformin hydrochloride, 250, 400 mg; Glibenclamide, 5 mg and Metformin hydrochloride, 500 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with test solution correspond to the principal peaks in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

For Glibenclamide—

Apparatus No. 2 (Paddle),

Medium. 500 ml of a buffer prepared by dissolving 3.09 g of *boric acid* and 3.73 g of *potassium chloride* in 250 ml of *water*, adjusted to pH 9.5 with *1M sodium hydroxide* and dilute to 1000 ml with *water*,

Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14)

Test solution. The filtrate obtained as above. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Weigh and transfer about 12.5 mg of *glibenclamide IPRS* to a 100.0 ml volumetric flask, add 20.0 ml of *acetonitrile*, shake to dissolve and dilute to volume with medium. Dilute 2.0 ml of the solution to 100.0 ml with medium.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50.0 volumes of a buffer solution prepared by dissolving 28.7 g of *monobasic ammonium phosphate* in 1000 ml of *water*, adjusted to pH 5.3 with *1M sodium hydroxide* and 50.0 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 200 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates, the tailing factor is between 0.8 to 2.0 and relative standard deviation is not more than 2 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{23}H_{28}ClN_3O_5S$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{23}H_{28}ClN_3O_5S$.

For Metformin Hydrochloride —

Apparatus No. 2 (Paddle),

Medium. 1000 ml, prepared by dissolving 6.8 g of *monobasic potassium phosphate* in 1000 ml of *water* and adjusted to pH 6.8 with *0.2 M sodium hydroxide*,

Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with dissolution medium if necessary, at the maximum at about 232 nm (2.4.7). Calculate the content of $C_4H_{11}N_5,HCl$, in the medium from the absorbance obtained from a solution of known concentration of *metformin hydrochloride IPRS* prepared by dissolving in the medium.

Calculate the content of $C_4H_{11}N_5,HCl$ in the medium.

Q: Not less than 75 per cent of the stated amount of $C_4H_{11}N_5HCl$.

Related substances. Determine by liquid chromatography (2.4.14).

For Glibenclamide —

Solvent mixture. A mixture of equal volumes of *acetonitrile* and *water.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 2.5 mg of Glibenclamide, disperse in the solvent mixture, dilute to 100.0 ml with the same solvent and filter.

Reference solution (a). Dissolve 12.5 mg of *glibenclamide IPRS* in 25.0 ml of *acetonitrile* and dilute to 50.0 ml with *water.* Dilute 10.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml from reference solution (a) to 100.0 ml with the solvent mixture.

Reference silution(c). A solution containing 0.0025per cent w/v of *glibenclamide related compound A IPRS* in the solvent mixture. Dilute 50 µl in 50 ml with reference solution (a).

Reference solution(d). A solution containing 50 mg of *metformin hydrochloride IPRS* dilute with 10 ml of reference solution (c).

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolving 28.8 g of *monobasic ammonium phosphate* in 800 ml of *water* adjusted to pH 5.3 with *1M sodium hydroxide* and dilute to 1000 ml with *water* and 40 volumes of *acetonitrile*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 100 µl.

Name	Relative retention time	Correction factor
Glibenclamide related compound A[1]	0.30	0.83
Glibenclamide	1	---
Unknown	1	---

[1](4-[2-(5-Chloro-2-methoxybenzamido)ethyl]benzenesulfonamide.

Inject reference solution (d). The relative retation time with reference to glibenclamide for glibenclamide related compound A is 0.3. The test is not valid unless the capacity factor is not less than 7.0, column efficiency is not less than 3000 theoretical plates.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of peak due to glibenclamide related compound A is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). The area of any secondary peak is not more than 0.2 times of the area of principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent). The sum of the areas of all the secondary peaks is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) excluding peak due to glibenclamide related compound A. Ignore any peak with an area 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

For Metformin Hydrochloride —

Solvent mixture. A mixture of 1 volume of *acetonitrile* and 40 volumes of *water.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 25 mg of Metformin Hydrochloride, disperse in the solvent mixture, dilute to 100.0 ml with the same solvent and filter.

Reference solution (a). A solution containing 0.025 per cent w/v solution of *metformin hydrochloride IPRS* in solvent mixture.

Reference solution (b). A solution containing 0.0025 per cent w/v solution each of *metformin hydrochloride related compound B IPRS* and *metformin hydrochloride related compound C IPRS* in the solvent mixture.

Reference solution(c). Dilute 0.5 ml from reference solution (b) to 50.0 ml with the reference solution (a).

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 90 volumes of a buffer solution prepared by dissolving 1.0 g each of *sodium heptanesulphonate* and *sodium chloride* in 1800 ml of *water,* adjusted to pH 3.8 with *0.06 M orthophosphoric acid* and dilute to 2000 ml with *water* and 10 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 218 nm,
- injection volume: 5 µl.

The relative retention time for metformin related compound B, metformin and metformin related compound C is about 0.86, 1.0 and 2.1 to 2.3 respectively.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to metformin related compound B and metformin is not less than 1.5.

Inject the test solution. The area of any secondary peak is not more than 0.1 per cent and the sum of areas of all the secondary

peaks is not more than 0.5 per cent, calculated by area normalization and ignore any peak with an area less than 0.05 per cent of the principal peak (0.05 per cent).

Uniformity of Content (2.5.4). Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of equal volumes of *acetonitrile* and *water.*

Test solution. Disperse one tablet with 20 ml of the solvent mixture shake for 30 minutes and dilute suitably to obtain a solution containing 0.0025 per cent w/v of glibenclamide.

Reference solution. A 0.0025 per cent w/v solution of *glibenclamide IPRS* in the solvent mixture.

Carry out the chromatographic procedure described under Related substances.

Inject the reference solution and the test solution.

Calculate the content of $C_{23}H_{28}ClN_3O_5S$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

For Glibenclamide —

Solvent mixture. A mixture of equal volumes of *acetonitrile* and *water.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 2.5 mg of Glibenclamide, disperse in the solvent mixture, dilute to 100.0 ml with the same solvent and filter.

Reference solution. Weigh and dissolve 12.5 mg of *glibenclamide IPRS* in 25.0 ml of *acetonitrile* and dilute to 50.0 ml with *water.* Dilute 2.0 ml of the solution to 20.0 ml with the solvent mixture.

Use the chromatographic system as described under Related substances of glyburide.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates and the relative standard deviation for replicate injections is not more than 1.5 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{23}H_{28}ClN_3O_5S$ in the tablets.

For Metformin Hydrochloride —

Solvent mixture. A mixture of 1 volume of *acetonitrile* and 40 volumes of *water.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 25 mg of Metformin Hydrochloride, disperse in the solvent mixture , dilute to 100.0 ml with the same solvent and filter.

Reference solution. A 0.025 per cent w/v solution of *metformin hydrochloride IPRS* in the solvent mixture.

Use the chromatographic system as described under Related substances of metformin .

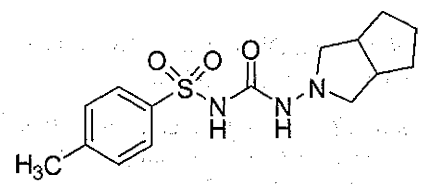
Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.5 per cent for metformin peak.

Inject the reference solution and the test solution.

Calculate the content of $C_4H_{11}N_5HCl$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Gliclazide



$C_{15}H_{21}N_3O_3S$ Mol. Wt. 323.4

Gliclazide is 1-(hexahydrocyclopenta[*c*]pyrrol-2(1*H*)-yl)-3-[(4-methylphenyl)sulphonyl]urea.

Gliclazide contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{15}H_{21}N_3O_3S$, calculated on the dried basis.

Category. Hypoglycaemic.

Description. A white or almost white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *gliclazide IPRS* or with the reference spectrum of gliclazide.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. 45 volumes of *acetonitrile* and 55 volumes of *water.*

Test solution. Dissolve 50 mg of the substance under examination in 23 ml of *acetonitrile* and dilute to 50.0 ml with *water.*

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution (b). Dissolve 5 mg of the substance under examination and 15 mg of *1-(hexahydrocyclopenta[c]pyrrol-2(1H)-yl)-3-[(2-methylphenyl)sulphonyl]urea IPRS (gliclazide impurity F IPRS)* in 23 ml of *acetonitrile* and dilute to 50 ml with *water*. Dilute 1 ml of the solution to 20 ml with the solvent mixture.

Reference solution (c). Dissolve 1.0 mg of *gliclazide impurity F IPRS* in 5 ml of *acetonitrile* and dilute to 10.0 ml with *water*. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 0.1 volume of *triethylamine*, 0.1 volume of *trifluoroacetic acid*, 45 volumes of *acetonitrile* and 55 volumes of *water*,
- flow rate: 0.9 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 20 µl.

Inject reference solution (b). The relative retention time with reference to gliclazide for gliclazide impurity F is about 0.9. The resolution between the peaks due to gliclazide impurity F and gliclazide is not less than 1.8.

Inject reference solution (a), (c) and the test solution. Run the chromatogram twice the retention time of the principal peak. The area of peak corresponding to gliclazide impurity F is not more than the area of peak obtained in the chromatogram with reference solution (c) (0.1 per cent), the area of any other secondary peak is not more than the principle peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all other secondary peaks is not more than twice the area of principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). Ignore any peak with an area 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

Gliclazide impurity B. Determine by liquid chromatography (2.4.14), as described under Related substances.

Test solution. Dissolve 0.4 g of the substance under examination in 2.5 ml of *dimethyl sulphoxide* and dilute to 10.0 ml with *water*. Stir for 10 minutes, store at 4° for 30 minutes and filter.

Reference solution. Dissolve 20 mg of *2-nitroso-octahydrocyclopenta[c]pyrrole IPRS (gliclazide impurity B IPRS)* in 100.0 ml of *dimethyl sulphoxide*. To 1.0 ml of the solution, add 12 ml of *dimethyl sulphoxide* and dilute to 50.0 ml with *water*. To 1.0 ml of the solution, add 12 ml of *dimethyl sulphoxide* and dilute to 50.0 ml with *water*.

Inject 50 µl of the test solution and the reference solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to impurity B is not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (2 ppm).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.25 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

Assay. Weigh 0.25 g, dissolve in 50 ml of *anhydrous acetic acid* and titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03234 g of $C_{15}H_{21}N_3O_3S$.

Gliclazide Tablets

Gliclazide Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of gliclazide, $C_{15}H_{21}N_3O_3S$.

Usual strength. 80 mg.

Identification

Shake a quantity of the powdered tablets containing 0.16 g of Gliclazide with 20 ml of *dichloromethane*, centrifuge and evaporate the supernatant liquid to dryness. The residue complies with the following test. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *gliclazide IPRS* or with the reference spectrum of gliclazide.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *phosphate buffer pH 7.4*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter. Measure the absorbance (2.4.7) of the filtrate, suitably diluted if necessary with dissolution medium to obtain a solution containing 12.5 µg per ml of Gliclazide at 226 nm and 290 nm. Correct the absorbance obtained at 226 nm by subtracting the absorbance obtained at 290 nm. Calculate the content of gliclazide, $C_{15}H_{21}N_3O_3S$ in the medium from the absorbances obtained from a solution prepared by dissolving 62 mg of *gliclazide IPRS* in 20 ml of *methanol*, adding sufficient dissolution medium to produce 1000 ml, dilute 1 ml of the solution to 5 ml with the dissolution medium.

Q. Not less than 70 per cent of the stated amount of $C_{15}H_{21}N_3O_3S$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. 45 volumes of *acetonitrile* and 55 volumes of *water*.

Test solution. Shake a quantity of the powdered tablets containing about 0.8 g of Gliclazide for 1 hour with 200 ml of *acetonitrile*, filter. Dilute 10.0 ml of the filtrate to 50.0 ml with a mixture of 1 volume of *acetonitrile* and 2 volumes of *water*.

Reference solution (a). Dilute 1.0 ml of the test solution to 500.0 ml with the solvent mixture.

Reference solution (b). Dissolve 5.0 mg of *gliclazide IPRS* and 15 mg of *1-(3-azabicyclo[3.3.0]oct-3-yl)-3-o-tolylsulpho-nylurea IPRS* in 25 ml of *acetonitrile*, dilute to 50.0 ml with *water*. Dilute 1.0 ml of the solution to 20.0 ml with the solvent mixture.

Reference solution (c). Dissolve 8.0 mg of *1-(3-azabicyclo[3.3.0]oct-3-yl)-3-o- tolylsulphonylurea IPRS* in 25 ml of *acetonitrile*, dilute to 50 ml with *water*. Dilute 1 ml of the solution to 100 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4 mm, packed with endcapped octylsilane bonded to porous silica (4 µm) (Such as Superspher 60 RP 8),
- mobile phase: a mixture of 0.1 volume of *triethylamine*, 0.1 volume of *trifluoroacetic acid*, 45 volumes of *acetonitrile* and 55 volumes of *water*,
- flow rate: 0.9 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between gliclazide and 1-(3-azabicyclo[3.3.0]oct-3-yl)-3-*o*-tolylsulphonylurea is not less than 1.8.

Inject reference solution (a), (c) and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with test solution, the area of peak corresponding to 1-(3-azabicyclo[3.3.0]oct-3-yl)-3-*o*-tolylsulphonylurea is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent); the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of other secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 40 volumes of *acetonitrile* and 60 volumes of *water*.

Test solution. Shake a quantity of the powdered tablets containing about 0.8 g of Gliclazide for 1 hour with 200 ml of *acetonitrile*, filter. Dilute 10.0 ml of the filtrate to 200.0 ml with the solvent mixture.

Reference solution (a). Dissolve 40 mg of *gliclazide IPRS* in 10 ml of *acetonitrile* and dilute to 200.0 ml with the solvent mixture.

Reference solution (b). Dissolve 5 mg of *gliclazide IPRS* and 15 mg of *1-(3-azabicyclo[3.3.0]oct-3-yl)-3-o-tolylsulphonyl-urea IPRS* in 25 ml of *acetonitrile*, dilute to 50 ml with *water*. Dilute 1.0 ml of the solution to 20.0 ml with the solvent mixture.

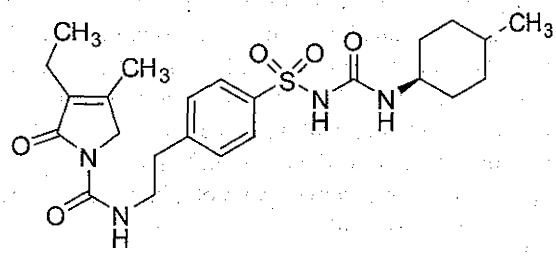
Use chromatographic system as described under Related substances.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to 1-(3-azabicyclo[3.3.0]oct-3-yl)-3-o-tolylsulphonylurea and gliclazide is not less than 1.8.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{15}H_{21}N_3O_3S$ in the tablets.

Glimepiride



$C_{24}H_{34}N_4O_5S$ Mol. Wt. 490.6

Glimepiride is 1-[[4-[2-(3-ethyl-4-methyl-2-oxo-3-pyrroline-1-carboxamido)ethyl]phenyl]sulphonyl]-3-*trans*-(4-methylcyclohexyl)urea.

Glimepiride contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{24}H_{34}N_4O_5S$, calculated on the anhydrous basis.

Category. Hypoglycaemic.

Descripiton. A white or almost white powder.

Identificaition

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum obtained with that *glimepiride IPRS* or with the reference spectrum of glimepiride.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Store the solutions at a temperature not exceeding 12° and for not more than 15 hours.

Solvent mixture. 20 volumes of *water* and 80 volumes of *acetonitrile.*

Test solution. Dissolve 20 mg of the substance under examination in 100.0 ml of the solvent mixture.

Reference solution (a). Dissolve the contents of a vial of *glimepiride for system suitability IPRS* (containing Glimepiride impurity B, C and D) in 2.0 ml of the test solution.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution (c). A 0.02 per cent w/v solution of *glimepiride IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm, packed with endcapped octadecylsilane bonded to porous silica (4 µm),
- mobile phase: a mixture of 50 volumes of a solution prepared by dissolving 0.5 g of *sodium dihydrogen orthophosphate* in 500 ml of *water*, adjusted to pH 2.5 with *orthophosphoric acid* and 50 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 228 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to glimepiride impurity B and glimepiride impurity C is not less than 4.0. The relative retention time with reference to glimepiride for 3-ethyl-4-methyl-2-oxo-*N*-[2-(4- sulphamoylphenyl)ethyl]-2,3-dihydro-1*H*-pyrrole-1-carboxamide (glimepiride sulphonamide) (glimepiride impurity B) is about 0.2, for methyl [[4-[2-[[(3-ethyl-4-methyl-2-oxo-2, 3-dihydro-1*H*-pyrrol-1-yl)carbonyl] amino] ethyl]phenyl] sulphonyl]carbamate (glimepiride urethane) (glimepiride impurity C) is about 0.3 and for 1-[[3-[2-[[(3-ethyl-4-methyl-2-oxo-2,3-dihydro-1*H*-pyrrol-1-l) carbonyl]amino]ethyl]n phenyl] sulphonyl]-3-(*trans*-4-methylcyclohexyl)urea (glimepiride impurity D) is about 1.1.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of the peak due to glimepiride impurity B is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent), the area of the peak due to glimepiride impurity D is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of all the secondary peaks other than glimepiride impurity B is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Impurity A. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use.

Test solution. Dissolve 10 mg of the substance under examination in 5 ml of *dichloromethane* and dilute to 20.0 ml with the mobile phase.

Reference solution (a). Dilute 0.8 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 2 mg of *glimepiride IPRS* (containing glimepiride impurity A) in 1.0 ml of *dichloromethane* and dilute to 4.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.0 mm, packed with diol silica gel (5 µm),
- mobile phase: a mixture of 1 volume of *anhydrous acetic acid,* 100 volumes of *2-propanol* and 899 volumes of *heptane*,
- flow rate: 0.5 ml per minute,
- spectrophotometer set at 228 nm,
- injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the peak-to-valley ratio is not less than 2.0, where H_p is the height above the baseline of the peak due to impurity A and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to glimepiride. The relative retention time with reference to glimepiride for glimepiride impurity A is about 0.9.

Inject reference solution (a) and the test solution. Run the chromatogram 1.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of the peak due to 1-[[4-[2-[[(3-ethyl-4-methyl-2-oxo-2,3-dihydro-1*H*-pyrrol-1-yl)carbonyl]amino]ethyl]phenyl] sulphonyl]-3-(*cis*-4-methylcyclohexyl)urea (glimepiride impurity A) is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.8 per cent).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 0.5 per cent, Method 3, determined by dissolving 0.25 g in 5.0 ml of *dimethylformamide.* Carry out the test on 1.0 ml of the solution. Carry out a blank test.

Assay. Determine by liquid chromatography (2.4.14) as described under test for Related substances with the following modification.

Inject reference solution (c) and the test solution.

Calculate the content of $C_{24}H_{34}N_4O_5S$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Glimepiride Tablets

Glimepiride Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of glimepiride, $C_{24}H_{34}N_4O_5S$.

Usual strengths. 1 mg; 2 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of phosphate buffer pH 7.8 prepared by dissolving 0.58 g of *monobasic potassium phosphate* and 8.86 g of *anhydrous dibasic sodium phosphate* in 1000 ml of *water* and adjusted to pH 7.8 with dilute *orthophosphoric acid* or *1 M sodium hydroxide*,
Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14), using the chromatographic system as described under Assay, using injection volume: 50 µl.

Solvent mixture. 50 volumes of *methanol* and 50 volumes of *water*.

Test solution. Use the filtrate, dilute if necessary, with the solvent mixture.

Reference solution. Dissolve a quantity of *glimepiride IPRS* in a mixture of 90 volumes of *acetonitrile* and 10 volumes of *water* to obtain a solution having a concentration of 0.125 mg of glimepiride per ml. Dilute 4.0 ml of the solution to 200.0 ml with the dissolution medium. Dilute 15.0 ml of the solution to 50 ml with the solvent mixture to obtain a final concentration of 0.00075 mg per ml of glimepiride.

Calculate the content of $C_{24}H_{34}N_4O_5S$ in the tablet.

Q. Not less than 75.0 per cent of the stated amount of $C_{24}H_{34}N_4O_5S$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Use freshly prepared solution.

Solvent mixture. 90 volumes of *acetonitrile* and 10 volumes of *water*.

Test solution. Disperse a quantity of powdered tablets containing about 5 mg of glimepiride in 50.0 ml of the solvent mixture. Centrifuge and use the clear supernatant.

Reference solution (a). A solution containing 0.004 per cent w/v of *glimepiride IPRS* and 0.002 per cent w/v each of *glimepiride sulphonamide (glimepiride impurity B IPRS)* and *glimepiride urethane (glimepiride impurity C IPRS)* in the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 20.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica (4 µm),
- mobile phase: a mixture of 50 volumes of a solution containing 0.5 g of *monobasic sodium phosphate* in 500 ml of *water*, adjusted to pH 2.1 with *orthophosphoric acid* and 50 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 228 nm,
- injection volume: 10 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to glimepiride impurity B and glimepiride impurity C is not less than 4.0 and the relative standard deviation for replicate injections of glimepiride is not more than 2.0 per cent. The relative retention time with reference to glimepiride for glimepiride impurity B is about 0.2 and for glimepiride impurity C is about 0.3.

Inject reference solution (b) and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution the area of the peak corresponding to glimepiride imputiy B multiplied with correction factor of 0.77 is not more than 2.5 times the area of principal peak in the chromatogram obtained with reference solution (b) (2.5 per cent), the area of any other secondary peak is not more than 0.5 times the area of principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks other than glimepiride impurity B is not more than the area of principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent), the sum of areas of all the secondary peaks is not more than 3.5 times the area of principal peak in the chromatogram obtained with reference solution

(b) (3.5 per cent). Ignore any peak with an area less than 0.1 times the area of principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay, using the following solution as the test solution.

Test solution. Disperse one tablet in the solvent mixture and dilute with the solvent mixture to obtain a solution containing 0.01 per cent w/v of glimepiride.

Calculate the content of $C_{24}H_{34}N_4O_5S$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

NOTE—Use freshly prepared solution.

Solvent mixture. 90 volumes of *acetonitrile* and 10 volumes of *water*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 10 mg glimepiride in the solvent mixture and dilute with the solvent mixture to obtain a solution containing 0.01 per cent w/v of glimepiride.

Reference solution (a). A solution containing 0.01 per cent w/v of *glimepiride IPRS* and 0.002 per cent w/v each of *glimepiride impurity B IPRS* and *glimepiride impurity C IPRS* in the solvent mixture.

Reference solution (b). A 0.01 per cent w/v solution of *glimepiride IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 12.5 cm x 4 mm, packed with octadecylsilane bonded to porous silica (4 µm),
- mobile phase: a mixture of 50 volumes of a solution containing 0.5 g of *monobasic sodium phosphate* in 500 ml of *water*, adjusted to pH 2.1 with *orthophosphoric acid* and 50 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 228 nm,
- injection volume: 10 µl.

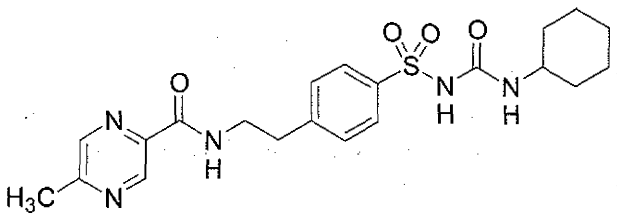
Inject reference solution (a). The test is not valid unless the resolution between the peaks due to glimepiride impurity B and glimepiride impurity C is not less than 1.5 and the relative standard deviation for replicate injections of glimepiride is not more than 2.0 per cent. The relative retention time with reference to glimepiride for glimepiride impurity B is about 0.25 and for glimepiride impurity C is about 0.35.

Inject reference solution (b) and the test solution.

Calculate the content of $C_{24}H_{34}N_4O_5S$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Glipizide



$C_{21}H_{27}N_5O_4S$ Mol. Wt. 445.5

Glipizide is 1-cyclohexyl-3-[[4-[2-[[(5-methylpyrazine-2-yl)carbonyl]amino]ethyl]phenyl]sulphonyl]urea

Glipizide contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{21}H_{27}N_5O_4S$, calculated on the dried basis.

Category. Hypoglycaemic.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *glipizide IPRS* or with the reference spectrum of glipizide.

B. When examined in the range 220 to 350 nm (2.4.7), a 0.002 per cent solution in *methanol*, shows two maxima, at about 226 nm and 274 nm. The ratio of the absorbance at 226 nm to that at about 274 nm, 2.0 to 2.4 .

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Solvent mixture. Equal volumes of *methanol* and *methylene chloride*.

Mobile phase. A mixture of 25 volumes of *anhydrous formic acid*, 25 volumes of *ethyl acetate* and 50 volumes of *methylene chloride*.

Test solution. Dissolve 0.10 g of the substance under examination in 100 ml of solvent mixture.

Reference solution. A 0.10 per cent w/v solution of *glipizide IPRS* in solvent mixture.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.005 per cent w/v each of *5-methyl-N-[2-(4-sulphamoylphenyl)ethyl] pyrazine-2- carboxamide IPRS (glipizide impurity A IPRS)* and *6-methyl-N-[2-(4-sulphamoylphenyl)ethyl]pyrazine-2- carboxamide IPRS (glipizide impurity D IPRS)* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 17 volumes of *acetonitrile* and 83 volumes of 0.35 per cent w/v solution of *dipotassium hydrogen phosphate*, adjusted to pH 8.0 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 274 nm,
- injection volume: 50 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to glipizide impurity A and glipizide impurity D is not less than 2.0. The relative retention time with reference to glipizide for glipizide impurity A is about 0.3, for glipizide impurity D is about 0.4 and for 1-cyclohexyl-3-[[4-[2-[[(6-methylpyrazin-2- yl)carbonyl]amino]ethyl] phenyl] sulphonyl]urea (glipizide impurity E) is about 1.1.

Inject reference solution (a) and the test solution. Run the chromatogram 1.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of the peak due to glipizide impurity A is not more 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent), the area of the peak due to glipizide impurity D and E is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1 g by drying in an oven at 105°.

Assay. Weigh 0.4 g, dissolve in 50 ml of *dimethylformamide*, add 0.2 ml of *quinaldine red solution*. Titrate with *0.1 M lithium methoxide* until the colour changes from red to colourless. Carry out a blank titration.

1 ml of *0.1 M lithium methoxide* is equivalent to 0.04455 g of $C_{21}H_{27}N_5O_4S$.

Storage. Store protected from moisture.

Glipizide Tablets

Glipizide Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of glipizide, $C_{21}H_{27}N_5O_4S$.

Usual strength. 5 mg.

Identification

A. Shake a quantity of the powdered tablets containing 25 mg of Glipizide with 10 ml of *dichloromethane* for 5 minutes, dry over *anhydrous sodium sulphate* and filter. Evaporate the filtrate to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *glipizide IPRS* or with the reference spectrum of glipizide.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of simulated intestinal fluid (without pancreatin) prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate in* 250 ml *water*, mix and add 77 ml of *0.2 M sodium hydroxide*, add 500 ml of *water*, adjusted to pH 6.8 with *0.2 M sodium hydroxide* or *0.2 M hydrochloric acid* and dilute to 1000 ml with *water*,

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, dilute suitably if necessary with the medium, at the maximum at about 276 nm (2.4.7). Calculate the content of $C_{21}H_{27}N_5O_4S$ in the medium from the absorbance obtained from a solution of known concentration of *glipizide IPRS* in the dissolution medium.

Q. Not less than 80 per cent of the stated amount of $C_{21}H_{27}N_5O_4S$.

Related substances. Determine by liquid chromatography (2.4.14).

Buffer solution. Dissolve 13.8 g of *monobasic sodium phosphate* in *water* and dilute to 1000 ml with *water*, adjusted to pH 6.0 with *2 M sodium hydroxide*.

Test solution. Disperse a quantity of the powdered tablets containing 5 mg of Glipizide in 50 ml of *methanol*, with the aid of ultrasound for 15 minutes with intermittent shaking, and dilute to 100.0 ml with the buffer solution, further sonicate for 15 minutes, filter.

Reference solution. A solution containing 0.01 per cent w/v of *glipizide IPRS* and 0.00005 per cent w/v of *glipizide related compound A* (*N-{2-[(4-aminosulfonyl)phenyl]ethyl}-5-methyl-pyrazinecarboxamide*) *IPRS* in *methanol*. Dilute 25.0 ml of the solution to 50.0 ml with the buffer solution.

Chromatographic system
- a stainless steel column 15 cm × 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 55 volumes of the buffer solution and 45 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

The relative retention time with reference to glipizide for glipizide related compound A is about 0.2.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to glipizide related compound A and glipizide is not less than 1.5 and the relative standard deviation for replicate injections is not more than 5.0 per cent for glipizide related compound A.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to glipizide related compound A is not more than four times the area of the corresponding peak in the chromatogram obtained with the reference solution (2.0 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Disperse one intact tablet in 50 ml of *methanol*, with the aid of mechanical shaking for 10 minutes, dilute to 100.0 ml with the buffer solution and further sonicate for 15 minutes. Dilute if necessary with equal volumes of the buffer solution and *methanol* to obtain a solution having similar concentration to the reference solution as obtained in Assay.

Inject the reference solution and the test solution.

Calculate the content of the $C_{21}H_{27}N_5O_4S$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 5 mg of Glipizide in 50 ml of *methanol*, with the aid of ultrasound for 15 minutes with intermittent shaking and dilute to 100.0 ml with the buffer solution, further sonicate for 15 minutes and filter.

Reference solution. A 0.01 per cent w/v solution of *glipizide IPRS* in *methanol*. Dilute 25.0 ml of the solution to 50.0 ml with the buffer solution.

Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{27}N_5O_4S$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Glipizide and Metformin Tablets

Glipizide and Metformin Hydrochloride Tablets

Glipizide and Metformin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of glipizide, $C_{21}H_{27}N_5O_4S$ and metformin hydrochloride, $C_4H_{11}N_5$, HCl.

Usual strengths. Glipizide, 2.5 mg and Metformin Hydrochloride, 250 mg; Glipizide, 5 mg and Metformin Hydrochloride, 250 mg; Glipizide, 5 mg and Metformin Hydrochloride, 500 mg.

Identification

In the Assay of glipizide, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a) and in the Assay of metformin hydrochloride, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

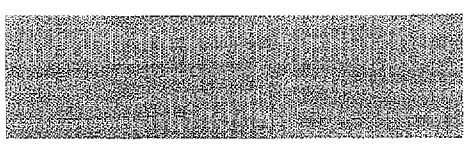
Tests

NOTE — Protect the solution from light.

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 1000 ml of 0.05 M phosphate buffer pH 6.8 prepared by dissolving 6.48 g of *monobasic potassium phosphate* and



0.83 g of *sodium hydroxide* in 1000 ml of *water*, adjusted to pH 6.8 with *dilute sodium hydroxide solution*, *(NOTE — Control of the pH is critical)*,

Speed and time. 50 rpm and 45 minutes for glipizide and 30 minutes for Metfonnin hydrochloride.

For Glipizide —

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A 0.005 per cent w/v solution of *glipizide IPRS* in *methanol*. Dilute a suitable volume of the solution with the dissolution medium to obtain the same concentration as expected in the test solution.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 48 volumes of a buffer solution prepared by dissolving 3.4 g of *monobasic potassium phosphate* in 800 ml of *water*, adjusted to pH 6.0 with *10 M sodium hydroxide*, dilute to 1000 ml with *water* and 52 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{27}N_5O_4S$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{21}H_{27}N_5O_4S$.

For Metformin Hydrochloride —

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with dissolution medium if necessary, at the maximum at about 233 nm (2.4.7). Calculate the content of $C_4H_{11}N_5$,HCl, in the medium from the absorbance obtained from a solution of known concentration of *metformin hydrochloride IPRS* in the dissolution medium.

Q. Not less than 80 per cent of the stated amount of $C_4H_{11}N_5$,HCl.

Related substances. Determine by liquid chromatography (2.4.14).

For Glipizide —

Solvent mixture. 60 volumes of *acetonitrile* and 40 volumes of *water*.

Buffer solution. Dissolve 2.6 g of *dibasic ammonium phosphate* in 1000 ml of *water*, adjusted to pH 8.0 with *ammonium hydroxide*.

Test solution. Disperse 5 intact tablets in the solvent mixture (50.0 per cent of the final volume) in a suitable volumetric flask with the aid of ultrasound for 30 minutes and shake vigorously for another 30 minutes to dissolve and dilute to volume with *water* to obtain a solution containing 0.005 per cent w/v of Glipizide (solution A). To 5.0 ml of solution A, add 5.0 ml of the solvent mixture and dilute to 20.0 ml with *water*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 25 volumes of the buffer solution, 70 volumes of *water* and 5 volumes of *acetonitrile*,
  B. a mixture of 25 volumes of the buffer solution, 25 volumes of *water* and 50 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 223 nm,
- injection volume: 50 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
3	100	0
18	0	100
20	0	100
22	100	0
30	100	0

Name	Relative retention time	Correction factor
Glipizide related compound A[1]	0.92	0.71
Glipizide	1.0	—

[1]*N*-{2-[(4-aminosulfonyl)phenyl]ethyl}-5-methyl-pyrazinecarboxamide.

Inject the test solution. The area of any peak corresponding to glipizide related compound A is not more than 2.0 per cent, the area of any other secondary peak (eluting after approximately 8 minutes) is not more than 0.5 per cent and the sum of areas of all the secondary peaks other than glipizide related compound A is not more than 1.0 per cent, calculated by area normalisation. Ignore the peak due to metformin hydrochloride and any peak with an area less than 0.05 per cent.

For Metformin Hydrochloride —

Buffer solution. Dissolve 9.41 g of *sodium 1-hexanesulfonate* in 1000 ml of *water*, adjusted to pH 2.0 with *trifluoroacetic acid*.

Solution B. A mixture of 60 volumes of *water* and 40 volumes of *acetonitrile*.

Solvent mixture. 63 volumes of *water*, 30 volumes of the buffer solution and 7 volumes of *acetonitrile*.

Test solution. Dilute a suitable volume of solution A (obtained from test solution of Glipizide) with the solvent mixture to obtain a solution containing 0.01 per cent w/v of Metformin Hydrochloride.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with phenyl group bonded to porous silica (3.5 µm),
- mobile phase: a mixture of 30 volumes of the buffer solution, 20 volumes of solution B and 50 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 218 nm,
- injection volume: 25 µl.

Inject the test solution. The area of any secondary peak is not more than 0.1 per cent and the sum of the areas of all the secondary peaks is not more than 0.5 per cent, calculated by area normalization and ignore the peak due to glipizide and any peak with an area less than 0.05 per cent.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Related substances of Glipizide with the following modifications.

Test solution. Disperse 1 intact tablet in the solvent mixture (50.0 per cent of the final volume) in a suitable volumetric flask with the aid of ultrasound for 30 minutes and shake vigorously for another 30 minutes to dissolve and dilute to volume with *water* to obtain a solution containing 0.00125 per cent w/v of Glipizide.

Reference solution. Dissolve 10 mg of *glipizide IPRS* in 60 ml of *acetonitrile*, with the aid of ultrasound for 20 minutes with intermittent shaking and dilute to 100.0 ml with *water*. To 25.0 ml of the solution, add 75 ml of the solvent mixture and dilute to 200.0 ml with *water*.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{27}N_5O_4S$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay.

For Glipizide —

Determine by liquid chromatography (2.4.14), as described under Related substances for glipizide with the following modifications.

Reference solution (a). Dissolve 10 mg of *glipizide IPRS* in 60 ml of *acetonitrile*, with the aid of ultrasound for 20 minutes with intermittent shaking and dilute to 100.0 ml with *water*. To 25.0 ml of the solution, add 75 ml of the solvent mixture and dilute to 200.0 ml with *water*.

Reference solution (b). Dissolve 2.5 mg of *glipizide related compound A IPRS* in 150 ml of *acetonitrile*, with the aid of ultrasound for 30 minutes and dilute to 250.0 ml with *acetonitrile*. Dilute 1.0 ml of the solution to 50.0 ml with reference solution (a).

The relative retention time with reference to glipizide for glipizide related compound A is about 0.92.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to glipizide related compound A and glipizide is not less than 1.2 in the chromatogram obtained with reference solution (b) and the relative standard deviation for the replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_{21}H_{27}N_5O_4S$ in the tablets.

For Metformin Hydrochloride —

Determine by liquid chromatography (2.4.14), as described under Related substances for metformin hydrochloride with the following modifications.

Reference solution (a). A 0.01 per cent w/v solution of *metformin hydrochloride IPRS* in the solvent mixture.

Reference solution (b). A 0.0005 per cent w/v solution of *dicyandiamide IPRS* in *water*. Dilute 1.0 ml of the solution to 100.0 ml with reference solution (a).

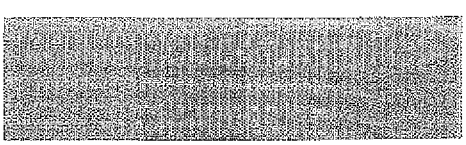
The relative retention time with reference to metformin for dicyandiamide is about 0.26.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to dicyandiamide and metformin is not less than 3.0 in the chromatogram obtained with reference solution (b) and the relative standard deviation for the replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (a).

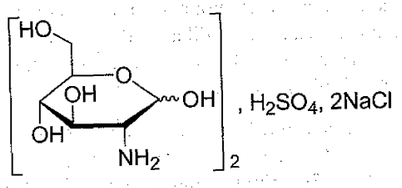
Inject reference solution (a) and the test solution.

Calculate the content of $C_4H_{11}N_5,HCl$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.



Glucosamine Sulphate Sodium Chloride



$C_{12}H_{26}N_2O_{10},H_2SO_4,2NaCl$ Mol. Wt. 573.3

Glucosamine Sulphate Sodium Chloride is bis(2-amino-2-deoxy-*D*-glucopyranose)sulphate bis(sodium chloride).

Glucosamine Sulphate Sodium Chloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{12}H_{26}N_2O_{10},H_2SO_4,2NaCl$ calculated on the dried basis.

Category. In the treatment of osteoarthritis.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6).Compare the spectrum with that obtained with *glucosamine sulphate sodium chloride IPRS* or with the reference spectrum of glucosamine sulphate sodium chloride.

B. It gives reaction (A) of chlorides (2.3.1).

C.1 ml of solution A gives reaction (A) of sodium salts. (2.3.1).

D. It gives reaction (A) of sulphates (2.3.1).

Tests

Solution A. A 10.0 per cent w/v solution in *carbon dioxide-free water*.

Appearance of solution. Dilute 5.0 ml of solution A to 25.0 ml with *water*. The solution is clear (2.4.1) and colourless (2.4.1).

pH (2.4.24). 3.0 to 5.0 determined in solution A.

Specific optical rotation (2.4.22). +50.0° to +55.0°, determined in solution A at 20°.

(*NOTE — Examine after 3 hour of preparation of solution A*).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.4 g of the substance under examination in 80 ml of the mobile phase with the aid of ultrasound and dilute to 100.0 ml with the mobile phase.

Reference solution. Dissolve 25.0 mg of *2-methylpyrazine IPRS* in the mobile phase and dilute to 10.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with end capped octadecylsilane bonded to porous silica (3µm),
- mobile phase: dissolve 0.5 g of *sodium heptanesulphonate* in *water*, add 0.5 ml of *orthophosphoric acid* and 4 ml of 5.6 per cent w/v solution of *potassium hydroxide* and dilute to 1000.0 ml with *water*. To 1000 ml of the solution add 50 ml of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 195 nm,
- injection volume: 20 µl.

Inject the reference solution . The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. Run the chromatogram twice the retention time of 2-methylpyrazine.

In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of principal peak in the chromatogram obtained with reference solution (0.05 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (0.2 per cent). Ignore any peak with the area less than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (0.03 per cent).

Heavy metals (2.3.13). Dissolve 2 g of substance under examination in 20 ml of *water*.12 ml of the solution complies with the limit test for heavy metals, Method D (10 ppm), using 10 ml of *lead standard solution (1 ppm Pb)*.

Sulphated ash (2.3.18). 23.5 per cent to 26.0 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

Microbial contamination (2.2.9). Total microbial count not more than 1000 CFU per g, total yeast and mold count not more than 100 CFU per g, 1 g is free from *Escherichia coli*.

Assay. Dissolve 0.25 g in 50 ml of *water* add 1.0 ml of *0.1 M hydrochloric acid*. Titrate with *0.1 M sodium hydroxide*, determining the end point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.02867 g of $C_{12}H_{28}Cl_2N_2Na_2O_{14}S$.

Storage. Store protected from light.

Glutaraldehyde Solution

$C_5H_8O_2$ Mol. Wt.100.1

Glutaraldehyde Solution is a dilution of Strong Glutaraldehyde Solution in a mixture of purified water and ethanol (95 per cent). For preparation of Glutaraldehyde Solution, ethanol (95 per cent) may be replaced by industrial methylated spirit.

Glutaraldehyde Solution contains not less than 9.2 per cent w/v and not more than 10.5 per cent w/v of glutaraldehyde, $C_5H_8O_2$.

Usual strengths. 0.1 per cent; 1.0 per cent.

Identification

A. Heat 5 ml with 10 ml of a solution containing 1 g of *hydroxylamine hydrochloride* and 2 g of *sodium acetate* on a water-bath for 10 minutes, allow to cool and filter. The melting point (2.4.21) of the residue, after washing with *water* and drying at 105°, is about 178°.

B. To 1 ml, add 2 ml of *ammoniacal silver nitrate solution* and mix gently for a few minutes; silver is deposited.

Tests

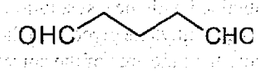
Ethanol (2.3.45). 50.0 to 60.0 per cent v/v.

Assay. Dissolve 4 g with 100 ml of a 7 per cent w/v solution of *hydroxylamine hydrochloride* previously neutralised to *bromophenol blue solution* with *1 M sodium hydroxide* and allow to stand for 30 minutes. Add 20 ml of *petroleum spirit (boiling range, 40° to 60°)* and titrate with *1 M sodium hydroxide* until the colour of the aqueous phase matches that of a 7 per cent w/v solution of *hydroxylamine hydrochloride* previously neutralised to *bromophenol blue solution* with *1 M sodium hydroxide*.

1 ml of *1 M sodium hydroxide* is equivalent to 0.05005 g of $C_5H_8O_2$.

Labelling. The label states (1) the date after which the solution is not intended to be used; (2) the conditions under which it should be stored.

Strong Glutaraldehyde Solution



$C_5H_8O_2$ Mol. Wt.100.1

Strong Glutaraldehyde Solution is an aqueous solution of glutaraldehyde (pentanedial).

Strong Glutaraldehyde Solution contains not less than 47.0 per cent and not more than 53.0 per cent w/w of glutaraldehyde, $C_5H_8O_2$.

Description. A colourless or almost colourless solution.

Identification

A. Heat 1 ml with 10 ml of a solution containing 1 g of *hydroxylamine hydrochloride* and 2 g of *sodium acetate* in *water* on a water-bath for 10 minutes, allow to cool and filter. The melting point of the residue, after washing with *water* and drying at 105°, is about 178° (2.4.21).

B. Add 0.05 ml to 2 ml of *ammoniacal silver nitrate solution* and mix gently for a few minutes; silver is deposited.

Tests

Acidity. Dilute 10 ml with 10 ml of *carbon dioxide-free water* and titrate with *0.1 M sodium hydroxide* using *bromothymol blue solution* as indicator. Not more than 5.0 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution.

Appearance of solution. Dilute 1 volume with 4 volumes of *water*. The solution is clear (2.4.1) and not more intensely coloured than BS6 (2.4.1).

Weight per ml (2.4.29). 1.126 to 1.134 g.

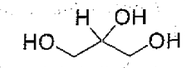
Assay. Dissolve 4 g in 100 ml of a 7 per cent w/v solution of *hydroxylamine hydrochloride* previously neutralised to *bromophenol blue solution* with *1 M sodium hydroxide* and allow to stand for 30 minutes. Add 20 ml of *petroleum spirit (boiling range, 40° to 60°)* and titrate with *1 M sodium hydroxide* until the colour of the aqueous phase matches that of a 7 per cent w/v solution of *hydroxylamine hydrochloride* previously neutralised to *bromophenol blue solution* with *1 M sodium hydroxide*.

1 ml of *1 M sodium hydroxide* is equivalent to 0.05005 g of $C_5H_8O_2$.

Storage. Store at a temperature not exceeding 15°.

Glycerin

Glycerol



$C_3H_8O_3$ Mol. Wt. 92.1

Glycerin is propane-1,2,3-triol.

Glycerin contains not less than 98.0 per cent and not more than 101.0 per cent of $C_3H_8O_3$, calculated on the anhydrous basis.

Category. Lubricant; laxative; pharmaceutical aid (humectant).

Description. A clear, colourless or almost colourless, syrupy liquid; hygroscopic.

Identification

Test C may be omitted if tests A and B are carried out. Test A may be omitted if tests B and C are carried out.

A. Mix 5 ml of Glycerin with 1 ml of *water*. On the solution, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *glycerin IPRS* treated in the same manner or with the reference spectrum of glycerin.

B. Refractive index (2.4.27). 1.470 to 1.475, determined at 20°.

C. Relative density (2.4.29). 1.258 to 1.268, determined at 20°.

Tests

Appearance of solution. Mix 50.0 g of Glycerin in *carbon dioxide-free water* and dilute to 100.0 ml with the same solvent (Solution A). Solution A is clear (2.4.1). Dilute 10.0 ml of solution A to 25.0 ml with *water*. The solution is colourless (2.4.1).

Acidity or alkalinity. To 50 ml of solution A, add 0.5 ml of *phenolphthalein solution*. The solution is colourless and not more than 0.2 ml of *0.1 M sodium hydroxide* is required to produce a pink colour. Reserve this solution for the test for Esters.

Chlorides (2.3.12). 10.0 ml of solution A, complies with the limit test for chlorides (10 ppm), using 2 ml of chloride standard solution (25 ppm).

Aldehydes. To 7.5 ml of solution A in a glass-stoppered flask, add 7.5 ml of *water* and 1.0 ml of *decolourised pararosaniline solution*, close the flask and allow to stand for 1 hour at 25°. The absorbance of the solution measured at 552 nm (2.4.7) is not more intense than that obtained in a standard solution prepared in the same manner by using 7.5 ml of *formaldehyde standard solution* (5 ppm CH_2O) and 7.5 ml of *water*. The test is not valid unless the standard solution is pink. (10 ppm).

Esters. Add 10 ml *0.1 M sodium hydroxide* to the solution reserved in the test for Acidity or alkalinity. Boil under a reflux condenser for 5 minutes. Cool, add 0.5 ml of *phenolphthalein solution* and titrate with *0.1 M hydrochloric acid*. Not less than 8.0 ml of *0.1 M hydrochloric acid* is required to decolourise the solution.

Halogenated compounds. Not more than 35 ppm.

To 10 ml of solution A, add 1 ml of *dilute sodium hydroxide solution*, 5 ml of *water* and 50 mg of *halogen-free nickel-aluminium alloy*. Heat on a water-bath for 10 minutes, allow to cool and filter. Rinse the flask and the filter with *water* until 25 ml of filtrate is obtained. To 5 ml of the filtrate, add 4 ml of *ethanol (95 per cent)*, 2.5 ml of *water*, 0.5 ml of *nitric acid* and 0.05 ml of *silver nitrate solution* and mix. Allow to stand for 2 minutes. Any opalescence in the solution is not more intense than that in a standard prepared at the same time by mixing 7.0 ml of *chloride standard solution (5 ppm Cl)*, 4 ml of *ethanol (95 per cent)*, 0.5 ml of *water*, 0.5 ml of *nitric acid* and 0.05 ml of *silver nitrate solution*.

Ethylene glycol, diethylene glycol and related substances. Determine by gas chromatography (2.4.13).

Test solution. Mix 5.88 g of Glycerin in *methanol* and dilute to 100.0 ml with *methanol*.

Reference solution (a). A solution containing 0.1 per cent w/v, each of, *ethylene glycol IPRS* and *diethylene glycol IPRS* in *methanol*. To 5.0 ml of the solution, add accurately weighed quantity of 5.88 g of Glycerin and dilute to 100.0 ml with *methanol*.

Reference solution (b). A solution containing 0.05 per cent w/v, each of, *glycerin*, *ethylene glycol IPRS* and *diethylene glycol IPRS* in *methanol*.

Chromatographic system

- a fused silica column 30 m × 0.32 mm, packed with 14 per cent cyanopropylphenyl and 86 per centdimethyl-polysiloxane (1µm) (Such as DB-1701),
- temperature:
  column. 100° to 220° @ 7.5° per minute, maintained at 220°,
  inlet port. 220° and detector 250°,
- split ratio: 1:20,
- flame ionization detector,
- flow rate: 38 cm per second using nitrogen as thecarrier gas,
- injection volume: 1µl.

The elution order is ethylene glycol, diethylene glycol and glycerin.

Inject reference solution (a) and (b). Run the chromatogram 3 times the retention time of the glycerin peak. The test is not valid unless the resolution between the peaks due to ethylene glycol and diethylene glycol is not less than 40 and between the peaks due to diethylene glycol and glycerin is not less than 10 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 10 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to ethylene glycol and diethylene glycol, each of, is not more than the area of the corresponding peaks in the chromatogram obtained with reference solution (a) (0.1 per cent) and the area of any other secondary peak is not more than 0.1 per cent, calculated by area normalisation.

The sum of all the impurities is not more than 1.0 per cent.

Sugars. Heat 10 ml of solution A with 1 ml of *dilute sulphuric acid* on a water-bath for 5 minutes. Add 3 ml of *dilute sodium hydroxide* (carbonate-free), mix and add drop wise 1 ml of freshly prepared *copper sulphate solution;* a clear blue solution is produced. Continue heating on the water-bath for 5 minutes; the solution remains blue and no precipitate is produced.

Heavy metals (2.3.13). Mix 4.0 g of Glycerin in 2 ml of *0.1 M hydrochloric acid* and dilute to 25 ml with *water*. The solution complies with the limit test for heavy metals, Method A (5 ppm).

Sulphated ash (2.3.18). Not more than 0.01 per cent, determined on 5.0 g after heating to boiling and ignition.

Water (2.3.43). Not more than 2.0 per cent, determined on 1.0 g.

Assay. Mix 75 mg in 45 ml of *water,* add 25.0 ml of a mixture of 1 volume of *0.1 M sulphuric acid* and 20 volumes of *0.1 M sodium periodate*. Allow to stand protected from light for 15 minutes. Add 5 ml of a 50 per cent w/v solution of *ethylene glycol,* allow to stand protected from light for 20 minutes and titrate with *0.1 M sodium hydroxide* using 0.5 ml of *phenolphthalein solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.00921 g of $C_3H_8O_3$.

Storage. Store protected from moisture.

Glycerin Oral Solution

Glycerin Oral Solution contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of glycerin, $C_3H_8O_3$.

Category. Soothing agent.

Usual strength. 50 per cent.

Identification

Heat a few drops with 500 mg of *potassium bisulphate* in a test tube; pungent vapors of acrolein are evolved.

Tests

pH (2.4.24). 5.5 to 7.5.

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Transfer 3 g of glycerin into a 500-ml volumetric flask, dilute with *water* to volume, and mix. Transfer 3 ml to a conical flask, add 100.0 ml of 0.3 per cent w/v solution of *potassium periodate* in *water*, swirl, and allow to stand at room temperature for 10 minutes. Add 4 g of *sodium bicarbonate* and 2 g of *potassium iodide*. Titrate immediately with *0.1 M potassium arsenite*, using 3 ml of *starch TS* as indicator. Carry out a blank titration.

1 ml of *0.1 M potassium arsenite* is equivalent to 0.002303 g of $C_3H_8O_3$.

Storage. Store protected from moisture.

Glyceryl Monostearate

Monostearin

Glyceryl Monostearate is a mixture of monoglycerides of stearic and palmitic acids, together with variable quantities of di- and triglycerides.

Glyceryl Monostearate contains not less than 35.0 per cent of monoglycerides, calculated as glyceryl monostearopalmitate, $C_{20}H_{40}O_4$, and not more than 7.0 per cent of free glycerin $C_3H_8O_3$, both calculated on the anhydrous basis.

Category. Pharmaceutical aid (emulsifying agent).

Description. A white or almost white, hard, waxy mass or unctuous powder or flakes.

Identification

A. Heat 1 g with 2 g of *potassium bisulphate* in an evaporating dish. Irritant, lachrymatory fumes are evolved which darken filter paper impregnated with *alkaline potassium mercuri-iodide solution.*

B. Heat 2.5 g with 40 ml of *ethanolic potassium hydroxide solution* for 30 minutes on a water-bath under a reflux condenser. Add 30 ml of *water*, evaporate the *ethanol*, acidify the hot mixture with 15 ml of *dilute hydrochloric acid*, cool and extract with 50 ml of *ether*. Wash the *ether* layer with two quantities, each of 10 ml, of a 20 per cent w/v solution of *sodium chloride*, dry the ether extract over *anhydrous sodium sulphate* and filter. Evaporate the solvent and dry the residue under reduced pressure. Melt the residue and fill one or two capillary tubes (for the determination of melting range) and allow to stand for 24 hours in a desiccator. Carry out the determination of melting range by Method II (2.4.21); the residue melts at 54° to 64°.

Tests

Acid value (2.3.23). Not more than 5.0, determined on 0.5 g dissolved in 50 ml of a mixture of equal volumes of *ethanol (95 per cent)* and *ether*.

Saponification value (2.3.37). 155 to 170.

Iodine value (2.3.28). Not more than 5.0 *(iodine bromide method)*.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 2.0 per cent, determined on 0.5 g dissolved in a mixture of 10 ml of *anhydrous methanol* and 10 ml of anhydrous *chloroform*.

Assay. Weigh 0.4 g and dissolve in 50 ml of *dichloromethane* in a glass-stoppered separating funnel. Add 25 ml of *water* and shake vigorously for 1 minute. Allow the layers to separate (if an emulsion is formed, add a few drops of *glacial acetic acid)*. Repeat the extraction with three further quantities, of 25, 20 and 20 ml, of *water* and reserve the dichloromethane solution (solution A). Filter the combined aqueous extracts through a filter paper moistened with *water*, wash the filter with two quantities, each of 5 ml, of *water* and dilute the combined filtrate and washings to 100.0 ml with *water* (solution B).

For monoglycerides — Filter solution A through a cotton wool plug. Wash the separating funnel and the filter with three quantities, each of 5 ml, of *dichloromethane*. Dilute the combined filtrate and washings to 100.0 ml with *dichloromethane*. To 25.0 ml of the solution add 25.0 ml of *periodic-acetic acid solution*, shake cautiously, allow to stand at 25° to 30° for 30 minutes, add 100 ml of *water* and 12 ml of *potassium iodide solution*. Titrate the liberated iodine with *0.1 M sodium thiosulphate* using 1 ml of *starch solution* as indicator. Repeat the determination using 25 ml of *dichloromethane* instead of 25.0 ml of the solution under examination. The difference between the titrations represents the amount of sodium thiosulphate required.

1 ml of *0.1 M sodium thiosulphate* is equivalent to 0.0172 g of monoglycerides, calculated as glyceryl monostearo-palmitate, $C_{20}H_{40}O_4$.

The quantity of *0.1 M sodium thiosulphate* used in the assay is not less than 85 per cent of the quantity of *sodium thiosulphate* used in the blank assay.

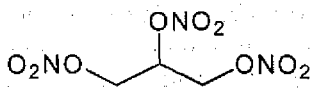
For free glycerin — To 50.0 ml of solution B in a 400-ml conical flask fitted with a ground-glass stopper add 25.0 ml of *periodic-acetic acid solution*, shake cautiously, allow to stand at 25° to 30° for 30 minutes, add 100 ml of *water* and 12 ml of *potassium iodide solution*. Titrate the liberated iodine with *0.1 M sodium thiosulphate* using 1 ml of *starch solution* as indicator. Repeat the determination using 50 ml of *water* instead of 50 ml of the solution under examination. The difference between the titrations represents the amount of *sodium thiosulphate* required.

1 ml of *0.1 M sodium thiosulphate* is equivalent to 0.0023 g of glycerin, calculated as $C_3H_8O_3$.

Storage. Store protected from light.

Diluted Glyceryl Trinitrate

Diluted Nitroglycerin



$C_3H_5N_3O_9$ Mol. Wt. 227.1

Diluted Glyceryl Trinitrate is 1,2,3-Propanetriol trinitrate.

Diluted Glyceryl Trinitrate is a mixture of nitroglycerin with lactose, dextrose, alcohol, propylene glycol, or other suitable inert excipient to permit safe handling.

Diluted Glyceryl Trinitrate contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of $C_3H_5N_3O_9$. It usually contains not more than 10.0 per cent of glyceryl trinitrate.

CAUTION — Undiluted glyceryl trinitrate can be exploded by percussion or excessive heat. Proper precautions should be exercised in handling it and only exceedingly small amounts should be isolated.

Category. Coronary vasodilator.

Description.A clear, colourless to pale yellow solution or a white powder depending upon the diluent.

Identification

A. In the test of Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to the spot in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 80 volumes of *toluene* and 20 volumes of *ethyl acetate*.

Spray reagent. Dissolve 1g of *diphenylamine* to 100.0 ml with *methanol*.

Test solution (a). Dissolve a quantity of the substance under examination in *methanol* to obtain a solution containing 1.0 per cent w/v of nitroglycerin and centrifuge, if necessary, to obtain a clear liquid solution or apply directly 1.0 per cent w/v nitroglycerin.

Test solution (b). Dilute test solution (a) in *methanol* to obtain 0.04 per cent w/v of nitroglycerin.

Reference solution. Dissolve a quantity of *diluted glyceryl trinitrate IPRS* in *methanol* to obtain 0.04 per cent w/v of nitroglycerin.

Apply to the plate 40 µl each of test solution (a) and (b); 5, 10, 15 and 20 µl of reference solutions. Allow the mobile phase to raise 8 cm. Dry the plate in air and spray the plate with spray reagent and irradiate the plate with short and long wavelength UV light for 15 minutes. Any secondary spot in the chromatogram obtained with the test solution (a) is not more intense than the spot in the chromatogram obtained with the reference solution of 20 µl. Compare the intensities of any secondary spots obtained with test solution (a) with those of the principal spots obtain with the reference solution (Corresponding to 0.5 per cent, 1.0 per cent, 1.5 per cent and 2.0 per cent respectively). The sums of the intensities of all the secondary spots are not more than 3.0 per cent. [Note: Nitrates of glycerin typically R_f values of 0.21, 0.37, and 0.61 for mono-, di- and tri-substituted glycerins, respectively]

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve a quantity of the substance under examination equivalent to 7.5 mg of the Glyceryl Trinitrate in 75 ml of mobile phase. If necessary, sonicate for 2 minutes or until the solid is totally dispersed, than shake by mechanical means for 30 minutes and dilute to 100.0 ml with the mobile phase.

Reference solution. Dissolve a quantity of *diluted glyceryl trinitrate IPRS* to obtain 0.0075 per cent w/v of Glyceryl Trinitrate in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of *methanol* and 50 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation is not more than 3.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_3H_5N_3O_9$.

Storage. Store protected from light at a temperature between15° and 30°.

Glyceryl Trinitrate Tablets

Nitroglycerin Tablets; Trinitrin Tablets

Glyceryl Trinitrate Tablets contain not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of glyceryl trinitrate, $C_3H_5N_3O_9$.

Usual strengths. 300 µg; 500 µg; 600 µg.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 80 volumes of *toluene*, 20 volumes of *ethyl acetate* and 5 volumes of *glacial acetic acid*.

Test solution. Extract a quantity of the powdered tablets containing 1 mg of glyceryl trinitrate with 1 ml of *acetone* in a glass stoppered vessel; shake for 30 minutes and filter.

Reference solution. Dissolve a quantity of *diluted glyceryl trinitrate IPRS* in *acetone* to obtain 0.1 per cent w/v of nitroglycerin.

Apply to the plate 20 µl of each solution. Allow the mobile phase to raise 8 cm. Dry the plate in air, spray with *diphenylamine solution*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to peak in the chromatogram obtained with the reference solution.

Tests

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay using the following test solution.

Test solution. Disperse one intact tablet with sufficient mobile phase to produce 0.0075 per cent w/v of nitroglycerin..

Inject reference solution and the test solution.

Calculate the content of $C_3H_5N_3O_9$ in the tablets.

Other tests. Comply with the tests stated under Tablets. The test for Disintegration does not apply.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 7.5 mg of Glyceryl Trinitrate in 75 ml of mobile phase. If necessary, sonicate for 2 minutes or until the solid is totally dispersed, than shake by mechanical means for 30 minutes and dilute to 100.0 ml with the mobile phase.

Reference solution. Dissolve a quantity of *diluted glyceryl trinitrate IPRS* to obtain 0.0075 per cent w/v of Glyceryl Trinitrate in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),

- mobile phase: a mixture of 50 volumes of *methanol* and 50 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation is not more than 3.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_3H_5N_3O_9$ in the tablets.

Storage. Store protected from light and moisture in glass containers of not more than 100 tablets, at a temperature not exceeding 30°. The container should be closed by means of a screw cap lined with aluminium or tin foil. Cotton wool wadding or other additional packing that absorbs glyceryl trinitrate should be avoided.

Labelling. The label states that the tablets should be allowed to dissolve slowly in the mouth.

Glycine Irrigation Solution

Glycine Irrigation Solution is a sterile solution of Glycine in Water for Injections.

Glycine Irrigation Solution contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of $C_2H_5NO_2$. It contains no antimicrobial agent.

Usual strength. 1.5 per cent w/v.

Description. A clear, colourless solution.

Identification

A. Evaporate 5 ml to dryness on a water-bath and dry at 105° for one hour. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *glycine IPRS* or with the reference spectrum of glycine.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 70 volumes of *1-propanol* and 30 volumes of *strong ammonia solution*.

Test solution. Dilute a suitable volume of the preparation under examination with *water* so that the resulting solution contains 0.25 per cent w/v of Glycine.

Reference solution. A 0.25 per cent w/v solution of *glycine IPRS*.

Apply to the plate 2 µl of each solution. After development, dry the plate at 105° for 10 minutes, spray with *ninhydrin solution* and heat at 105° for 2 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 4.5 to 6.5.

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

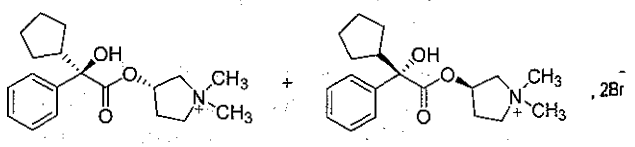
Assay. Dilute a measured volume of the preparation under examination containing about 0.15 g of Glycine to 25 ml with *water*. Add 10 ml of *formaldehyde solution*, previously adjusted to a pH of 9.0, and 0.25 ml of a mixed indicator solution prepared by dissolving 75 mg of *phenolphthalein* and 25 mg of *thymol blue* in 100 ml of *ethanol (50 per cent)*. Titrate with *0.1 M sodium hydroxide* until the yellow colour disappears and a faint violet colour appears.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.007507 g of $C_2H_5NO_2$.

Storage. Store in single dose containers at a temperature not exceeding 30°.

Labelling. The label states (1) Not for Injection; (2) that the solution should not be used if it contains visible particles.

Glycopyrrolate



$C_{19}H_{28}BrNO_3$ Mol. Wt. 398.3

Glycopyrrolate is Pyrrolidinium, 3-[(*SR*)-(cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethyl-,[*IPRS*-]bromide.

Glycopyrrolate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{19}H_{28}BrNO_3$, calculated on the dried basis.

Category. Anticholinergic.

Description. A white crystalline powder; hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *glycopyrrolate IPRS* or with the reference spectrum of glycopyrrolate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. It gives the reactions of bromides (2.3.1).

Tests

Related substances. A. Determine by liquid chromatography (2.4.14).

NOTE — Used when the synthetic route is 5-nitroisopthalic acid may be present.

Buffer solution. A buffer solution prepared by dissolving 1.0 g of *anhydrous sodium sulphate* and 200 mg of *sodium 1-hexanesulphonate monohydrate* in 650 ml of *water*, to this solution add 3.0 ml of *0.5 M sulphuric acid*, and mix,

Solvent mixture. Prepare a solution of 1.0 g of *anhydrous sodium sulphate*, 6.8 g of *monobasic potassium phosphate*, and 200 mg of *sodium 1-hexanesulphonate monohydrate* in 650 ml of *water*. To this solution add 3.0 ml of *0.5M sulphuric acid*, 150 ml of *methanol* and 200 ml of *acetonitrile* and mix. Adjusted to pH 2.8 with *orthophosphoric acid.*

Test solution. Dissolve 25 mg of the substance under examination in 25.0 ml of *solvent mixture.*

Reference solution. A solution containing 0.00015 per cent w/v each of *glycopyrrolate IPRS, glycopyrrolate related compound A IPRS, glycopyrrolate related compound B IPRS, glycopyrrolate related compound C IPRS* in *solvent mixture.*

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. 20 volumes of *acetonitrile*, 15 volumes of *methanol* and 65 volumes of buffer solution,
  B. 50 volumes of *acetonitrile*, 15 volumes of *methanol* and 35 volumes of a buffer solution,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 222 nm,
- injection volume: 50 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)

Glycopyrrolate related compound A[1]	0.45
Glycopyrrolate	1.00
Glycopyrrolate related compound B[2]	1.14
Glycopyrrolate related compound C[3]	2.68
Individual impurity	—
Total impurity	—

[1]5-Nitrobenzene-1,3-dicarboxylic acid.

[2]1-Methylpyrrolidin-3-yl-2-cyclopentyl-2-hydroxy-2-phenylacetate.

[3]2-Cyclopentyl-2-hydroxy-2-phenylacetic acid.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to glycopyrrolate and glycopyrrolate related compound B is not less than 2.0, the tailing factor is not more than 2.0, the relative standard deviation is not more than 6.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of peaks due to glycopyrrolate related compound A, glycopyrrolate related compound B, related compound C is not more than the area of the peak due to glycopyrrolate in the chromatogram obtained with reference solution (0.15 per cent), the area of any secondary peak is not more than 0.66 times the area of the peak due to glycopyrrolate in the chromatogram obtained with reference solution (0.10 per cent) and the sum of the areas of all the secondary peaks is not more than 3.33 times the area of the glycopyrrolate peak in the chromatogram obtained with reference solution (0.50 per cent).

NOTE — If the Related substances test other than A is used the label states the article complies with Related substances B.

B. Determine by liquid chromatography (2.4.14).

NOTE—Used when the synthetic route is didehydroglycopyrrolate, chloroglycopyrrolate and methyl cyclopentylmandelate may be present.

Buffer solution. A buffer solution prepared by dissolving 3.4 g of *monobasic potassium phosphate* in 1000 ml of *water*, adjusted to pH 2.5 ± 0.2 with *orthophosphoric acid.*

Solvent mixture. Equal volume of *acetonitrile* and *buffer solution.*

Test solution. Dissolve 25 mg of the substance under examination in 50.0 ml of solvent mixture.

Reference solution (a). A solution containing 0.05 per cent w/v of *glycopyrrolate IPRS*, and 0.0001 per cent w/v of each benzoic acid, *glycopyrrolate related compound B IPRS, glycopyrrolate related compound C IPRS, glycopyrrolate related compound I IPRS* and *glycopyrrolate related compound L IPRS* in the solvent mixture.

Reference solution (b). A 0.0001 per cent w/v solution of *glycopyrrolate IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 10 cm x 2.1 mm, packed with octadecylsilane bonded to porous silica (1.7 µm),
- column temperature: 45°,

Name	Relative retention time	Correction factor
Benzoic Acid	0.82	0.32
Didehydroglycopyrrolate[1]	0.89	1.00
Glycopyrrolate	1.00	—
Glycopyrrolate base[2]	1.06	0.71
Chloroglycopyrrolate[3]	1.22	0.71
Cyclopentylmandelicacid[4]	1.32	0.53
Methyl cyclopentylmandelate[5]	1.52	0.56
Individual impurity	—	1.00
Total impurity	—	—

[1]3-[2-(cyclopent-1-en-1-yl)-2-hydroxy-2-phenylacetoxy]-1,1-dimethylpyrrolidin-1-ium bromide,

[2]1-Methylpyrrolidin-3-yl-2-cyclopentyl-2-hydroxy-2-phenylacetate,

[3](RS)-3-[(SR)-2-(4-chlorophenyl)-2-cyclopentyl-2-hydroxyacetoxy]-1,1-dimethylpyrrolidin-1-ium bromide,

[4]2-Cyclopentyl-2-hydroxy-2-phenylacetic acid,

[5]Methyl 2-cyclopentyl-2-hydroxy-2-phenylacetate.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to glycopyrrolate and glycopyrrolate related compound B is not less than 2.0. the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of peaks due to benzoic acid, didehydroglycopyrrolate, glycopyrrolate related compound B, glycopyrrolate related compound I, related compound C and related compound L is not more than 0.75 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent), the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent) and the sum of the areas of all the secondary peaks is not more than 5.0 times the area of the peak in the chromatogram obtained with reference solution (b) (1.0 per cent).

Limit of Erythro Isomer. Determine by liquid chromatography (2.4.14).

Buffer solution. A buffer solution prepared by dissolving 2.8 g of *monobasic sodium phosphate* in 1000 ml of *water*, adjusted to pH 6.5 ± 0.05 with *dilute sodium hydroxide solution*.

Test solution. Dissolve 25 mg of the substance under examination in 50.0 ml of the mobile phase.

Reference solution (a). A solution containing 0.004 per cent w/v of each *glycopyrrolate erythro isomer IPRS* and *glycopyrrolate IPRS* in *mobile phase*.

Reference solution (b). A 0.001 per cent w/v solution of *glycopyrrolate IPRS* in mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm, packed with beta cyclodextrin bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of *methanol*, 10 volumes of *acetonitrile* and 40 volumes of a buffer solution,
- flow rate: 1 ml per minute,
- spectrophotometer set at 222 nm,
- injection volume: 10 µl.

Name	Relative retention time
Erythro isomer (*R,R/S,S*-glycopyrrolate)[1]	0.89
Glycopyrrolate	1.00

[1](*RS*)-3-[(*RS*)-2-cyclopentyl-2-hydroxy-2-phenylacetoxy]-1,1-dimethylpyrrolidinium bromide.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to erythro isomer and glycopyrrolate is not less than 1.2.

Inject reference solution (b). The tailing factor is not more than 2.0. and the relative standard deviation for replicate injections is not more than 6.0 per cent

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of impurity due to erythro isomer (*R,R/S,S*-glycopyrrolate) is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent).

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *glycopyrrolate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica or ceramic microparticles (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 65 volumes of a buffer solution prepared by dissolving 1.0 g of *anhydrous sodium sulphate* and 200 mg of *sodium 1-hexanesuphonate monohydrate* in 650 ml of *water*; to this solution add 3.0 ml of *0.5 M sulphuric acid*, 20 volumes of *acetonitrile* and 15 volumes of *methanol*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 222 nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{28}BrNO_3$.

Storage. Store protected from moisture.

Glycopyrrolate Injection

Glycopyrrolate Injection is a sterile solution of Glycopyrrolate in Water for Injection.

Glycopyrrolate Injection contains not less than 93.0 per cent and not more than 107.0 per cent of the stated amount of glycopyrrolate, $C_{19}H_{28}BrNO_3$.

Usual strengths. 0.2 mg per ml; 2 mg per 10 ml.

Identification

Determine by thin layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 30 volumes of *butyl alcohol*, 10 volumes of *glacial acetic acid* and 10 volumes of *water*.

Spray reagent. A solution prepared immediately by dissolving 2 g of *bismuth subnitrate* in a mixture of 100.0 ml of *water*, and 25.0 ml with *glacial acetic acid* (solution A). Dissolve 40 g of *potassium iodide* in 100.0 ml of *water* (solution B). Mix 10 ml of *(solution A)* and 10 ml of *(solution B)* and add to a solution containing 100 ml of *water* and 20 ml of *glacial acetic acid*.

Test solution. Dilute a volume of injection to obtain a solution containing 0.01 per cent w/v of glycopyrrolate in *water*.

Reference solution. A 0.01 per cent w/v solution of *glycopyrrolate IPRS* in *water*.

Apply to the plate 30 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and spray with reagent. The R_f values and colour of the principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 2.0 to 3.0.

Bacterial Endotoxins (2.2.3). Not more than 555.5 Endotoxin Units per mg of glycopyrrolate.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of injection containing 5 mg of Glycopyrrolate to 25.0 ml with *mobile phase*.

Reference solution (a). A solution containing 0.02 per cent w/v of *glycopyrrolate IPRS* in *mobile phase*.

Reference solution (b). A 0.05 per cent w/v solution of *benzaldehyde* in *mobile phase*. Dilute 2.0 ml of the solution to 25 ml in reference solution (a).

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A buffer solution prepared by dissolving 1.0 g of *anhydrous sodium sulphate* and 200 mg of *sodium pentanesulphonate monohydrate* in 615 ml of *water*; add 3.0 ml of *0.5 M sulphuric acid*, 235 ml of *acetonitrile* and 150 ml of *methanol* in a 1000-ml volumetric flask,
- flow rate: 2 ml per minute,
- spectrophotometer set at 222 nm,
- injection volume: 35 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to benzaldehyde and glycopyrrolate is not less than 3.0.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject reference solution (a) and the test solution .

Calculate the content of $C_{19}H_{28}BrNO_3$ in the injection.

Storage. Store in single dose or multi dose containers, preferably of Type I glass.

Glycopyrrolate Tablets

Glycopyrrolate Tablets contain not less than 93.0 per cent and not more than 107.0 per cent of the stated amount of glycopyrrolate, $C_{19}H_{28}BrNO_3$.

Usual strength. 1 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 500 ml of *water*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter, rejecting the first few ml of filtrate, store the solution at 5°.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate.

Reference solution. Dissolve a sufficient quantity of *glycopyrrolate IPRS* in minimum quantity of *methanol*, dilute with the dissolution medium to obtain a solution having the concentration similar to the expected concentration of the test solution. Store the solution at 5°.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- sample temperature: 5°,
- mobile phase: a mixture of 620 volumes of a buffer solution prepared by dissolving 1.0 g of *anhydrous sodium sulphate* and 200 mg of *sodium 1-pentanesulphonate* in 620 ml of *water*, 200 volumes of *acetonitrile*, 180 volumes of *methanol* and 3 volumes of *0.5M sulphuric acid*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 80 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Q. Not less than 75 per cent of the stated amount of $C_{19}H_{28}BrNO_3$.

Related substances. Determine by liquid chromatography (2.4.14).

Buffer solution. A buffer solution prepared by dissolving 1.0 g of *anhydrous sodium sulphate* and 200 mg of *sodium 1-hexanesulphonate monohydrate* in 650 ml of *water*, to this solution add 3.0 ml of *0.5 M sulphuric acid*, and mix.

Solvent mixture. Dissolve 1.0 g of *anhydrous sodium sulphate*, 6.8 g of *monobasic potassium phosphate*, and 200 mg of *sodium 1-hexanesulfonate monohydrate* in 650 ml of *water*. To this solution add 3.0 ml of *0.5M sulphuric acid*, 150 ml of *methanol* and 200 ml of *acetonitrile* and mix. Adjust the pH to 2.8 with *ortho phosphoric acid*.

Test solution. Shake a quantity of the powdered tablets containing 12.5 mg of Glycopyrrolate with 15 ml of the solvent mixture and disperse with the aid of ultrasound for 10 minutes. Shake further, if necessary, dilute to 25.0 ml with solvent mixture and filter through suitable filter, rejecting the first few ml of filtrate.

Reference solution. A solution containing 0.00015 per cent w/v each of *glycopyrrolate IPRS*, *glycopyrrolate related compound B IPRS* and *glycopyrrolate related compound C IPRS* in *solvent mixture*.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. 20 volumes of *acetonitrile*, 15 volumes of *methanol* and 65 volumes of the buffer solution,
  B. 50 volumes of *acetonitrile*, 15 volumes of *methanol* and 35 volumes of the buffer solution,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 222 nm,
- injection volume: 50 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
10	100	0
25	10	90
35	10	90
37	100	0
45	100	0

Name	Relative retention time
Glycopyrrolate related compound A[1]	0.45
Glycopyrrolate	1.00
Glycopyrrolate related compound B[2]	1.14
Glycopyrrolate related compound C[3]	2.68
Individual impurity	—
Total impurity	—

[5-Nitrobenzene-1,3-dicarboxylic acid,

[1-Methylpyrrolidin-3-yl-2-cyclopentyl-2-hydroxy-2-phenylacetate,

[2-Cyclopentyl-2-hydroxy-2-phenylacetic acid.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to glycopyrrolate and glycopyrrolate related compound B is not less than 2.0, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 6.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of impurity due to glycopyrrolate related compound C is not more than 1.7 times the area of the principal peak in the chromatogram obtained with reference solution (0.5 per cent), the area of any secondary peak is not more than 0.67 times the area of the principal peak in the chromatogram obtained with reference solution (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 4.0 times the area of the peak in the chromatogram obtained with reference solution (1.2 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Disperse one tablet in 5.0 ml of the mobile phase, with the aid of ultrasound for 10 minutes and dilute to 10.0 ml with the mobile phase. Centrifuge and use the supernatant liquid. Dilute further, if necessary, with the mobile phase.

Calculate the content of $C_{19}H_{28}BrNO_3$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 10 mg of Glycopyrrolate add 75 ml of mobile phase and disperse by shaking for 30 minutes and mixing if necessary with the aid of ultrasound for further 10 minutes. Dilute to 100.0 ml with the mobile phase, centrifuge and use the filtrate.

Reference solution. A 0.01 per cent w/v solution of *glycopyrrolate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica or ceramic microparticles (5 µm),
- mobile phase: a mixture of 65 volumes of a buffer solution prepared by dissolving 1.0 g of *anhydrous sodium sulphate* and 200 mg of *sodium 1-hexanesuphonate monohydrate* in 650 ml of *water*, to this solution add 3.0 ml of *0.5 M sulphuric acid*, 20 volumes of *acetonitrile* and 15 volumes of *methanol*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 222 nm,
- injection volume: 50 µl.

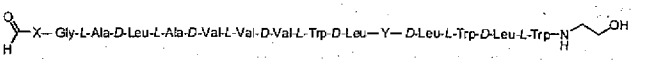
Inject the reference solution.The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{28}BrNO_3$ in the tablets.

Storage. Store protected from moisture.

Gramicidin



Gramicidin	X	Y	Mol. Formula	Mol. Wt.
A1	*L*-Val	*L*-Trp	$C_{99}H_{140}N_{20}O_{17}$	1882
A2	*L*-Ile	*L*-Trp	$C_{100}H_{142}N_{20}O_{17}$	1896
B1	*L*-Val	*L*-Phe	$C_{97}H_{139}N_{19}O_{17}$	1843
C1	*L*-Val	*L*-Tyr	$C_{97}H_{139}N_{19}O_{18}$	1859
C2	*L*-Ile	*L*-Tyr	$C_{98}H_{141}N_{19}O_{18}$	1873

Category. Polypeptide Antibacterial.

Gramicidin consists of a family of antimicrobial linear polypeptides substance obtained by extraction from tyrothricin and produced by fermentation broth of *Brevibacillus brevis* Dubos. The main component is gramicidin A1, together with gramicidins A2, B1, C1 and C2 in particular.

Gramacidin has potency not less than 900 Units per mg, calculated on the dried basis.

Description. A white or almost white crystalline powder; slightly hygroscopic.

Identification

Test B may be omitted if tests A and C are carried out. Tests C may be omitted if test A and B is carried out.

A. Dissolve 0.10 g in *ethanol* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of the solution to 100.0 ml with *ethanol*. When examined in the range 240 nm to 320 nm (2.4.7), the resulting solution shows absorption maxima, at about 282 nm and about 290 nm, a shoulder at about 275 nm and an absorption minimum at about 247 nm. The specific absorbance at the maximum at about 282 nm is 105 to 125.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 3 volumes of *methanol,* 9 volumes of *butanol,* 15 volumes of *water,* 24 volumes of *glacial acetic acid* and 49 volumes of *butyl acetate.*

Test solution. Dissolve 5 mg of the substance under examination in 6.0 ml of *ethanol.*

Reference solution (a). Dissolve 5 mg of *gramicidin IPRS* in 6.0 ml of *ethanol.*

Reference solution (b). Dissolve 5 mg of *tyrothricin IPRS* in 6.0 ml of *ethanol.*

Apply to the plate 1 µl of each solution. After development, dry the plate in air, spray with *dimethylaminobenzaldehyde solution* and heat at 90° until the spots appear. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatograms obtained with reference solution (a) and (b).

C. In the test for Composition, the retention time of three principal peak in the chromatogram obtained with test solution corresponds to the three peak in the chromatogram obtained with reference solution (a).

Tests

Composition. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 10 ml of *methanol* and dilute to 25.0 ml with mobile phase.

Reference solution (a). Dissolve 25 mg of *gramicidin IPRS* in 10 ml of *methanol* and dilute to 25.0 ml with mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 50.0 ml with mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with base dectivated end capped octadecylsilane bonded to porous silica (5 µm),
- column temperature: 50°,
- mobile phase: a mixture of 71 volumes of *methanol* and 29 volumes of *water.*
- flow rate: 1 ml per minute,
- spectrophotometer set at 282 nm,
- injection volume: 20 µl.

Name	Relative retention time
Gramicidin impurity C1[1]	0.7
Gramicidin impurity C2[2]	0.8
Gramicidin A1(Retention time: about 22 minutes)	1.0
Gramicidin impurity A2[3]	1.2
Gramicidin impurity B1[4]	1.9

[1][10-methionine]gramicidin C1.

[2]gramicidin C2

[3]gramicidin A2 3-hydroxypropyl.

[4]gramicidin B1.

Inject reference solution (a). Run the chromatogram 2.5 times the retention time of gramicidin A1. The test is not valid unless the resolution between the peak due to gramicidin A1 and gramicidin A2 is not less than 1.5.

Inject reference solution (b) and the test solution. The ratio of the content of gramicidin A1 to the sum of the contents of gramicidins A1, A2, B1, C1 and C2 is not less than 60.0 per cent and sum of the contents of gramicidins A1, A2, B1, C1 and C2 is not less than 95.0 per cent. Ignore any peak with area due to gramicidin A1 in the chromatogram obtained with reference solution (b).

Related substances. Determine by liquid chromatography (2.4.14) as described under Composition.

The area peaks other than principal peak in the chromatogram obtained with test solution is not more than 2.0 per cent and not more than 1 peak is more than 1.0 per cent. Ignore any peak with area due to gramicidin A1, A2, B1, C1 and C2.

Melting point (2.4.21). About 230°.

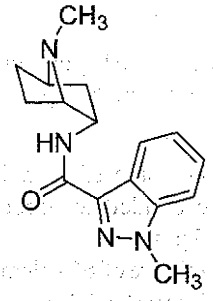
Sulphated ash (2.3.18). Not more than 1.0 per cent, determined on 1.0 g.

Loss on drying (2.4.19). Not more than 3.0 per cent, determined on 1.0 g by drying in an oven at 60° over *diphosphorus pentoxide* at a pressure not exceeding 0.1 kPa for 3 hours.

Assay. Determine by the microbiological assay of antibiotics, Method B (2.2.10), and express the result in Units of gramicidin per mg.

Storage. Store protected from light and moisture.

Granisetron



$C_{18}H_{24}N_4O$ Mol. Wt. 312.4

Granisetron is 1-Methyl-*N*-(9-methyl-endo-9-azabicyclo[3.3.1] non-3-yl]-1*H*-indazole-3-carboxamide.

Granisetron contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{18}H_{24}N_4O$, calculated on the dried basis.

Category. As Antiemetic in cytotoxic drug induced nausea and vomiting.

Description. An off white to pale yellow powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *granisetron IPRS* or with the reference spectrum of granisetron.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Impurity E. Not more than 0.15 per cent. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G.*

Solvent mixture. 20 volumes of *water* and 80 volumes of *acetonitrile.*

Mobile phase. 6.5 volumes of *ammonium hydroxide,* 30 volumes of *2-propanol* and 50 volumes of *ethyl acetate.*

Test solution. Dissolve 0.5 g of the substance under examination in 10.0 ml of the solvent mixture.

Reference solution. A 0.0075 per cent w/v solution of *granisetron impurity E IPRS* in the solvent mixture.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and expose it to iodine vapours for 30 minutes. Any secondary spot, corresponding to the spot obtained with the reference solution, in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Related substances. Determine by liquid chromatography (2.4.14).

(*NOTE — Protect the solutions from light and use the solutions within 4 hours.*)

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the same solvent.

Reference solution (a). A 0.0001 per cent w/v solution of *granisetron IPRS* in the mobile phase.

Reference solution (b). Transfer 2 ml of the test solution to a colourless glass vial, stopper it and expose the solution either to sunlight for 4 hours or under a UV lamp for 16 hours (partial degradation of granisetron to generate impurity C). A degradation of at least about 0.3 per cent of granisetron to impurity C must be obtained as shown by appearance of a corresponding peak in the chromatogram. If not, expose the solution once again to sunlight or under a UV lamp.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 80 volumes of *water,* 20 volumes of *acetonitrile,* 0.1 volume of *hexylamine* and 0.16 volume of *orthophosphoric acid.* Adjusted to pH 7.5 ± 0.05 with *triethylamine,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 305 nm,
- injection volume: 10 µl.

Name	Relative retention time
Granisetron impurity D[4]	0.4
Granisetron impurity B[2]	0.5
Granisetron impurity A[1]	0.7
Granisetron impurity C[3]	0.8
Granisetron	1.0

[1] 2-methyl-*N*-[(1*R*,3r,5*S*)-9-methyl-9-azabicyclo[3.3.1]non-3-yl]-2*H*-indazole-3-carboxamide,

[2] *N*-[(1*R*,3r,5*S*)-9-methyl-9-azabicyclo[3.3.1]nons-3-yl]-1*H*-indazole-3-carboxamide,

[3] *N*-[(1*R*,3r,5*S*)-9-azabicyclo[3.3.1]non-3-yl]-1-methyl-1*H*-indazole-3-carboxamide,

[4] 1-methyl-1*H*-indazole-3-carboxylic acid.

Run the chromatogram twice the retention time of peak due to granisetron.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to impurity C and granisetron is not less than 3.5 and the tailing factor is not more than 2.0 in the chromatogram obtained with reference solution (b). The relative standard deviation for replicate injections is not more than 5.0 per cent using granisetron peak in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to granisetron impurity A and granisetron impurity B is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent). The area of any peak due to granisetron impurity C is not more than two times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). The area of any peak due to granisetron impurity D is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained

with reference solution (a) (0.1 per cent). The sum of areas of all secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modification.

Reference solution (a). A 0.1 per cent w/v solution of *granisetron IPRS* in the mobile phase.

Reference solution (b). Transfer 2 ml of the test solution to a colourless glass vial, stopper it and expose the solution either to sunlight for 4 hour or under a UV lamp for 16 hour (partial degradation of granisetron to impurity C). A degradation of at least about 0.3 per cent of granisetron to impurity C must be obtained as shown by appearance of a corresponding peak in the chromatogram. If not, expose the solution once again to sunlight or under a UV lamp.

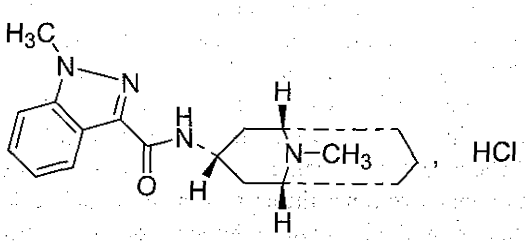
Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to impurity C and granisetron is not less than 3.5 and the tailing factor is not more than 2.0 in the chromatogram obtained with reference solution (b). The relative standard deviation for replicate injections is not more than 0.73 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_{18}H_{24}N_4O$.

Storage. Store protected from light and moisture.

Granisetron Hydrochloride



$C_{18}H_{25}ClN_4O$ Mol. Wt. 348.9

Granisetron Hydrochloride is 1-Methyl-*N*-[(1*R*,3*r*,5*S*)-9-methyl-9-azabicyclo[3.3.1]non-3-yl]-1*H*-indazole-3-carboxamide hydrochloride.

Granisetron Hydrochloride contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{18}H_{25}ClN_4O$, calculated on the dried basis.

Category. As Antiemetic in cytotoxic drug induced nausea and vomiting.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *granisetron hydrochloride IPRS* or with the reference spectrum of granisetron hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

C. A 1.0 per cent w/v solution gives the reaction (A) of chlorides (2.3.1).

Tests

pH (2.4.24). 4.0 to 6.5, determined in a 1.0 per cent w/v solution.

Impurity E. Determine by thin layer chromatography (2.4.17), coating the plate with *silica gel* GF_{254}.

Solvent mixture. 20 volumes of *water* and 80 volumes of *acetonitrile.*

Mobile phase. A mixture of 6.5 volumes of *ammonia*, 30 volumes of *2-propanol* and 50 volumes of *ethyl acetate.*

Test solution. Dissolve 0.5 g of the substance under examination in 10.0 ml of the solvent mixture.

Reference solution. A 0.025 per cent w/v solution of *granisetron impurity E IPRS [(1R,3r,5S)-9-methyl-9-azabicyclo(3.3.1)nonan-3-amine)]* in the solvent mixture.

Apply to the plate 2 µl of each solution. After development, dry the plate in air and expose it to iodine vapours for 30 minutes. Any secondary spot, corresponding to the spot obtained with reference solution, in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Protect all the solutions from light.

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the same solvent.

Reference solution (a). A 0.1 per cent w/v solution of *granisetron hydrochloride IPRS* in the mobile phase.

Reference solution (b). Transfer 2 ml of the test solution to a colourless glass vial, stopper it and expose the solution either to sunlight for 4 hours or under a UV lamp for 16 hours (partial degradation of granisetron to generate impurity C). A degradation of at least about 0.3 per cent of granisetron to impurity C must be obtained as shown by appearance of a corresponding peak in the chromatogram. If not, expose the solution once again to sunlight or under a UV lamp.

Reference solution (c). Dilute 0.5 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (d). A solution containing 0.001 per cent w/v of *granisetron impurity A IPRS* and 0.0005 per cent w/v of *granisetron impurity B IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 80 volumes of *water*, 20 volumes of *acetonitrile*, 0.1 volume of *hexylamine* and 0.16 volume of *orthophosphoric acid*. Adjusted to pH 7.5 ± 0.05 with *triethylamine*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 305 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Granisetron impurity D[4]	0.4	---
Granisetron impurity B[2]	0.5	1.7
Granisetron impurity A[1]	0.7	---
Granisetron impurity C[3]	0.8	---
Granisetron	1.0	---

[1] 2-methyl-*N*-[(1R,3r,5S)-9-methyl-9-azabicyclo[3.3.1]non-3-yl]-2*H*-indazole-3-carboxamide,

[2] *N*-[(1R,3r,5S)-9-methyl-9-azabicyclo[3.3.1]nons-3-yl]-1*H*-indazole-3-carboxamide,

[3] *N*-[(1R,3r,5S)-9-azabicyclo[3.3.1]non-3-yl]-1-methyl-1*H*-indazole-3-carboxamide,

[4] 1-methyl-1*H*-indazole-3-carboxylic acid,

Run the chromatogram twice the retention time of peak due to granisetron.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to impurity C and granisetron is not less than 3.5 and the tailing factor is not more than 2.0 for granisetron peak. The relative standard deviation for replicate injections is not more than 10.0 per cent for granisetron peak.

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to impurity B is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent). The area of any peak corresponding to impurity C is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent). The area of any peak corresponding to impurity A is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent). The area of any peak corresponding to impurity D is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent). The area of any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent). The sum of areas of all secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modification.

Inject reference solution (a). The test is not valid unless the relative standard deviation is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{18}H_{25}ClN_4O$.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Granisetron Injection

Granisetron Hydrochloride Injection

Granisetron Injection is a sterile solution of Granisetron Hydrochloride in Water for Injections. It may contain suitable preservatives.

Granisetron Injection contains not less than 93.0 per cent and not more than 107.0 per cent of the stated amount of granisetron, $C_{18}H_{24}N_4O$.

Usual strength. 1 mg per ml.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 60 volumes of *methylene chloride*, 40 volumes of *alcohol*, 5 volumes of *water* and 2 volumes of *ammonium hydroxide*.

Test solution. Use the undiluted Injection.

Reference solution. Dissolve a quantity of *granisetron hydrochloride IPRS* in *water* to get similar concentration of the test solution.

Apply to the plate 20 µl each of the reference solution and the test solution. Allow the mobile phase to rise 15 cm. Dry the plate under a current of warm air for about 5 minutes and examine the plate under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to the spot in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.24). 4.0 to 6.0.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Perform the determination under subdued light and use amber autosampler vials and low-actinic glassware.

Buffer solution. Dissolve 15.6 g of *monobasic sodium phosphate dihydrate* in 900 ml of *water*, adjusted to pH 2.0 with *orthophosphoric acid* and dilute with *water* to 1000 ml.

Test solution. Dilute the sample with *water* if necessary to obtain a solution having a known concentration of 0.1 per cent w/v of granisetron.

Reference solution (a). A 0.011 per cent w/v solution of *granisetron hydrochloride IPRS* in *water*.

Reference solution (b). A solution containing 0.0001 per cent w/v of each granisetron hydrochloride, granisetron impurity B, C and D in a mixture of 75 volumes of *water* and 25 volumes of *methanol*.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, polar end-capped packed with octadecylsilane bonded to porous silica (4 µm),
- mobile phase: a mixture of 75 volumes of buffer solution, 24 volumes of *methanol* and 1.1 volume of *tetrahydrofuran*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 300 nm,
- injection volume: 15 µl.

Name	Relative retention time	Correction factor
Granisetron impurity A[1]	0.5 to 0.6	—
Granisetron impurity B[2]	0.7	1.25
Granisetron	1.0	—
Granisetron impurity C[3]	1.2	1.0
Granisetron impurity D[4]	2.1 to 2.3	0.67

[1]2-methyl-*N*-[(1*R*,3r,5*S*)-9-methyl-9-azabicyclo[3.3.1]non-3-yl]-2*H*-indazole-3-carboxamide,

[2]*N*-[(1*R*,3r,5*S*)-9-methyl-9-azabicyclo[3.3.1]non-3-yl]-1*H*-indazole-3-carboxamide,

[3]*N*-[(1*R*,3r,5*S*)-9-azabicyclo[3.3.1]non-3-yl]-1-methyl-1*H*-indazole-3-carboxamide,

[4]1-methyl-1*H*-indazole-3-carboxylic acid.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to impurity C and granisetron is not less than 2.

Inject reference solution (a) and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of peak corresponding to impurity C is not more than 0.07 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.7 per cent). The sum of areas of all known impurities peaks is not more than 0.13 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.3 per cent). The area of any other secondary peak is not more than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with relative retention time of about 0.5 to 0.6 for granisetron impurity A. Ignore any peak with an area less than 0.01 times the area of the principal peak obtained in reference solution (a) (0.1 per cent).

Bacterial endotoxins (2.2.3). Not more than 25 Endotoxin unit per mg of granisetron.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modification.

Test solution. A 0.011 per cent w/v solution of Granisetron Hydrochloride in *water*.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{18}H_{24}N_4O$ in the injection.

Storage. Store protected from light, at temperature not exceeding 30°.

Labelling. The label states (1) the strength in terms of the equivalent amount of granisetron in a suitable dose-volume; (2) the route of injection.

Granisetron Tablets

Granisetron Hydrochloride Tablets

Granisetron Tablets contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of granisetron, $C_{18}H_{24}N_4O$.

Usual strength. 1 mg.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 60 volumes of *methylene chloride*, 40 volumes of *alcohol*, 5 volumes of *water* and 2 volumes of *ammonium hydroxide*.

Test solution. Disperse a quantity of the powdered tablets containing 4 mg of Granisetron with 10 ml of *0.1 M hydrochloric acid* with the aid of ultrasound for 3 minutes and filter.

Reference solution. A 0.044 per cent w/v solution of *granisetron hydrochloride IPRS* in *0.1 M hydrochloric acid*.

Apply to the plate 20 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in a current of air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 500 ml of a phosphate buffer pH 6.5, prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 800 ml of *water*, adjusted to pH 6.5 with *1 M sodium hydroxide* and diluting to 1000 ml with *water*.

Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

NOTE—Perform the determination under subdued light and use amber autosampler vials and low-actinic glassware.

Buffer solution. Dissolve 15.6 g of *monobasic sodium phosphate dihydrate* in 900 ml of *water*, adjust to pH 2.0 with *orthophosphoric acid*, and dilute with *water* to 1000 ml.

Test solution. Use the filtrate, dilute if necessary, with the buffer solution.

Reference solution. Dissolve a quantity of *granisetron hydrochloride IPRS* in the buffer solution to obtain a solution of known concentration similar to the test solution.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, polar end-capped packed with octadecylsilane bonded to porous silica (4 µm),
- mobile phase: a mixture of 75 volumes of buffer solution, 24 volumes of *methanol* and 1.1 volume of *tetrahydrofuran*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 300 nm,
- injection volume: 100 µl.

Inject the reference solution and the test solution.

Q. Not less than 75 per cent of the stated amount of $C_{18}H_{24}N_4O$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Perform the determination under subdued light and use amber autosampler vials and low-actinic glassware.

Buffer solution. Dissolve 15.6 g of *monobasic sodium phosphate dihydrate* in 900 ml of *water*, adjust to pH 2.0 with *orthophosphoric acid*, and dilute with *water* to 1000 ml.

Test solution. Weigh and powder 20 tablets. Transfer a quantity of powder containing 10 mg of granisetron in 100-ml volumetric flask, add about 50 ml of buffer solution and disperse with the aid of ultrasound for about 10 minutes, cool and dilute to volume with buffer solution and filter.

Reference solution (a). A 0.011 per cent w/v solution of *granisetron hydrochloride IPRS* in the buffer solution.

Reference solution (b). A solution containing 0.01 per cent w/v of *granisetron hydrochloride IPRS* and 0.001 per cent w/v each of granisetron impurity B, C and D in the buffer solution.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, polar end-capped packed with octadecylsilane bonded to porous silica (4 µm),
- mobile phase: a mixture of 75 volumes of buffer solution, 24 volumes of *methanol* and 1.1 volume of *tetrahydrofuran*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 300 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Granisetron impurity A[1]	0.5 to 0.6	—
Granisetron impurity B[2]	0.7	1.25
Granisetron	1.0	—
Granisetron impurity C[3]	1.2	1.0
Granisetron impurity D[4]	2.1 to 2.3	0.67

[1]2-methyl-*N*-[(1*R*,3r,5*S*)-9-methyl-9-azabicyclo[3.3.1]non-3-yl]-2*H*-indazole-3-carboxamide,

[2]*N*-[(1*R*,3r,5*S*)-9-methyl-9-azabicyclo[3.3.1]non-3-yl]-1*H*-indazole-3-carboxamide,

[3]*N*-[(1*R*,3r,5*S*)-9-azabicyclo[3.3.1]non-3-yl]-1-methyl-1*H*-indazole-3-carboxamide,

[4]1-methyl-1*H*-indazole-3-carboxylic acid,

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to impurity C and granisetron is not less than 2, the tailing factor is not less than 0.8 and not more than 1.5 for granisetron peak.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution. The area of any peak corresponding to impurity C is not more than 0.7 per cent. The sum of areas of all the known impurities peaks is not more than 1.3 per cent. The area of any other secondary peak is not more than 0.5 per cent. Ignore any peak with relative retention time about 0.5 to 0.6 for granisetron impurity A. Ignore any peak with an area less than 0.1 per cent. Calculated by area normalisation method.

Uniformity of content. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modification.

Test solution. Disperse 1 tablet in the buffer solution with the aid of ultrasound, and dilute to obtain a solution containing 0.01 per cent w/v solution of Granisetron.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{18}H_{24}N_4O$ in the tablets.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modification.

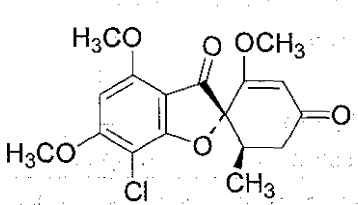
Inject reference solution (a) and the test solution.

Calculate the content of $C_{18}H_{24}N_4O$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of Granisetron.

Griseofulvin



$C_{17}H_{17}ClO_6$ Mol. Wt. 352.8

Griseofulvin is (1'*S*,6'*R*)-7-chloro-2',4,6-trimethoxy-6'-methyl-3*H*-spiro[1-benzofuran-2,1'-cyclohex[2]ene]-3,4'-dione produced by the growth of certain strains of *Penicillium griseofulvum*.

Griseofulvin contains not less than 94.0 per cent and not more than 102.0 per cent of $C_{17}H_{17}ClO_6$, calculated on the dried basis.

Category. Antifungal.

Description. A white to yellowish white powder. It shows polymorphism (2.5.11).

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *griseofulvin IPRS* or with the reference spectrum of griseofulvin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. Melting range (2.4.21). 217° to 224°.

Tests

Appearance of solution. A 7.5 per cent w/v solution in *dimethylformamide* is clear (2.4.1), and not more intensely coloured than reference solution YS4 (2.4.1).

Acidity. Suspend 0.25 g in 20 ml of *ethanol (95 per cent)* and titrate with *0.2 M sodium hydroxide* using *phenolphthalein solution* as indicator; not more than 1.0 ml is required to change the colour of the solution.

Specific optical rotation (2.4.22). +354° to +364°, determined at 20° in 1.0 per cent w/v solution in *dimethylformamide*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in mobile phase B and dilute to 50.0 ml with the mobile phase B.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase B.

Reference solution (b). Dissolve 5 mg of *griseofulvin for system suitability IPRS* (containing impurities A, B and C) in 10 ml of mobile phase B.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with end capped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 20 volumes of 0.1 per cent *v/v* solution of *anhydrous formic acid*, adjusted to pH 4.5 with *dilute ammonia* and 80 volumes of *water*,
  B. a mixture of 15 volumes of *water*, 20 volumes of 0.1 per cent *v/v* solution of *formic acid*,

adjusted to pH 4.5 with *dilute ammonia* and 65 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 290 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	50	50
3	50	50
13	40	60
16	10	90
24	10	90
28	50	50

Name	Relative retention time	Correction factor
Griseofulvin impurityA[1]	0.4	0.6
Griseofulvin impurity B[2]	0.7	—
Griseofulvin (Retention time: about 16 minutes)	1.0	—
Griseofulvin impurity C[3]	1.1	—

[1](1*S*,6*R*)-7-chloro-4,6-dimethoxy-6-methyl-3*H*-spiro[1-benzofuran-2,1-cyclohexane]-2,3,4-trione,

[2](1*S*,6*R*)-2,4,6-trimethoxy-6-methyl-3*H*-spiro[1-benzofuran-2,1-cyclohex[2]ene]-3,4-dione,

[3](1*S*)-7-chloro-2,4,6-trimethoxy-6-methyl-3*H*-spiro[1-benzofuran-2,1-cyclohexan[2,5]diene]-3,4-dione.

Inject reference solution (b). The test is not valid unless the peak-to-valley ratio is not less than 3.0, where H_p is the height above the baseline of the peak due to impurity C and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to griseofulvin.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to griseofulvin impurity A is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent), the area of any peak corresponding to griseofulvin impurity B is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (3.0 per cent), the area of any peak corresponding to griseofulvin impurity C is not more than 0.75 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.75 per cent), the area of any other secondary peak is not more than 0.15 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (5.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in mobile phase B and dilute to 50.0 ml with mobile phase B.

Reference solution. A 0.05 per cent w/v solution of *griseofulvin IPRS* in mobile phase B.

Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{17}ClO_6$.

Storage. Store protected from moisture.

Griseofulvin Tablets

Griseofulvin Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of griseofulvin, $C_{17}H_{17}ClO_6$.

Usual strengths. 125 mg; 500 mg.

Identification

A. Extract a quantity of the powdered tablets containing 0.125 g of Griseofulvin with 20 ml of *dichloromethane*, add 1 g of *anhydrous sodium sulphate*, shake and filter. Evaporate the filtrate to dryness and dry at a pressure not exceeding 0.7 kPa for 1 hour. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6).Compare the spectrum with that obtained with *griseofulvin IPRS* or with the reference spectrum of griseofulvin.

B. Disperse 5 mg of the powdered tablets in 1 ml of *sulphuric acid* and add 5 mg of powdered, *potassium dichromate*; a wine-red colour is produced.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 1000 ml of a 1.5 per cent w/v solution of *sodium lauryl sulphate*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measurethe absorbance of filtrate, suitably diluted with *methanol(80 per cent)*, at the maximum at 291 nm (2.4.7).Calculate the content of $C_{17}H_{17}ClO_6$, taking 725 as the specific absorbance at the maximum at 291 nm.

Q. Not less than 75 per cent of the stated amount of $C_{17}H_{17}ClO_6$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing 0.25 g of Griseofulvin in mobile phase B and dilute to 500.0 ml with mobile phase B.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase B.

Reference solution (b). A 0.05 per cent w/v solution of *griseofulvin for system suitability IPRS* in mobile phase B.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with end capped octadecylsilane bonded to porous silica (5 µm) (Such as Discovery C18),
- mobile phase: A. a mixture of 20 volumes of 0.1 per cent *v/v* solution of *formic acid*, adjusted to pH 4.5 with *dilute ammonia* and 80 volumes of *water*,
  B. a mixture of 15 volumes of *water*, 20 volumes of 0.1 per cent *v/v* solution of *formic acid*, adjusted to pH 4.5 with *dilute ammonia* and 65 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 290 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	50	50
3	50	50

Griseofulvin impurity C[3]	1.1	—

[1](1*S*,6*R*)-7-chloro-4,6-dimethoxy-6-methyl-3*H*-spiro[1-benzofuran-2,1-cyclohexane]-2,3,4-trione,

[2](1*S*,6*R*)-2,4,6-trimethoxy-6-methyl-3*H*-spiro[1-benzofuran-2,1-cyclohex[2]ene]-3,4-dione,

[3](1*S*)-7-chloro-2,4,6-trimethoxy-6-methyl-3*H*-spiro[1-benzofuran-2,1-cyclohexan[2,5]diene]-3,4-dione.

Inject reference solution (b). The test is not valid unless the peak-to-valley ratio is not less than 3.0, where H_p is the height above the baseline of the peak due to impurity C and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to griseofulvin.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to griseofulvin impurity A is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent), the area of any peak corresponding to griseofulvin impurity B is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (3.0 per cent), the area of any peak corresponding to griseofulvin impurity C is not more than 0.75 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.75 per cent), the area of any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (5.0 per cent). Ignore any peak with an area less than 0.1 times the area of principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 0.25 g of Griseofulvin in mobile phase B and dilute to 500.0 ml with mobile phase B.

Reference solution. A 0.05 per cent w/v solution of *griseofulvin IPRS* in mobile phase B.

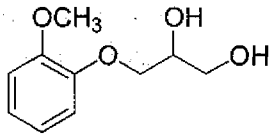
Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{17}ClO_6$ in the tablets.

Guaiphenesin



$C_{10}H_{14}O_4$ Mol. Wt. 198.2

Guaiphenesin is (*RS*)-3-(2-methoxyphenoxy)propane-1,2-diol.

Guaiphenesin contains not less than 98.0 per cent and not more than 101.5 per cent of $C_{10}H_{14}O_4$, calculated on the dried basis.

Category. Expectorant.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *guaiphenesin IPRS* or with the reference spectrum of guaiphenesin.

B. In the test for Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

C. Melts at 79° to 83° (2.4.21).

Tests

Appearance of solution. A 2.0 per cent w/v solution is clear (2.4.1), and colourless (2.4.1).

pH (2.4.24). 5.0 to 7.0, determined in a 1.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 100 mg of the substance under examination in 50.0 ml of *acetonitrile.*

Reference solution (a). A 0.001 per cent w/v solution of *guaiphenesin IPRS* in *acetonitrile.*

Reference solution (b). Dissolve 10 mg of *guaiacol* in 50.0 ml of *acetonitrile.* Dilute 0.5 ml of the solution to 50.0 ml with *acetonitrile.*

Reference solution (c). Dissolve 50 mg of *guaiacol* in 50.0 ml of *acetonitrile.* Dilute 5.0 ml of the solution to 10.0 ml with the test solution.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 1 volume of *glacial acetic acid* and 99 volumes of *water,*
  B. *acetonitrile,*
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 276 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
32	50	50
33	80	20
40	80	20

Inject reference solution (c) . The test is not valid unless the resolution between the peaks due to guaiphenesin and guaiphenesin impurity A is not less than 3.0. The relative retention time with reference to guaiphensin for 2-(2-methoxyphenoxy)propane-1,3-diol(B-isomer) (guaiphenesin impurity B) is about 0.9, for 2-methoxyphenol (guaiacol) (guaiphenesin impurity A) is about 1.4, for 1,1'-oxybis[3-(2-methoxyphenoxy)propan-2-ol] (bisether) (guaiphenesin impurity C) is about 3.1, for 1,3-bis(2-methoxyphenoxy)propan-2-ol (guaiphenesin impurity D) is about 3.7.

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with the test solution the area of secondary peak corresponding to guaiphenesin impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent), the area of secondary peak corresponding to guaiphenesin impurity B is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). The sum of area of all the secondary peaks other than guaiphenesin impurity B is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Chlorides and monochlorohydrins. To 10 ml of a 2.0 per cent w/v solution, add 2 ml of *2 M sodium hydroxide,* heat on a water-bath for 5 minutes, cool and add 3 ml of *2 M nitric acid.* The resulting solution complies with the limit test for chlorides (2.3.12) using 2.0 ml of *chloride standard solution (25 ppm Cl)* (250 ppm).

Heavy metals (2.3.13). 12 ml of a solution prepared by dissolving 2.0 g in 25 ml of a mixture of 9 volumes of *ethanol (95 per cent)* and 1 volume of *water* complies with the limit test for heavy metals, Method D (25 ppm), using 10 ml of *lead standrd solution (2 ppm pb)*.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

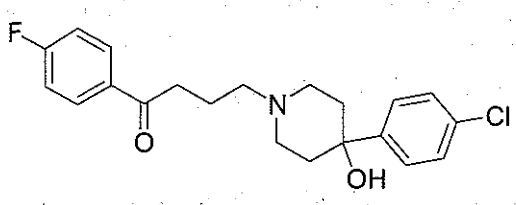
Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 60° over *phosphorus pentoxide* at a pressure of 1.5 to 2.5 kPa for 3 hours.

Assay. Weigh 50 mg and dissolve in 10 ml of *water*. Add 20 ml of *sodium periodate solution* and allow to stand for 10 minutes. Add 25.0 ml of *sodium arsenite solution* and 1 ml of a 16.6 per cent w/v solution of *potassium iodide*, allow to stand for 10 minutes and titrate with *0.05 M iodine solution* using 2 ml of *starch solution* as indicator. Repeat the procedure without the substance under examination. The difference between the titrations represents the amount of iodine required.

1 ml of *0.05 M iodine* is equivalent to 0.009911 g of $C_{10}H_{14}O_4$.

H

Haloperidol



$C_{21}H_{23}ClFNO_2$ Mol. Wt. 375.9

Haloperidol is 4-[4-(4-chlorophenyl)-4-hydroxypiperidino]-4'-fluorobutyrophenone.

Haloperidol contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{21}H_{23}ClFNO_2$, calculated on the dried basis.

Category. Antipsychotic.

Description. A white to faintly yellowish, amorphous or microcrystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *haloperidol IPRS* or with the reference spectrum of haloperidol.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.0015 per cent w/v solution in a mixture of 90 volumes of *methanol* and 10 volumes of *0.1 M hydrochloric acid* shows an absorption maximum at about 245 nm, about 0.49 to 0.53.

C. In the test for Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to haloperidol in the chromatogram obtained with reference solution (a).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use and protect from light.

Test solution. Dissolve 0.1 g of the substance under examination in *methanol* and dilute to 10.0 ml with *methanol.*

Reference solution (a). A solution containing 0.01 per cent w/v of *haloperidol IPRS* and 0.005 per cent w/v of *bromperidol IPRS* in *methanol.*

Reference solution (b). Dilute 5.0 ml of the test solution to 100.0 ml with *methanol.* Dilute 1.0 ml of the solution to 10.0 ml with *methanol.*

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: A. a 1.7 per cent w/v solution of *tetrabutylammonium hydrogen sulphate*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
15	50	50
20	50	50
25	90	10

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to haloperidol and bromperidol is not less than 3.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). The sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 60° at a pressure not exceeding 0.1 kPa for 3 hours.

Assay. Dissolve 0.2 g in 25 ml of *anhydrous glacial acetic acid.* Titrate with *0.05 M perchloric acid*, using 0.2 ml of *1-naphtholbenzein solution* as indicator and titrating until the colour changes from orange-yellow to yellowish green. Carry out a blank titration.

1 ml of *0.05 M perchloric acid* is equivalent to 0.01879 g $C_{21}H_{23}ClFNO_2$.

Storage. Store protected from light.

Haloperidol Injection

Haloperidol Injection is a sterile solution of Haloperidol in Lactic Acid diluted with Water for Injections.

Haloperidol Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of haloperidol, $C_{21}H_{23}ClFNO_2$.

Usual strengths. 5 mg per ml; 10 mg per ml.

Identification

A. To a volume of the injection containing 20 mg of Haloperidol add 5 ml of *water* and 1 ml of *1 M sodium hydroxide* and extract with 10 ml of *chloroform*. Filter the chloroform extract through absorbent cotton, evaporate the filtrate to dryness and dry the residue at 60° at a pressure not exceeding 0.7 kPa. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *haloperidol IPRS* or with the reference spectrum of haloperidol.

B. When examined in the range 230 nm to 360 nm (2.4.7), the final solution obtained in the Assay shows an absorption maximum only at about 245 nm.

Tests

pH (2.4.24). 2.8 to 3.6.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 80 volumes of *chloroform*, 10 volumes of *glacial acetic acid* and 10 volumes of *methanol*.

Test solution. The injection under examination.

Reference solution (a). Dilute 1.0 ml of the injection to 100.0 ml with *methanol*.

Reference solution (b). Dilute 1.0 ml of the injection to 200.0 ml with *methanol*.

Apply to the plate a volume of the injection containing 0.1 mg of Haloperidol and the same volume of the reference solutions. After development, dry the plate in air and spray with *dilute potassium iodobismuthate solution*. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

Bacterial endotoxins (2.2.3). Not more than 71.4 Endotoxin Units per mg of haloperidol.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. To a measured volume of the injection containing about 10 mg of Haloperidol add 8 ml of *water* and 10 ml of *1 M hydrochloric acid*. Extract with successive quantities of 25, 25, 10 and 10 ml of *ether*. Wash the combined ether extracts with 10 ml of *water*, combine the aqueous layers and remove the ether using a rotary evaporator. Add sufficient *water* to produce 100.0 ml and dilute 10.0 ml to 100.0 ml with *methanol*. Measure the absorbance of the resulting solution at the maximum at about 245 nm (2.4.7). Calculate the content of $C_{21}H_{23}ClFNO_2$ taking 346 as the specific absorbance at 245 nm.

Storage. Store protected from light.

Haloperidol Oral Solution

Haloperidol Oral Drops; Haloperidol Solution

Haloperidol Oral Solution is a solution of Haloperidol in Purified Water prepared with the aid of Lactic Acid.

Haloperidol Oral Solution contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of haloperidol, $C_{21}H_{23}ClFNO_2$.

Usual strengths. 1 mg per ml; 2 mg per ml.

Description. A clear, colourless solution.

Identification

A. To a volume of the oral solution containing 20 mg of Haloperidol, add 1 ml of *1 M sodium hydroxide*, extract with 10 ml of *chloroform*, filter and evaporate the filtrate to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *haloperidol IPRS* treated in the same manner or with the reference spectrum of haloperidol.

B. When examined in the range 230 nm to 360 nm (2.4.7), the final solution obtained in the Assay shows an absorption maximum only at about 245 nm.

Tests

pH (2.4.24). 3.5 to 4.5.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 92 volumes of *dichloromethane*, 8 volumes of *methanol* and 1 volume of *strong ammonia solution*.

Test solution. Dilute the oral solution if necessary with *methanol* to contain 0.1 per cent w/v of Haloperidol.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol*.

Reference solution (b). Dilute 1.0 ml of the test solution to 200.0 ml with *methanol*.

Apply to the plate 50 µl of each solution. After development, dry the plate in air and spray with *dilute potassium*

iodobismuthate solution. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

Other tests. Comply with the tests stated under Oral Liquids.

Assay. To a measured volume of the oral solution containing about 10 mg of Haloperidol add 8 ml of *water* and 10 ml of *1 M hydrochloric acid*. Extract with successive quantities of 25, 25, 10 and 10 ml of *ether*. Wash the combined ether extracts with 10 ml of *water*, combine the aqueous layers and remove the ether using a rotary evaporator. Add sufficient *water* to produce 100.0 ml and dilute 10.0 ml to 100.0 ml with *methanol*. Measure the absorbance of the resulting solution at the maximum at about 245 nm (2.4.7). Calculate the content of $C_{21}H_{23}ClFNO_2$ taking 346 as the specific absorbance at 245 nm.

Storage. Store protected from light at a temperature between 15° and 25°.

Haloperidol Tablets

Haloperidol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of haloperidol, $C_{21}H_{23}ClFNO_2$.

Usual strengths. 1.5 mg; 5 mg; 10 mg.

Identification

A. To a quantity of the powdered tablets containing 10 mg of Haloperidol add 5 ml of *water* and 1 ml of *1 M sodium hydroxide* and extract with 10 ml of *chloroform*. Filter the chloroform extract through absorbent cotton, evaporate the filtrate to dryness and dry the residue at 60° at a pressure not exceeding 0.7 kPa. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *haloperidol IPRS* or with the reference spectrum of haloperidol.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (b).

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *gastric fluid simulated* (without enzyme),
Speed and time. 100 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a suitable quantity of *haloperidol IPRS* in the dissolution medium to obtain a solution having known concentration similar to the expected concentration of the test solution.

Chromatographic system
- a stainless steel column 25 cm × 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of *0.05M monobasic potassium phosphate*, adjusted to pH 4.0 with *1M sodium hydroxide* or *orthophosphoric acid* and 60 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 3.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{23}ClFNO_2$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{21}H_{23}ClFNO_2$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 80 volumes of *chloroform*, 10 volumes of *glacial acetic acid* and 10 volumes of *methanol*.

Test solution (a). Shake a quantity of the powdered tablets containing 10 mg of Haloperidol with 10 ml of *chloroform*, filter, evaporate the filtrate to dryness and dissolve the residue in 1 ml of *chloroform*.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with *chloroform*.

Reference solution (a). Dilute 1.0 ml of test solution (a) to 200.0 ml with *chloroform*.

Reference solution (b). A 0.1 per cent w/v solution of *haloperidol IPRS* in *chloroform*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and spray with *dilute potassium iodobismuthate solution*. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (a) shows a distinct and clearly visible spot.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14).

Test solution. Place one tablet in 10 ml of the mobile phase, shake in an ultrasonic bath for 2 minutes, centrifuge and use the supernatant liquid after diluting suitably with the mobile phase if necessary.

Reference solution. A solution containing 0.015 per cent w/v of *haloperidol IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 5 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 55 volumes of a 1 per cent w/v solution of *ammonium acetate* and 45 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 247 nm,
- injection volume: 20 µl.

Calculate the content of $C_{21}H_{23}ClFNO_2$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the powder containing 20 mg of Haloperidol, shake with 60 ml of the mobile phase, place in an ultrasonic bath for 2 minutes, add sufficient quantity of the mobile phase to produce 100.0 ml. Centrifuge and use the supernatant liquid.

Reference solution. A solution containing 0.02 per cent w/v of *haloperidol IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 5 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 55 volumes of a 1 per cent w/v solution of *ammonium acetate* and 45 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 247 nm,
- injection volume: 20 µl.

Calculate the content of $C_{21}H_{23}ClFNO_2$ in the tablets.

Storage. Store protected from light.

Heparin Sodium

Heparin Sodium is the sodium salt of sulphated glycosaminoglycans present as a mixture of heterogeneous molecules varying in molecular weights. It is present in mammalian tissues and is usually obtained from the intestinal mucosa or other suitable tissues of domestic mammals used for food by man. The sourcing of heparin material must be specified in compliance with applicable regulatory requirements. It is purified to retain a combination of activities against different fractions of the blood clotting sequence. It is composed of polymers of alternating derivatives of D-glucosamine (N-sulphated, O-sulphated, or N-acetylated) and uronic acid, L-iduronic acid or D-glucuronic acid) joined by glycosidic linkages. The component activities of the mixture are in ratios corresponding to those shown by the Heparin Sodium reference standard. Some of these components have the property of prolonging the clotting time of blood. This occurs mainly through the formation of a complex of each component with the plasma proteins antithrombin III and heparin cofactor II to potentiate the inactivation of thrombin. Other coagulation proteases in the clotting sequence, such as activated factor X, are also inhibited.

Heparin Sodium intended for use in the manufacture of parenteral preparation contains not less than 180 IU per mg for Heparin obtained from the intestinal mucosa or other suitable tissues of domestic mammals used for food by man except bovine source. Heparin sodium intended for use in the manufacture of parenteral preparation contains not less than 150 IU per mg obtained from the intestinal mucosa or other suitable tissues of bovine and heparin sodium not intended for the use in the parenteral preparation contains not less than 120 IU per mg, calculated on the dried basis.

Category. Anticoagulant.

Description. A white or greyish-white powder; moderately hygroscopic.

Identification

A. It complies with the requirements described under assay.

B. It gives reaction (A) of sodium salts (2.3.1).

C. In the test for Oversulphated chondroitin sulphate, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.24). 5.0 to 7.5, determined in 1.0 per cent w/v solution.

Oversulphated Chondroitin Sulphate (OSCS). Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 500 mg of the substance under examination in 10.0 ml of *water*.

Reference solution (a). A 2.0 per cent w/v solution of *heparin sodium IPRS* in *water*.

Reference solution (b). A 0.02 per cent w/v solution of *oversulphated chondroitin sulphate IPRS* in reference solution (a).

Chromatographic system
- a stainless steel column 25 cm x 2 mm, packed with a hydroxide- selective, strong anion-exchange resin consisting of a highly cross-linked core of 13 µm micoporous particles having a pore size less than 10 Angstrom units and consisting of ethylvinyl benzene cross-linked with 55 per cent divinylbenzene with a latex coating composed of 85 nm diameter microbeads bonded with alkanol quaternary ammonium ions (6 per cent),
- column temperature: 40°,
- mobile phase: A. a 0.04 per cent w/v solution of *sodium dihydrogen phosphate dihydrate* in *water*, adjusted to pH 3.0 with *phosphoric acid*, filter,
  B. a 14.0 per cent w/v solution of *sodium perchlorate* in mobile phase A, adjusted to pH 3.0 with *phosphoric acid*, filter,
- a gradient programme using the conditions given below,
- flow rate: 0.22 ml per minute,
- spectrophotometer set at 202 nm,
- injection volume: 10 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
60	10	90
61	80	20
75	80	20

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to oversulphated chondroitin sulphate and heparin is not less than 1.5. The retention time of heparin is about 30 minutes and of oversulphated chondroitin sulphate is about 50 minutes.

Inject reference solution (a) and the test solution. The retention time of the principal peak obtained from the test solution corresponds to the peak obtained from reference solution (a). In the chromatogram obtained with the test solution, no peak corresponding to OSCS is observed.

Protein and nucleotidic impurities. Absorbance of a 0.4 per cent w/v solution at about 260 nm (2.4.7) (for nucleotides) and about 280 nm (for proteins) is not more than 0.2 and 0.15 respectively.

Nitrogen (2.3.30). Not more than 2.5 per cent, calculated on the dried basis.

Heavy metals (2.3.13). 0.5 g complies with the limit test for heavy metals, Method B (40 ppm).

Sulphated ash (2.3.18). 28.0 to 41.0 per cent, determined on 0.2 g.

Loss on drying (2.4.19). Not more than 8.0 per cent, determined on 1.0 g by drying in an oven over phosphorous pentaoxide at 60° at a pressure not exceeding 0.7 kPa for 3 hours.

Assay. *Potency.* For Heparin sodium obtained from the porcine or other source, perform the assay using method A. For Heparin Sodium obtained from bovine source, perform the assay using method A or B.

Method A

The anticoagulant activity of heparin is determined *in vitro* by its ability to accelerate the inhibition of thrombin, factor IIa (anti-IIa assay) by antithrombin. The International Unit is the activity contained in a stated amount of the International Standard for unfractionated heparin. *heparin sodium IPRS*, calibrated in International Units using by comparison with the International Standard using the 2 assays given below, is used as the reference preparation.

The assay of anti-factor Xa activity is carried out to determine the ratio of the anti-factor Xa activity to anti-factor IIa activity.

For anti-IIa and anti-Xa assays, carry out the assay by determining the absorbance (end-point method) or the change of absorbance per minute (kinetic method).

Anti-Factor IIa Activity

Reference and test solution. Prepare 4 independent series of 4 dilutions each of the substance under examination and of *heparin sodium IPRS* in *tris (hydroxylmethyl) aminomethane-EDTA buffer solution pH 8.4*; a concentration range within 0.005 IU and 0.03 IU per ml is suitable. The dilutions chosen must give a liner response when results are plotted as absorbance against log concentration.

Label 16 tubes for the dilutions of the substance under examination and 16 tubes for the dilutions of the reference preparation: T_1, T_2, T_3, T_4 for each of the 4 series of dilutions of the substance to be examined and S_1, S_2, S_3, S_4 for each of the 4 series of dilutions of the reference preparation. To each of the 32 tubes add 100 µl of *antithrombin III solution* and 50 µl of the appropriate dilution of the substance under examination or the reference preparation. After each addition, mix but do not allow bubbles to form. Treating the tubes in 2 subsequent series in the order S_1, S_2, S_3, S_4, T_1, T_2, T_3, T_4, T_1, T_2, T_3, T_4, S_1, S_2, S_3, S_4, allow to equilibrate at 37° (water-bath or heating block) for at least 1 minute and add to each tube 25 µl of *human thrombin solution*. Incubate for exactly 1 minute and add 50 µl of a chromogenic substrate specific to factor IIa at a concentration suitable for the assay (for example, *D-phenylalanyl-L-pipecolyl-L-arginine-4-nitroanilide dihydrochloride* dissolved in *water* to give a 1.25 mM solution).

For the kinetic method, transfer the mixtures to semi-micro cuvettes and measure the change in absorbance per minute (2.4.7) at 405 nm using a suitable reading device.

For the end-point method, stop the reaction after exactly 4 minutes by adding 50 µl of a 20 per cent v/v solution

of *glacial acetic acid*. Assess whether exactly 4 minutes of incubation with the chromogenic substrate yields the optimal absorbance reading and, if necessary, adjust the incubation time to give the best dose-response curve. Then, transfer the mixtures to semi-micro cuvettes and measure the absorbance (2.4.7) at 405 nm using a suitable reading device.

Determine the blank amidolytic activity at the beginning and at the end of the procedure in a similar manner, using *tris(hydroxymethyl)aminomethane-EDTA buffer solution pH 8.4* instead of the reference and test solutions; the 2 blank values do not differ significantly.

Calculate the regression of the absorbance on log concentrations of the solutions of the substance under examination and of *heparin sodium IPRS* and calculate the potency of the substance under examination in International Units per ml using the usual statistical methods for parallel-line assays (5.7).

Anti-Factor Xa Activity

Reference and test solution. Prepare 4 independent series of 4 dilutions each of the substance under examination and of *heparin sodium IPRS* in *tris(hydroxymethyl) aminomethane-EDTA buffer solution pH 8.4*; a concentration range must be within 0.03 IU and 0.375 IU per ml is suitable. The dilutions chosen must give a linear response when results are plotted as absorbance against log concentration.

Label 16 tubes for the dilutions of the substance under examination and 16 tubes for the dilutions of the reference preparation: T_1, T_2, T_3, T_4 for each of the 4 series of dilutions of the substance under examination and S_1, S_2, S_3, S_4 for each of the 4 series of dilutions of the reference preparation. To each of the 32 tubes add 50 µl of *antithrombin III solution* and 50 µl of the appropriate dilution of the substance under examination or the reference preparation. After each addition, mix but do not allow bubbles to form. Treating the tubes in 2 subsequent series in the order S_1, S_2, S_3, S_4, T_1, T_2, T_3, T_4, T_1, T_2, T_3, T_4, S_1, S_2, S_3, S_4, allow to equilibrate at 37° (water-bath or heating block) for 1 minute and add to each tube 100 µl of *bovine factor Xa solution*. Incubate for exactly 2 minutes and add 100 µl of a chromogenic substrate specific to factor Xa at a concentration suitable for the assay (for example, *N-α-benzyloxycarbonyl-D-arginyl-L-glycyl-L-arginine-4-nitroanilide-di-hydrochloride* dissolved in *water* to give a 1 mM solution).

For the kinetic method, transfer the mixtures to semi-micro cuvettes and measure the change in absorbance per minute (2.4.7) at 405 nm using a suitable reading device.

For the end-point method, stop the reaction after exactly 4 minutes by adding 50 µl of a 20 per cent v/v solution of *glacial acetic acid*. Assess whether exactly 4 minute of incubation with the chromogenic substrate yields the optimal absorbance reading and, if necessary, adjust the incubation time to give the best dose-response curve. Then, transfer the mixtures to semi-micro cuvettes and measure the absorbance (2.4.7) at 405 nm using a suitable reading device.

Determine the blank amidolytic activity at the beginning and at the end of the procedure in a similar manner, using *tris(hydroxymethyl)aminomethane-EDTA buffer solution pH 8.4* instead of the reference and test solutions; the 2 blank values do not differ significantly.

Calculate the regression of the absorbance on log concentrations of the solutions of the substance under examination and of *heparin sodium IPRS* and calculate the potency of the substance under examination in International Units per ml using the usual statistical methods for parallel-line assays (5.7).

Method B

Determine the potency of heparin sodium by comparing the concentration necessary to prevent the clotting of sheep or goat or human plasma with the concentration of the reference solution of heparin sodium necessary to give the same effect under the condition of the following method of assay.

Test solution. Dissolve 25 mg of substance under examination, in sufficient saline to produce a concentration of 1 mg per ml, and dilute to a concentration estimated to correspond to that of the reference solution.

Reference solution. Determine by preliminary trial, if necessary, approximately the minimum quantity of heparin sodium RS which, when added in 0.8 ml of saline, maintains fluidity in 1ml of prepared plasma for 1 hour after the addition of 0.2 ml of calcium chloride (1 in 100). This quantity is usually between 1 and 3 Heparin Units. On the day of the assay prepare a reference solution such that it contains, in each 0.8 ml of saline, the above-determined quantity of the reference standard.

Preparation of plasma. Collect blood from sheep directly into a vessel containing about 8 per cent of sodium citrate in the proportion of one volume to each 19 volumes of blood to be collected. Mix immediately by gentle agitation and inversion of the vessel. Promptly Centrifuge the blood, and pool the separated plasma. To a 1 ml portion of the pooled plasma in a clean test tube add 0.2 ml of calcium chloride (1 in 100), and mix. Consider the plasma suitable for use if a solid clot forms within 5 minutes. To store plasma for future use, subdivide the pooled lot into portions not exceeding 100 ml in volume, and store in the frozen state, preventing even partial thawing prior to use. For use in the assay, thaw the frozen plasma in a water-bath at a temperature not exceeding 37°. Remove particulate matter by straining the thawed plasma through a coarse filter.

Procedure. To meticulously clean 13 mm X 100 mm test tubes add graded amounts of the reference solution selecting the

amount so that the largest does not exceed 0.8 ml and so that they correspond roughly to a geometric series in which each step is approximately 5 per cent greater than the next lower. To each tube so prepared add sufficient saline to make the total volume 0.8 ml. Add 1.0 ml of prepared plasma to each tube. Then add 0.2 ml of calcium chloride (1 in 100), note the time, immediately insert a suitable stopper in each tube, and mix the contents by inverting three times in such a way that the entire inner surface of the tube is wet.

In the same manner set up a series using the test solution, completing the entire process of preparing and mixing the tubes of both reference solution and the test solution within 20 minutes after the addition of the prepared plasma. One hour, accurately timed, after the addition of the calcium chloride, determine the extent of clotting in each tube, recognizing three grades (0.25, 0.50, and 0.75) between zero and full clotting (1.0). If the series does not contain 2 tubes graded more than 0.5, and 2 tubes graded less than 0.5, repeat the assay, using appropriately modified reference solution and test solution.

Convert to logarithms the volumes of reference solution used in the successive 5 or 6 tubes that bracket a grade of clotting of 0.5, including at least 2 tubes with larger and 2 tubes with a smaller grade than 0.5. Number and list the tubes serially, and tabulate for each the grade of clotting observed in each tube. From the log-volumes, x, and separately from their corresponding grades of clotting, y, compute the paired averages x_i and y_i of Tubes 1, 2, and 3, of tubes 2, 3, and 4, of Tubes 3, 4, and 5, and, where the series consists of 6 tubes, of Tubes 4, 5, and 6, respectively. If for one of these paired averages the average grade, y_i, is exactly 0.50, the corresponding xi is the median log –volume of the reference solution x_s. Otherwise, interpolate xs from the paired values of y_i, x_i, and y_{i+1}, x_{i+1} that fall immediately below and above grade 0.5 as

$$x_s = \frac{x_i + (y_i - 0.5)(x_{i+1} - x_i)}{(y_i - y_{i+1})}$$

From the paired data on the tubes of the test solution, compute similarly its median log-volume x_U.

The log potency of the test solution is

$$M = x_s - x_u + \log R$$

where, R = v_s/v_u is the ratio of the heparin Units (v_s) per ml of the reference solution to the mg (v_U) of heparin sodium per ml of the test solution.

Heparin Sodium intended for use in the manufacture of parenteral preparation without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.03 Endotoxin Unit per Unit of heparin.

Heparin Sodium intended for use in the manufacture of parenteral preparation without a further appropriate sterilization procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from moisture in tightly-closed containers, sealed so as to exclude micro-organisms.

Labelling. The label states to indicate the tissue and the animal species from which it is derived, and the number of International Units per miligram.

Heparin Injection

Heparin Sodium Injection

Heparin Injection is a sterile solution of Heparin Sodium in Water for Injection. The pH of the solution may be adjusted by the addition of a suitable alkali or acid.

Heparin Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated potency in terms of IU per ml.

Usual strengths. 1000 Units per ml; 5000 Units per ml; 10000 Units per ml.

Description. A clear, colourless or straw coloured solution, free from turbidity and matter which deposit on standing.

Identification

A. It complies with the requirements described under assay.

B. It gives reaction (A) of sodium salts (2.3.1).

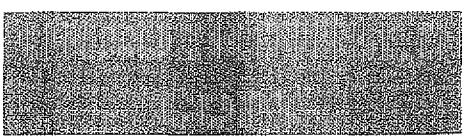
Tests

pH (2.4.24). 5.0 to 7.5.

Bacterial endotoxins (2.2.3). Not more than 0.03 Endotoxin Unit per Unit of heparin.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. *Potency.* The anticoagulant activity of heparin is determined *in vitro* by its ability to accelerate the inhibition of thrombin, factor IIa (anti-IIa assay) by antithrombin. The International Unit is the activity contained in a stated amount of the International Standard for unfractionated heparin. *heparin sodium IPRS*, calibrated in International Units using by comparison with the International Standard using the 2 assays given below, is used as the reference preparation.



The assay of anti-factor Xa activity is carried out to determine the ratio of the anti-factor Xa activity to anti-factor IIa activity.

For anti-IIa and anti-Xa assays, carry out the assay by determining the absorbance (end-point method) or the change of absorbance per minute (kinetic method).

Anti-Factor IIa Activity

Reference and test solution. Prepare 4 independent series of 4 dilutions each of the substance under examination and of *heparin sodium IPRS* in *tris (hydroxylmethyl) aminomethane-EDTA buffer solution pH 8.4*; a concentration range within 0.005 IU and 0.03 IU per ml is suitable. The dilutions chosen must give a liner response when results are plotted as absorbance against log concentration.

Label 16 tubes for the dilutions of the substance under examination and 16 tubes for the dilutions of the reference preparation: T_1, T_2, T_3, T_4 for each of the 4 series of dilutions of the substance to be examined and S_1, S_2, S_3, S_4 for each of the 4 series of dilutions of the reference preparation. To each of the 32 tubes add 100 µl of *antithrombin III solution* and 50 µl of the appropriate dilution of the substance under examination or the reference preparation. After each addition, mix but do not allow bubbles to form. Treating the tubes in 2 subsequent series in the order S_1, S_2, S_3, S_4, T_1, T_2, T_3, T_4, T_1, T_2, T_3, T_4, S_1, S_2, S_3, S_4, allow to equilibrate at 37° (water-bath or heating block) for at least 1 minute and add to each tube 25 µl of *human thrombin solution*. Incubate for exactly 1 minute and add 50 µl of a chromogenic substrate specific to factor IIa at a concentration suitable for the assay (for example, *D-phenylalanyl-L-pipecolyl-L-arginine-4-nitroanilide dihydrochloride* dissolved in *water* to give a 1.25 mM solution).

For the kinetic method, transfer the mixtures to semi-micro cuvettes and measure the change in absorbance per minute (2.4.7) at 405 nm using a suitable reading device.

For the end-point method, stop the reaction after exactly 4 minutes by adding 50 µl of a 20 per cent v/v solution of *glacial acetic acid*. Assess whether exactly 4 minutes of incubation with the chromogenic substrate yields the optimal absorbance reading and, if necessary, adjust the incubation time to give the best dose-response curve. Then, transfer the mixtures to semi-micro cuvettes and measure the absorbance (2.4.7) at 405 nm using a suitable reading device.

Determine the blank amidolytic activity at the beginning and at the end of the procedure in a similar manner, using *tris(hydroxymethyl)aminomethane-EDTA buffer solution pH 8.4* instead of the reference and test solutions; the 2 blank values do not differ significantly.

Calculate the regression of the absorbance on log concentrations of the solutions of the substance under examination and of *heparin sodium IPRS* and calculate the potency of the substance under examination in International Units per ml using the usual statistical methods for parallel-line assays (5.7).

Anti-Factor Xa Activity

Reference and test solution. Prepare 4 independent series of 4 dilutions each of the substance under examination and of *heparin sodium IPRS* in *tris(hydroxymethyl)aminomethane-EDTA buffer solution pH 8.4*; a concentration range must be within 0.03 IU and 0.375 IU per ml is suitable. The dilutions chosen must give a linear response when results are plotted as absorbance against log concentration.

Label 16 tubes for the dilutions of the substance under examination and 16 tubes for the dilutions of the reference preparation: T_1, T_2, T_3, T_4 for each of the 4 series of dilutions of the substance under examination and S_1, S_2, S_3, S_4 for each of the 4 series of dilutions of the reference preparation. To each of the 32 tubes add 50 µl of *antithrombin III solution* and 50 µl of the appropriate dilution of the substance under examination or the reference preparation. Determine the blank amidolytic activity at the beginning and at the end of the procedure in a similar manner, using *tris(hydroxymethyl)aminomethane-EDTA buffer solution pH 8.4* instead of the reference and test solutions; the 2 blank values do not differ significantly.

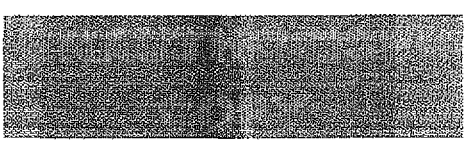
Calculate the regression of the absorbance on log concentrations of the solutions of the substance under examination and of *heparin sodium IPRS* and calculate the potency of the substance under examination in International Units per ml using the usual statistical methods for parallel-line assays (5.7).

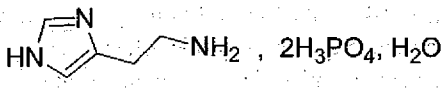


Storage. Store at a temperature not exceeding 30°.

Labelling. The label states to indicate the volume of the total contents and the potency in terms of Heparin Units per ml, except that single-dose containers may be labeled additionally to indicate the single unit-dose volume and the total number of Heparin Units. Where it is labeled with total content, the label states also that the entire contents are to be used or, if not, any remaining portion is to be discarded. Label it to indicate also the tissue and the animal species from which it is derived.

Histamine Phosphate

Histamine Acid Phosphate



$C_5H_9N_3,2H_3PO_4,H_2O$ Mol. Wt. 325.2

Histamine Phosphate is 2-(1*H*-imidazol-4-yl)ethylamine diphosphate monohydrate.

Histamine Phosphate contains not less than 98.0 per cent and not more than 101.0 per cent of $C_5H_9N_3,2H_3PO_4$, calculated on the anhydrous basis.

Category. Diagnostic aid (gastric secretion indicator).

Description. Colourless, long prismatic crystals.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *histamine phosphate IPRS* or with the reference spectrum of histamine phosphate.

B. In the test for Histidine, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

C. Dissolve 0.1 g in 7 ml of *water* and add 3 ml of *sodium hydroxide solution*. Dissolve 50 mg of *sulphanilic acid* in 10 ml of *water* containing 0.1 ml of *hydrochloric acid* and 0.1 ml of a 10 per cent w/v solution of *sodium nitrite*. On mixing the two solutions a deep red colour is produced.

D. It gives reaction (A) of phosphates (2.3.1).

Tests

Appearance of solution. Solution A is clear (2.4.1), and not more intensely coloured than reference solution BYS7 (2.4.1).

pH (2.4.24). 3.7 to 3.9, determined in a 5.0 per cent w/v solution in *carbon dioxide-free water* (solution A).

Histidine. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 75 volumes of *acetonitrile*, 20 volumes of *water* and 5 volumes of *strong ammonia solution*.

Test solution (a). Dissolve 0.5 g of the substance under examination in 10 ml of *water*.

Test solution (b). Dilute 5.0 ml of test solution to 25.0 ml with *water*.

Reference solution (a). A 1.0 per cent w/v solution of *histamine phosphate IPRS*.

Reference solution (b). A solution containing 0.05 per cent w/v of *DL-histidine monohydrochloride*.

Reference solution (c). A mixture of equal volumes of test solution (a) and reference solution (b).

Apply to the plate 1 µl of each solution. After development, dry the plate in a current of air and repeat the development in the same direction. Dry the plate in a current of air, spray with *ninhydrin solution* and heat at 110° for 10 minutes. Any spot corresponding to histidine monohydrochloride in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Sulphates (2.3.17). 3 ml of solution A diluted to 15 ml with *water* complies with the limit test for sulphates (0.1 per cent).

Water (2.3.43). 5.0 to 6.2 per cent, determined on 0.3 g.

Assay. Weigh 0.14 g, dissolve in 5 ml of *anhydrous formic acid* and add 20 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01536 g of $C_5H_9N_3,2H_3PO_4$.

Storage. Store protected from light.

Histamine Phosphate Injection

Histamine Acid Phosphate Injection

Histamine Phosphate Injection is a sterile solution of Histamine Phosphate in Water for Injections.

Histamine Phosphate Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of histamine phosphate, $C_5H_9N_3,2H_3PO_4,H_2O$.

Usual strength. 1 mg per ml.

Identification

A. Evaporate a volume of the injection containing about 2 mg of Histamine Phosphate on a water bath to dryness, dissolve

the residue in 0.5 ml of *water*, and add 0.5 ml of *sodium hydroxide*. Add 2 drops of a 10 per cent w/v solution of *sodium nitrite* and 1 ml of a solution prepared by mixing 50 mg of *sulphanilic acid* with 10 ml of *water* containing 2 drops of *hydrochloric acid*; an orange-red colour is produced.

B. To 1 ml of the injection containing not less than 1 mg of Histamine Phosphate (concentrate a larger volume by evaporation, if necessary), add *ammonium molybdate* solution dropwise; a yellow precipitate, which is soluble in *ammonia*, is formed.

Tests

pH (2.4.24). 3.0 to 6.0.

Bacterial endotoxins (2.2.3). Not more than 125.0 Endotoxin Units per mg of histamine phosphate.

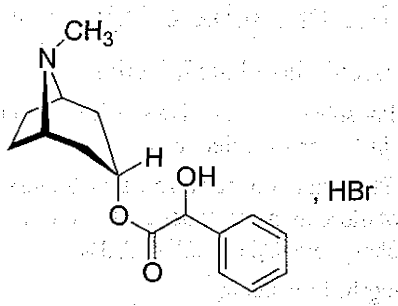
Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Measure a volume of the injection containing about 10 mg of Histamine Phosphate, transfer to a tared 25 ml centrifuge tube containing a thin glass rod slightly curved at the end, add 0.5 ml of *nitranilic acid solution* with continuous stirring and allow to stand for 15 minutes. Add 10 ml of *ethanol (95 per cent)*, mix and keep at 0° for 3 hours. Centrifuge for 1 minute, dislodge any particles at the surface and again centrifuge for 1 minute. Decant the supernatant liquid and stir the precipitate with 5 ml of ice-cold *ethanol (95 per cent)*. Centrifuge for 2 minutes, decant and repeat the washing with two further quantities, each of 5 ml, of ice-cold *ethanol (95 per cent)* and finally with 5 ml of *ether*. Smear the residue over the inside of the tube by means of the glass rod and dry to constant weight at 130°.

1 g of the residue is equivalent to 0.9529 g of $C_5H_9N_3,2H_3PO_4,H_2O$.

Storage. Store protected from light.

Homatropine Hydrobromide



$C_{16}H_{21}NO_3,HBr$ Mol. Wt. 356.3

Homatropine Hydrobromide is (1*R*,3*r*,5*S*)-3-(*RS*)-mandeloyloxytropane hydrobromide.

Homatropine Hydrobromide contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{16}H_{21}NO_3,HBr$, calculated on the dried basis.

Category. Anticholinergic.

Description. Colourless crystals or a white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *homatropine hydrobromide IPRS* or with the reference spectrum of homatropine hydrobromide.

B. Dissolve 50 mg in 1 ml of *water* and add 2 ml of *2 M acetic acid*. Heat, add 4 ml of *picric acid solution* and allow to cool, shaking occasionally. The crystals, after washing with two quantities, each of 3 ml, of iced *water* and drying at 105° melt at 182° to 186° (2.4.21).

C. Dissolve about 10 mg in 1 ml of *water*, add a slight excess of *10 M ammonia* and shake with 5 ml of *chloroform*. Evaporate the chloroform layer to dryness on a water-bath and add 1.5 ml of a 2 per cent w/v solution of *mercuric chloride* in *ethanol (60 per cent)*; a yellow colour develops which becomes red on warming.

D. It gives reaction (A) of bromides (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and not more intensely coloured than reference solution BS8 (2.4.1).

pH (2.4.24). 5.0 to 6.5; determined in a 5.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dilute 5.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 25.0 ml with the mobile phase.

Reference solution (c). A 0.01 per cent w/v solution of *hyoscine hydrobromide IPRS* in the mobile phase. To 10.0 ml of the solution, add 0.5 ml of the test solution and dilute to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature: 40°,

- mobile phase: a mixture of 33 volumes of *methanol* and 67 volumes of a solution prepared by dissolving 6.8 g of *potassium dihydrogen phosphate* and 7.0 g of *sodium heptanesulphonate monohydrate* in 1000 ml of *water*, adjusted to pH 2.7 with 33 per cent w/v solution of *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Name	Relative retention time
Homatropine impurity C[1]	0.2
Homatropine impurity A[2]	0.9
Homatropine (Retention time: about 6.8 minutes)	1.0
Homatropine impurity B[3]	1.1
Homatropine impurity D[4]	1.9

[1]mandelic acid,
[2]dehydrohomatropine,
[3]hyoscine,
[4]atropine.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to homatropine and homatropine impurity B is not less than 1.5 and the tailing factor for principal peak is not more than 2.5.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of peak corresponding to homatropine impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). The area of any peak corresponding to homatropine impurities B, C and D is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent) and the peak due to the bromide ion which appears close to the peak due to the solvent.

Sulphated ash (2.3.18). Not more than 0.1 per cent, determined on 0.5 g.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.3 g in 20 ml of *anhydrous glacial acetic acid* and add 7 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03563 g of $C_{16}H_{21}NO_3,HBr$.

Storage. Store protected from light.

Homatropine Eye Drops

Homatropine Hydrobromide Eye Drops

Homatropine Eye Drops are a sterile solution of Homatropine Hydrobromide in Purified Water.

Homatropine Eye Drops contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of homatropine hydrobromide, $C_{16}H_{21}NO_3,HBr$.

Usual strength. 2 per cent w/v.

Identification

A. To a volume containing 60 mg of Homatropine Hydrobromide add 3 ml of *dilute ammonia solution*, extract with 15 ml of *chloroform*, dry the chloroform extract over *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *homatropine hydrobromide IPRS* treated in the same manner or with the reference spectrum of homatropine.

B. To the residue obtained in test A, add 1.5 ml of a 2 per cent w/v solution of *mercuric chloride* in *ethanol (60 per cent)*; a yellow colour is produced which becomes red on gentle warming (distinction from most other alkaloids except atropine and hyoscyamine).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 134 volumes of *ethyl acetate*, 33 volumes of *anhydrous formic acid* and 33 volumes of *water*.

Test solution. Use the eye drops, diluted if necessary with water to contain 1 per cent w/v of Homatropine Hydrobromide.

Reference solution. Dilute 1.0 ml of the test solution to 200.0 ml with *water*.

Apply to the plate 40 µl of each solution. After development, dry the plate at 105° until the odour of the solvent is no longer detectable, allow to cool and spray with *dilute potassium iodobismuthate solution* until spots appear. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution. After development, dry at 105° until the odour of solvent is no longer detectable, allow to cool and spray with *dilute potassium iodobismuthate solution*

until spots appear. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Other tests. Comply with the tests stated under Eye Drops.

Assay. Determine by gas chromatography (2.4.13).

Test solution (a). Add 1 ml of a 2 per cent w/v solution of *atropine sulphate IPRS* (internal standard) in *methanol* (solution A) and 1 ml of *dilute ammonia solution* to a volume of the eye drops containing about 20 mg of Homatropine Hydrobromide, diluted if necessary to 5.0 ml with *water*. Extract with two quantities, each of 5 ml, of *chloroform*, shake the combined extracts with 1 g of *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness. Dissolve the residue in 10.0 ml of *dichloromethane*. To 1.0 ml of the solution add 0.2 ml of a mixture of 4 volumes of N,O-*bis* (*trimethylsilyl*)-*acetamide* and 1 volume of *trimethyl- chlorosilane*, mix and allow to stand for 30 minutes.

Test solution (b). Prepare in the same manner as test solution (a) but omitting the addition of solution A.

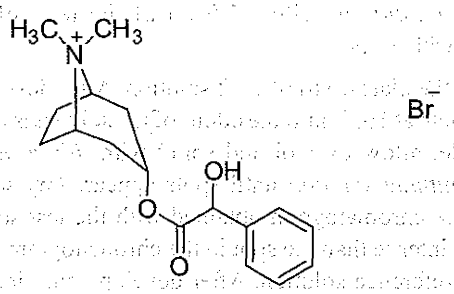
Reference solution. Add 1 ml of solution A and 1 ml of *dilute ammonia solution* to 5.0 ml of a 0.4 per cent w/v solution of *homatropine hydrobromide IPRS* and complete the procedure described under test solution (a) beginning at the words "Extract with two quantities, each of 5 ml, of *chloroform*....".

Chromatographic system

- a glass column 1.5 m x 4 mm, packed with acid-washed, silanised diatomaceous support (80 to 100 mesh) coated with 3 per cent w/w of phenyl methyl silicone fluid (50 per cent phenyl) (Such as OV-17),
- temperature:
  column. 220°,
  inlet port and detector. 280°,
- flow rate: 30 ml per minute, using nitrogen as the carrier gas.

Calculate the content of $C_{16}H_{21}NO_3$,HBr in the eye drops.

Homatropine Methylbromide



$C_{17}H_{24}BrNO_3$ Mol. Wt. 370.3

Homatropine Methylbromide is (1*R*,3*r*,5*S*)-3-[[(2*RS*)-2-hydroxy-2-phenylacetyl]oxy]-8,8-dimethyl-8-azoniabicyclo[3.2.1]octane bromide.

Homatropine Methylbromide contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{17}H_{24}BrNO_3$, calculated on the dried basis.

Category. Anticholinergic

Description. A white or almost white, crystalline powder or colourless crystals.

Identification

Test A may be omitted if tests B and C are carried out. Test B may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *homatropine methylbromide IPRS* or with the reference spectrum of homatropine methylbromide.

B. Dissolve 50 mg in 1 ml of *water* and add 2 ml of *dilute acetic acid*. Heat and add 4 ml of *picric acid solution*, allow to cool, shaking occasionally. Wash the crystals, with two quantities, each of 3 ml of iced *water* and dried at 105°. The residue melts between 132° to 138° (2.4.21).

C. It gives reaction (A) of bromides (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *carbon dioxide-free water* (solution A) is clear (2.4.1) and colourless (2.4.1).

pH (2.4.24). 4.5 to 6.5, determined in solution A.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 18 volumes of *acetonitrile* and 82 volumes of mobile phase A.

Test solution. Dissolve 50 mg of the substance under examination in 25.0 ml of the solvent mixture.

Reference solution (a). Dilute 5.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 25.0 ml with the solvent mixture.

Reference solution (c). Dissolve 5.0 mg of *homatropine hydrobromide IPRS* in the solvent mixture and dilute to 50.0 ml with the solvent mixture. To 10.0 ml of the solution, add 0.5 ml of the test solution and dilute to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),

- column temperature: 25°,
- mobile phase: A. dissolve 3.4 g of *potassium dihydrogen phosphate* and 5 g of *sodium heptanesulphonate monohydrate* in 1000 ml of *water*, and adjusted to pH 3.0 with a 33 per cent w/v solution of *orthophosphoric acid*,

  B. a mixture of 40 volumes of mobile phase A and 60 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.4 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	70	30
2	70	30
15	30	70
20	70	30
25	70	30

Inject reference solution (c). The test is not valid unless resolution between the peaks due to homatropine methylbromide and homatropine impurity B is not less than 2.5 and tailing factor for the peak due to homatropine methylbromide is not more than 2.5. The relative retention time with respect to homatropine methylbromide for (*2RS*)-2-hydroxy-2-phenylacetic acid (mandelic acid) (homatropine impurity C) is about 0.7, for (*1R,3s,5s*)-3-[[(*2RS*)-2-hydroxy-2-phenylacetyl]oxy]-8,8-dimethyl-8-azoniabicyclo[3.2.1]oct-6-ene(methyldehydro-homatropine) (homatropine impurity A) is about 0.9, for homatropine (homatropine impurity B) is about 1.2, for (*1R,2R,4S,5S,7s*)-7-[[(*2S*)-3-hydroxy-2-phenyl propanoyl]oxy-9,9-dimethyl-3-oxa-9-azoniatricyclo nonane (methylhyoscine) (homatropine impurity D) is about 1.3, for methylatropine (homatropine impurity E) is about 1.4 and for methyl (*2RS*)-2-hydroxy-2-phenylacetate(methyl mandelate) (homatropine impurity F) is about 1.7.

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with the test solution the area of secondary peak corresponding to homatropine impurities A and B; for each impurity is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent), The area of the secondary peaks corresponding to homatropine impurities C, D, E and F; for each impurities is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The sum of the areas of all secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore the peak due to the bromide ion which appears close to the principle peak due the solvent. Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.3 g and dissolve in 10 ml of *water*. Titrate with *0.1 M silver nitrate*, determining the end-point potentiometrically (2.4.25), using a silver indicator electrode and a silver- silver chloride reference electrode.

1 ml of *0.1 M silver nitrate* is equivalent to 0.03703 g of $C_{17}H_{24}BrNO_3$.

Storage. Store protected from light.

Homatropine Methylbromide Tablets

Homatropine Methylbromide Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of homatropine methylbromide, $C_{17}H_{24}BrNO_3$.

Usual strength. 15 mg.

Identification

Shake a quantity of powdered tablets containing about 10 mg of Homatropine Methylbromide, with 15 ml of a mixture of equal volumes of *methanol* and *water* for 10 minutes, and filter. Evaporate the filtrate on a steam bath to dryness, and dry at 105° for 1 hour. The residue of homatropine methylbromide so obtained melts between 190° and 198° (2.4.21).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *water*,

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter. Measure the absorbance (2.4.7) of the filtrate, suitably diluted if necessary with dissolution medium at 258 nm. Calculate the content of homatropine methylbromide, $C_{17}H_{24}BrNO_3$ in the medium from the absorbance obtained from a solution of known concentration of *homatropine methylbromide IPRS*.

Q. Not less than 75 per cent of the stated amount of $C_{17}H_{24}BrNO_3$.

Uniformity of content.

Test solution. Disperse 1 tablet in *water* to obtain a solution of 0.01 per cent w/v of Homatropine Methylbromide.

Reference solution. A 0.01 per cent w/v solution of *homatropine methylbromide IPRS* in *water.*

Transfer 2.0 ml each of the test solution and the reference solution to separate glass-stoppered 50-ml flasks. To each flask, add 0.1 ml of 10 per cent w/v solution of *sodium hydroxide solution* and heat on a water-bath at 80° for 15 minutes, cool. Add 2.0 ml of *0.2 M ceric ammonium sulphate* in *1 M sulphuric acid*, and mix. To each flask, add 20 ml of *n-hexane* and shake for 15 minutes and measure the absorbance at 242 nm (2.4.7).

Other tests. Comply with the tests stated under Tablets.

Assay

Test solution. Weigh and powder 20 tablets. Shake a quantity of powder containing about 12.5 mg of Homatropine Methylbromide with 10 ml of *water* for 30 minutes. Filter under reduced pressure through a sintered-glass crucible into a test tube placed in the suction flask under the filtering funnel, and wash under suction with several small portions of *water*. Transfer the contents of the test tube to a 25-ml volumetric flask and dilute with *water*.

Reference solution. A 0.05 per cent w/v solution of *homatropine methylbromide IPRS* in *water.*

Transfer 10.0 ml each of the test solution and the reference solution to separate test tubes, to each add 1 ml of *2.5 M sulphuric acid* and 2 ml of *ammonium reineckate*, shake and allow to stand for 1 hour. Filter through a sintered-glass crucible with suction, using portions of the filtrate to transfer the precipitate completely to the filter, and wash it with three 2-ml portions of ice-cold *water*. Completely dissolve the precipitate by pouring over it 1-ml portions of *acetone* with the application of suction and dilute to 10 ml with *acetone* and measure the absorbance at 525 nm (2.4.7).

Calculate the content of $C_{17}H_{24}BrNO_3$ in the tablets.

Storage. Store protected from light.

Hyaluronidase

Hyaluronidase is a material containing enzymes, which depolymerise the mucopolysaccharide, hyaluronic acid. It may be prepared from the testes and semen of mammals and purified by fractional precipitation so as to remove inert material and to which hydrolysed gelatin or a suitable non-protein stabilising agent may be added. The product is freeze-dried in single dose containers, which are sealed so as to exclude micro-organisms.

Hyaluronidase contains not less than 300 Units per mg, calculated on the dried basis. It may contain a suitable stabilizer.

Category. Depolymerising enzyme used as spreading factor.

Description. A white or yellowish-white, fluffy powder.

Identification

A. A solution containing the equivalent of 100 Units in 1 ml of *saline solution* depolymerises an equal volume of a 1 per cent w/v solution of *sodium hyaluronate* at 20° in 1 minute as shown by a pronounced decrease in viscosity. This action is destroyed by heating the initial solution at 100° for 30 minutes.

B. A solution containing the equivalent of 1 Unit in 0.2 ml of *saline solution* when injected intracutaneously into experimental animals together with a suitable indicator shows a spreading activity when compared with a control solution.

Tests

Appearance of solution. A 1.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and not more than faintly yellow.

pH (2.4.24). 4.5 to 7.5, determined in a 0.3 per cent w/v solution in *carbon dioxide-free water.*

Light absorption. Dissolve a quantity containing 1500 Units in sufficient *carbon dioxide-free water* to produce 5.0 ml and measure the absorbance of the resulting solution at about 260 nm and 280 nm; absorbance at about 260 nm, not more than 0.42 and at about 280 nm, not more than 0.60 (2.4.7).

Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 0.5 g by drying in vacuum at 60° for 2 hours.

Bacterial endotoxins (2.2.3). Not more than 0.2 Endotoxin Unit per unit of hyaluronidase.

Sterility (2.2.11). Complies with the test for sterility.

Assay. The potency of hyaluronidase is determined by comparing its effects against those of the Standard Preparation.

Diluent for hyaluronidase solution. Mix 100 ml of *phosphate buffer solution pH 6.4* with 100 ml of *water*. Dissolve 0.14 g of hydrolysed gelatin in the solution at 37°, used within 2 hours.

Standard Preparation

The Standard Preparation is the 1st International Standard for Hyaluronidase, bovine, established in 1955, consisting of dried bovine testicular hyaluronidase diluted with lactose (supplied in ampoules containing 10 tablets of 20 mg each; each tablet contains approximately 200 Units).

Test solution. Dissolve a suitable quantity of the preparation under examination by adding cold *diluent for hyaluronidase solutions*. Dilute the solution with cold *diluent for hyaluronidase solutions* so that the absorbances of the

dilutions being assayed will fall on the upper linear part of the reference curve prepared as follows.

To each of 12 test-tubes (100 mm x 16 mm) add 0.50 ml of *hyaluronate solution* and, respectively and in duplicate, 0.5, 0.4, 0.3, 0.2, 0.1 and 0.0 ml of *diluent for hyaluronidase solutions*. If quantities of the solution of the standard solution other than those indicated below are used, change the quantities of *diluent for hyaluronidase solutions* accordingly. At intervals of 30 seconds add to the tubes 0.0, 0.1, 0.2, 0.3, 0.4 and 0.5 ml of the solution of the standard solution, respectively and in duplicate, making the final volume in each tube 1.0 ml, mixing the contents by shaking gently and placing each tube in a water-bath maintained at 37.0° ± 0.2°. After exactly 30 minutes, remove each tube in order from the water-bath at intervals of 30 seconds and immediately add 4.0 ml of *serum solution*. Shake and allow to stand at room temperature for 30 minutes. Shake again and measure the absorbance at about 640 nm (2.4.7). Repeat the operation using 0.50 ml of *phosphate-buffered saline* in place of the *hyaluronate solution* and make any necessary corrections. Prepare a reference curve by plotting the mean of the corrected absorbance for each level against the potency.

Standard solution. Dissolve one tablet of the Standard Preparation, weighed, in sufficient cold *diluent for hyaluronidase solutions* to give a solution of known concentration containing about 1.5 Units per ml. This solution should be prepared immediately before use.

To each of 6 test-tubes (100 mm x 16 mm) add 0.5 ml of *hyaluronate solution* and sufficient *diluent for hyaluronidase solutions* so that the final volume in each tube after the addition of the solution of the preparation being examined is 1.0 ml. At intervals of 30 seconds add to each tube sufficient of the solution of the preparation being examined so that the tubes contain about 0.3, 0.5 and 0.7 Units, respectively and in duplicate, shaking each tube gently and continuing as described under test solution, beginning at the words "placing each tube in a water-bath..."

Storage. Store protected from moisture at a temperature not exceeding 15°.

Labelling. The label states (1) the total number of Units in the container; (2) the name of any added stabilising agent; (3) that the preparation is not intended for intravenous injection.

Hyaluronidase Injection

Hyaluronidase Injection is a sterile material consisting of Hyaluronidase with or without excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Hyaluronidase Injection contains not less than 90.0 per cent and not more than 115.0 per cent of the stated number of Units of hyaluronidase activity.

Usual strength. 1500 Units.

Description. A white or yellowish-white powder.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

A. A solution containing the equivalent of 100 Units in 1 ml of *saline solution* depolymerises an equal volume of a 1 per cent w/v solution of *sodium hyaluronate* at 20° in 1 minute as shown by a pronounced decrease in viscosity. This action is destroyed by heating the initial solution at 100° for 30 minutes.

B. A solution containing the equivalent of 1 Unit in 0.2 ml of *saline solution* when injected intracutaneously into experimental animals together with a suitable indicator shows a spreading activity when compared with a control solution.

Tests

pH (2.4.24). 4.5 to 7.5, determined in a 0.3 per cent w/v solution in *carbon dioxide-free water*.

Appearance of solution. A 1.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and not more than faintly yellow.

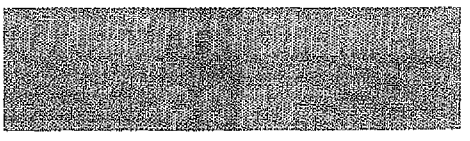
Bacterial endotoxins (2.2.3). Not more than 0.2 Endotoxin Unit per unit of hyaluronidase.

Assay. The potency of hyaluronidase is determined by comparing its effects against those of the Standard Preparation.

Diluent for hyaluronidase solution. Mix 100 ml of *phosphate buffer solution pH 6.4* with 100 ml of *water*. Dissolve 0.14 g of hydrolysed gelatin in the solution at 37°, used within 2 hours.

Standard Preparation

The Standard Preparation is the 1st International Standard for Hyaluronidase, bovine, established in 1955, consisting of dried



bovine testicular hyaluronidase diluted with lactose (supplied in ampoules containing 10 tablets of 20 mg each; each tablet contains approximately 200 Units).

Test solution. Dissolve the contents of a container by adding cold *diluent for hyaluronidase solutions*. Dilute the solution with cold *diluent for hyaluronidase solutions* so that the absorbances of the dilutions being assayed will fall on the upper linear part of the reference curve prepared as follows.

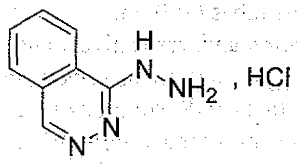
To each of 12 test-tubes (100 mm x 16 mm) add 0.50 ml of *hyaluronate solution* and, respectively and in duplicate, 0.5, 0.4, 0.3, 0.2, 0.1 and 0.0 ml of *diluent for hyaluronidase solutions*. If quantities of the solution of the standard solution other than those indicated below are used, change the quantities of *diluent for hyaluronidase solutions* accordingly. At intervals of 30 seconds add to the tubes 0.0, 0.1, 0.2, 0.3, 0.4 and 0.5 ml of the solution of the standard solution, respectively and in duplicate, making the final volume in each tube 1.0 ml, mixing the contents by shaking gently and placing each tube in a water-bath maintained at 37.0° ± 0.2°. After exactly 30 minutes, remove each tube in order from the water-bath at intervals of 30 seconds and immediately add 4.0 ml of *serum solution*. Shake and allow to stand at room temperature for 30 minutes. Shake again and measure the absorbance at about 640 nm (2.4.7). Repeat the operation using 0.50 ml of *phosphate-buffered saline* in place of the *hyaluronate solution* and make any necessary corrections. Prepare a reference curve by plotting the mean of the corrected absorbance for each level against the potency.

Standard solution. Dissolve one tablet of the Standard Preparation, accurately weighed, in sufficient cold *diluent for hyaluronidase solutions* to give a solution of known concentration containing about 1.5 Units per ml. This solution should be prepared immediately before use.

To each of 6 test-tubes (100 mm x 16 mm) add 0.50 ml of *hyaluronate solution* and sufficient *diluent for hyaluronidase solutions* so that the final volume in each tube after the addition of the solution of the preparation being examined is 1.0 ml. At intervals of 30 seconds add to each tube sufficient of the solution of the preparation being examined so that the tubes contain about 0.3, 0.5 and 0.7 Units, respectively and in duplicate, shaking each tube gently and continuing as described under test solution, beginning at the words "placing each tube in a water-bath..."

Labelling. The label states (1) the total number of Units contained in it; (2) the nature of any added stabilising agent; (3) that the injection should be used immediately after preparation; (4) that the preparation is not intended for intravenous injection.

Hydralazine Hydrochloride



$C_8H_8N_4,HCl$ Mol. Wt. 196.6

Hydralazine Hydrochloride is phthalazin-1-yl-hydrazine hydrochloride.

Hydralazine Hydrochloride contains not less 98.5 per cent and not more than 101.0 per cent of $C_8H_8N_4,HCl$, calculated on the dried basis.

Category. Vasodilator; antihypertensive.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B, C and D may be omitted if tests A and E are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *hydralazine hydrochloride IPRS* or with the reference spectrum of hydralazine hydrochloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution shows absorption maxima at about 240 nm, 260 nm, 305 nm and 315 nm and their absorbances are about 0.55, 0.55, 0.27 and 0.22 respectively.

C. Dissolve 0.5 g in a mixture of 8 ml of *2 M hydrochloric acid* and 100 ml of *water*. Add 2.0 ml of *sodium nitrite solution*, allow to stand for 10 minutes and filter. The precipitate, after washing with *water* and drying at 105°, melts at 209° to 212° (2.4.21).

D. To a solution of about 10 mg in 2 ml of *water* add 2 ml of a 2 per cent w/v solution of *2-nitrobenzaldehyde* in *ethanol (95 per cent)*; an orange precipitate is obtained.

E. A 5.0 per cent w/v solution gives the reactions of chlorides (2.3.1).

Tests

Appearance of solution. A 0.4 per cent w/v solution is clear (2.4.1), and not more intensely coloured than reference solution GYS4 (2.4.1).

pH (2.4.24). 3.5 to 4.2, determined in a 2.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution (a). Dissolve 25 mg of the substance under examination in sufficient quantity of the mobile phase to make 50 ml.

Test solution (b). Dilute 1.0 ml of test solution (a) to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 5.0 ml of test solution (b) to 25.0 ml with the mobile phase.

Reference solution (b). Dissolve 25 mg of *phthalazine* in sufficient quantity of the mobile phase to make 50 ml and dilute 4.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (c). Mix 4.0 ml of test solution (a) and 10.0 ml of reference solution (b) and dilute to 100.0 ml with the mobile phase.

The solutions should be used within 8 hours of preparation.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with porous spherical particles of finely-divided silica gel chemically bonded to nitrile groups (10 µm),
- mobile phase: a mixture of 22 volumes of *acetonitrile* and 78 volumes of a solution containing 1.44 g of *sodium dodecyl sulphate* and 0.75 g of *tetrabutylammonium bromide* per litre adjusted to pH 3.0 with *0.05 M sulphuric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject test solution (b) and adjust the sensitivity of the detector so that the height of the principal peak in the chromatogram is not less than 70 per cent of the full scale of the recorder. When the chromatograms are recorded in the prescribed conditions, the retention time of hydralazine is about 10 to 12 minutes. If necessary, adjust the concentration of acetonitrile in the mobile phase.

Inject test solution (a) and continue the chromatography for 3 times the retention time of hydralazine. Inject reference solution (a). The area of any secondary peak in the chromatogram obtained with test solution (a) is not greater than the area of the peak in the chromatogram obtained with reference solution (a).

The test is not valid unless (a) the chromatogram obtained with reference solution (c) shows two principal peaks and the resolution between the peaks is not less than 2.5 and (b) the principal peak in the chromatogram obtained with reference solution (a) has a signal-to-noise ratio of at least 3.

Hydrazine. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 90 volumes of *toluene* and 10 volumes of *ethanol (95 per cent)*.

Test solution. Dissolve 0.12 g of the substance under examination in 4 ml of *water* and 4 ml of a 15 per cent w/v solution of *salicylaldehyde* in *methanol* and 0.2 ml of *hydrochloric acid*. Mix and let it stand at a temperature not exceeding 25° for 2 to 4 hours to allow complete sedimentation of the precipitate. Add 4 ml of toluene, shake vigorously and centrifuge. Transfer the supernatant liquid to a 100-ml separating funnel, separate the toluene layer and shake vigorously, each time for 3 minutes, with two quantities, each of 20 ml, of a 20 per cent w/v solution of *sodium metabisulphite* and with two quantities, each of 50 ml, of *water*. Separate the toluene layer and use it as the test solution.

Reference solution. Prepare at the same time and in the same manner as described for the test solution using 1 ml of a solution prepared by dissolving 12 mg of *hydrazine sulphate* in sufficient quantity of *2 M hydrochloric acid* to make 100 ml and diluting 1.0 ml of the solution to 100.0 ml with the same solvent and 3 ml of *water*.

Apply to the plate 20 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate in air and examine under ultraviolet light at 365 nm. Any spot in the chromatogram obtained with the test solution showing a yellow fluorescence is not more intense than the spot in the chromatogram obtained with the reference solution.

Heavy metals (2.3.13). Moisten the residue obtained in the test for Sulphated ash with 2 ml of *hydrochloric acid*, evaporate to dryness and dissolve the residue in sufficient *water* to produce 20 ml. 12 ml of the resulting solution complies with the limit test for heavy metals, Method D (20 ppm). Use *lead standard solution (2 ppm Pb)* to prepare the standard

Sulphated ash (2.3.18). Not more than 0.1 per cent, determined on 2.0 g.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa.

Assay. Weigh 0.1 g and dissolve in a mixture of 25 ml of water and 35 ml of *hydrochloric acid*. Titrate with *0.05 M potassium iodate*, determining the end-point potentiometrically (2.4.25) and using a calomel reference electrode and a platinum indicator electrode.

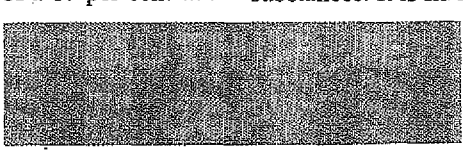
1 ml of *0.05 M potassium iodate* is equivalent to 0.009832 g of $C_8H_8N_4,HCl$.

Storage. Store protected from light.

Hydralazine Injection

Hydralazine Hydrochloride Injection

Hydralazine Injection is a sterile material consisting of Hydralazine Hydrochloride with or without auxiliary substances. It is filled in a sealed container.



The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use. For intravenous infusion, the injection should be diluted with an appropriate volume of a suitable diluent.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Hydralazine Injection contains not less than 98.0 per cent and not more than 114.0 per cent of the stated amount of hydralazine hydrochloride, $C_8H_8N_4,HCl$.

Usual strength. 20 mg.

Description. A white or almost white powder; very hygroscopic.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *hydralazine hydrochloride IPRS* or with the reference spectrum of hydralazine hydrochloride.

B. It give the reactions of chlorides (2.3.1).

Tests

pH (2.4.24). 3.5 to 4.2, determined in a 2.0 per cent w/v solution.

Appearance of solution. A 2.0 per cent w/v solution is not more opalescent than opalescence standard OS2 (2.4.1). A 2.0 per cent w/v solution in *0.01 M hydrochloric acid* is not more intensely coloured than reference solution GYS6 (2.4.1).

Hydrazine. Determine by thin-layer chromatography (2.4.17), using a silica gel 60-precoated plate.

Mobile phase. The upper layer obtained by shaking together 80 volumes of *hexane*, 20 volumes of *strong ammonia solution* and 20 volumes of *ethyl acetate*.

Test solution. Dissolve the contents of a container in sufficient *0.1 M methanolic hydrochloric acid* to produce a solution containing 0.5 per cent w/v of Hydralazine Hydrochloride. To 2.0 ml add 1.0 ml of a 2 per cent w/v solution of *salicylaldehyde* in *methanol* and 0.1 ml of *hydrochloric acid*, centrifuge and decant the supernatant liquid.

Reference solution. Prepare in the same manner, but using 2.0 ml of a 0.00025 per cent w/v solution of *hydrazine sulphate* in *0.1 M methanolic hydrochloric acid* in place of the solution of the substance under examination.

Apply to the plate 40 µl of each solution. After development, dry the plate in air and spray with *dimethylaminobenzaldehyde reagent*. In the chromatogram obtained with the test solution, any spot corresponding to hydrazine is not more intense than the spot in the chromatogram obtained with the reference solution.

Bacterial endotoxins (2.2.3). Not more than 1.45 Endotoxin Units per mg of hydralazine.

Assay. Mix the contents of 10 containers. Dissolve 0.1 g of the mixed contents of the 10 containers in a mixture of 25 ml of *water* and 35 ml of *hydrochloric acid*. Titrate with *0.05 M potassium iodate*, determining the end-point potentiometrically (2.4.25) and using a calomel reference electrode and a platinum indicator electrode.

1 ml of *0.05 M potassium iodate* is equivalent to 0.009832 g of $C_8H_8N_4,HCl$.

Storage. Store protected from light at a temperature not exceeding 30°.

Labelling. The label states that solutions containing glucose should not be used in the preparation of an intravenous infusion.

Hydrochloric Acid

Concentrated Hydrochloric Acid

HCl Mol. Wt. 36.5

Hydrochloric Acid contains not less than 35.0 per cent w/w and not more than 38.0 per cent w/w of HCl.

Category. Pharmaceutical aid (acidifying agent).

Description. A clear, colourless, fuming liquid.

Identification

A. When added to *potassium permanganate*, chlorine is evolved.

B. It gives the reactions of chlorides (2.3.1).

Tests

Arsenic (2.3.10). Mix 10 g with 40 ml of *water* and 1 ml of *stannous chloride solution AsT*; the resulting solution complies with the limit test for arsenic (1 ppm).

Heavy metals (2.3.13). Evaporate 3.5 ml to dryness on a water-bath, add 2 ml of *dilute acetic acid* to the residue and add *water* to make 25 ml. The resulting solution complies with the limit test for heavy metals, Method A (5 ppm).

Bromide and iodide. Dilute 5 ml with 10 ml of *water*, add 1 ml of *chloroform* and, dropwise with constant shaking, *chlorinated lime solution*; the chloroform layer does not become brown or violet.

Free chlorine. To 15 ml, add 100 ml of *carbon dioxide-free water*, 1 ml of a 10 per cent w/v solution of *potassium iodide* and 0.5 ml of *starch solution* and allow to stand in the dark for 2 minutes. Any blue colour produced disappears on the addition of 0.2 ml of *0.01 M sodium thiosulphate*.

Sulphite. Dilute 1.0 ml with 10 ml of *water* and add 0.25 ml of *barium chloride solution* and 1 ml of *0.01 M iodine*; the colour of the iodine is not completely discharged.

Sulphates (2.3.17). Mix 6.5 ml with 10 mg of *sodium bicarbonate*, evaporate to dryness on a water-bath and dissolve the residue in 15 ml of *distilled water*. The resulting solution complies with the limit test for sulphates (20 ppm).

Residue on evaporation. Not more than 0.01 per cent, determined on 100 g by evporating to dryness on a water-bath and drying at 105°.

Assay. Weigh 2.0 g, add 30 ml of *water*, mix and titrate with *1 M sodium hydroxide* using *methyl red solution* as indicator.

1 ml of *1 M sodium hydroxide* is equivalent to 0.03646 g of HCl.

Storage. Store in stoppered containers of glass or any other inert material at a temperature not exceeding 30°.

Dilute Hydrochloric Acid

Dilute Hydrochloric Acid is prepared by mixing 274 g of Hydrochloric Acid and 726 g of Purified Water.

Dilute Hydrochloric Acid contains not less than 9.5 per cent and not more than 10.5 per cent w/w of HCl.

Description. A clear, colourless liquid.

Identification

A. When added to *potassium permanganate*, chlorine is evolved.

B. It gives the reactions of chlorides (2.3.1).

Tests

Arsenic (2.3.10). Mix 20.0 g with 20 ml of *water* and 1 ml of *stannous chloride AsT*; the resulting solution complies with the limit test for arsenic (0.5 ppm).

Heavy metals (2.3.13). Dissolve the residue obtained in the test for Residue on evaporation in 1 ml of *2 M hydrochloric acid*, dilute to 25.0 ml with *water;* to 2.5 ml of the resulting solution add 2 ml of *dilute acetic acid* and add *water* to make 25 ml. The resulting solution complies with the limit test for heavy metals, Method A (2 ppm).

Free chlorine. To 60 ml add 50 ml of *carbon dioxide-free water*, 1 ml of a 10 per cent w/v solution of *potassium iodide* and 0.5 ml of *starch solution* and allow to stand in the dark for 2 minutes. Any blue colour produced disappears on the addition of 0.2 ml of *0.01 M sodium thiosulphate*.

Residue on evaporation. Not more than 0.01 per cent, determined on 100 g by evaporating to dryness on a water-bath and dry at 105°.

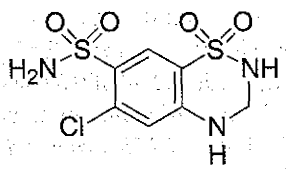
Sulphates (2.3.17). Mix 26 ml with 10 mg of *sodium bicarbonate*, evaporate to dryness on a water-bath and dissolve the residue in 15 ml of *distilled water*. The resulting solution complies with the limit test for sulphates (5 ppm).

Assay. Weigh 6.0 g, add 30 ml of *water*, mix and titrate with *1 M sodium hydroxide* using *methyl red solution* as indicator.

1 ml of *1 M sodium hydroxide* is equivalent to 0.03646 g of HCl.

Storage. Store in stoppered containers of glass or any other inert material at a temperature not exceeding 30°.

Hydrochlorothiazide



$C_7H_8ClN_3O_4S_2$ Mol. Wt. 297.7

Hydrochlorothiazide is 6-chloro-3,4-dihydro-2*H*-1,2,4-benzothiadiazine-7-sulphonamide 1,1-dioxide.

Hydrochlorothiazide contains not less than 98.0 per cent and not more than 102.0 per cent of $C_7H_8ClN_3O_4S_2$, calculated on the dried basis.

Category. Diuretic.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and D may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *hydrochlorothiazide IPRS* or with the reference spectrum of hydrochlorothiazide.

B. When examined in the range 230 nm to 300 nm (2.4.7), a 0.001 per cent w/v solution in *0.01 M sodium hydroxide* shows an absorption maximum only at about 273 nm; absorbance at about 273 nm, 0.5 to 0.54. When examined in the range 300 nm to 360 nm, a 0.005 per cent w/v solution in *0.01 M sodium hydroxide* shows an absorption maximum at 323 nm; absorbance at about 323 nm, 0.45 to 0.48.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. Ethyl acetate.

Test solution. Dissolve 0.5 g of the substance under examination in 100 ml of *acetone*.

Reference solution. A 0.5 per cent w/v solution of *hydrochlorothiazide IPRS* in *acetone*.

Apply to the plate 4 µl of each solution. After development, dry the plate in a current of air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

D. Heat gently about 1 mg with 2 ml of a freshly prepared 0.05 per cent w/v solution of *chromotropic acid sodium salt* in a cooled mixture of 7 volumes of *water* and 13 volumes of *sulphuric acid;* a violet colour develops.

Tests

Acidity or alkalinity. Shake 0.5 g of the powdered substance under examination with 25 ml of *water* for 2 minutes and filter. To 10 ml of the filtrate add 0.2 ml of *0.01 M sodium hydroxide* and 0.15 ml of *methyl red solution*. The solution is yellow and not more than 0.4 ml of *0.01 M hydrochloric acid* is required to change the colour of the solution to red.

Related substances. Determine by liquid chromatography (2.4.14).

Buffer solution. Dissolve 35.8 g of *disodium hydrogen phosphate* in 1000 ml of *water*, adjusted to pH 3.2 with *dilute phosphoric acid*. Dilute 100.0 ml of the solution to 2000.0 ml with *water*.

Solvent mixture (a). A mixture of equal volumes of *acetonitrile* and *methanol*.

Solvent mixture (b). Dilute 50.0 ml of solvent mixture (a) to 200.0 ml with *buffer solution*.

Test solution. Dissolve 30 mg of the substance under examination in 5 ml of solvent mixture (a) with the aid of ultrasound and dilute to 20.0 ml with *buffer solution*.

Reference solution (a). Dissolve 15 mg, each of, *hydrochlorothiazide IPRS* and *hydrochlorothiazide impurity A IPRS (chlorothiazide IPRS)* in 25 ml of solvent mixture (a) and dilute to 100 ml with *buffer solution*. Dilute 5.0 ml of the solution to 100.0 ml with solvent mixture (b).

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with solvent mixture (b). Dilute 5.0 ml of the solution to 20.0 ml with solvent mixture (b).

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: A. to 940 ml of *buffer solution*, add 60.0 ml of *methanol* and 10.0 ml of *tetrahydrofuran*,
  B. to a mixture of 500 ml of *methanol* and 500 ml of *buffer solution*, add 50.0 ml of *tetrahydrofuran*,
- a gradient programme using the conditions given below,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 224 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
17	55	45
30	55	45
35	100	0
50	100	0

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to hydrochlorothiazide impurity A and hydrochlorothiazide is not less than 2.5.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Chlorides (2.3.12). Dissolve 1.0 g in 25 ml of *acetone* and dilute to 30 ml with *water*. The resulting solution complies with the limit test for chlorides (250 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances with the following modification.

Test solution (a). Dilute 1.0 ml of test solution to 20.0 ml with *buffer solution*.

Reference solution(c). Dissolve 30.0 mg of *hydrochlorothiazide IPRS* in 5 ml of a solvent mixture (a), using sonication if necessary, and dilute to 20.0 ml with *buffer solution*. Dilute 1.0 ml of the solution to 20.0 ml with *buffer solution*.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm packed with octadecylsilane silica gel (3 µm),
- mobile phase: A. to 940 ml of *buffer solution*, add 60.0 ml of *methanol* and 10.0 ml of *tetrahydrofuran* and mix,
  B. to a mixture of 500 ml of *methanol* and 500 ml of *buffer solution*, add 50.0 ml of *tetrahydrofuran* and mix,
- a gradient programme using the conditions given below,
- flow rate: 1.6 ml per minute,
- spectrophotometer set at 224 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
4	80	20
10	20	80
11	80	20

Name	Relative retention time
Impurity A[1]	0.9
Hydrochlorothiazide (Retention time: about 2.2 minutes)	1.0

[1]6-chloro-2*H*-1,2,4-benzothiadiazine-7-sulfonamide 1,1-dioxide (chlorothiazide).

Inject the reference solution (a). The test is not valid unless the resolution between the peaks due to impurity A and hydrochlorothiazide is not less than 2.

Inject the reference solution (c) and the test solution (a).

Calculate the content of $C_7H_8ClN_3O_4S_2$.

Hydrochlorothiazide Tablets

Hydrochlorothiazide Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of hydrochlorothiazide, $C_7H_8ClN_3O_4S_2$.

Usual strengths. 25 mg; 50 mg.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. Ethyl acetate.

Test solution. Triturate a quantity of the powdered tablets containing 10 mg of Hydrochlorothiazide with 10 ml of *acetone* and filter.

Reference solution. A 0.1 per cent w/v solution of *hydrochlorothiazide IPRS* in *acetone*.

Apply to the plate 5 µl of each solution. After development, dry the plate in a current of air, examine under ultraviolet light at 254 nm and then spray with *ethanolic sulphuric acid (20 per cent)*, heat at 105° for 30 minutes and immediately expose to nitrous fumes in a closed tank for 15 minutes (the nitrous fumes may be generated by adding *7 M sulphuric acid* dropwise to a solution containing 10 per cent w/v of *sodium nitrite* and 3 per cent w/v of *potassium iodide*). Place the plate in a current of warm air for 15 minutes and spray with a 0.5 per cent w/v solution of *N-(1-naphthyl)ethylenediamine dihydrochloride* in *ethanol (95 per cent)*. Examine the plate again. By each method of visualisation the principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the solution and filter promptly through a membrane filter disc with an average pore diameter not greater than 1.0 mm. Reject the first few ml of the filtrate and dilute a suitable volume of the filtrate with *0.1 M hydrochloric acid*. Measure the absorbance of the resulting solution at the maximum at about 272 nm (2.4.7). Calculate the content of $C_7H_8ClN_3O_4S_2$ taking 644 as the specific absorbance at 272 nm.

Q. Not less than 60 per cent of the stated amount of $C_7H_8ClN_3O_4S_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Buffer solution. Dissolve 35.8 g of *disodium hydrogen phosphate* in 1000 ml of *water*, adjusted to pH 3.2 with *dilute phosphoric acid*. Dilute 100.0 ml of the solution to 2000.0 ml with *water*.

Solvent mixture. A mixture of equal volumes of *acetonitrile* and *methanol*.

Test solution. Disperse a quantity of the powdered tablets containing 50 mg of Hydrochlorothiazide with 25 ml of the solvent mixture and dilute to 100.0 ml with buffer solution, filter through a glass fibre filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with a mixture containing 1 volume of *methanol*, 1 volume of *acetonitrile* and 2 volumes of buffer solution.

Reference solution (b). Dissolve 15 mg, each of, *hydrochlorothiazide IPRS* and *hydrochlorothiazide impurity A IPRS (chlorothiazide IPRS)* in 25 ml of the solvent mixture and dilute to 100.0 ml with buffer solution. Dilute 5.0 ml of the solution to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm) (Such as Phenosphere ODS or Microsorb ODS),
- mobile phase: A. a mixture of 10 volumes of *tetrahydrofuran*, 60 volumes of *methanol* and 940 volumes of *buffer solution*,

  B: a mixture of 50 volumes of *tetrahydrofuran*, 500 volumes of *methanol* and 500 volumes of buffer solution,
- a gradient programme using the conditions given below,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 224 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
17	55	45
30	55	45
35	100	0
50	100	0

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to chlorothiazide and hydrochlorothiazide is not less than 2.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). The sum of areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (2.5 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 30 mg of hydrochlorothiazide in 20 ml of the mobile phase with the aid of ultrasound, add 20 ml of *acetonitrile* and further sonicate for 5 minutes, with intermittent shaking and dilute to 200.0 ml with the mobile phase, filter.

Reference solution (a). A 0.015 per cent w/v solution of *hydrochlorothiazide IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.015 per cent w/v, each of, *hydrochlorothiazide IPRS* and *chlorothiazide IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 90 volumes of *0.1M monobasic sodium phosphate* and 10 volumes of *acetonitrile*, adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

The relative retention time for chlorothiazide with respect to hydrochlorothiazide is about 0.8.

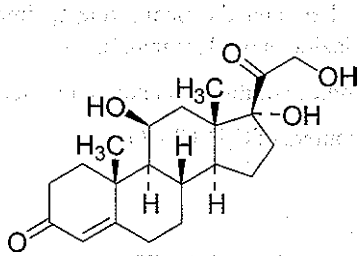
Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to hydrochlorothiazide and chlorothiazide is not less than 2.0 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 1.5 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_7H_8ClN_3O_4S_2$ in the tablets.

Hydrocortisone

Cortisol



$C_{21}H_{30}O_5$ Mol. Wt. 362.5

Hydrocortisone is 11β,17α ,21-trihydroxypregn-4-ene-3, 20- dione.

Hydrocortisone contains not less than 96.0 per cent and not more than 104.0 per cent of $C_{21}H_{30}O_5$, calculated on the dried basis.

Category. Adrenocortical steroid.

Description. A white to practically white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Test C may be omitted if tests A and B are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *hydrocortisone IPRS* or with the reference spectrum of hydrocortisone.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase (a). A mixture of 77 volumes of *dichloromethane*, 15 volumes of *ether*, 8 volumes of *methanol* and 1.2 volumes of *water*.

Mobile phase (b). A mixture of 80 volumes of *ether*, 15 volumes of *toluene* and 5 volumes of *1-butanol* saturated with *water*.

Solvent mixture. 90 volumes of *chloroform* and 10 volumes of *methanol*.

Test solution. Dissolve 0.25 g of the substance under examination in 100.0 ml with solvent mixture.

Reference solution. A 0.25 per cent w/v solution of *hydrocortisone IPRS* in the same solvent mixture.

Apply to the plate 2 µl of each solution. Develop the chromatograms successively with each mobile phase. After both developments, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution. Spray the plate with *ethanolic sulphuric acid (20 per cent)*, heat at 120° for 10 minutes or until spots appear and allow to cool. Examine the chromatograms in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution is similar in colour in daylight, fluorescence under ultraviolet light at 365 nm, position and size to the principal spot in the chromatogram obtained with the reference solution.

C. To 2 ml of a 0.1 per cent w/v solution in *ethanol (95 per cent)* add 2 ml of *sulphuric acid*; an intense yellow colour is produced with a green fluorescence, which is particularly intense under ultraviolet light at 365 nm. Add the solution to 10 ml of *water* and mix; the fluorescence under ultraviolet light at 365 nm does not disappear.

Tests

Specific optical rotation (2.4.22). +150° to +156°, determined in a 1.0 per cent w/v solution in *dioxan*.

Light absorption (2.4.7). A 0.001 per cent w/v solution in *ethanol (95 per cent)* exhibits a maximum at about 240 nm; absorbance at about 240 nm, between 0.42 and 0.45.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in sufficient *tetrahydrofuran* to produce 10 ml.

Reference solution (a). Dissolve 2 mg of *hydrocortisone IPRS* and 2 mg of *prednisolone IPRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with base deactivated end-capped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 220 ml of *tetrahydrofuran* and 700 ml of *water*, allowed to equilibrate, diluted to 1000 ml with *water* and mixed again,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Equilibrate the column with the mobile phase for about 30 minutes.

Inject reference solution (a). The retention times are: prednisolone, about 14 minutes and hydrocortisone about 15.5 minutes. The test is not valid unless the resolution between the peaks corresponding to prednisolone and hydrocortisone is at least 2.2. If necessary, adjust the concentration of *tetrahydrofuran* in the mobile phase.

Inject reference solution (b) and the test solution. Run the chromatogram of the test solution for 4 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak other than the principal peak, is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent): the sum of the areas of all the peaks other than the principal peak is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent). Ignore any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with reference solution (b).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Weigh 0.1 g, dissolve in sufficient *ethanol* to produce 100.0 ml. Dilute 2.0 ml of the solution to 100.0 ml with *ethanol* and mix. Measure the absorbance of the resulting solution (2.4.7) at the maximum at 241.5 nm. Calculate the content of $C_{21}H_{30}O_5$ taking 440 as the specific absorbance at 241.5 nm.

Storage. Store protected from light.

Hydrocortisone Ointment

Hydrocortisone Ointment contains Hydrocortisone in a suitable base.

Hydrocortisone Ointment contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of hydrocortisone, $C_{21}H_{30}O_5$.

Usual strengths. 0.5 per cent w/w; 1 per cent w/w; 2.5 per cent w/w.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *octadecylsilane silica gel G*.

For ointments containing more than 0.5 per cent w/w of Hydrocortisone—

Test solution. Disperse a quantity of ointment containing 25 mg of Hydrocortisone in 5 ml of hot *hexane*, cool, extract with 10 ml of *methanol (90 per cent)* and filter.

Reference solution (a). A 0.25 per cent w/v solution of *hydrocortisone IPRS* in *methanol*.

Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

For ointments containing 0.5 per cent w/w or less of Hydrocortisone—

Test solution. Disperse a quantity of ointment containing 5 mg of Hydrocortisone in 50 ml of hot *hexane*, cool, extract with 10 ml of *methanol (90 per cent)* and filter.

Reference solution (a). A 0.05 per cent w/v solution of *hydrocortisone IPRS* in *methanol*.

Reference solution (b). A mixture of equal volumes of the reference solution (a) and the test solution.

Mobile phase. A mixture of 1.2 volumes of *water*, 8 volumes of *methanol*, 15 volumes of *ether* and 77 volumes of *dichloromethane*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and spray with *alkaline tetrazolium blue solution* and examine in day light. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). If it does not, the principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

B. In the Assay, the chromatogram obtained with the test solution (b) corresponds to that in the chromatogram obtained with the reference solution.

Tests

Other tests. Comply with the tests stated under Ointment.

Assay. Determine by liquid chromatography (2.4.14).

For ointment containing more than 0.5 per cent w/w of Hydrocortisone—

Solution A. A 0.5 per cent w/v solution of *betamethasone* (internal standard) in *methanol*.

Test solution (a). Disperse a quantity of ointment containing 25 mg of Hydrocortisone in 40 ml of a mixture of 3 volumes of *methanol* and 1 volume of a 15 per cent w/v solution of *sodium chloride* by shaking. Add 50 ml of hot *hexane*, shake and separate the lower layer. Repeat the extraction using a further two 10-ml quantities of the *methanolic sodium chloride solution*. To the combined extracts add 5 ml of solution A and dilute to 100.0 ml with *water*, filter through glass mimcrofibre filter paper.

Test solution (b). Disperse a quantity of ointment containing 25 mg of Hydrocortisone in 100 ml of hot *hexane*, cool and extract with 20 ml of a solution prepared by mixing 3 volumes of *methanol* with 1 volume of a 15 per cent w/v solution of *sodium chloride*. Repeat the extraction using a further two 10-ml quantities of the *methanolic sodium chloride solution*. To the combined extracts add 5 ml of *methanol* and dilute to 100.0 ml with *water*, filter through glass microfibre filter paper.

Reference solution. Dissolve 25 mg of *hydrocortisone IPRS* in 45 ml of *methanol*, add 5 ml of solution A and dilute to 100.0 ml with *water*.

For ointments containing 0.5 per cent w/w or less of Hydrocortisone—

Solution B. A 0.11 per cent w/v solution of *betamethasone* (internal standard) in *methanol*.

Test solution (a). Disperse a quantity of the ointment containing 5 mg of Hydrocortisone in 40 ml of a mixture of 3 volumes of *methanol* and 1 volume of a 15.0 per cent w/v solution of *sodium chloride*. Add 50 ml of hot *hexane*, shake and separate the lower layer. Repeat the extraction using a further two 10-ml quantities of the *methanolic sodium chloride solution*. To the combined extracts add 5 ml of solution B and dilute to 100.0 ml with *water*, filter.

Test solution (b). Disperse a quantity of ointment containing 5 mg of Hydrocortisone in 100 ml of hot *hexane*, cool and extract with 20 ml of a solution prepared by mixing 3 volumes of *methanol* with 1 volume of a 15 per cent w/v solution of *sodium chloride*. Repeat the extraction using a further two 10-ml quantities of the *methanolic sodium chloride solution*. To the combined extracts add 5 ml of *methanol* and dilute to 100 ml with *water*, filter.

Reference solution. Dissolve 5 mg of *hydrocortisone IPRS* in 45 ml of *methanol* and add 5 ml of solution B and dilute to 100.0 ml with *water*.

Chromatographic system
- a stainless steel column 10 cm x 5 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: 50 per cent v/v *methanol*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

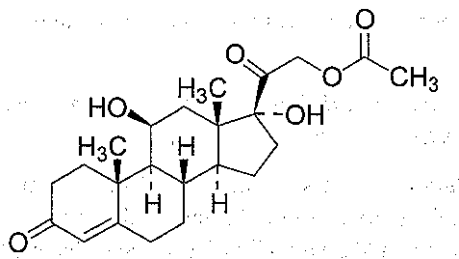
Inject the reference solution and test solution (a).

Calculate the content of $C_{21}H_{30}O_5$ in the ointment.

Storage. Store protected from light.

Hydrocortisone Acetate

Cortisol Acetate



$C_{23}H_{32}O_6$ Mol. Wt. 404.5

Hydrocortisone Acetate is 11β,17α-dihydroxy-3,20- dioxopregn-4-en-21-yl acetate.

Hydrocortisone Acetate contains not less than 96.0 per cent and not more than 104.0 per cent of $C_{23}H_{32}O_6$, calculated on the dried basis.

Category. Adrenocortical steroid.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C, and D are carried out. Tests C and D may be omitted if tests A and B are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *hydrocortisone acetate IPRS* or with the reference spectrum of hydrocortisone acetate.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. Add a mixture of 1.2 volumes of *water* and 8 volumes of *methanol* to a mixture of 15 volumes of *ether* and 77 volumes of *dichloromethane*.

Test solution (a). Dissolve 25 mg of the substance under examination in *methanol* and dilute to 5 ml with the same solvent. Use this solution to prepare test solution (b). Dilute 2.0 ml of the solution to 10.0 ml with *dichloromethane*.

Test solution (b). Transfer 2.0 ml of the solution obtained in preparing test solution (a) to a 15-ml glass tube with a glass or plastic stopper. Add 10 ml of *saturated methanolic potassium hydrogen carbonate solution* and immediately pass a stream of *nitrogen* through the solution for 5 minutes. Stopper the tube. Heat in a water-bath at 45° protected from light for 2½ hours. Allow to cool.

Reference solution (a). Prepare in the same manner as test solution (a) but using *hydrocortisone acetate IPRS* in place of the substance under examination.

Reference solution (b). Prepare in the same manner as test solution (b) but using 2 ml of the solution obtained in preparing reference solution (a) in place of the solution obtained in preparing test solution (a).

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in each of the chromatograms obtained with the test solutions is similar to the principal spot in the chromatogram obtained with the corresponding reference solution. Spray with *ethanolic sulphuric acid (20 per cent v/v)* and heat at 120° for 10 minutes or until the spots appear. Allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in each of the chromatograms obtained with the test solutions is similar in position, colour in daylight, fluorescence under ultraviolet light at 365 nm, position and size to that in the chromatogram obtained with the corresponding reference solution. The principal spots in the chromatograms obtained with test solution (b) and reference solution (b) have an R_f value distinctly lower than that of the principal spots in the chromatograms obtained with test solution (a) and reference solution (a).

C. To 2 ml of a 0.1 per cent w/v solution in *ethanol (95 per cent)* add 2 ml of *sulphuric acid* and mix; an orange colour is produced with a green fluorescence which is particularly intense under ultraviolet light at 365 nm. Add the solution to 10 ml of *water* and mix; the fluorescence under ultraviolet light at 365 nm does not disappear.

D. It gives the reaction of acetyl groups (2.3.1).

Tests

Specific optical rotation (2.4.22). +158° to +167°, determined in a 1.0 per cent w/v solution in *dioxan*.

Light absorption (2.4.7). A 0.001 per cent w/v solution in *ethanol (95 per cent)* shows an absorption maximum at about 240 nm; absorbance at about 240 nm, between 0.38 and 0.40.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in sufficient *methanol* to produce 10 ml.

Reference solution (a). Dissolve 2 mg of *hydrocortisone acetate IPRS* and 2 mg of *cortisone acetate IPRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with base deactivated endcapped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 400 ml of *acetonitrile* and 550 ml of *water*, allowed to equilibrate, diluted to 1000 ml with *water* and mixed again,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Equilibrate the column with the mobile phase for about 30 minutes.

Inject reference solution (a). The retention times are: hydrocortisone acetate, about 10 minutes and cortisone acetate about 12 minutes. The test is not valid unless the resolution between the peaks corresponding to hydrocortisone acetate and cortisone acetate is at least 4.2. If necessary, adjust the concentration of acetonitrile in the mobile phase.

Inject reference solution (b) and the test solution. Continue the chromatography of the test solution for 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak other than the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and not more than one such peak has an area greater than half the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all the peaks other than the principal peak is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent). Ignore any peak due to the solvent and any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with reference solution (b).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 2.0 g by drying in an oven at 105° for 3 hours.

Assay. Weigh 0.1 g, dissolve in sufficient *ethanol* to produce 100.0 ml. Dilute 2.0 ml of the solution to 100.0 ml with *ethanol* and mix. Measure the absorbance of the resulting solution (2.4.7) at the maximum at 241.5 nm. Calculate the content of $C_{23}H_{32}O_6$ taking 395 as the specific absorbance at 241.5 nm.

Storage. Store protected from light.

Hydrocortisone Cream

Hydrocortisone Acetate Cream; Cortisol Acetate Cream

Hydrocortisone Cream contains Hydrocortisone Acetate in a suitable cream base.

Hydrocortisone Cream contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of hydrocortisone acetate, $C_{23}H_{32}O_6$.

Usual strengths. 1 per cent; 2.5 per cent.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 77 volumes of *dichloromethane*, 15 volumes of *ether*, 8 volumes of *methanol* and 1.2 volumes of *water*.

For creams containing more than 0.5 per cent w/w of Hydrocortisone Acetate—

Test solution. Disperse a quantity of the cream containing 25 mg of Hydrocortisone Acetate with 10 ml of *methanol (90 per cent)*, add 50 ml of hot *hexane* and shake. Discard the upper layer, add 5 g of *anhydrous sodium sulphate* to the lower layer, mix and filter through a glass microfiber filter paper.

Reference solution. A mixture of equal volumes of the test solution and a 0.25 per cent w/v solution of *hydrocortisone acetate IPRS* in *methanol*.

For creams containing 0.5 per cent w/w or less of Hydrocortisone Acetate—

Test solution. Disperse a quantity of the cream containing 5 mg of Hydrocortisone Acetate with 10 ml of *methanol (90 per cent)*, add 50 ml of hot *hexane* and shake. Discard the upper layer, add 5 g of *anhydrous sodium sulphate* to the lower layer, mix and filter through a glass microfiber filter paper.

Reference solution. A mixture of equal volumes of the test solution and a 0.05 per cent w/v solution of *hydrocortisone acetate IPRS* in *methanol*.

Apply to the plate 5 µl of each solution. After development dry the plate in air and spray with *alkaline tetrazolium blue solution* and examine in day light. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution, which appears as a single, compact spot.

B. In the Assay, the chromatogram obtained with test solution (a) corresponds to that in the chromatogram obtained with the reference solution.

Tests

Other tests. Comply with the tests stated under Creams.

Assay. Determine by liquid chromatography (2.4.14).

For creams containing more than 0.5 per cent w/w of Hydrocortisone Acetate—

Test solution (a). Disperse a quantity containing 25 mg of Hydrocortisone Acetate in 40 ml of a solution prepared by mixing 75 ml of *methanol* with 25 ml of a 15 per cent w/v solution of *sodium chloride* by shaking. Add 50 ml of hot *hexane*, shake and separate the lower layer. Repeat the extraction using two 10-ml quantities of the *methanolic sodium chloride solution*. Add 5 ml of *methanol* to the combined extracts and dilute to 100.0 ml with *water*, mix and filter through a glass microfiber filter paper.

Test solution (b). Prepare in the same manner as test solution (a) but adding 5 ml of internal standard solution in place of the 5 ml of *methanol* before diluting to 100.0 ml.

Reference solution. Dissolve 25 mg of *hydrocortisone acetate IPRS* in 45 ml of *methanol*, add 5 ml of a 0.5 per cent w/v solution of *betamethasone* (internal standard) in *methanol* and dilute to 100.0 ml with *water*.

For creams containing 0.5 per cent w/w or less of Hydrocortisone Acetate—

Test solution (a). Disperse a quantity containing 5 mg of Hydrocortisone Acetate in 40 ml of a solution prepared by mixing 75 ml of *methanol* with 25 ml of a 15 per cent w/v solution of *sodium chloride* by shaking. Add 50 ml of hot *hexane*, shake and separate the lower layer. Repeat the extraction using two 10-ml quantities of the *methanolic sodium chloride solution*. Add 5 ml of *methanol* to the combined extracts and dilute to 100.0 ml with *water*, mix and filter through a glass microfiber filter paper.

Test solution (b). Prepare in the same manner as test solution (a) but adding 5 ml of internal standard solution in place of the 5 ml of *methanol* before diluting to 100.0 ml.

Reference solution. Dissolve 5 mg of *hydrocortisone acetate IPRS* in 45 ml of *methanol*, add 5 ml of a 0.11 per cent w/v solution of *betamethasone* (internal standard) in *methanol* and dilute to 100.0 ml with *water*.

Chromatographic system

- a stainless steel column 10 cm x 5 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: 50 per cent v/v *methanol*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject the reference solution and test solution (b).

Calculate the content of $C_{23}H_{32}O_6$ in the Cream.

Hydrocortisone Eye Ointment

Hydrocortisone Acetate Eye Ointment; Cortisol Acetate Eye Ointment

Hydrocortisone Eye Ointment contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of hydrocortisone acetate, $C_{23}H_{32}O_6$.

Usual strength. 2.5 per cent w/w.

Identification

Boil 2 g with 20 ml of *methanol*, shake, cool to 0° for 30 minutes, filter and evaporate the filtrate to dryness. The residue complies with the following tests.

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. 90 volumes of *acetone* and 10 volumes of *formamide*.

Mobile phase. A mixture of 30 volumes of *toluene* and 10 volumes of *chloroform*.

Test solution. Dissolve 25 mg of the substance under examination in 10 ml of the solvent mixture.

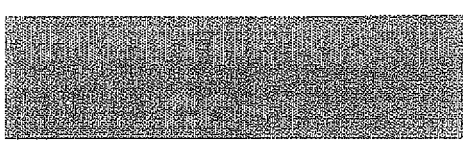
Reference solution (a). Dissolve 25 mg of *hydrocortisone IPRS* in 10 ml of the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

B. Dissolve about 1 mg in 1 ml of *sulphuric acid* and mix; an orange colour is produced with a green fluorescence, which is particularly intense under ultraviolet light at 365 nm. Add the solution to 10 ml of *water* and mix; the fluorescence under ultraviolet light at 365 nm does not disappear.



C. Dissolve 10 mg in 1 ml of *methanol*, warm and add 1 ml of *potassium cupri-tartrate solution*; an orange-red precipitate is slowly formed.

Tests

Other tests. Comply with the tests stated under Eye Ointments.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the ointment containing 10 mg of Hydrocortisone Acetate, shake with 20.0 ml of *methanol* for 30 minutes and centrifuge. To 10.0 ml of the clear, supernatant layer add sufficient *methanol* to produce 50.0 ml.

Reference solution. A solution containing 0.01 per cent w/v of *hydrocortisone acetate IPRS* in *methanol*.

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with porous silica particles (5 µm),
- mobile phase: a mixture of 425 volumes of *butyl chloride* saturated with *water*, 70 volumes of *tetrahydrofuran*, 35 volumes of *methanol* and 30 volumes of *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Calculate the content of $C_{23}H_{32}O_6$ in the ointment.

Storage. Store protected from light at a temperature not exceeding 30°.

Hydrocortisone Acetate Injection

Cortisol Acetate Injection

Hydrocortisone Acetate Injection is a sterile suspension of a very fine powder of Hydrocortisone Acetate in Water for Injections or Sodium Chloride Injection containing suitable dispersing agents.

Hydrocortisone Acetate Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of hydrocortisone acetate, $C_{23}H_{32}O_6$.

Usual strength. 25 mg per ml.

Identification

Filter a volume containing 50 mg of Hydrocortisone Acetate through a sintered-glass filter, wash the residue with four quantities, each of 5 ml, of *water*, dissolve in 20 ml of *chloroform*, wash the chloroform solution with four quantities, each of 10 ml, of *water*, discard the washings, filter the chloroform solution through a plug of cotton and evaporate the filtrate to dryness. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *hydrocortisone acetate IPRS* or with the reference spectrum of hydrocortisone acetate.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. 90 volumes of *acetone* and 10 volumes of *formamide*.

Mobile phase. A mixture of 30 volumes of *toluene* and 10 volumes of *chloroform*.

Test solution. Dissolve 25 mg of the substance under examination in 10 ml of the solvent mixture.

Reference solution (a). Dissolve 25 mg of *hydrocortisone acetate IPRS* in 10 ml of the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

Tests

Other tests. Comply with the tests stated under Parenteral Preparations (Injections)

Assay. Determine by liquid chromatography (2.4.14).

Test solution. To a measured volume of the injection containing about 50 mg of Hydrocortisone Acetate add 70 ml of *methanol*, shake to produce a clear solution and dilute to 100.0 ml with *methanol*. Dilute 10.0 ml of the resulting solution to 20.0 ml with *water*.

Reference solution. Dissolve 25.0 mg of *hydrocortisone acetate IPRS* in 50 ml of *methanol* and add sufficient *water* to produce 100.0 ml.

Chromatographic system
- a stainless steel column 10 cm x 5 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Spherisorb ODS 1),

- mobile phase: 50 per cent v/v solution of *methanol*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

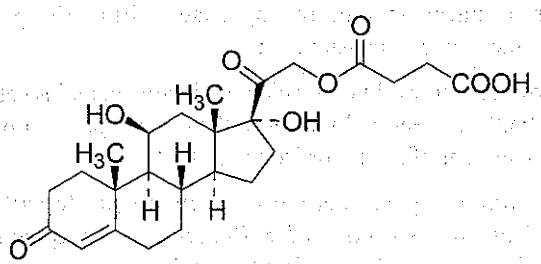
Calculate the content of $C_{23}H_{32}O_6$ in the injection.

Storage. Store protected from light.

Labelling. The label states (1) that the contents are meant for local injection only; (2) that the container should be gently shaken before a dose is withdrawn; (3) the names of the dispersing agents used, if any.

Hydrocortisone Hemisuccinate

Hydrocortisone Hydrogen Succinate; Cortisol Hydrogen Succinate



$C_{25}H_{34}O_8$ Mol. Wt. 462.6

Hydrocortisone Hemisuccinate is 11β,17α -dihydroxy-3,20-dioxopregn-4-en-21-yl hydrogen succinate.

Hydrocortisone Hemisuccinate contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{25}H_{34}O_8$, calculated on the dried basis.

Category. Adrenocortical steroid.

Description. A white or almost white, crystalline powder; hygroscopic.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests C and D may be omitted if tests A and B are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Dry the substances before use at 105° for 3 hours and examine them as discs. Compare the spectrum with that obtained with *hydrocortisone hemisuccinate IPRS* or with the reference spectrum of hydrocortisone hemisuccinate.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. Add a mixture of 1.2 volumes of *water* and 8 volumes of *methanol* to a mixture of 15 volumes of *ether* and 77 volumes of *dichloromethane*.

Test solution (a). Dissolve 25 mg of the substance under examination in *methanol* and dilute to 5 ml with the same solvent. Use this solution to prepare test solution (b). Dilute 2.0 ml of the solution to 10.0 ml with *dichloromethane*.

Test solution (b). Transfer 2.0 ml of the solution obtained in preparing test solution (a) to a 15-ml glass tube with a glass or plastic stopper. Add 10 ml of a 0.8 g per litre solution of *sodium hydroxide* in *methanol* and immediately pass a stream of *nitrogen* through the solution for 5 minutes. Stopper the tube. Heat in a water-bath at 45° protected from light for 30 minutes. Allow to cool.

Reference solution (a). Prepare in the same manner as test solution (a) but using *hydrocortisone hemisuccinate IPRS* in place of the substance under examination.

Reference solution (b). Prepare in the same manner as test solution (b) but using 2 ml of the solution obtained in preparing reference solution (a) in place of the solution obtained in preparing test solution (a).

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in each of the chromatograms obtained with the test solutions is similar to the principal spot in the chromatogram obtained with the corresponding reference solution. Spray with *ethanolic sulphuric acid (20 per cent v/v)* and heat at 120° for 10 minutes or until the spots appear. Allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in each of the chromatograms obtained with the test solutions is similar in position, colour in daylight, fluorescence under ultraviolet light at 365 nm, position and size to that in the chromatogram obtained with the corresponding reference solution. The principal spots in the chromatograms obtained with test solution (b) and reference solution (b) have an R_f value distinctly higher than that of the principal spots in the chromatograms obtained with test solution (a) and reference solution (a).

C. Add about 2 mg to 2 ml of *sulphuric acid;* a yellow to brownish red colour develops with a green fluorescence that is particularly intense when examined under ultraviolet light at 365 nm.

D. About 30 mg gives the reaction of esters (2.3.1).

Tests

Appearance of solution. A 2.0 per cent w/v solution in *sodium bicarbonate solution* is clear (2.4.1).

Light absorption (2.4.7). A 0.001 per cent w/v solution in *ethanol (95 per cent)* shows an absorption maximum at about 240 nm; absorbance at about 240 nm, between 0.34 and 0.36.

Specific optical rotation (2.4.22). +147° to +153°, determined in a 1.0 per cent w/v solution in *ethanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in sufficient *methanol* to produce 10 ml.

Reference solution (a). Dissolve 2 mg of *hydrocortisone hemisuccinate IPRS* and 2 mg of *dexamethasone IPRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with base deactivated end-capped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 330 ml of *acetonitrile* and 600 ml of *water* and 1.0 ml of *orthophosphoric acid*, allowed to equilibrate, diluted to 1000 ml with *water* and mixed again,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Equilibrate the column with the mobile phase for about 30 minutes.

Inject reference solution (a). The retention times are: dexamethasone, about 12.5 minutes and hydrocortisone hemisuccinate about 15 minutes. The test is not valid unless the resolution between the peaks corresponding to dexamethasone and hydrocortisone hemisuccinate is at least 5.0. If necessary, adjust the concentration of acetonitrile in the mobile phase.

Inject reference solution (b) and the test solution. Continue the chromatography for twice the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak other than the principal peak, is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all the peaks other than the principal peak is not greater than 0.75 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.75 per cent). Ignore any peak due to the solvent and any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with reference solution (b).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 4.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.1 g, dissolve in sufficient *ethanol* to produce 100.0 ml. Dilute 2.0 ml of the solution to 100.0 ml with *ethanol* and mix. Measure the absorbance of the resulting solution (2.4.7) at the maximum at about 241.5 nm. Calculate the content of $C_{25}H_{34}O_8$ taking 353 as the specific absorbance at 241.5 nm.

Storage. Store protected from light and moisture.

Hydrocortisone Sodium Succinate Injection

Cortisol Sodium Succinate Injection

Hydrocortisone Sodium Succinate Injection is a sterile material made from Hydrocortisone Hemisuccinate with the aid of a suitable alkali such as Sodium Hydroxide or Sodium Carbonate. It may contain suitable buffering agents. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Hydrocortisone Sodium Succinate Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of hydrocortisone, $C_{21}H_{30}O_5$.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Usual strengths. The equivalent of 100 mg and 500 mg of hydrocortisone.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with the reference spectrum of *hydrocortisone sodium succinate IPRS* or with the reference spectrum of hydrocortisone sodium succinate.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A freshly prepared mixture of 1 volume of *anhydrous formic acid*, 10 volumes of *absolute ethanol* and 150 volumes of *dichloromethane*.

Test solution. A 0.1 per cent w/v solution of the contents of the sealed container in a mixture of 1 volume of *methanol* and 9 volumes of *dichloromethane*.

Reference solution (a). A 0.1 per cent w/v solution of *hydrocortisone sodium succinate IPRS* in the same solvent mixture.

Reference solution (b). A solution containing 0.1 per cent w/v, each of, *hydrocortisone hemisuccinate IPRS* and *methylprednisolone hydrogen succinate IPRS* in the same solvent mixture.

Apply to the plate 5 µl of each solution. After development, dry the plate in air until the solvents have evaporated, spray with *ethanolic sulphuric acid (20 per cent)*, heat at 120° for 10 minutes, allow to cool and examine in daylight and under ultraviolet light at 365 nm. By each method of visualization the principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two spots that may not be completely separated.

Tests

pH (2.4.24). 6.5 to 8.0, determined in a solution containing the equivalent of 5.0 per cent w/v of hydrocortisone.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of equal volumes of *acetonitrile* and *water*.

Test solution. Dissolve a sufficient quantity of the contents of the sealed container in a solvent mixture to produce a solution containing the equivalent of 0.25 per cent w/v of hydrocortisone.

Reference solution (a). Dilute 2.0 ml of the test solution to 100.0 ml with solvent mixture.

Reference solution (b). Dilute 0.035 per cent w/v solution of *hydrocortisone IPRS* in *acetonitrile* with solvent mixture.

Reference solution (c). Dilute a solution containing 0.04 per cent w/v, each of, *hydrocortisone hemisuccinate IPRS* and *dexamethasone IPRS* with solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 330 ml of *acetonitrile* and 600 ml of *water* and 1 ml of *orthophosphoric acid*, allowed to equilibrate, diluted to 1000 ml with *water* and mixed again,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Equilibrate the column with the mobile phase for about 30 minutes.

Inject reference solution (c). The test is not valid unless in the chromatogram obtained the resolution between the peaks corresponding to dexamethasone and hydrocortisone hemisuccinate is at least 5.0.

Inject the test solution. Allow the chromatography to proceed for twice the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any peak corresponding to hydrocortisone is not greater than the area of the peak in the chromatogram obtained with reference solution (b) (7 per cent) and the area of any other secondary peak is not greater than the area of the peak in the chromatogram obtained with reference solution (a) (2 per cent).

Bacterial endotoxins (2.2.3). Not more than 1.25 Endotoxin Units per mg of Hydrocortisone.

Assay. Determine the weight of the contents of 10 containers. Dissolve the mixed contents of the 10 containers in sufficient *water* to produce a solution containing the equivalent of 0.001 per cent w/v of hydrocortisone. Measure the absorbance of the resulting solution at the maximum at about 248 nm (2.4.7). Calculate the content of $C_{21}H_{30}O_5$ taking 449 as the specific absorbance at 248 nm.

Storage. Store protected from moisture in single dose containers at a temperature not exceeding 30°.

Labelling. The label states (1) the strength in terms of the equivalent amount of hydrocortisone; (2) that the prepared solution should be used only if it is clear; (3) that the solution should be used immediately after preparation.

Hydrogenated Vegetable Oil

Hydrogenated Vegetable Oil is a mixture of triglycerides of fatty acids of vegetable origin.

Category. Pharmaceutical aid.

Description. An almost white, fine powder at room temperature and a pale yellow, oily liquid above its melting point.

Identification

Comply with the tests for Acid value (2.3.23), Iodine value (2.3.28) and Saponification value (2.3.37).

Tests

Melting range (2.4.21). 57° to 85°.

Acid value (2.3.23). Not more than 4.0.

Iodine value (2.3.28). Not more than 5.

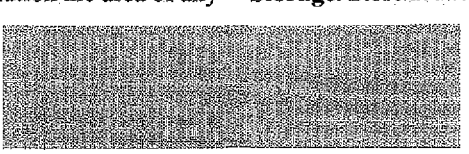
Saponification value (2.3.37). 175 to 200.

Unsaponifiable matter (2.3.39). Not more than 0.8 per cent w/w.

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Loss on drying (2.4.19). Not more than 0.1 per cent, determined on 5.0 g by drying in oven at 105° for 4 hours.

Storage. Store at a temperature between 8° to 25°.



Hydrogen Peroxide Solution (20 Vol)

Hydrogen Peroxide Solution (6 per cent); Dilute Hydrogen Peroxide Solution

H_2O_2 Mol. Wt. 34.0

Hydrogen Peroxide Solution (20 Vol) is an aqueous solution of hydrogen peroxide. It may contain a suitable stabilising agent.

Hydrogen Peroxide Solution (20 Vol) contains not less than 5.0 per cent w/v and not more than 7.0 per cent w/v of H_2O_2, corresponding to about 20 times its volume of available oxygen.

Category. Antiseptic; deodorant.

Description. A clear, colourless liquid. It decomposes in contact with oxidisable organic matter and with certain metals and also if allowed to become alkaline.

Identification

A. To 1 ml add 0.2 ml of *1 M sulphuric acid* and 0.25 ml of *0.02 M potassium permanganate*; the solution becomes colourless with evolution of gas.

B. Shake 0.05 ml with 2 ml of *1 M sulphuric acid*, 2 ml of *ether* and 0.05 ml of *potassium chromate solution*; the ether layer becomes blue.

Tests

Acidity. To 10 ml add 20 ml of *water* and 0.25 ml of *methyl red solution*. Not less than 0.2 ml and not more than 1.0 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution.

Organic stabilizers. Shake 20 ml with successive quantities of 10, 5 and 5 ml of *chloroform*. Evaporate the combined chloroform extracts at a temperature not exceeding 25° at a pressure of 2 kPa and dry in a desiccator. The residue weighs not more than 10 mg (500 ppm).

Non-volatile matter. Place 10 ml in a platinum dish and allow to stand until effervescence ceases. Evaporate the solution on a water-bath and dry the residue at 105°; the residue weighs not more than 20 mg.

Assay. To 1.0 ml add 20 ml of *1 M sulphuric acid* and titrate with *0.02 M potassium permanganate*.

1 ml of *0.02 M potassium permanganate* is equivalent to 0.001701 g of H_2O_2 or 0.56 ml of oxygen.

Storage. Store protected from light in containers resistant to hydrogen peroxide at a temperature not exceeding 30°. If the solution does not contain a stabilising agent, it should be stored in a refrigerator (2° to 8°). It should not be stored for long periods.

Labelling. The label states whether or not the solution contains a stabilising agent.

Hydrogen Peroxide Solution (100 Vol)

Hydrogen Peroxide Solution (27 per cent); Strong Hydrogen Peroxide Solution

Hydrogen Peroxide Solution (100 Vol) is an aqueous solution of hydrogen peroxide. It may contain a suitable stabilising agent.

Hydrogen Peroxide Solution (100 Vol) contains not less than 26.0 per cent w/w and not more than 28.0 per cent w/w of H_2O_2, corresponding to about 100 times its volume of available oxygen.

Category. Antiseptic; deodorant.

Description. A clear, colourless liquid. It decomposes vigorously in contact with oxidisable organic matter and with certain metals and also if allowed to become alkaline.

Identification

A. To 1 ml add 0.2 ml of *1 M sulphuric acid* and 0.25 ml of *0.02 M potassium permanganate*; the solution becomes colourless with evolution of gas.

B. Shake 0.05 ml with 2 ml of *1 M sulphuric acid*, 2 ml of *ether* and 0.05 ml of *potassium chromate solution*; the ether layer becomes blue.

Tests

Acidity. Dilute 10 ml with 100 ml of *water* and add 0.25 ml of *methyl red solution*. Not less than 0.05 ml and not more than 0.5 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution.

Organic stabilisers. Shake 20 ml with successive quantities of 10, 5 and 5 ml of *chloroform*. Evaporate the combined chloroform extracts at a temperature not exceeding 25° at a pressure of 2 kPa and dry in a desiccator. The residue weighs not more than 10 mg (500 ppm).

Non-volatile matter. Place 10 ml in a platinum dish and allow to stand until effervescence ceases. Evaporate the solution on a water-bath and dry the residue at 105°; the residue weighs not more than 20 mg.

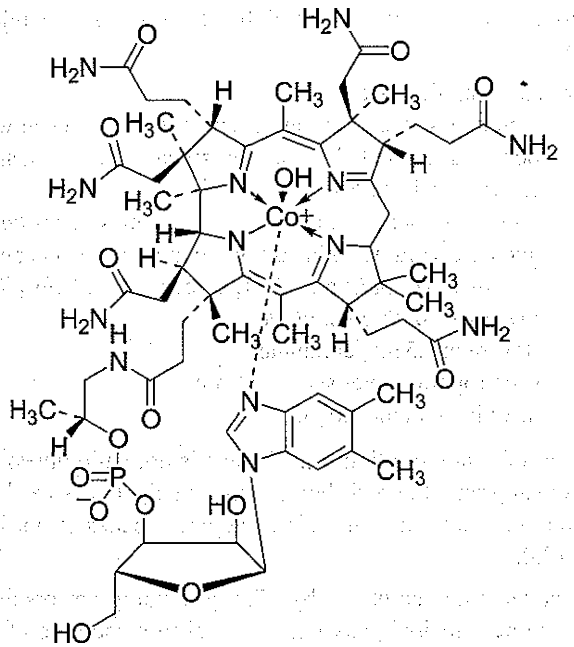
Assay. Dilute about 1.0 g to 100.0 ml with *water*. To 10.0 ml of the resulting solution add 20 ml of *1 M sulphuric acid* and titrate with *0.02 M potassium permanganate*.

1 ml of *0.02 M potassium permanganate* is equivalent to 0.001701 g of H_2O_2 or 0.56 ml of oxygen.

Storage. Store protected from light in containers resistant to hydrogen peroxide at a temperature not exceeding 30°. If the solution does not contain a stabilising agent, it should be stored in a refrigerator (2° to 8°). It should not be stored for long periods.

Labelling. The label states whether or not the solution contains a stabilising agent.

Hydroxocobalamin



$C_{62}H_{89}CoN_{13}O_{15}P$ Mol. Wt. 1346.4

Hydroxocobalamin is Coα-[α-(5,6-dimethylbenzimidazolyl)]-Coβ-hydroxocobamide. It occurs either as aquocobalamin chloride (Coα-[α-(5,6-dimethylbenzimidazolyl)]-ICoβ-aquocobamide chloride) or as aquocobalamin sulphate.

Hydroxocobalamin contains not less than 96.0 per cent and not more than 102.0 per cent of aquocobalamin chloride, $C_{62}H_{89}CoN_{13}O_{15}P,HCl$, or of aquocobalamin sulphate, $C_{124}H_{178}Co_2N_{26}O_{30}P_2,H_2SO_4$, both calculated on the dried basis.

Category. Vitamin B_{12} analogue used as haematopoietic.

Description. Dark red crystals or a crystalline powder; very hygroscopic. Some decomposition may occur on drying.

Identification

A. Measure the absorbance of the solution used in the Assay at the maxima at about 274 nm, 351 nm and 525 nm (2.4.7); ratios of the absorbances at about 274 nm and 525 nm to that at about 351 nm, about 0.8 and about 0.3 respectively.

B. Fuse 1 mg of the substance with 50 mg of *potassium hydrogen sulphate*, cool, break up the mass, add 3 ml of *water* and boil until dissolved. Add 0.05 ml of *phenolphthalein solution* and sufficient *5 M sodium hydroxide* to produce a faint pink colour. Add 0.5 g of *sodium acetate*, 0.5 ml of *1 M acetic acid* and 0.5 ml of a 0.2 per cent w/v solution of *nitroso R salt*; a red or orange-red colour is produced immediately. Add 0.5 ml of *hydrochloric acid* and boil for 1 minute; the red colour persists.

C. It gives the reactions of chlorides or of sulphates, as the case may be (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Use freshly prepared solutions and protect them from bright light.

Test solution. Dissolve 10 mg of the substance under examination in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 5.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (c). Dissolve 25 mg of the substance under examination in 10 ml of *water*, warming if necessary. Allow to cool and add 1 ml of a 2.0 per cent w/v solution of *chloramine T* and 0.5 ml of *0.05 M hydrochloric acid*. Dilute to 25.0 ml with *water*. Shake and allow to stand for 5 minutes. Inject immediately.

Chromatographic system

- a stainless steel column 25 cm x 4 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 19.5 volumes of *methanol* and 80.5 volumes of a solution containing 15 g per litre of *citric acid* and 8.1 g of *disodium hydrogen phosphate*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 351 nm,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless the chromatogram obtained shows three principal peaks and the resolution between each pair of adjacent peaks is at least 3.0.

Inject reference solution (b). The chromatogram obtained shows one principal peak with a signal-to-noise ratio of at least 5.

Inject reference solution (a) and the test solution. Continue the chromatography for four times the retention time of the principal peak in the chromatogram obtained with reference solution (a). In the chromatogram obtained with the test solution, the sum of the areas of any peaks apart from the principal peak is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (5 per cent). Ignore any peak whose area is less than that of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.4.19). 8 to 12 per cent (aquocobalamin chloride) and 8 to 16 per cent (aquocobalamin sulphate), determined on 1.0 g by drying in an oven at 100° at a pressure not exceeding 0.7 kPa.

Assay. *Protect the solutions from light throughout the Assay.*

Weigh a 25 mg and dissolve in sufficient of a solution containing 0.8 per cent v/v of *glacial acetic acid* and 1.09 per cent w/v of *sodium acetate* to produce 1000 ml. Measure the absorbance of the resulting solution at the maximum at about 351 nm (2.4.7). Calculate the content of $C_{62}H_{89}CoN_{13}O_{15}P,HCl$, or of $C_{124}H_{178}Co_2N_{26}O_{30}P_2,H_2SO_4$, taking 190 or 188 respectively, as the specific absorbance at 351 nm.

Storage. Store protected from light and moisture at a temperature not exceeding 30°.

Labelling. The label states whether the contents are aquocobalamin chloride or aquocobalamin sulphate.

Hydroxocobalamin Injection

Hydroxocobalamin Injection is a sterile solution of Hydroxocobalamin in Water for Injections containing sufficient Acetic Acid, Hydrochloric Acid or Sulphuric acid to adjusted to pH 4.

Hydroxocobalamin Injection contains not less than 95.0 per cent and not more than 110.0 per cent of the stated amount of anhydrous hydroxocobalamin, $C_{62}H_{89}CoN_{13}O_{15}P$.

Usual strengths. 500 µg per ml; 1 mg per ml.

Identification

Measure the absorbance at about 351 nm and 361 nm; ratio of the absorbance at about 361 nm to that at about 351 nm, about 0.65 (2.4.7).

Tests

pH (2.4.24). 3.8 to 5.5.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Use freshly prepared solutions and protect them from bright light.

Test solution. Dilute the injection with the mobile phase, if necessary, to obtain a solution having a concentration of 0.05 per cent w/v of hydroxocobalamin.

Reference solution (a). Dilute 1.0 ml of the test solution to 20.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 50.0 ml with the mobile phase.

Reference solution (c). Add 0.2 ml of a freshly prepared 2 per cent w/v solution of *chloramine T* and 0.1 ml of *0.05 M hydrochloric acid* to a volume of the injection containing the equivalent of 5 mg of hydroxocobalamin, dilute to 10.0 ml with *water*, shake, allow to stand for 5 minutes and inject immediately.

Chromatographic system

- a stainless steel column 25 cm × 4 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as Lichrosorb 100 CH 8/11),
- mobile phase: a mixture of 19.5 volumes of *methanol* and 80.5 volumes of a solution containing 1.5 per cent w/v of *citric acid* and 0.81per cent w/v of *disodium hydrogen orthophosphate*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 351 nm,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless the chromatogram obtained shows three principal peaks and the resolution between each pair of adjacent peaks is not less than 3.0.

Inject reference solution (b). The chromatogram obtained shows one principal peak with a signal-to-noise ratio of not less than 5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the sum of the areas of any secondary peaks is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (10 per cent). Ignore any peak the area of which is less than that of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Bacterial endotoxins (2.2.3). Not more than 0.4 Endotoxin Unit per µg of hydroxocobalmin.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

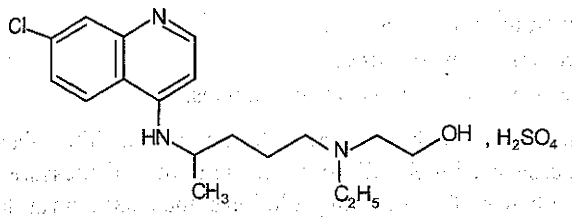
Assay. Dilute a measured volume of the injection containing about 4 mg of anhydrous hydroxocobalamin to 200.0 ml with a

solution containing 0.8 per cent v/v of *glacial acetic acid* and 1.09 per cent w/v of *sodium acetate* and measure the absorbance of the resulting solution at the maximum at about 351 nm (2.4.7). Calculate the content of $C_{62}H_{89}CoN_{13}O_{15}P$ taking 195 as the specific absorbance at 351 nm.

Storage. Store protected from light.

Labelling. The label states the strength in terms of the equivalent amount of anhydrous hydroxocobalamin.

Hydroxychloroquine Sulphate



$C_{18}H_{26}ClN_3O, H_2SO_4$ Mol Wt. 434.0

Hydroxychloroquine Sulphate is 2-[[(RS)-4-[(7-chloroquinolin-4-yl)amino]pentyl](ethyl)amino]ethan-1-ol sulphate.

Hydroxychloroquine Sulphate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{18}H_{26}ClN_3O, H_2SO_4$, calculated on the dried basis.

Category. Antiprotozoal.

Description. A white to off-white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum that obtained with *hydroxychloroquine sulphate IPRS* or with the reference spectrum of hydroxychloroquine sulphate.

B. It gives reaction (A) of sulphates (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of substance under examination in mobile phase A and dilute to 50.0 ml with mobile phase A.

Reference solution (a). A 0.0001 per cent w/v solution of *hydroxychloroquine sulphate IPRS* in mobile phase A.

Reference solution (b). A solution containing 0.0001 per cent w/v, each of, *desethyl hydroxychloroquine IPRS* and *hydroxychloroquine sulphate IPRS* in mobile phase A.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 90 volumes of *water*, 10 volumes of *acetonitrile* and 0.2 volume of *orthophosphoric acid*,
  B. a mixture of 20 volumes of *water*, 80 volumes of *acetonitrile* and 0.1 volume of *orthophosphoric acid*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
2	100	0
10	85	15
18	0	100
25	0	100
25.1	100	0
50	100	0

Name	Relative retention time	Correction factor
Desethyl hydroxychloroquine[1]	0.92	—
Hydroxychloroquine sulphate	1.0	—
Hydroxychloroquine-O-sulphate[2]	1.4	1.34
4,7- dichloroquinoline	2.8	0.35

[1](*RS*)-2-[[4-[(7-chloro-4-quinolyl)amino] pentyl] amino] ethanol,
[2](*RS*)-2-*N*-[-(7-chloro-4-quinolyl amino) pentyl]–*N*- ethylamino-ethanol-1-(hydrogen sulphate).

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to desethyl hydroxychloroquine and hydroxychloroquine sulphate is not less than 1.0 in the chromatogram obtained with reference solution (b), the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to desethyl hydroxychloroquine is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent), the area of any peak corresponding to hydroxychloroquine-O-sulphate is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent), the area of any peak corresponding

to 4,7-dichloroquinoline is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 6 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.6 per cent). Ignore the peak due to sulphate and any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Chlorides (2.3.12). Dissolve 0.7 g in 15.0 ml of *water*. The solution complies with the limit test for chlorides (350 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 2.0 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modifications.

Test solution. Dissolve 50 mg of substance under examination in mobile phase A and dilute to 50.0 ml with mobile phase A. Dilute 1.0 ml of the solution to 10.0 ml with mobile phase A.

Reference solution . A 0.01 per cent w/v solution of *hydroxychloroquine sulphate IPRS* in mobile phase A.

Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{26}ClN_3O, H_2SO_4$.

Storage. Store protected from light.

Hydroxychloroquine Tablets

Hydroxychloroquine Sulphate Tablets

Hydroxychloroquine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of hydroxychloroquine sulphate, $C_{18}H_{26}ClN_3O, H_2SO_4$.

Usual strength. 200 mg

Identification

A. Dissolve a quantity of the powdered tablets containing 0.1 g of Hydroxychloroquine Sulphate in a mixture of 10 ml of *water* and 2 ml of *2M sodium hydroxide* and extract with two 20-ml quantities of *chloroform*. Wash the Combined chloroform extract with *water*, dry with *anhydrous sodium sulphate*, evaporate to dryness and dissolve the residue in 2 ml of *chloroform*. The resulting solution complies with the following test

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *hydroxychloroquine sulphate IPRS* treated in the same manner or with the reference spectrum of hydroxychloroquine.

B. Shake a quantity of the powdered tablets containing 0.1 g of Hydroxychloroquine Sulphate with 10 ml of *water* and filter. To the filterate add 1 ml of *2M hydrochloric acid* and 1 ml of *barium chloride solution*. A white precipitate is produced.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter, dilute if necessary with the dissolution medium and measure the absorbance of the resulting solution at the maximum at about 343 nm (2.4.7). Calculate the content of $C_{18}H_{26}ClN_3O, H_2SO_4$ in the medium from the absorbance obtained from a solution of known concentration of *hdroxychloroquine sulphate IPRS* in the same medium.

Q. Not less than 75 per cent of the stated amount of $C_{18}H_{26}ClN_3O, H_2SO_4$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing 200 mg of Hydroxychloroquine Sulphate in 150 ml of mobile phase A, dilute to 200.0 ml with mobile phase A and filter. Dilute 1.0 ml of the solution to 10.0 ml with mobile phase A.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with mobile phase A.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with mobile phase A.

Reference solution (c). A 0.00005 per cent w/v solution of *2-[4-[(7-chloro-4-quinolinyl)amino]pentyl]aminoethanol IPRS* in mobile phase A.

Reference solution (d). A solution containing 0.0001 per cent, w/v each, of *hydroxychloroquine sulphate IPRS* and *2-[4-[(7-chloro- 4-quinolinyl)amino]pentyl]aminoethanol IPRS* in mobile phase A.

Use the chromatographic system as described under Assay.

Inject reference solution (d). The test is not valid unless the resolution between the peaks due to 2-[4-[(7-chloro-4-quinolinyl)amino]pentyl]aminoethanol and hydroxychloroquine is not less than 1.5.

Inject reference solution (a), (b), (c) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to 2-[4-[(7-chloro-4- quinolinyl)amino] pentyl]aminoethanol is not more than the area of principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). The sum of the areas of other secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 200 mg of Hydroxychloroquine Sulphate with 150 ml of mobile phase A, dilute to 200.0 ml and filter. Dilute 1.0 ml of the filtrate to 10.0 ml with mobile phase A.

Reference solution (a). A 0.01 per cent w/v solution of *hydroxychloroquine sulphate IPRS* in mobile phase A.

Reference solution (b). A 0.0001 per cent w/v solution, each of, *hydroxychloroquine sulphate IPRS* and *2-[4-[(7-chloro-4-quinolinyl)amino]pentyl]aminoethanol IPRS* in mobile phase A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: A. a mixture of 90 volumes of *water*, 10 volumes of *acetonitrile*, and 0.2 volume of *orthophosphoric acid*,
  B. a mixture of 20 volumes of *water*, 80 volumes of *acetonitrile*, and 0.1 volume of *orthophosphoric acid*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

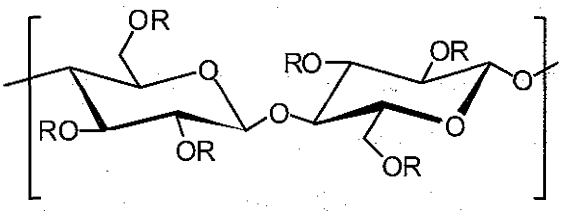
Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
2	100	0
10	85	15
18	100	0
25	100	0

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to 2-[4-[(7-chloro-4-quinolinyl)amino]pentyl]aminoethanol and hydroxychloroquine is not less than 1.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{18}H_{26}ClN_3O, H_2SO_4$.

Hydroxyethylcellulose



R = -H or $—CH_2CH_2OH$

Hydroxyethylcellulose is cellulose, 2-hydroxyethyl ether.

Hydroxyethylcellulose is a partially substituted poly(hydroxyethyl) ether of cellulose. It is available in several grades, varying in viscosity and degree of substitution, and some grades are modified to improve their dispersion in water. It may contain suitable anticaking agents.

Category. Pharmaceutical aid.

Description. A white to light tan; hygroscopic powder or granules.

Identification

A. Stir 1 g into 100 ml of *water*, it is dissolved completely to produce a colloidal solution that remains clear when heated to 60°.

B. Place 1 ml of the solution from test A on a glass plate and allow the water to evaporate; a thin, self-sustaining film is formed.

C. To 1 ml of 0.05 per cent w/v solution, add 1 ml of 5.0 per cent w/v *phenol* solution. Add 5 ml of *sulphuric acid*, shake and allow to cool; the colour of the solution so obtained becomes orange.

Tests

pH (2.4.24). 6.0 to 8.5, determined in a 1.0 per cent w/v solution.

Viscosity (2.4.28). 50.0 per cent to 150.0 per cent of the labelled viscosity.

Lead (2.3.15). Not more than 0.001 per cent.

Heavy metals (2.3.13). 1 g complies with the test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 5.0 per cent.

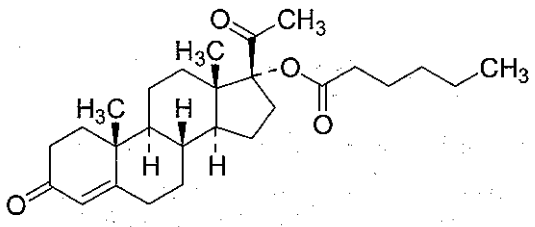
Loss on drying (2.4.19). Not more than 10.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Storage. Store protected from moisture.

Labelling. The label indicates its viscosity, under specified conditions, in aqueous solution. The indicated viscosity may be in the form of a range encompassing 50 per cent to 150 per cent of the average value.

Hydroxyprogesterone Hexanoate

Hydroxyprogesterone Caproate



$C_{27}H_{40}O_4$ Mol. Wt. 428.6

Hydroxyprogesterone Hexanoate is 3,20-dioxopregn-4-en-17α-yl hexanoate

Hydroxyprogesterone Hexanoate contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{27}H_{40}O_4$, calculated on the dried basis.

Category. Progestogen.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *hydroxyprogesterone hexanoate IPRS* or with the reference spectrum of hydroxyprogesterone hexanoate.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. A mixture of 90 volumes of *acetone* and 10 volumes of *1,2-propane diol*.

Mobile phase. A mixture of equal volumes of *cyclohexane* and *light petroleum (40° to 60°)*.

Test solution. Dissolve 25 mg of the substance under examination in 10.0 ml of the same solvent mixture.

Reference solution (a). Dissolve 25 mg of *hydroxyprogesterone hexanoate IPRS* in 10.0 ml of the same solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

C. Dissolve 1 mg in 1 ml of *sulphuric acid* and allow to stand for 2 minutes; a faint yellow colour is produced which, on the addition of 0.5 ml of *water*, changes first to green, then to red and finally to reddish-violet with a blue fluorescence.

D. Heat 50 mg with 2 ml of *0.5 M ethanolic potassium hydroxide* in a water-bath for 5 minutes. Add 3 ml of *water*, evaporate the ethanol, add 2 ml of *sulphuric acid (50 per cent)* and heat on a water-bath; the odour of hexanoic acid is produced.

Tests

Acidity. Dissolve 0.2 g in 25 ml of *ethanol* previously neutralised to *bromothymol blue solution* and titrate immediately with *0.01 M sodium hydroxide* until a faint blue colour is produced. Not more than 1.0 ml of *0.01 M sodium hydroxide* is required.

Specific optical rotation (2.4.22). +44.0° to +49.0°, determined in a 2.0 per cent w/v solution in *dioxan*.

Related foreign steroids. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254*.

Mobile phase. A mixture of equal volumes of *cyclohexane* and *ethyl acetate*.

Test solution. Dissolve 0.1 g of the substance under examination in 10.0 ml of *chloroform*.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with *chloroform*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained

with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.1 per cent, determined on 2.0 g

Assay. Weigh 60 mg and dissolve in sufficient *ethanol* to produce 100.0 ml. Dilute 5.0 ml to 250.0 ml with *ethanol* and measure the absorbance of the resulting solution at the maximum at about 240 nm (2.4.7). Calculate the content of $C_{27}H_{40}O_4$ taking 395 as the specific absorbance at 240 nm.

Storage. Store protected from light.

Hydroxyprogesterone Injection

Hydroxyprogesterone Caproate Injection;
Hydroxyprogesterone Hexanoate Injection

Hydroxyprogesterone Injection is a sterile solution of Hydroxyprogesterone Hexanoate in a suitable ester, in a suitable fixed oil or in any mixture of fixed oils.

Hydroxyprogesterone Hexanoate Injection contains not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of hydroxyprogesterone hexanoate, $C_{27}H_{40}O_4$.

Usual strength. 250 mg per ml.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254*.

Mobile phase. A mixture of equal volumes of *cyclohexane* and *ethyl acetate*.

Test solution. Dilute the injection with *chloroform* to give a solution containing 1.0 per cent w/v of Hydroxyprogesterone Hexanoate.

Reference solution. A solution containing 1 per cent w/v of *hydroxyprogesterone hexanoate IPRS* in *chloroform*.

Apply to the plate 1 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution. Ignore any spots due to the vehicle.

B. Dissolve a volume of the injection containing 0.1 g of Hydroxyprogesterone Hexanoate in 10 ml of *light petroleum (40° to 60°)* and extract with three quantities, each of 10 ml, of a mixture of 7 volumes of *glacial acetic acid* and 3 volumes of *water*. Wash the combined extracts with 10 ml of *light petroleum (40° to 60°)*, dilute with *water* until the solution becomes turbid and allow to stand in ice for about 2 hours until a white precipitate is produced. The precipitate, after washing with *water*, melts at about 120° (2.4.21).

Tests

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. To a quantity of the injection containing about 0.125 g of Hydroxyprogesterone Hexanoate add sufficient *chloroform* to produce 100.0 ml. Dilute 5.0 ml to 100.0 ml with *chloroform*; to 5.0 ml add 10 ml of *isoniazid solution* and sufficient *methanol* to produce 20.0 ml. Allow to stand for 45 minutes and measure the absorbance of the resulting solution at the maximum at about 380 nm (2.4.7), using as the blank 5 ml of *chloroform* treated in the same manner. Calculate the content of $C_{27}H_{40}O_4$ from the absorbance obtained by repeating the operation using a 0.00625 per cent w/v solution of *hydroxyprogesterone hexanoate IPRS* in *chloroform* and beginning at the words "to 5.0 ml add..."

Storage. Store protected from light.

Labelling. The label states that the preparation is intended for intramuscular injection only.

Hydroxypropyl Cellulose

Cellulose, 2-Hydroxypropyl Ether; Hyprolose

Hydroxypropylcellulose is a cellulose having some of the hydroxyl groups in the form of the 2-hydroxypropyl ether. It may contain not more than 0.6 per cent of silica (SiO_2). The various grades commercially available are distinguished by a number indicative of the apparent viscosity in millipascal seconds of a 2 per cent w/w solution measured at 20°.

Category. Pharmaceutical aid (tablet excipient; suspending agent).

Description. A white or yellowish white powder; hygroscopic after drying.

Identification

A. With constant stirring add a quantity equivalent to 1 g of the dried substance into 50 ml of *carbon dioxide-free water* previously heated to 90°. Allow to cool, dilute to 100.0 ml with *carbon dioxide-free water* and continue stirring until solution is complete (solution A). Heat 10 ml of solution A on a water-bath with stirring. At temperatures above 40° the solution becomes cloudy or a flocculent precipitate is formed. On cooling, the solution becomes clear.

B. To 10 ml of solution A add 0.3 ml of *2 M acetic acid* and 2.5 ml of a 10 per cent w/v solution of *tannic acid*; a yellowish white, flocculent precipitate is produced which dissolves in *6 M ammonia*.

C. Without heating completely dissolve 0.2 g in 15 ml of a 70 per cent w/w solution of *sulphuric acid*, pour the solution with stirring into 100 ml of iced *water*. In a test-tube kept in ice, mix thoroughly 1 ml of the solution with 8 ml of *sulphuric acid*, added dropwise. Heat in a water-bath for exactly 3 minutes and cool immediately in ice. When the mixture is cool, carefully add 0.6 ml of a solution containing 3 g of *ninhydrin* in 100 ml of a 4.55 per cent w/v solution of *sodium metabisulphite*, mix well and allow to stand at 25°; a pink colour is produced immediately which becomes violet within 100 minutes.

D. Place 1 ml of solution A on a glass plate. After evaporation of the *water* a thin film is produced.

Tests

Appearance of solution. Solution A is not more opalescent than opalescence standard OS3 (2.4.1), and not more intensely coloured than reference solution YS6 (2.4.1).

pH (2.4.24). 5.0 to 8.5, determined in solution A.

Apparent viscosity. 75 to 140 per cent of the stated value, determined by the following method. Weigh a quantity equivalent to 2.0 g of the dried substance and add, with constant stirring, to 50 ml of *water* previously heated to 90°. Allow to cool, dilute to 100.0 ml with *water* and continue stirring until solution is complete. Adjust the weight of the solution to 100 g and centrifuge the solution to expel any trapped air. Determine the viscosity, Method C, at 20° using a shear rate of 10 s^{-1} (2.4.28). For a product of low viscosity, use a quantity of the substance under examination sufficient to prepare a solution of the concentration stated on the label.

Chlorides (2.3.12). Dilute 5.0 ml of solution A to 15 ml with *water*. The resulting solution complies with the limit test for chlorides (0.5 per cent).

Silica. Not more than 0.6 per cent, determined by the following method. To the residue obtained in the test for Sulphated ash add sufficient *ethanol (95 per cent)* to moisten the residue completely. Add 6 ml of *hydrofluoric acid* in small portions. Evaporate to dryness at 95° to 105° taking care to avoid loss by spurting. Cool and rinse the walls of the platinum crucible with 6 ml of *hydrofluoric acid*. Add 0.5 ml of *sulphuric acid* and evaporate to dryness. Progressively increase the temperature, ignite at 900°, allow to cool in a desicator and weigh. The difference between the weight of the residue obtained in the test for Sulphated ash and the weight of the final residue is equal to the amount of silica in the substance under examination.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 1.6 per cent, determined on 1.0 g in a platinum crucible.

Loss on drying (2.4.19). Not more than 7.0 per cent, determined on 0.5 g by drying in an oven at 105°.

Storage. Store protected from moisture.

Labelling. The label states the apparent viscosity in millipascal seconds of a 2 per cent w/w solution. For products of low viscosity the label also states the concentration of the solution to be used and the apparent viscosity in millipascal seconds.

Hydroxypropylmethylcellulose

Cellulose, 2-Hydroxypropylmethyl Ether; Hypromellose

Hydroxypropylmethylcellulose is a cellulose having some of the hydroxyl groups in the form of the methyl ether and some in the form of the 2-hydroxypropyl ether. The various grades commercially available are distinguished by a number indicative of the apparent viscosity in millipascal seconds of a 2 per cent w/v solution measured at 20°.

Category. Treatment of tear deficiency; pharmaceutical aid (tablet excipient; suspending agent).

Description. A white or yellowish white, fibrous or granular powder; hygroscopic after drying.

Identification

A. With constant stirring add a quantity containing 1 g of the dried substance into 50 ml of *carbon dioxide-free water* previously heated to 90°. Allow to cool, dilute to 100 ml with *carbon dioxide-free water* and continue stirring until solution is complete (solution A). Heat 10 ml of solution A in a water-bath with stirring. At temperatures above 50° the solution becomes cloudy or a flocculent precipitate is formed. On cooling, the solution becomes clear or slightly opalescent.

B. To 10 ml of solution A add 10 ml of *1 M sodium hydroxide* or *1 M hydrochloric acid*; in either case the mixture remains stable.

C. To 10 ml of solution A add 0.3 ml of *2 M acetic acid* and 2.5 ml of a 10 per cent w/v solution of *tannic acid*; a yellowish white, flocculent precipitate is produced which dissolves in *6 M ammonia*.

D. Without heating completely dissolve 0.2 g in 15 ml of a 70 per cent w/w solution of *sulphuric acid*, pour the solution with stirring into 100 ml of iced *water*. In a test-tube kept in ice, mix thoroughly 1 ml of the solution with 8 ml of *sulphuric acid*, added dropwise. Heat in a water-bath for exactly 3 minutes and cool immediately in ice. When the mixture is cool, carefully add 0.6 ml of a solution containing 3 g of *ninhydrin* in 100 ml of a 4.55 per cent w/v solution of *sodium metabisulphite*, mix well and allow to stand at 25°; a pink colour is produced immediately which becomes violet within 100 minutes.

E. Place 1 ml of solution A on a glass plate. After evaporation of the *water* a thin film is produced.

Tests

pH (2.4.24). 5.5 to 8.0, determined in solution A.

Appearance of solution. Solution A is not more opalescent than opalescence standard OS3 (2.4.1), and not more intensely coloured than reference solution YS6 (2.4.1).

Apparent viscosity. 75 to 140 per cent of the stated value, determined by the following method. Weigh a quantity equivalent to 2.0 g of the dried substance and add, with constant stirring, to 50 ml of *water* previously heated to 90°. Allow to cool, dilute to 100.0 ml with *water* and continue stirring until solution is complete. Adjust the weight of the solution to 100 g and centrifuge the solution to expel any trapped air. Determine the viscosity, Method C, at 20° using a shear rate of 10 s^{-1} (2.4.28).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Chlorides (2.3.12). Dilute 5.0 ml of solution A to 15 ml with *water*. The resulting solution complies with the limit test for chlorides (0.5 per cent).

Sulphated ash (2.3.18). Not more than 3.0 per cent.

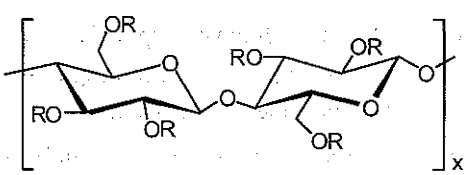
Loss on drying (2.4.19). Not more than 10.0 per cent, determined on 0.5 g by drying in an oven at 105°.

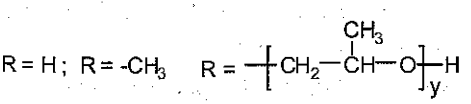
Storage. Store protected from moisture.

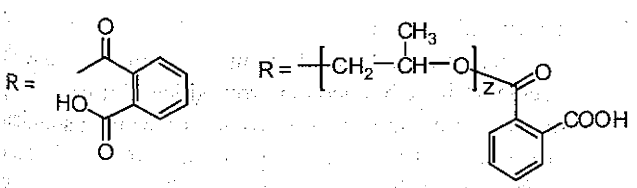
Labelling. The label states the apparent viscosity in millipascal seconds of a 2 per cent w/v solution.

Hydroxypropyl Methylcellulose Phthalate

Hypromellose Phthalate







Hydroxypropyl Methylcellulose Phthalate is 2-hydroxypropyl methylcellulose phthalate.

Category. Pharmaceutical aid.

Description. A white to off-white, free flowing flakes or a granular powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *hydroxypropyl methylcellulose phthalate IPRS* or with the reference spectrum of hydroxypropyl methylcellulose phthalate.

Tests

Viscosity (2.4.28). Not less than 80 per cent and not more than 120 per cent of the label claim at 20° by dissolving 10 g, previously dried at 105° for 1 hour, in 90 g of a mixture of equal weights of *methanol* and *dichloromethane*.

Free phthalic acid. Not more than 1.0 per cent.

Test solution. Disperse 200 mg of the substance under examination with 50 ml of *acetonitrile*, with the aid of ultrasound. Add 10 ml of *water*, mix and dilute to 100.0 ml with *acetonitrile*.

Reference solution. Disperse 12.5 mg of *phthalic acid* with 125 ml of *acetonitrile*. Add 25 ml of *water* and dilute to 250.0 ml with *acetonitrile*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 85 volumes of *0.1 M cyanoacetic acid* and 15 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of phthalic acid.

Phthalyl content. Not less than 21.0 per cent and not more than 35.0 per cent.

Transfer 1 g to a conical flask, dissolve in 50 ml of a mixture of 2 volume of *ethanol*, 2 volume of *acetone* and 1 volume of *water*. Add *phenolphthalein TS* and titrate with *0.1 M sodium hydroxide*. Carry out a blank titration.

Calculate the content of phthalyl by using formula:

$$0.01(149.1)(V/W) - 2(149.1/166.1)(P)$$

where 149.1 and 166.1 are the molecular weights of the phthalyl group and phthalic acid respectively,

V is the volume, in ml of *0.1 M sodium hydroxide* consumed after correction for the blank,

W is the weight, in g, calculated on the anhydrous basis of Hypromellose Phthalate taken,

and P is the percentage of free phthalic acid found as directed in the test for Limit of free phthalic acid.

Chlorides. Dissolve 2.0 g in 40 ml of *0.2 M sodium hydroxide*, add 1 drop of *phenolphthalein TS*, and add *2 M nitric acid* dropwise, with stirring, until the red colour is discharged. Add an additional 20 ml of *2 M nitric acid* with stirring. Heat on a water-bath, with stirring, until the gel-like precipitate formed becomes granular. Cool the mixture, and centrifuge. Separate the liquid phase, and wash the residue with three successive 20-ml portions of *water*, separating the washings by centrifuging. Dilute the combined liquids with *water* to 200 ml, mix, and filter. 35 ml of the filtrate complies with the limit test for chlorides (0.07 per cent).

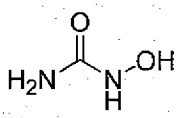
Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 5.0 per cent, determined on 0.5 g.

Storage. Store protected from moisture.

Hydroxyurea



$CH_4N_2O_2$ Mol. Wt. 76.1

Hydroxyurea contains not less than 97.0 per cent and not more than 103.0 per cent of $CH_4N_2O_2$, calculated on the dried basis.

Category. Anticancer.

Description. A white to off-white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *hydroxyurea IPRS* or with the reference spectrum of hydroxyurea.

Tests

Urea and related compounds. Determine by paper chromatography (2.4.15).

Mobile phase. A mixture of equal volumes of *isobutyl alcohol* and *water*, mix, use upper layers as the mobile phase and lower layers as stationary phase.

Test solution. Dissolve 10.0 mg of the substance under examination in 1.0 ml of *water*.

Reference solution. A 0.01 per cent w/v solution of *urea IPRS* in *water*.

Use a suitable chromatographic paper strip by dipping it in pH 6.5 buffer solution (prepared by mixing of 700 ml of *0.2 M dibasic sodium phosphate* and 300 ml of *0.1 M citric acid*). Dry the paper strip, and apply 100 µl of the test solution and 50 µl of the reference solution. Place the strip in a chromatographic chamber for descending chromatography containing the stationary phase in the bottom of the chamber and the mobile phase in the trough. Develop for 24 hours, remove the strip from the chamber, dry in air again develop from 24 hours. Remove the strip, air dry, spray with *p-dimethylaminobenzaldehyde* solution 1.0 per cent (Dissolving 1.0 g of *p-dimethylaminobenzaldehyde* in 50 ml of *alcohol*, add 2 ml of *hydrochloric acid* and dilute with *alcohol* to 100.0 ml), heat at 90° for 1 to 2 minutes. Not more than two spots, other than the major component, are present in the test solution and their intensities are not greater than the intensity of the spot from the reference solution (0.5 per cent of each impurity). The Rf values relative to *hydroxyurea*, the principal spot, are 0.65 and 1.26 (*urea*).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.5 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in vacuum at 60° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 40 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). A solution containing 0.04 per cent w/v each of of *hydroxyurea IPRS* and *hydroxylamine hydrochloride* in the mobile phase.

Reference solution (b). A 0.04 per cent w/v solution of *hydroxyurea IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column of 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 85 volumes of a buffer solution prepared by dissolving 1.7 g of *tetrabutylammonium hydrogen sulphate* and 1.74 g of *dibasic potassium*

phosphate anhydrous in 1000 ml of *water*, adjusted to pH 5.0 with *1M sodium hydroxide or* dilute *orthophosphoric acid* and 15 volumes of *methanol*,
- flow rate: 0.5 ml per minute,
- spectrophotometer set at 214 nm,
- injection volume: 10 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to hydroxylamine and hydroxyurea is not less than 1.5.

Inject reference solution (b). The test is not valid unless the theoretical plates is not less than 5000, tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (b) and the test solution.

Calculate content of $CH_4N_2O_2$.

Storage. Store protected from moisture.

Hydroxyurea Capsules

Hydroxyurea Capsules contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of hydroxyurea, $CH_4N_2O_2$.

Usual strength. 500 mg.

Identification

Shake a quantity of the contents of the capsules containing 30 mg of Hydroxyurea, to a centrifuge tube, add 10 ml of *anhydrous methanol*. Mix and centrifuge for 3 minutes. Transfer 1.0 ml of the clear supernatant to a mortar containing 500 mg of *potassium bromide*, triturate to a homogeneous blend, dry in a vacuum desiccators at 60° for 3 hours, and prepare a suitable disk.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *hydroxyurea IPRS* treated in the same manner or with the reference spectrum of hydroxyurea.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 500 ml of *water*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of medium and filter.

Determine by liquid chromatography (2.4.14) using the chromatographic conditions as described under Assay.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium. Withdraw a suitable volume of the medium and filter, rejecting the first few ml of filtrate.

Reference solution. Prepare a solution using *hydroxyurea IPRS* in the dissolution medium to obtain a solution having concentration similar to the expected concentration in the test solution.

Inject the reference solution and the test solution.

Calculate the content of $CH_4N_2O_2$.

Q. Not less than 80 per cent of the stated amounts of $CH_4N_2O_2$.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the mixed contents of 20 capsules containing 40 mg of Hydroxyurea and transfer to a 100.0 ml volumetric flask. Add about 75 ml of mobile phase and disperse with the aid of ultrasound for about 10 minutes. Stir the solution with magnetic stirrer for further 30 minutes, cool and dilute to volume, filter, rejecting the first few ml of filtrate.

Reference solution (a). A solution containing 0.04 per cent w/v each of *hydroxyurea IPRS* and *hydroxylamine hydrochloride* in the mobile phase.

Reference solution (b). A 0.04 per cent w/v solution of *hydroxyurea IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column of 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 85 volumes of a buffer solution prepared by dissolving 1.7 g of *tetrabutylammonium hydrogen sulphate* and 1.74 g of *dibasic potassium phosphate anhydrous* in 1000 ml of *water*, adjusted to pH 5.0 with *dilute sodium hydroxide or* dilute *orthophosphoric acid* and 15 volumes of *methanol*,
- flow rate: 0.5 ml per minute,
- spectrophotometer set at 214 nm,
- injection volume: 10 µl.

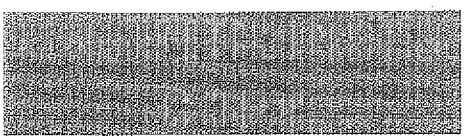
Inject reference solution (a). The test is not valid unless the resolution between the peaks due to hydroxylamine and hydroxyurea is not less than 1.5.

Inject reference solution (b). The test is not valid unless the theoretical plates is not less than 5000, tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

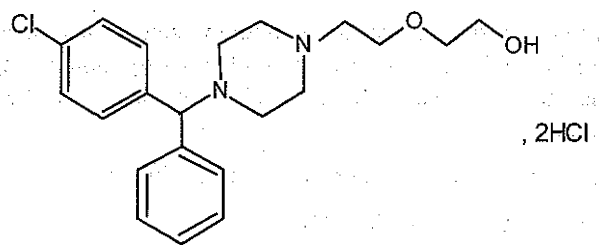
Inject reference solution (b) and the test solution.

Calculate content of $CH_4N_2O_2$ in the capsules.

Storage. Store protected from moisture.



Hydroxyzine Hydrochloride



$C_{21}H_{27}ClN_2O_2,2HCl$ Mol. Wt. 447.8

Hydroxyzine Hydrochloride is (*RS*)-2-[2-[4-[(4-chlorophenyl) phenylmethyl]piperazin-1-yl]ethoxy]ethanol dihydrochloride.

Hydroxyzine Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{21}H_{27}ClN_2O_2,2HCl$, calculated on the dried basis.

Category. Antiallergic.

Description. A white or almost white, hygroscopic, crystalline powder.

Identification

Tests B and C may be omitted if tests A and D are carried out. Test A may be omitted if tests B, C and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *hydroxyzine hydrochloride IPRS* or with the reference spectrum of hydroxyzine hydrochloride.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 1 volume of *ammonia*, 24 volumes of *ethanol (95 per cent)* and 75 volumes of *toluene*.

Solvent mixture. 50 volumes of *methanol* and 50 volumes of *dichloromethane*.

Test solution. Dissolve 0.5 g of the substance under examination in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution (a). A 5.0 per cent w/v solution of *hydroxyzine hydrochloride IPRS* in the solvent mixture.

Reference solution (b). A 5.0 per cent w/v solution of *meclozine dihydrochloride* in the solvent mixture. Dilute 1.0 ml of the solution to 2.0 ml with reference solution (a).

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and spray with *potassium iodobismuthate solution* and examine immediately. The principal spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated principal spots.

C. Dissolve 0.1 g in *ethanol (95 per cent)* and dilute to 15 ml with the same solvent. Add 15 ml of a saturated solution of *picric acid* in *ethanol (95 per cent)*. Allow to stand for 15 minutes; a precipitate is formed, filter. Recrystallise from *ethanol (95 per cent)*. Initiate crystallization, if necessary, by scratching the wall of the tube with a glass rod. The crystals melt (2.4.21) at 189° to 192°.

D. It gives reaction (A) of chlorides (2.3.1).

Tests

Solution A. A 10.0 per cent w/v solution in *water*.

Appearance of solution. Solution A is clear (2.4.1) and not more intensely coloured than reference solution YS7 (2.4.1).

Optical rotation (2.4.22). - 0.1° to + 0.1°, determined on solution A.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of the substance under examination in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). A 0.1 per cent w/v solution of *hydroxyzine hydrochloride IPRS* in the mobile phase.

Reference solution (b). Dilute 3.0 ml of the test solution to 200.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 25.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with base-deactivated octadecylsilane bonded to porous silica (3 µm),
- mobile phase: dissolve 0.5 g of *sodium methanesulphonate* in a mixture of 14 volumes of *triethylamine*, 300 volumes of *acetonitrile* and 686 volumes of *water*, adjusted to pH 2.7 with *sulphuric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the peak-to-valley ratio is not less than 10.0, where H_p is the height above the baseline of the peak immediately before the peak due to hydroxyzine and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to hydroxyzine.

Inject reference solution (b) and the test solution. Run the chromatogram 2.5 times the retention time of the principal

peak. The area of any secondary peak is not more than 0.33 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.03 per cent).

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method A (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.2 g in 10 ml of *anhydrous acetic acid* and 40 ml of *acetic anhydride*, add 10 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02239 g of $C_{21}H_{29}Cl_3N_2O_2$.

Storage. Store protected from light and moisture.

Hydroxyzine Oral Solution

Hydroxyzine Oral Solution contains Hydroxyzine Hydrochloride in a suitable vehicle.

Hydroxyzine Oral Solution contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of hydroxyzine hydrochloride,, $C_{21}H_{27}ClN_2O_2,2HCl$.

Usual strength. 10 mg per 5 ml.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. 1 volume of *dichloromethane* and 1 volume of *methanol*.

Mobile phase. A mixture of 1 volume of *13.5 M ammonia*, 24 volumes of *ethanol* and 75 volumes of *toluene*.

Test solution. Disperse a quantity of the oral solution containing 50 mg of Hydroxyzine Hydrochloride with 5 ml of solvent mixture and dilute to 50.0 ml with the solvent mixture, centrifuge and use the supernatant liquid.

Reference solution (a). A 1.0 per cent w/v solution of *hydroxyzine hydrochloride IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.5 per cent w/v, each of, *hydroxyzine hydrochloride IPRS* and *meclozine hydrochloride IPRS* in the solvent mixture.

Apply to the plate 30 µl of the test solution and 2 µl of reference solution (a) and (b). Allow the mobile phase to rise 15 cm. Dry the plate in air, spray with *potassium iodobismuthate solution*, heat at 110° for 5 minutes and allow to cool. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

Tests

pH (2.4.24). 2.7 to 3.0.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the oral solution containing 50 mg of Hydroxyzine Hydrochloride with 10 ml of mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 2.0 ml of the test solution to 100.0 ml with the mobile phase. Further dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). A 0.01 per cent w/v solution of *hydroxyzine hydrochloride IPRS* in the mobile phase.

Reference solution (c). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Further dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 14 volumes of *triethylamine*, 300 volumes of *acetonitrile* and 686 volumes of a 0.075 per cent w/v solution of *sodium methanesulphonate*, adjusted to pH 2.7 with *sulphuric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

The retention time of hydroxyzine is about 9 minutes.

Inject reference solution (b). The test is not valid unless the peak-to-valley ratio is not less than 10, where H_p is the height above the baseline of the peak immediately before the peak due to hydroxyzine and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to hydroxyzine.

Inject reference solution (a), (c) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal

peak in the chromatogram obtained with reference solution (a) (0.2 per cent). The sum of the areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the oral solution containing 50 mg of Hydroxyzine Hydrochloride with 10 ml of *water* for 20 minutes, add 125 ml of *methanol* and shake for a further 30 minutes and dilute to 250.0 ml with 30 per cent v/v solution of *acetonitrile*, filter. Dilute 5.0 ml of the solution to 10.0 ml with a 30 per cent v/v solution of *acetonitrile*.

Reference solution (a). A 0.01 per cent w/v solution of *hydroxyzine hydrochloride IPRS* in 30 per cent v/v solution of *acetonitrile*.

Reference solution (b). A 0.01 per cent w/v solution of *hydroxyzine hydrochloride IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

Inject reference solution (b). The test is not valid unless the peak-to-valley ratio is not less than 10, where H_p is the height above the baseline of the peak immediately before the peak due to hydroxyzine and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to Hydroxyzine.

Inject reference solution (a) and the test solution.

Determine the weight per ml (2.4.29) of the oral solution and calculate the content of $C_{21}H_{27}ClN_2O_2,2HCl$.

Hydroxyzine Tablets

Hydroxyzine Hydrochloride Tablets

Hydroxyzine Tablets contain Hydroxyzine Hydrochloride.

Hydroxyzine Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of hydroxyzine hydrochloride, $C_{21}H_{27}ClN_2O_2,2HCl$.

Usual strengths. 10 mg; 25 mg.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 1 volume of *13.5 M ammonia*, 24 volumes of *ethanol* and 75 volumes of *toluene*.

Solution A. 1 volume of *methanol* and 1 volume of *dichloromethane*.

Test solution. Shake a quantity of the powdered tablets containing 100 mg of Hydroxyzine Hydrochloride with 5 ml of solution A and dilute to 10 ml with solution A, centrifuge and use the supernatant liquid.

Reference solution (a). A 1.0 per cent w/v solution of *hydroxyzine hydrochloride IPRS* in solution A.

Reference solution (b). A solution containing 0.5 per cent w/v, each of, *hydroxyzine hydrochloride IPRS* and *meclozine hydrochloride IPRS* in solution A.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air spray with *potassium iodobismuthate solution*, heat at 110° for 5 minutes and allow to cool. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Dilute the filtrate, if necessary, with the medium. Measure the absorbance of the resulting solution at the maximum at about 230 nm (2.4.7). Calculate the content of $C_{21}H_{27}ClN_2O_2,2HCl$ in the medium from the absorbance obtained from a solution of known concentration of *hydroxyzine hydrochloride IPRS*.

Q. Not less than 75 per cent of the stated amount of $C_{21}H_{27}ClN_2O_2,2HCl$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 50 mg of Hydroxyzine Hydrochloride with 10 ml of the mobile phase and dilute to 50.0 ml with the mobile phase, filter.

Reference solution (a). Dilute 2.0 ml of the test solution to 100.0 ml with the mobile phase. Further dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). A 0.01 per cent w/v solution of *hydroxyzine hydrochloride IPRS* in the mobile phase.

Reference solution (c). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Further dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 14 volumes of *triethylamine*, 300 volumes of *acetonitrile* and 686 volumes of a 0.075 per cent w/v solution of *sodium methanesulphonate*, adjusted to pH 2.7 with *sulphuric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (a), (c) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). The sum of areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg of Hydroxyzine Hydrochloride with 10 ml of *water* for 20 minutes, add 125 ml of *methanol* and shake for a further 30 minutes and dilute to 250.0 ml with 30 per cent v/v solution of *acetonitrile*, filter. Dilute 5.0 ml of the filtrate to 10.0 ml with 30 per cent v/v solution of *acetonitrile*.

Reference solution (a). A 0.01 per cent w/v solution of *hydroxyzine hydrochloride IPRS* in a 30 per cent v/v solution of *acetonitrile*.

Reference solution (b). A 0.01 per cent w/v solution of *hydroxyzine hydrochloride IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

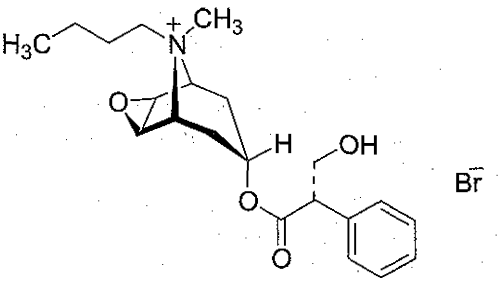
Inject reference solution (b). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing fcator is not more than 2.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{21}H_{27}ClN_2O_2,2HCl$ in the tablets.

Hyoscine Butylbromide

Scopolamine Butylbromide



$C_{21}H_{30}BrNO_4$ Mol. Wt. 440.4

Hyoscine Butylbromide is (1*S*,3*s*,5*R*,6*R*,7*S*,8*r*)-6,7-epoxy-8-butyl-3-[(*S*)-tropoyloxy]tropanium bromide.

Hyoscine Butylbromide contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{21}H_{30}BrNO_4$, calculated on the dried basis.

Category. Parasympatholytic.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *hyoscine butylbromide IPRS* or with the reference spectrum of hyoscine butylbromide.

B. It gives the reactions of bromides (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and colourless (2.4.1).

pH (2.4.24). 5.5 to 6.5, determined in a 10.0 per cent w/v solution.

Specific optical rotation (2.4.22). −20.0° to −18.0°, determined in a 5.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in mobile phase B and dilute to 10.0 ml with mobile phase B.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase B. Dilute 1.0 ml of the solution to 10.0 ml with mobile phase B.

Reference solution (b). Dissolve 5 mg *of hyoscine butylbromide for system suitability IPRS* (containing impurity A and B) in mobile phase B and dilute to 10.0 ml with mobile phase B.

Chromatographic system

- a stainless steel column 10 cm × 4.6 mm, packed with silica gel bonded to alkyl groups (1.8 µm),
- column temperature: 50°,
- mobile phase: A. a mixture of 5 volumes of *acetonitrile* and 95 volumes of a 0.2 per cent v/v solution of *perchloric acid*,

  B. a mixture of 30 volumes of a 0.2 per cent v/v solution of *perchloric acid* and 70 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 2.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 2 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	91	9
1	91	9
4.2	75	25
5.5	66	34
10	15	85
11	15	85
12	91	9
15	91	9

Name	Relative retention time
Bromide	0.1
Hyoscine impurity B[1]	0.28
Hyoscine impurity A[2]	0.37
Hyoscine butylbromide (Retention time: about 6 minutes)	1.0

[1](2*RS*)-3-hydroxy-2-phenylpropanoic acid (DL-tropic acid),

[2](*R*,2*R*,4*S*,5*S*,7*S*)-9-methyl-3-oxa-9-azatricyclo[3.3.1.02,4] nonan-7-yl (2*S*)-3-hyroxy-2-phenylpropanoate (hyoscine).

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to hyoscine impurity B and hyoscine impurity A is not less than 2.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to hyoscine impurity A is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). The sum of the areas of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent). Ignore the peak due to bromide and any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 2.5 per cent, determined on 0.5 g by drying in an oven at 105°.

Assay. Dissolve 0.6 g in 30 ml of *anhydrous glacial acetic acid* and add 5 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, using *1-naphtholbenzein solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04404 g of $C_{21}H_{30}BrNO_4$.

Storage. Store at a temperature not exceeding 30° protected from light and moisture.

Hyoscine Butylbromide Injection

Scopolamine Butylbromide Injection

Hyoscine Butylbromide Injection is a sterile solution of Hyoscine Butylbromide in Water for Injections.

Hyoscine Butylbromide Injection contains not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of hyoscine butylbromide, $C_{21}H_{30}BrNO_4$.

Usual strength. 20 mg per ml.

Identification

Evaporate to dryness a volume of the injection containing 0.1 g of Hyoscine Butylbromide, shake the residue with 20 ml of *chloroform*, filter, evaporate the filtrate to dryness and triturate the residue with 5 ml of *acetonitrile*. Evaporate to dryness and dry the residue at 50° at a pressure not exceeding 0.7 kPa for 1 hour. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *hyoscine butylbromide IPRS* or with the reference spectrum of hyoscine butylbromide.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.15 per cent w/v solution in *0.01 M hydrochloric acid* shows absorption maxima at about 252 nm, 257 nm and 264 nm and a less well-defined maximum at about 247 nm.

C. To 1 mg add 0.2 ml of *fuming nitric acid* and evaporate to dryness on a water-bath. Dissolve the residue in 2 ml of *acetone* and add 0.1 ml of a 3 per cent w/v solution of *potassium hydroxide* in *methanol*; a violet colour is produced.

Tests

pH (2.4.24). 3.7 to 5.5.

Hyoscine. Determine by liquid chromatography (2.4.14).

Test solution. The injection diluted if necessary, to contain 1.0 per cent w/v of Hyoscine Butylbromide in *0.001 M hydrochloric acid.*

Reference solution (a). A 0.001 per cent w/v solution of *hyoscine hydrobromide IPRS* in *0.001 M hydrochloric acid.*

Reference solution (b). Add 10 µl of the test solution to 10 ml of reference solution (a).

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (10 µm),
- mobile phase: dissolve 2.0 g of *sodium dodecyl sulphate* in a mixture of 370 ml of *0.001M hydrochloric acid* and 680 ml of *methanol,*
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to hyoscine and butylhyoscine is not less than 5.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to hyoscine is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of the injection containing 100 mg of Hysoscine Butylbromide to 20.0 ml with *0.001 M hydrochloric acid.*

Reference solution (a). A 0.005 per cent w/v solution of *hysoscine butylbromide IPRS* in *0.001 M hydrochloric acid.*

Reference solution (b). A 0.006 per cent w/v solution of *tropic acid* in *0.001 M hydrochloric acid.*

Reference solution (c). A solution containing 0.5 per cent w/v of *hysoscine butylbromide IPRS* and 0.003 per cent w/v of *tropic acid* in *0.001 M hydrochloric acid.*

Chromatographic system
- a stainless steel column 12.5 cm × 4 mm, packed with octadecylsilane bonded to porous silica (5 µm), (Such as LiChrospher 60 RP- Select B),
- column temperature: 45°,
- mobile phase: a mixture of 87.5 volumes of a buffer solution prepared by dissolving 12.65 g of *sodium dihydrogen orthophosphate monohydrate* and 3.4 g of *tetrabutylammonium hydrogen sulphate*, in 1000 ml of *water*, adjusted to pH 5.5 with *0.5 M sodium hydroxide* and 12.5 volumes of *methanol,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Hyoscine butylbromide (Retention time: about 5 minutes)	1.0	—
Tropic acid	1.3	—
Hyoscine impurity G[1]	2.6	0.41

[1](1*R*,2*R*,4*S*,5*S*,7s,9r)-9-butyl-9-methyl-7-[(2-phenylprop-2-enoyl)oxy]-3-oxa-9-azoniatricyclo[3.3.1$0^{2,4}$]nonane (apo-N-butylhyoscine).

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to hyoscine butylbromide and tropic acid is not less than 1.5.

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to hyoscine impurity G is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent), the area of any peak corresponding to tropic acid is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.2 per cent), the area of any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (2.5 per cent). Ignore the peak due to bromide and any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Bacterial endotoxins (2.2.3). Not more than 8.75 Endotoxin Units per mg of hyoscine butylbromide.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of injection containing about 40 mg of Hyoscine Butylbromide in 100.0 ml of *0.001M hydrochloric acid.*

Reference solution. A 0.04 per cent w/v solution of *hyoscine butylbromide IPRS* in *0.001M hydrochloric acid.*

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (10 µm) (Such as Lichrosorb C8),
- mobile phase: a buffer solution prepared by dissolving 2.0 g of *sodium lauryl sulphate* in a mixture of 370 volumes of *0.001 M hydrochloric acid* and 680 volumes of *methanol,*

- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, tailing factor is not more than 2.0 per cent and the relative standard deviation for replicate injections is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{30}BrNO_4$ in the injection.

Storage. Store at a temperature not exceeding 30° protected from light and moisture.

Hyoscine Butylbromide Tablets

Scopolamine Butylbromide Tablets

Hyoscine Butylbromide Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of hyoscine butylbromide, $C_{21}H_{30}BrNO_4$.

Usual strength. 10 mg.

Identification

Shake a quantity of the powdered tablets containing 50 mg of Hyoscine Butylbromide with 20 ml of *chloroform*, filter, evaporate the filtrate to dryness and triturate the residue with 5 ml of *acetonitrile*. Evaporate to dryness and dry the residue at 50° at a pressure not exceeding 0.7 kPa for 1 hour. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *hyoscine butylbromide IPRS* or with the reference spectrum of hyoscine butylbromide.

B. To 1 mg add 0.2 ml of *fuming nitric acid* and evaporate to dryness on a water-bath. Dissolve the residue in 2 ml of *acetone* and add 0.1 ml of a 3 per cent w/v solution of *potassium hydroxide* in *methanol*; a violet colour is produced.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 500 ml of *0.001M hydrochloric acid*,
Speed and time. 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Dilute the filtrate with the dissolution medium to obtain a solution containing 0.002 per cent w/v of Hyoscine Butylbromide.

Reference solution. A 0.002 per cent w/v solution of *hyoscine butylbromide IPRS* in the dissolution medium.

Chromatographic system
- a stainless steel column 12.5 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm), (Such as Lichrospher 60 RP select B),
- mobile phase: a mixture of 78 volumes of a buffer solution prepared by dissolving 2.5 g of *sodium heptanesulphonate monohydrate* in 720 ml of a 0.908 per cent w/v solution of *potassium dihydrogen orthophosphate* and add 60 ml of 1.188 per cent w/v solution of *disodium hydrogen orthophosphate* and 24 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 50 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{30}BrNO_4$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{21}H_{30}BrNO_4$.

Hyoscine. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the powdered tablets containing 0.1 g of Hyoscine Butylbromide with 10 ml of *0.001M hydrochloric acid* with the aid of ultrasound for 15 minutes, centrifuge and filter.

Reference solution (a). A 0.001 per cent w/v solution of *hyoscine hydrobromide IPRS* in *0.001 M hydrochloric acid.*

Reference solution (b). Add 10 µl of the test solution to 10 ml of reference solution (a).

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (10 µm),
- mobile phase: dissolve 2.0 g of *sodium dodecyl sulphate* in a mixture of 370 ml of *0.001M hydrochloric acid* and 680 ml of *methanol*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to hyoscine and butylhyoscine is not less than 5.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to hyoscine is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel F254.*

Mobile phase. A mixture of 0.5 volume of *anhydrous formic acid* , 1.5 volumes of *water*, 9 volumes of *ethanol* and 9 volumes of *methylene chloride*.

Test solution. Shake a quantity of the powdered tablets containing 20 mg of Hyoscine Butylbromide with 5 ml of *0.01M hydrochloric acid* and filter.

Reference solution (a). Dilute 3 volumes of the test solution to 100 volumes with *0.01M hydrochloric acid.*

Reference solution (b). Dilute 1 volume of the test solution to 50 volumes with *0.01M hydrochloric acid.*

Reference solution (c). Dilute 1 volume of the test solution to 400 volumes with *0.01M hydrochloric acid.*

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 4 cm, dry the plate at 60° for 15 minutes and spray with a solution prepared by mixing equal volumes of a 40 per cent w/v solution of *potassium iodide* in *water* and a solution prepared by dissolving 0.85 g of *bismuth oxynitrate* in a mixture of 10 ml of *glacial acetic acid* and 40 ml of *water* and diluting 1 volume of the mixture with 2 volumes of *glacial acetic acid* and 10 volumes of *water* immediately before use. Allow the plate to dry in air, spray well with 5.0 per cent w/v solution of *sodium nitrite* and examine immediately.

In the chromatogram obtained with the test solution, the principal spot has an R_f value of 0.45.

In the chromatogram obtained with the test solution any secondary spot with an R_f value less than that of the principal spot is not more intense than the spot in the chromatogram obtained with reference solution (a) (3.0 per cent), not more than two such spots are more intense than the spot in the chromatogram obtained with reference solution (c) (0.25 per cent); any secondary spot with an R_f value more than that of the principal spot is not more intense than the spot in the chromatogram obtained with reference solution (b) (2.0 per cent) and not more than one such spot with an R_f value more than that of the principal spot is more intense than the spot in the chromatogram obtained with reference solution (c) (0.25 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay using following test solution.

Test solution. Disperse one tablet in 25.0 ml of *0.001 M hydrochloric acid* with the aid of ultrasound.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 40 mg of Hyoscine Butylbromide in 60 ml of *0.001M hydrochloric acid*, dilute to 100.0 ml with *0.001M hydrochloric acid*, centrifuge and filter.

Reference solution. A 0.04 per cent w/v of solution of *hyoscine butylbromide IPRS* in *0.001M hydrochloric acid.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (10 µm) (Such as Lichrosorb C8),
- mobile phase: a buffer solution prepared by dissolving 2.0 g *sodium lauryl sulphate* in a mixture of 370 volumes of *0.001 M hydrochloric acid* and 680 volumes of *methanol*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, tailing factor is not more than 2.0 per cent and the relative standard deviation for replicate injections is not more than 2.0.

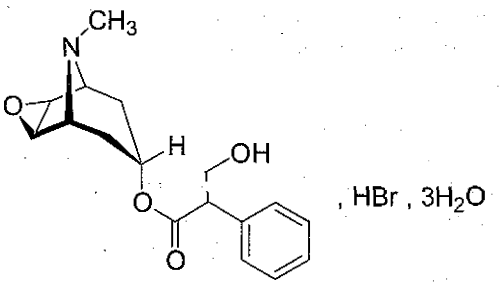
Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{30}BrNO_4$ in the tablets.

Storage. Store at a temperature not exceeding 30° protected from light and moisture.

Hyoscine Hydrobromide

Scopolamine Hydrobromide



$C_{17}H_{21}NO_4,HBr,3H_2O$ Mol. Wt. 438.3

Hyoscine Hydrobromide is (1*S*,3*s*,5*R*,6*R*,7*S*)-6,7-epoxytropan-3-yl(*S*)-tropate hydrobromide trihydrate.

Hyoscine Hydrobromide contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{17}H_{21}NO_4,HBr$, calculated on the anhydrous basis.

Category. Parasympatholytic.

Description. Colourless crystals or a white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *hyoscine hydrobromide IPRS* or with the reference spectrum of hyoscine hydrobromide.

B. To about 1 mg add 0.2 ml of *fuming nitric acid* and evaporate to dryness on a water-bath. Dissolve the residue in 2 ml of *acetone* and add 0.1 ml of a 3 per cent w/v solution of *potassium hydroxide* in *methanol*; a violet colour is produced.

C. It gives the reaction of alkaloids (2.3.1).

D. It gives the reactions of bromides (2.3.1).

Tests

pH (2.4.24). 4.0 to 5.5, determined in a 5.0 per cent w/v solution.

Specific optical rotation (2.4.22). –27.0° to –24.0°, determined in a 5.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 70 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with mobile phase.

Reference solution (a). Dilute 2.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 25.0 ml with the mobile phase.

Reference solution (c). A solution containing 0.001 per cent w/v of *hyoscine hydrobromide impurity B IPRS* and 0.0014 per cent w/v of the substance under examination in the mobile phase.

Chromatographic system

- stainless steel column 12.5 cm x 4.0 mm, packed with octylsilane bonded to porous silica (3 µm),
- mobile phase: a mixture of 330 volumes of *acetonitrile* and 670 volumes of a 0.25 per cent w/v solution of *sodium dodecyl sulphate*, previously adjusted to pH 2.5 with *3 M orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 5 µl.

Name	Relative retention time	Correction factor
Hyoscine impurity D[1]	0.2	0.3
Hyoscine impurity B[2]	0.9	—
Hyoscine (Retention time: about 5 minutes)	1.0	—
Hyoscine impurity A[3]	1.3	—
Hyoscine impurity C[4]	2.4	0.6

[1]DL-tropic acid,

[2]norhyoscine,

[3]hyoscyamine,

[4]apohyoscine.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to hyoscine impurity B and hyoscine is not less than 1.5 and the tailing factor for the peak due to hyoscine is not more than 2.5.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 3 times the retention time of the peak due to hyoscine. In the chromatogram obtained with the test solution, the area of peak corresponding to hyoscine impurity B is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). The area of peak corresponding to hyoscine impurities A, C and D is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The sum of areas of all the secondary peaks is not more than 1.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.7 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent) and the peak due to bromide ion which appears close to the solvent peak.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 10.0 to 13.0 per cent, determined on 0.2 g.

Assay. Weigh 0.4 g, dissolve in 10 ml of *anhydrous glacial acetic acid*, warming if necessary, cool the solution and add 20 ml of *dioxan*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03843 g of $C_{17}H_{21}NO_4,HBr$.

Storage. Store protected from light and moisture in well-filled containers of small capacity in a refrigerator at a temperature not exceeding 15°.

Hyoscine Hydrobromide Injection

Scopolamine Hydrobromide Injection

Hyoscine Hydrobromide Injection is a sterile solution of Hyoscine Hydrobromide in Water for Injection.

Hyoscine Hydrobromide Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of hyoscine hydrobromide, $C_{17}H_{21}NO_4,HBr,3H_2O$.

Usual strength. 400 µg per ml.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 50 volumes of *chloroform*, 40 volumes of *acetone* and 10 volumes of *diethylamine*.

Test solution. Evaporate a volume of the injection containing 5 mg of Hyoscine Hydrobromide to dryness on a water-bath, triturate the residue with 1 ml of *ethanol (95 per cent)*, allow to stand and use the supernatant liquid.

Reference solution. A solution containing 0.5 per cent w/v of *hyoscine hydrobromide IPRS* in *ethanol (95 per cent)*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air, heat it at 105° for 20 minutes, allow to cool and spray with *dilute potassium iodobismuthate solution*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the chromatogram obtained with test solution (b) shows a peak with the same retention time as the peak derived from hyoscine hydrobromide in the chromatogram obtained with the reference solution.

C. Evaporate a suitable volume to dryness. To 1 ml of a 1.0 per cent w/v solution of the residue add 1 ml of *5 M ammonia*, shake with *chloroform* and evaporate the chloroform solution to dryness on a water-bath. To the residue add 1.5 ml of a 2.0 per cent w/v solution of *mercuric chloride* in *ethanol (60 per cent)*; a white precipitate is produced which dissolves on warming (distinction from atropine and hyoscyamine).

D. It gives reaction (A) of bromides (2.3.1).

Tests

pH (2.4.24). 4.0 to 6.0.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of injection containing about 0.04 g of Hyoscine Hydrobromide in 100.0 ml of *water*.

Reference solution. A 0.04 per cent w/v solution of *hyoscine hydrobromide IPRS* in *water*.

Chromatographic system

- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm) (Such as Lichrosorb RP18),
- mobile phase: a mixture of 1 volume of 60 per cent w/v solution of *perchloric acid*, 31 volumes of *methanol* and 68 volumes of *water*, adjusted to pH 2.5 with *13.5 M ammonia*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{21}NO_4,HBr,3H_2O$ in the injection.

1 mg of $C_{17}H_{21}NO_4,HBr$ is equivalent to 1.141 mg of $C_{17}H_{21}NO_4,HBr,3H_2O$.

Storage. Store at a temperature not exceeding 15°, protected from light.

Hyoscine Hydrobromide Tablets

Scopolamine Hydrobromide Tablets

Hyoscine Hydrobromide Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of hyoscine hydrobromide, $C_{17}H_{21}NO_4,HBr,3H_2O$.

Usual strengths. 300 µg; 600 µg.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 50 volumes of *chloroform*, 40 volumes of *acetone* and 10 volumes of *diethylamine*.

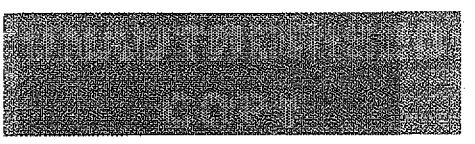
Test solution. Shake a quantity of the powdered tablets containing 10 mg of Hyoscine Hydrobromide with 2 ml of *ethanol (95 per cent)* and centrifuge.

Reference solution. A solution containing 0.5 per cent w/v of *hyoscine hydrobromide IPRS* in *ethanol (95 per cent)*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air, heat it at 105° for 20 minutes, allow to cool and spray with *dilute potassium iodobismuthate solution*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the chromatogram obtained with test solution (b) shows a peak with the same retention time as the peak derived from hyoscine hydrobromide in the chromatogram obtained with the reference solution.

C. Extract a quantity of the powdered tablets containing 1 mg of Hyoscine Hydrobromide with 5 ml of *ethanol (95 per cent)*, filter and evaporate the filtrate to dryness on a water-bath. Cool, add 0.2 ml of *fuming nitric acid* and again evaporate to dryness on a water-bath; a yellow residue is produced. To the cooled residue add 2 ml of *acetone* and 0.2 ml of a 3.0 per cent w/v solution of *potassium hydroxide* in *methanol*; a deep violet colour is produced. (Atropine and hyoscyamine also yield this reaction; the reaction is masked by other alkaloids).



D. The powdered tablets give reaction (A) of bromides (2.3.1).

Tests

Uniformity of content. Complies with the test stated under Tablets.

For tablets containing 600 µg of Hyoscine Hydrobromide—

Test solution (a). Powder one tablet and triturate with 5 ml of *0.1 M hydrochloric acid.* Add 1.0 ml of a 0.0375 per cent w/v solution of *atropine sulphate IPRS* (internal standard) in *methanol* (solution A), extract with two quantities, each of 5 ml, of *chloroform* and discard the chloroform extracts. Add 1 ml of *5 M ammonia.* Extract with two quantities, each of 5 ml, of *chloroform*, shake the combined extracts with 1 g of *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness. Dissolve the residue in 0.5 ml of a mixture of 20 volumes of *dichloromethane*, 4 volumes of *N,O-bis(trimethylsilyl) acetamide* and 1 volume of *trimethylchlorosilane*, mix and allow to stand for 30 minutes.

Test solution (b). Prepare in the same manner as test solution (a) but omitting the addition of solution A.

Reference solution. Add 1 ml of a 0.0375 per cent w/v solution of *atropine sulphate IPRS* (internal standard) in *methanol* (solution A) and 1 ml of *5 M ammonia* to 5.0 ml of a 0.012 per cent w/v solution of *hyoscine hydrobromide IPRS* and complete the procedure described under test solution (a) beginning at the words "extract with two quantities,...".

Carry out the procedure as described under Assay. Calculate the content of $C_{17}H_{21}NO_4,HBr,3H_2O$ in the tablet.

For tablets containing less than 600 µg of Hyoscine Hydrobromide — Use the same procedure but with correspondingly smaller concentrations of *hyoscine hydrobromide IPRS* and *atropine sulphate IPRS.*

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 25 volumes of *acetonitrile* and 75 volumes of *water.*

Internal standard solution. A 0.02 per cent w/v solution of *atropine sulphate IPRS* in the solvent mixture.

Test solution (a). Disperse 10 whole tablets in 7 ml of the solvent mixture with the aid of ultrasound and dilute to obtain a solution containing 0.015 per cent w/v of Hyoscine Hydrobromide in the solvent mixture, centrifuge and filter the supernatant liquid.

Test solution (b). Disperse 10 whole tablets in 7 ml of the solvent mixture with the aid of ultrasound and dilute to obtain a solution containing 0.015 per cent w/v of Hyoscine Hydrobromide in internal standard solution.

Reference solution. A 0.015 per cent w/v solution of *hyoscine hydrobromide IPRS* in internal standard solution.

Chromatographic system

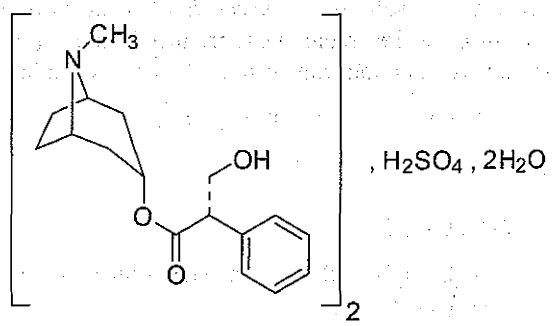
- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm) (Such as Lichrosorb RP18),
- mobile phase: *0.05 M sodium octanesulphonate* in a mixture of 1 volume of a 60 per cent w/v solution of *perchloric acid*, 3 volumes of *methanol*, 21 volumes of *acetonitrile* and 75 volumes of *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject the reference solution, internal standard solution, test solution (a) and (b).

Calculate the content of $C_{17}H_{21}NO_4,HBr,3H_2O$ in the tablets. 1 mg of $C_{17}H_{21}NO_4,HBr$ is equivalent to 1.141 mg of $C_{17}H_{21}NO_4,HBr,3H_2O$.

Storage. Store at a temperature not exceeding 15°, protected from light.

Hyoscyamine Sulphate



$(C_{17}H_{23}NO_3)_2,H_2SO_4,2H_2O$ Mol. Wt. 712.9

Hyoscyamine Sulphate is bis (1*R*,3*r*,5*S*)- 8-methyl-8-azabicyclo[3.2.1]oct-3-yl (2*S*)-3-hydroxy-2-phenylpropionate] sulphate dihydrate.

Hyoscyamine Sulphate contains not less than 98.0 per cent and not more than 101.0 per cent of $(C_{17}H_{23}NO_3)_2,H_2SO_4,2H_2O$, calculated on the anhydrous basis.

Category. Anticholinergic.

Description. A white or almost white, crystalline powder or colourless needles.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *hyoscyamine sulphate IPRS* or with the reference spectrum of hyoscyamine sulphate.

B. To 0.5 ml of solution A, add 2 ml of *dilute acetic acid* and heat. To the hot solution add 4 ml of *picric acid solution*, allow to cool, shaking occasionally. Collect the crystals, wash with 2 quantities, each of 3 ml, of iced *water* and dry at 105°. The crystal melts between 164° to 168°(2.4.21).

C. To about 1 mg of test solution add 0.2 ml of *fuming nitric acid* and evaporate to dryness on a water-bath and dissolve the residue in 2 ml of *acetone*, add 0.2 ml of a 3.0 per cent w/v solution of *potassium hydroxide* in *methanol*; a violet colour develops.

D. It gives reaction (A) of sulphates (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *water* (solution A) is clear (2.4.1) and not more intensely coloured than reference solution BYS6 (2.4.1).

pH (2.4.24). 4.5 to 6.2, determined in 2.0 per cent w/v solution in *carbon dioxide-free water*.

Specific optical rotation (2.4.22). –29.0° to –24.0°, determined in solution A.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 60 mg of the substance under examination to 50.0 ml with mobile phase A. Further dilute 10.0 ml of the solution to 50.0 ml with mobile phase A.

Reference solution (a). Dilute 5.0 ml of the test solution to 100.0 ml with mobile phase A. Further dilute 5.0 ml of the solution to 50.0 ml with mobile phase A.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 25.0 ml with mobile phase A.

Reference solution (c). Dissolve 5 mg of *(1R,3r,5S)-8-azabicyclo[3.2.1]oct-3-yl(2S)-3-hydroxy-2-phenylpropanoate(norhyoscyamine) IPRS (hyoscyamine impurity E IPRS)* in the 20.0 ml of test solution. Dilute 5.0 ml of the solution to 25.0 ml with mobile phase A.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature. 25°,
- mobile phase: A. dissolve 3.5 g of *sodium dodecyl sulphate* in 606 ml of a 0.7 per cent w/v solution of *potassium dihydrogen phosphate* previously adjusted to pH 3.3 with *0.05 M orthophosphoric acid* and mix with 320 ml of *acetonitrile*,

  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	95	5
2	95	5
20	70	30
20.1	95	5
25	95	5

Inject reference solution (c). The relative retention time for (2*RS*)-3-hydroxy-2-phenylpropanoic acid (DL-tropic acid) (hyoscyamine impurity A) is about 0.2, for (1*R*,3*S*,5*R*,6*RS*)-6-hydroxy-8-methyl-8-azabicyclo[3.2.1]oct-3-yl (2*S*)-3-hydroxy-2-phenylpropanoate(7-hydroxyhyoscyamine) (hyoscyamine impurity B) is about 0.67, for (1*S*,3*R*,5*S*,6*RS*)-6-hydroxy-8-methyl-8-azabicyclo[3.2.1]oct-3-yl (2*S*)-3-hydroxy-2-phenylpropanoate (6-hydroxyhyoscyamine) (hyoscyamine impurity C) is about 0.72, hyoscine (hyoscyamine impurity D) is about 0.8, for (1*R*,3*r*,5*S*)-8- azabicyclo[3.2.1]oct-3-yl (2*S*)-3-hydroxy-2-phenylpropanoate(norhyoscyamine) (hyoscyamine impurity E) is about 0.9, for (1*R*,3*r*,5*S*)-8-methyl-8-azabicyclo[3.2.1]oct-3-yl (2*R*)-2-hydroxy-3-phenyl propanoate (littorine) (hyoscyamine impurity F) is about 1.1 and for (1*R*,3*r*,5*S*)-8-methyl-8-azabicyclo[3.2.1]oct-3-yl 2-phenylprop-2-enoate (apoatropine) (hyoscyamine impurity G) is about 1.8. The test is not valid unless resolution between the peaks due to hyoscyamine and hyoscyamine impurity E is not less than 2.5. Multiply the peak areas of the impurities by the correction factor for calculating the contents, for impurity A is 0.3; impurity G is 0.6.

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with the test solution, the area of secondary peak corresponding to impurity E is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent). The area of the secondary peaks corresponding to hyoscyamine impurities A, B, C, D, F, G, for each impurity, is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The sum of the areas of all secondary peaks is not more than the area of the principal peak in the

chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 2.0 to 5.5 per cent, determined on 0.5 g.

Assay. Weigh 0.5 g and dissolve in 25 ml of *anhydrous acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.0677 g of $C_{34}H_{48}N_2O_{10}S$.

Storage. Store protected from light and moisture.

Hyoscyamine Injection

Hyoscyamine Sulphate Injection

Hyoscyamine Injection is a sterile solution of Hyoscyamine Sulphate in Water for Injections.

Hyoscyamine Injection contains not less than 93.0 per cent and not more than 107.0 per cent of the stated amount of hyoscyamine sulphate, $(C_{17}H_{23}NO_3)_2,H_2SO_4,2H_2O$.

Usual strengths. 0.5 mg per ml; 2.0 mg per ml.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

B. After evaporation to dryness, complies with the test for sulphates (2.3.1).

Tests

pH (2.4.24). 3.0 to 6.5.

Bacterial Endotoxin test (2.2.3). Not more than 714.3 Endotoxin Units per mg of hyoscyamine sulphate.

Other tests. Comply with the tests stated under Parenteral Preparations (Injection).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of injection containing about 1 mg of Hyoscyamine Sulphate to 200.0 ml with *0.01 M hydrochloric acid.*

Reference solution (a). A 0.016 per cent w/v solution of *hyoscyamine sulphate IPRS* in *0.01 M hydrochloric acid.*

Reference solution (b). Dilute 3.0 ml of reference solution (a) to 100.0 ml with *0.01 M hydrochloric acid.*

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with phenyl groups chemically bonded to porous silica (5 µm),
- mobile phase: a mixture of 1800 volumes of the buffer solution, prepared by dissolving 13.6 g of *monobasic potassium phosphate* in 1800 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid*, dilute to 2000 ml with *water*, add 0.3 volume of *triethylamine* and 200 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 50 µl.

Inject reference solution (b). The test is not valid unless the tailing factor is not more than 1.8 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (b) and the test solution.

Calculate the content of $(C_{17}H_{23}NO_3)_2,H_2SO_4,2H_2O$ in the injection.

Storage. Store in single-dose or multiple-dose containers, preferably of Type I glass at controlled room temperature.

Hyoscyamine Oral Solution

Hyoscyamine Sulphate Oral Solution

Hyoscyamine Oral Solution is a mixture consisting of Hyoscyamine sulphate with buffering agents and other excipients. It contains suitable flavouring agents. It is filled in a sealed container.

The oral solution is constituted by dispersing the contents of the sealed container in the specified volume of water just before use.

Hyoscyamine Oral Solution contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of hyoscyamine sulphate, $(C_{17}H_{23}NO_3)_2,H_2SO_4,2H_2O$.

Usual strength. 0.125 mg per ml.

Storage. Store the constituted solution in a refrigerator 2° to 8°. Discard any unused portion after 30 days of reconstitution.

The contents of the sealed container comply with the requirements stated under Oral Liquids and with the following requirements.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

Tests

pH (2.4.24). 3.0 to 6.5, determined in the reconstituted solution.

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the constituted solution containing 0.5 mg of Hyoscyamine Sulphate and dissolve in 100.0 ml of *0.01 M hydrochloric acid.*

Reference solution (a). A 0.016 per cent w/v solution of *hyoscyamine sulphate IPRS* in *0.01 M hydrochloric acid.*

Reference solution (b). Dilute 3.0 ml of reference solution (a) to 100.0 ml with *0.01 M hydrochloric acid.*

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with phenyl groups chemically bonded to porous silica (5 µm),
- mobile phase: a mixture of 90 volumes of the buffer solution prepared by dissolving 13.6 g of *monobasic potassium phosphate* in 1800 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid*, dilute to 2000 ml with *water*, add 0.3 volume of *triethylamine* and 10 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 50 µl.

Inject reference solution (b). The test is not valid unless the tailing factor is not more than 1.8 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (b) and the test solution.

Calculate the content of $(C_{17}H_{23}NO_3)_2,H_2SO_4,2H_2O$ in oral solution.

Hyoscyamine Tablets

Hyoscyamine Sulphate Tablets

Hyoscyamine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of hyoscyamine sulphate, $(C_{17}H_{23}NO_3)_2,H_2SO_4,2H_2O$.

Usual strength. 0.125 mg.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

B. It gives reaction (A) of sulphates (2.3.1).

Tests

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay, using the following solution as the test solution.

Test solution. Disperse 1 Tablet in 25 ml of *0.01 M hydrochloric acid.*

Calculate the content of $(C_{17}H_{23}NO_3)_2,H_2SO_4,2H_2O$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 Tablets. Disperse a quantity of powder containing about 0.125 mg of Hyoscyamine Sulphate in 25.0 ml of *0.01 M hydrochloric acid.*

Reference solution (a). A 0.016 per cent w/v solution of *hyoscyamine sulphate IPRS* in *0.01 M hydrochloric acid.*

Reference solution (b). Dilute 3.0 ml of reference solution (a) to 100 ml with *0.01 M hydrochloric acid.*

Tropic acid solution. A 0.0003 per cent w/v solution of tropic acid in *0.01 M hydrochloric acid.*

Reference solution (c). To 3.0 ml of the reference solution (a), add 4.0 ml of the tropic acid solution and dilute to 100 ml with *0.01 M hydrochloric acid.*

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with phenyl groups bonded to porous silica (4 µm),
- mobile phase: a mixture of 0.3 volume of *triethylamine,* 1800 volumes of the buffer solution prepared by dissolving about 13.6 g of *monobasic potassium phosphate* in 1800 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid,* dilute to 2000 ml with *water* and 200 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 50 µl.

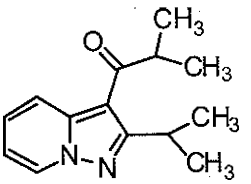
Inject reference solution (c). The test is not valid unless the resolution between the peaks due to hyoscyamine and tropic acid is not less than 1.5 and the tailing factor is not more than 1.8. The relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (b) and the test solution.

Calculate the content of $(C_{17}H_{23}NO_3)_2,H_2SO_4,2H_2O$ in the tablets.

I

Ibudilast



$C_{14}H_{18}N_2O$ Mol Wt. 230.3

Ibudilast is 2-Methyl-1-(2-propan-2-ylpyrazolo[1,5-a]pyridin-3-yl)propan-1-one.

Ibudilast contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{14}H_{18}N_2O$, calculated on the dried basis.

Category. Antiallergic; antiasthamatic and vasodilator.

Description. A white to off white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ibudilast IPRS* or with the reference spectrum of ibudilast.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and diluted to 50 .0 ml with the mobile phase.

Reference solution. A 0.05 per cent w/v solution of *ibudilast IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 80 volumes of *methanol* and 20 volumes of *water*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2500 theoretical plates, the tailing factor is not more than 3.0.

Inject test solution. The area of any secondary peak is not more than 0.5 per cent and the sum of areas of all the secondary peaks peaks is not more than 1.5 per cent, calculated by area normalisation.

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 43° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 50 .0 ml with the mobile phase. Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution. A 0.0025 per cent w/v solution of *ibudilast IPRS* in the mobile phase.

Chromatographic system

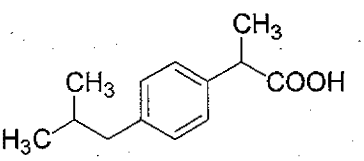
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 80 volumes of *methanol* and 20 volumes of *water*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates and the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_{18}N_2O$

Ibuprofen



$C_{13}H_{18}O_2$ Mol. Wt. 206.3

Ibuprofen is (*RS*)-2-(4-isobutylphenyl)propionic acid.

Ibuprofen contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{13}H_{18}O_2$, calculated on the dried basis.

Category. Anti-inflammatory; analgesic.

Description. A white or almost white, crystalline powder or colourless crystals.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ibuprofen IPRS* or with the reference spectrum of ibuprofen.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.05 per cent w/v solution in *0.1 M sodium hydroxide* shows absorption maxima at about 264 nm and 272 nm, and a shoulder at about 258 nm. The ratio of the absorbance at about 264 nm to that at the shoulder at about 258 nm is 1.20 to 1.30. The ratio of the absorbance at the maximum at about 272 nm to that at the shoulder at about 258 nm is 1.00 to 1.10.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H*.

Mobile phase. A mixture of 75 volumes of *n-hexane*, 25 volumes of *ethyl acetate* and 5 volumes of *glacial acetic acid*.

Test solution. Dissolve 0.5 g of the substance under examination in 100.0 ml of *dichloromethane*.

Reference solution. A 0.5 per cent w/v solution of *ibuprofen IPRS* in *dichloromethane*.

Apply to the plate 5 µl of each solution. After development, dry the plate at 120° for 30 minutes, lightly spray the plate with a 1 per cent w/v solution of *potassium permanganate* in *1 M sulphuric acid*, heat at 120° for 20 minutes and examine under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Appearance of solution. A 10.0 per cent w/v solution in *ethanol (95 per cent)* is clear (2.4.1), and colourless (2.4.1).

Optical rotation (2.4.22). – 0.05° to + 0.05°, determined in a 2.5 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in 2 ml of *acetonitrile* and add sufficient of the mobile phase to produce 10.0 ml.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 20 mg of *ibuprofen IPRS* in 2 ml of *acetonitrile*, add 1 ml of 0.006 per cent w/v solution of *2-(4-butylphenyl)propionic acid IPRS* in *acetonitrile* and add sufficient mobile phase to produce 10.0 ml.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 600 volumes of *water*, 340 volumes of *acetonitrile* and 0.5 volume of *orthophosphoric acid* diluted to 1000 volumes with *water* after equilibration,
- flow rate: 2 ml per minute,
- spectrophotometer set at 214 nm,
- injection volume: 20 µl.

Equilibrate the column with the mobile phase for about 45 minutes before starting the chromatography.

Inject reference solution (a) and (b). In the chromatogram obtained with reference solution (b) measure the height (*a*) of the peak due to 2-(4-butylphenyl) propionic acid and the height (*b*) of the lowest point of the curve separating this peak from that due to ibuprofen. The test is not valid unless *a* is greater than 1.5*b*. If necessary, adjust the concentration of acetonitrile in the mobile phase to obtain the required resolution. Verify the repeatability by making five separate injections of 20 µl of reference solution (a). The test is not valid unless the relative standard deviation of the area of the principal peak is less than 2.0 per cent.

Inject reference solution (a), (b) and the test solution. Run the chromatogram for 1.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to 2-(4-butylphenyl) propionic acid is not greater than that of the peak due to 2-(4-butylphenyl) propionic acid in the chromatogram obtained with reference solution (b), the area of any other secondary peak is not greater than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) and the sum of the areas of any such peaks is not greater than 0.7 times the area of the principal peak in the chromatogram obtained with reference solution (a). Ignore any peak the area of which is less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a).

Impurity F. Determine by gas chromatography (2.4.13).

Methylating solution. Dilute 1 ml of *N,N-dimethylformamide dimethyl acetal* and 1 ml of *pyridine* to 10 ml with *ethyl acetate*.

Test solution. Weigh about 50 mg of the substance under examination into a sealable vial, dissolve in 1.0 ml of *ethyl acetate*, add 1 ml of the methylating solution, seal and heat at 100° in a block heater for 20 minutes, cool. Remove the reagents under a stream of nitrogen at room temperature. Dissolve the residue in 5 ml of *ethyl acetate*.

Reference solution (a) Dissolve 0.5 mg of *ibuprofen impurity F IPRS* in *ethyl acetate* and dilute to 10.0 ml with *ethyl acetate*.

Reference solution (b) Weigh about 50.0 mg of *ibuprofen IPRS* into a sealable vial, dissolve in 1.0 ml of reference solution (a), add 1 ml of the methylating solution, seal and heat at 100° in a block heater for 20 min. Allow to cool. Remove the reagents under a stream of nitrogen at room temperature. Dissolve the residue in 5 ml of *ethyl acetate*.

Chromatographic system
- a capillary column 25 m x 0.53 mm, packed with fused silica coated with macrogol 20000 (film thickness 2 µm),
- temperature:
  column 150°,
  injector port: 200° and detector port at 250°,
- flame ionization detector,
- flow rate: 5 ml per minute using nitrogen as the carrier gas.

Inject 1 µl of reference solution (b) and the test solution. Run the chromatogram twice the retention time of the principal peak. The relative retention time with reference to ibuprofen for 3-[4-(2methylpropyl)phenyl] propionic acid (ibuprofen impurity F) is about 1.5. The area of the peak corresponding to ibuprofen impurity F is not more than 0.1 per cent of the principal peak.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* at a pressure not exceeding 0.1 kPa.

Assay. Weigh 0.4 g, dissolve in 100 ml of *ethanol (95 per cent)* and titrate with *0.1 M sodium hydroxide* using 0.2 ml of *phenolphthalein solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.02063 g of $C_{13}H_{18}O_2$.

Ibuprofen Cream

Ibuprofen Cream contains Ibuprofen in a suitable cream base.

Ibuprofen Cream contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of ibuprofen, $C_{13}H_{18}O_2$.

Usual strength. 15 per cent w/w.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H*.

Mobile phase. A mixture of 5 volumes of *anhydrous acetic acid*, 25 volumes of *ethyl acetate* and 75 volumes of *n-hexane*.

Test solution. Shake a quantity of the cream containing 50 mg of Ibuprofen with 10 ml of *dichloromethane* for 5 minutes and filter.

Reference solution. A 0.5 per cent w/v solution of *ibuprofen IPRS* in *dichloromethane*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate at 120° for 30 minutes, lightly spray the plate with a 1 per cent w/v solution of *potassium permanganate* in *1M sulphuric acid*, heat at 120° for 20 minutes and examine under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the cream containing 0.1 g of Ibuprofen with 25 ml of *methanol* for 10 minutes, dilute to 50 ml with *methanol* and filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol*.

Reference solution (b). Dissolve 50 mg of *ibuprofen IPRS* in 2.5 ml of a 0.006 per cent w/v solution of *2-(4-butylphenyl) propionic acid IPRS* in *methanol* and dilute to 25.0 ml with *methanol*.

Chromatographic system
- a stainless steel column 15 cm × 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm) (such as Spherisorb ODS 2),
- mobile phase: a mixture of 0.5 volume of *orthophosphoric acid*, 340 volumes of *acetonitrile* and 660 volumes of *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 214 nm,
- injection volume: 20 µl.

Inject reference solution (b). Measure the height (a) of the peak due to 2-(4-butylphenyl)-propionic acid and the height (b) of the lowest point of the curve separating this peak from that due to ibuprofen. The test is not valid unless (a) is more than 1.5 (b).

Inject reference solution (a), (b) and the test solution. Run the chromatogram for 1.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to 2-(4-butylphenyl)-propionic acid is not more than that of the peak due to 2-(4-butylphenyl)propionic acid in the chromatogram obtained with reference solution (b), the area of any other secondary peak is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a)

(0.3 per cent) and the sum of the areas of other secondary peaks is not more than 0.7 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.7 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Other tests. Comply with the tests stated under Creams.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the cream containing 50 mg of ibuprofen with 25 ml of the mobile phase for 10 minutes, decant the solution into a 50 ml graduated flask, rinse the original flask with two 10 ml quantities of the mobile phase, dilute the combined solution and rinsings to 50 ml with the mobile phase and filter.

Reference solution. A 0.1 per cent w/v solution of *ibuprofen IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (10 µm) (such as Nucleosil C18),
- mobile phase: a mixture of 0.3 volumes of *orthophosphoric acid*, 24.7 volumes of *water* and 75 volumes of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 264 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{13}H_{18}O_2$ in the cream.

Ibuprofen Gel

Ibuprofen Gel is a solution of Ibuprofen in a suitable water-miscible base.

Ibuprofen Gel contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of ibuprofen, $C_{13}H_{18}O_2$.

Usual strength. 15 per cent w/w.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H*.

Mobile phase. A mixture of 5 volumes of *anhydrous acetic acid*, 25 volumes of *ethyl acetate* and 75 volumes of *n-hexane*.

Test solution. Weigh a quantity containing 50 mg of Ibuprofen and transfer to a separating funnel with the aid of 10 ml of *dichloromethane*. Shake vigorously for 5 minutes and filter.

Reference solution. A 0.5 per cent w/v solution of *ibuprofen IPRS* in *dichloromethane*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 10 cm. After development, dry the plate at 120° for 30 minutes, lightly spray the plate with a 1 per cent w/v solution of *potassium permanganate* in *1 M sulphuric acid*, heat at 120° for 20 minutes and examine under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the substance under examination containing 0.1 g of Ibuprofen in 25 ml of warm *methanol*, cool and dilute to 50.0 ml with *methanol*.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol*.

Reference solution (b). Dissolve 50 mg of *ibuprofen IPRS* in 2.5 ml of a 0.006 per cent w/v solution of *2-(4-butylphenyl)-propionic acid IPRS* in *methanol* and dilute to 25.0 ml with *methanol*.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 0.5 volume of *orthophosphoric acid*, 340 volumes of *acetonitrile* and 660 volumes of *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 214 nm,
- injection volume: 20 µl.

Equilibrate the column with the mobile phase for 45 minutes.

Inject reference solution (b). Measure the height (a) of the peak due to 2-(4-butylphenyl) propionic acid and the height (b) of the lowest point of the curve separating this peak from that due to ibuprofen.

The test is not valid unless *a* is greater than 1.5*b*. If necessary, adjust the concentration of acetonitrile in the mobile phase to obtain the required resolution.

Inject reference solution (a), (b) and the test solution. Run the chromatogram for 1.5 times the retention time of the principal

peak. In the chromatogram obtained with the test solution the area of any peak corresponding to 2-(4-butylphenyl) propionic acid is not more than that of the peak due to 2-(4- butylphenyl)-propionic acid in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of any other secondary peak is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent) and the sum of the areas of other secondary peaks is not more than 0.7 times the area of the principal peak in the chromatogram obtained with the reference solution (a) (0.7 per cent). Ignore any peak the area of which is less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Other tests. Comply with the tests stated under Gel.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the substance under examination containing 50 mg of Ibuprofen with 50 ml of warm *methanol* for 10 minutes, cool and add sufficient *methanol* to produce 100 ml. Dilute 10.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution. Dilute 10.0 ml of a solution containing 0.05 per cent w/v of *ibuprofen IPRS* in *methanol* to 20.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 3 volumes of *ortho-phosphoric acid*, 247 volumes of *water* and 750 volumes of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 264 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{13}H_{18}O_2$ in the gel.

Ibuprofen Tablets

Ibuprofen Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of ibuprofen, $C_{13}H_{18}O_2$. The tablets are coated.

Usual strengths. 200 mg; 400 mg; 600 mg.

Identification

A. Extract a quantity of the powdered tablets containing 0.5 g of Ibuprofen with 20 ml of *acetone*, filter and evaporate the filtrate to dryness in a current of air without heating. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ibuprofen IPRS* or with the reference spectrum of ibuprofen.

B. The residue obtained in test A, after recrystallisation from *light petroleum (40° to 60°)*, melts at about 75° (2.4.21).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *phosphate buffer pH 7.2*,
Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc having an average pore diameter not greater than 1.0 µm, rejecting the first few ml of the filtrate. Dilute a suitable volume of the filtrate with the same solvent. Measure the absorbance of the resulting solution at the maximum at about 221 nm (2.4.7). Similarly, measure the absorbance of the solution of known concentration of *ibuprofen IPRS*. Calculate the content of $C_{13}H_{18}O_2$.

Q. Not less than 75 per cent of the stated amount of $C_{13}H_{18}O_2$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H*.

Mobile phase. A mixture of 75 volumes of *n-hexane*, 25 volumes of *ethyl acetate* and 5 volumes of *glacial acetic acid*.

Test solution. Extract a quantity of the powdered tablets containing 0.2 g of Ibuprofen with three quantities, each of 10 ml, of *chloroform*, filter, evaporate the combined filtrate to about 1 ml and add sufficient *chloroform* to produce 2 ml.

Reference solution. Dilute 1 volume of the test solution to 100 volumes with *chloroform*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air, lightly spray the plate with a 1 per cent w/v solution of *potassium permanganate* in *1 M sulphuric acid*, heat at 120° for 20 minutes and examine under ultraviolet light at 365 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution. Ignore any spot with an R_f value relative to ibuprofen of about 1.2.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.5 g of Ibuprofen, extract with 60 ml of *chloroform* for 15 minutes and filter through a sintered-glass crucible of porosity 3. Wash the residue with three quantities, each of 10 ml, of *chloroform* and gently evaporate the filtrate just to dryness in a current of air. Dissolve the

residue in 100 ml of *ethanol (95 per cent)*, previously neutralized to *phenolphthalein solution*, and titrate with *0.1 M sodium hydroxide* using *phenolphthalein solution* as indicator.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.02063 g of $C_{13}H_{18}O_2$.

Ibuprofen and Paracetamol Tablets

Ibuprofen and Paracetamol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ibuprofen, $C_{13}H_{18}O_2$ and paracetamol, $C_8H_9O_2$.

Usual strength. Ibuprofen, 400 mg and Paracetamol, 325 mg.

Identification

In the Assay, the two principal peaks in the chromatogram obtained with the test solution correspond to the peaks due to ibuprofen and paracetamol in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium.

For ibuprofen — 900 ml of phosphate buffer pH 7.2.

For paracetamol — 900 ml of phosphate buffer pH 5.8.

Speed and time. 50 rpm and 45 minutes,

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve an accurately weighed quantity of *ibuprofen IPRS* and *paracetamol IPRS* in minimum quantity of *acetonitrile* and dilute with dissolution medium to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 75 volumes of a buffer solution prepared by dissolving 3.9 g of *sodium di-hydrogen phosphate dihydrate* and 8.9 g of *disodium hydrogen phosphate dihydrate* in *water*, adjusted to pH 7.0 with *orthophosphoric acid*, diluted to 1000 ml with *water* and 25 volumes of *acetonitrile*.
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 5 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections for each of the peaks corresponding to paracetamol and ibuprofen is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of paracetamol, $C_8H_9O_2$ and ibuprofen, $C_{13}H_{18}O_2$.

Q. Not less than 75 per cent of the stated amount of paracetamol, $C_8H_9O_2$ and ibuprofen, $C_{13}H_{18}O_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Solution A. Dissolve 6.8 g of *potassium dihydrogen phosphate* in 1000 ml of *water* and adjusted to pH 3.0 with *orthophosphoric acid.*

Solvent mixture. A mixture of 40 volumes of solution A and 60 volumes of *methanol.*

Test solution. Weigh and transfer a quantity of powdered tablets containing 0.1 g of ibuprofen to a 50.0 ml volumetric flask, add 30.0 ml of solvent mixture and disperse with the aid of ultrasound for 10 minutes. Cool and dilute to volume with solvent mixture, and filter, rejecting the first few ml of the filterate.

Reference solution (a). Dissolve about 40 mg of *ibuprofen IPRS* and 33 mg of *paracetamol IPRS* in 60 ml of solvent mixture with intermittent shaking. Dilute to 200.0 ml with solvent mixture.

Reference solution (b). Dilute 3.0 ml of reference solution (a) to 100.0 ml with solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 25°,
- auto sampler temperature: 10°,
- mobile phase: A. a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and add 0.25 g *hexane-1-sulphonic acid sodium salt* and filter,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 214 nm,
- injection volume: 10 µl,

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	98	2
6	98	2
16	80	20
22	65	35
55	60	40
63	45	55
63.1	98	2
70	98	2

Name	Relative retention time
p-Amino Phenol	0.36
Paracetamol	1.0
p-Nitro Phenol	2.95
p-Chloroacetanilide	3.21
Ibuprofen Impurity J[1]	3.77
Ibuprofen Impurity A[2]	5.86
Ibuprofen	6.0
Ibuprofen Impurity B[3]	6.23

[1] (2*RS*)-2-[4-(2-methylpropanoyl)phenyl]propanoic acid,

[2] (2*RS*)-2-[3-(2-methylpropyl)phenyl]propanoic acid,

[3] (2*RS*)-2-(4-butylphenyl)propanoic acid.

Inject reference solution (b). The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 for both the principal peaks.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to p-amino phenol, p-nitro phenol, p-chloroacetanilide and ibuprofen impurity J, A, B are not more than the area of the principal peak of paracetamol and ibuprofen, respectively in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of any other secondary peak is not more than the area of the principal peak of paracetamol in the chromatogram obtained with reference solution (b) (0.3 per cent) and the sum of areas of all secondary peaks is not more than 6.66 times the area of the principal peak of paracetamol in the chromatogram obtained with reference solution (b) (2.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 160 mg of Ibuprofen to 100.0 ml with mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the same solvent.

Reference solution. A solution containing 0.013 per cent w/v of *paracetamol IPRS* and 0.016 per cent of *ibuprofen IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: a mixture of 75 volumes of a buffer solution prepared by dissolving 3.9 g of *sodium di-hydrogen phosphate dihydrate* and 8.9 g of *disodium hydrogen phosphate dihydrate* in *water*, adjusted to pH 7.0 with *orthophosphoric acid*, diluted to 1000 ml with *water* and 24.5 volumes of *acetonitrile* and 0.5 volume of *methanol*.
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 5 µl.

Inject the reference solution. The test is not valid unless the resolution between the two principal peaks is not less than 10.0 and the relative standard deviation for replicate injections for both the principal peaks are not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of paracetamol, $C_8H_9O_2$ and ibuprofen, $C_{13}H_{18}O_2$, in the tablets.

Storage. Store protected from moisture, at a temperature below 30°.

Ibuprofen and Pseudoephedrine Hydrochloride Tablets

Ibuprofen and Pseudoephedrine Hydrochloride Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ibuprofen, $C_{13}H_{18}O_2$ and pseudoephedrine hydrochloride, $C_{10}H_{15}NO,HCl$.

Usual strength. Pseudoephedrine Hydrochloride, 30 mg and Ibuprofen, 200 mg.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 80 volumes of *chloroform*, 15 volumes of *methanol* and 5 volumes of *glacial acetic acid*.

Test solution. Shake a quantity of the powdered tablets containing 30 mg of Pseudoephedrine Hydrochloride in 10 ml of *methanol*, centrifuge and use the supernatant liquid.

Reference solution (a). A 0.2 per cent w/v solution of *pseudoehedrine hydrochloride IPRS* in *methanol*.

*Reference solution (b).*A 0.2 per cent w/v solution of *ibuprofen IPRS* in *methanol.*

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate at 105° for 5 to 10 minutes and expose to iodine vapour for 5 to 10 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a) and (b).

B.In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with reference solution (d).

Tests

Dissolution (2.5.2).

For Ibuprofen —

Apparatus No. 2 (Paddle),
Medium: 900 ml of *phosphate buffer pH 7.2*,
Speed and time. 50 rpm for 30 minutes.

Withdraw a suitable volume of the medium and filter. Reject the first few ml of the filtrate and dilute a suitable volume of the filtrate with dissolution medium. Measure the absorbance of the resulting solution at the maximum at about 224 nm (2.4.7). Calculate the content of ibuprofen, $C_{13}H_{18}O_2$ in the medium from the absorbance obtained from a solution of known concentration of *ibuprofen IPRS.*

Q. Not less than 75 per cent of the stated amount of $C_{13}H_{18}O_2$.

For Pseudoephedrine hydrochloride —

Apparatus No. 2 (Paddle),

Medium: 900 ml of *phosphate buffer pH 7.2*,
Speed and time. 50 rpm for 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *pseudoephedrine hydrochloride IPRS* in the dissolution medium to obtain a solution of known concentration similar to the expected concentration of the test solution.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with silica chemically-bonded nitrile groups (5 µm),
- mobile phase: a mixture of equal volumes of a buffer solution prepared by dissolving 0.5 g of *monobasic potassium phosphate* in 1000 ml of *water*, adjusted to pH 3.3 with *ortho phosphoric acid* and *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per centand the tailing factor is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{15}NO,HCl$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{10}H_{15}NO,HCl$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

*Test solution.*Weigh and powder 20 tablets. Disperse a quantity of the powder containing 200 mg of Ibuprofen in 20.0 ml volumetric flask, add equal volume of reference solution (a) and *acetonitrile,* sonicate and filter.

*Reference solution(a).*A 0.015 per cent w/v solution of *butylparaben* in mobile phase.

*Reference solution(b).*A 2.0 per cent w/v solution of *ibuprofen IPRS* in equal volume of reference solution (a) and *acetonitrile.*

*Reference solution(c).*A 0.3 per cent w/v solution of *pseudoephedrine hydrochloride IPRS* in equal volume of reference solution (a) and *acetonitrile.*

*Reference solution(d).*Dilute reference solution (b) and (c) with the *acetonitrile* to obtain a solution having a known concentration similar to the test solution.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a buffer solution prepared by dissolving 2.5 g of *docusate sodium* in a mixture of 50 volumes of *water* and 41 volumes of *acetonitrile* and add 1.0 ml of *orthophosphoric acid*, adjusted to pH 3.2 with *ammonium hydroxide.*
- flow rate: 2 ml per minute,
- spectrophotometer set at 254nm,
- injection volume: 5 µl.

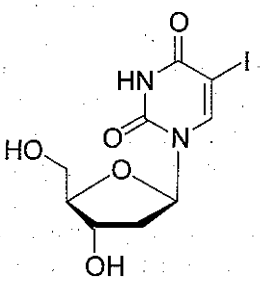
Inject reference solution(d). The relative retention times are about 0.55 for butylparaben, 0.7 for pseudoephedrine and 1.0 for ibuprofen. the resolution between the butylparaben peak and the pseudoephedrine peak and between the pseudoephedrine peak and the ibuprofen peak is not less than 2.0. The test is not valid unless the tailing factor for each analyte peak is not more than 3.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution(d) and the test solution.

Calculate the contents of $C_{13}H_{18}O_2$ and $C_{10}H_{15}NO,HCl$ in the tablets.

Storage. Store protected from moisture.

Idoxuridine



$C_9H_{11}IN_2O_5$ Mol. Wt. 354.1

Idoxuridine is 2'-deoxy-5-iodouridine.

Idoxuridine contains not less than 98.0 per cent and not more than 101.0 per cent of $C_9H_{11}IN_2O_5$, calculated on the dried basis.

Category. Antiviral (for topical use).

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *idoxuridine IPRS* or with the reference spectrum of idoxuridine. Examine the substances as dispersions containing 1 mg in 0.3 g of *potassium bromide IR*.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.004 per cent w/v solution in *0.01 M sodium hydroxide* shows an absorption maximum only at about 279 nm; absorbance at about 279 nm, about 0.65.

C. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (c).

D. Heat about 5 mg in a test-tube over a naked flame; a violet vapour is evolved.

Tests

Appearance of solution. A 1.0 per cent w/v solution in *1 M sodium hydroxide* is clear (2.4.1), and colourless (2.4.1).

pH (2.4.24). 5.5 to 6.5, determined in a 0.1 per cent w/v solution.

Specific optical rotation (2.4.22). +28.0° to +32.0°, determined in a 1.0 per cent w/v solution in *1 M sodium hydroxide*.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 50 volumes of *2-propanol*, 40 volumes of *chloroform* and 10 volumes of *strong ammonia solution*.

Test solution (a). Dissolve 0.4 g of the substance under examination in 10 ml of a mixture of 5 volumes of *methanol* and 1 volume of *strong ammonia solution*.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with the same solvent mixture.

Reference solution (a). Dilute 5.0 ml of test solution (b) to 100.0 ml with the same solvent mixture.

Reference solution (b). A solution containing 0.02 per cent w/v, each of, *5-iodouracil IPRS* and *2-deoxyuridine IPRS* in the same solvent mixture.

Reference solution (c). A solution containing 0.4 per cent w/v of *idoxuridine IPRS* in the same solvent mixture.

Apply to the plate 5 µl of each solution. After development, dry the plate in a current of cold air and repeat the development. After removal of the plate following the second development, dry it in a current of cold air and examine under ultraviolet light at 254 nm. The spots due to 5-iodouracil and 2'-deoxyuridine in the chromatogram obtained with reference solution (b) are more intense than any corresponding spots in the chromatogram obtained with test solution (a). Any other secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a).

Iodide. Not more than 0.1 per cent, determined by the following method. Dissolve 0.25 g in 25 ml of *0.1 M sodium hydroxide*, 5 ml of *dilute hydrochloric acid* and sufficient *water* to produce 50 ml, allow to stand for 10 minutes and filter. To 25 ml of the filtrate add 5 ml of *hydrogen peroxide solution (10 vol)* and 10 ml of *chloroform* and shake. Any pink colour produced in the organic layer is not more intense than that obtained by repeating the procedure using 1 ml of a 0.033 per cent w/v solution of *potassium iodide* in place of the substance under examination.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 60° over *phosphorus pentoxide* at a pressure of 1.5 to 2.5 kPa.

Assay. Weigh 0.3 g, dissolve in 50 ml of *dimethylformamide* and titrate with *0.1 M tetrabutylammonium hydroxide*,

determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.03541 g of $C_9H_{11}IN_2O_5$.

Storage. Store protected from light.

Idoxuridine Eye Drops

Idoxuridine Eye Drops are a sterile solution of Idoxuridine in Purified Water.

Idoxuridine Eye Drops contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of idoxuridine, $C_9H_{11}IN_2O_5$.

Usual strength. 0.1 per cent w/v.

Identification

A. Dilute a suitable volume with *0.01 M sodium hydroxide* to produce a solution containing 0.003 per cent w/v of Idoxuridine. When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows an absorption maximum only at about 279 nm.

B. In the Assay, the chromatogram obtained with the reference solution (a) shows a peak that corresponds to the peak due to idoxuridine in the chromatogram obtained with the test solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of the eye drops with sufficient of a solution of *sulphanilamide* (internal standard) to obtain a solution containing 0.08 per cent w/v of Idoxuridine and 0.0001 per cent w/v of the internal standard.

Reference solution. A solution containing 0.0004 per cent w/v each of *2'-deoxyuridine* and *5-bromo-2'-deoxyuridine*, 0.0008 per cent w/v of *5-iodouracil* and 0.0001 per cent w/v of *sulphanilamide* (internal standard).

Chromatographic system
- a stainless steel column 30 cm x 4 mm, packed with endcapped octadecylsilane bonded to porous silica (10 µm) (Such as µBondapak C18),
- mobile phase: a mixture of 4 volumes of *methanol* and 96 volumes of *water*,
- flow rate: 1.7 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

The order of elution of the peaks following the internal standard is deoxyuridine, iodouracil, bromodeoxyuridine and idoxuridine. Several peaks due to excipients may appear in the chromatogram obtained with the test solution before the peak due to the internal standard.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the ratio of the area of any peak due to 2'-deoxyuridine to the area of the peak due to sulphanilamide is not more than the ratio of the areas of the corresponding peaks in the chromatogram obtained with the reference solution (0.5 per cent). The ratio of the area of any peak due to 5-iodouracil to the area of the peak due to sulphanilamide is not more than the ratio of the areas of the corresponding peaks in the chromatogram obtained with the reference solution (1.0 per cent). The ratio of the area of any peak due to 5-bromo-2'-deoxyuridine to the area of the peak due to sulphanilamide is not more than the ratio of the areas of the corresponding peaks in the chromatogram obtained with the reference solution (0.5 per cent).

Other tests. Comply with the tests stated under Eye Drops.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Add 2 ml of a 10 per cent v/v solution of *ethanol (95 per cent)* to 15.0 ml of a solution prepared by diluting a measured volume of the eye drops with *water* if necessary to give a final concentration of 0.1 per cent w/v of Idoxuridine (solution A) and dilute to 20.0 ml with *water*.

Reference solution (a). Shake 0.1 g of *idoxuridine IPRS* with 50 ml of *water* until dissolved and then dilute to 100.0 ml with *water*. To 15.0 ml of the solution add 2.0 ml of a solution prepared by diluting 10 ml of a 1.2 per cent w/v of *sulphathiazole* (internal standard) in *ethanol (95 per cent)* to 100 ml with *water* (solution B), and dilute to 20.0 ml with *water*.

Reference solution (b). Add 2.0 ml of solution B to 15.0 ml of solution A and dilute to 20.0 ml with *water*.

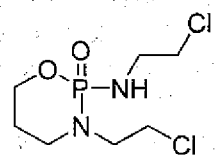
Chromatographic system
- a stainless steel column 30 cm x 4 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 87 volumes of *water* and 13 volumes of *methanol*,
- flow rate: 1.7 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Calculate the content of $C_9H_{11}IN_2O_5$ in the eye drops.

Storage. Store at a temperature not exceeding 30°. The eye drops should not be allowed to freeze.

Labelling. The label states that the eye drops should not be used for continuous periods of treatment exceeding 21 days.

Ifosfamide



$C_7H_{15}Cl_2N_2O_2P$ Mol. Wt. 261.1

Ifosfamide is (*RS*)-*N*,3-bis(2-chloroethyl)-1,3,2-oxazaphosphinan-2-amine 2-oxide.

Ifosfamide contains not less than 98.0 per cent and not more than 102.0 per cent of $C_7H_{15}Cl_2N_2O_2P$, calculated on the anhydrous basis.

Category. Cytotoxic alkylating agent

Description. A white or almost white, fine, crystalline powder, hygroscopic.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ifosfamide IPRS* or with the reference spectrum of ifosfamide.

Tests

Solution A. Dissolve 5.0 g in *carbon dioxide-free water* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution A is clear (2.4.1) and not more intensely coloured than reference solution YS7 (2.4.1).

Acidity or alkalinity. Dilute 5 ml of solution A to 50 ml with *carbon dioxide-free water*. To 10 ml of the solution, add 0.1 ml of *methyl red solution*. Not more than 0.1 ml of *0.01 M hydrochloric acid* is required to change the colour of the indicator to red. To another 10 ml of the solution, add 0.1 ml of *phenolphthalein solution*. Not more than 0.3 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator to pink.

Optical rotation (2.4.22). – 0.10° to + 0.10°, determined on solution A.

Related substances. A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel*.

Solvent mixture. Equal volumes of *methanol* and *water*.

Mobile phase. A mixture of 10 volumes of *water*, 15 volumes of *methanol*, 25 volumes of *anhydrous acetic acid* and 50 volumes of *dichloromethane*.

Test solution. Dissolve 1.0 g of the substance under examination in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution (a). A solution containing 0.025 per cent, w/v each, of *ifosfamide impurity A IPRS (3-[(2-chloroethyl) amino]propyl dihydrogen phosphate IPRS)* and ifosfamide impurity C (*chloroethylamine hydrochloride)* in the solvent mixture.

Reference solution (b). A 0.015 per cent w/v solution of *ifosfamide impurity B IPRS (bis[3-[(2-chloroethyl) amino]propyl] dihydrogen diphosphate IPRS)* in the solvent mixture.

Reference solution (c). A solution containing 0.005 per cent w/v of *ethanolamine* (ifosfamide impurity D), 0.02 per cent w/v of *ifosfamide impurity A IPRS* and 0.08 per cent w/v of ifosfamide impurity C in the solvent mixture.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate at 115° for 45 minutes. At the bottom of a chromatographic tank, place an evaporating dish containing a 0.32 per cent w/v solution of *potassium permanganate* and add an equal volume of *dilute hydrochloric acid*, close the tank and allow to stand for 10 minutes. Place the plate whilst still hot in the tank, avoiding contact of the stationary phase with the solution, and close the tank. Leave the plate in contact with the chlorine vapour for 20 minutes. Withdraw the plate and place it in a current of cold air until the excess of chlorine is removed (about 20 minutes) and an area of coating below the points of application does not give a blue colour with a drop of *potassium iodide* and *starch solution*. Avoid prolonged exposure to cold air. Immerse the plate in a 0.1 per cent w/v solution of *tetramethylbenzidine* in *ethanol (95 per cent)* for 5 seconds. Allow the plate to dry and examine. In the chromatogram obtained with the test solution, any spot corresponding to ifosfamide impurity A or impurity C is not more intense than the corresponding spot in the chromatogram obtained with reference solution (a) (0.25 per cent), any spot corresponding to impurity B is not more intense than the corresponding spot in the chromatogram obtained with reference solution (b) (0.15 per cent); any other spot is not more intense than the principal spot in the chromatogram obtained with reference solution (b) (0.15 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows 3 clearly separated spots.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel*.

Solvent mixture. Equal volumes of *methanol* and *dichloromethane*.

Mobile phase. 1 volume of *dichloromethane* and 10 volumes of *acetone*.

Test solution. Dissolve 0.2 g of the substance under examination in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution (a). A solution containing 0.005 per cent w/v each of *ifosfamide impurity E IPRS (3-chloro-N-(2-chloroethyl)propan-1-amine)* and *ifosfamide impurity F IPRS ((RS)-2-chloro-3-(2-chloroethyl)-1,3,2-oxazaphosphinane 2-oxide)* in the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v each of *ifosfamide impurity E IPRS* and *ifosfamide IPRS* in the solvent mixture.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate at 115° for 45 minutes. Proceed as described under Related substances test A. Any spot corresponding to ifosfamide impurity E or impurity F in the chromatogram obtained with the test solution is not more intense than the corresponding spot in the chromatogram obtained with reference solution (a) (0.25 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

Chlorides (2.3.12). 25 ml of freshly prepared solution A complies with the limit test for chlorides (100 ppm).

Heavy metals (2.3.13). 12 ml of solution A complies with limit for heavy metals, method D (10 ppm), using 10 ml of *lead standard solution (1 ppm Pb)*.

Water (2.3.43). Not more than 0.5 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (*2.2.29*).

NOTE — Use the solutions within 24 hours.

Solution A. Dissolve 50 mg of *ethyl parahydroxybenzoate* in 25 ml of *ethanol (95 per cent)* and dilute to 100.0 ml with *water*.

Test solution. To 0.15 g of the substance under examination, add 10.0 ml of solution A and dilute to 250.0 ml with *water*.

Reference solution. To 15 mg of *ifosfamide IPRS*, add 1.0 ml of solution A and dilute to 25.0 ml with *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 30 volumes of *acetonitrile* and 70 volumes of *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 195 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to ifosfamide and ethyl parahydroxybenzoate is not less than 6.0 and the relative standard deviation of replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_7H_{15}Cl_2N_2O_2P$.

Storage. Store protected from moisture.

Ifosfamide Injection

Ifosfamide Injection is a sterile solution of Ifosfamide in Water for Injections or a suitable liquid. It is prepared by dissolving Ifosfamide for Injection in the requisite amount of a suitable liquid immediately before use.

The injection complies with the requirements stated under Parenteral Preparations.

Storage. Ifosfamide Injection should be used immediately after preparation but, in any case, within the period recommended by the manufacturer when prepared and stored strictly in accordance with the manufacturer's instructions.

Ifosfamide for Injection

Ifosfamide for Injection is a sterile material consisting of Ifosfamide with or without excipients. It is supplied in a sealed container.

CAUTION — Ifosfamide is Cytotoxic. Carry out the procedures described below exercising appropriate precautions.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Ifosfamide Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of ifosfamide, $C_7H_{15}Cl_2N_2O_2P$.

Usual strength. 1000 mg per ml.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ifosfamide IPRS* or with the reference spectrum of ifosfamide.

Tests

Solution A. Dissolve 5.0 g in *carbon dioxide-free water* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution A is clear (2.4.1) and not more intensely coloured than YS7 (2.4.1).

pH (2.4.24). 4.0 to 7.0, determined in 8.0 per cent w/v solution.

Related substances. A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. Equal volumes of *methanol* and *water*.

Mobile phase. A mixture of 10 volumes of *water*, 15 volumes of *methanol*, 25 volumes of *anhydrous acetic acid* and 50 volumes of *dichlormethane*.

Test solution. Dissolve a quantity of the sealed container in the solvent mixture to obtain a solution containing 10 per cent w/v of Ifosfamide.

Reference solution (a). A solution containing 0.025 per cent w/v each of *ifosfamide impurity A IPRS (3-[(2-chloroethyl) amino]propyl dihydrogen phosphate IPRS)* and *chloroethylamine hydrochloride* (ifosfamide impurity C) in the solvent mixture.

Reference solution (b). A 0.015 per cent w/v solution of *ifosfamide impurity B IPRS (bis[3-[(2-chloroethyl)amino] propyl] dihydrogen diphosphate IPRS)* in the solvent mixture.

Reference solution (c). A solution containing 0.005 per cent w/v of *ethanolamine* (ifosfamide impurity D), 0.02 per cent w/v of *ifosfamide impurity A IPRS* and 0.08 per cent w/v of *chloroethylamine hydrochloride* (ifosfamide impurity C) in the solvent mixture.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate at 115° for 45 minutes. At the bottom of a tank, place an evaporating dish containing a 0.32 per cent w/v solution of *potassium permanganate* and add an equal volume of *dilute hydrochloric acid*, close the tank and allow to stand for 10 minutes. Place the plate whilst still hot in the tank, avoiding contact of the stationary phase with the solution, and close the tank. Leave the plate in contact with the chlorine vapour for 20 minutes. Withdraw the plate and place it in a current of cold air until the excess of chlorine is removed (about 20 minutes) and an area of coating below the points of application does not give a blue colour with a drop of *potassium iodide and starch solution*. Avoid prolonged exposure to cold air. Immerse the plate in a 0.1 per cent w/v solution of *tetramethylbenzidine* in *ethanol (95 per cent)* for 5 seconds. Allow the plate to dry and examine. In the chromatogram obtained with the test solution, any spot corresponding to ifosfamide impurity A or impurity C is not more intense than the corresponding spot in the chromatogram obtained with reference solution (a) (0.25 per cent), any spot corresponding to ifosfamide impurity B is not more intense than the corresponding spot in the chromatogram obtained with reference solution (b) (0.15 per cent). Any other spot is not more intense than the principal spot in the chromatogram obtained with reference solution (b) (0.15 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows three clearly separated spots.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. Equal volumes of *methanol* and *water*.

Mobile phase. 1 volume of *dichloromethane* and 10 volumes of *acetone*.

Test solution. Dissolve a quantity of the contents of the sealed container in the solvent mixture to obtain a solution containing 2.0 per cent w/v of Ifosfamide.

Reference solution (a). A solution containing 0.005 per cent w/v, each of, *ifosfamide impurity E IPRS* and *ifosfamide impurity F IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v each of *ifosfamide impurity E IPRS* and *ifosfamide impurity F IPRS* in the solvent mixture.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate at 115° for 45 minutes. At the bottom of a tank, place an evaporating dish containing a 0.32 per cent w/v solution of *potassium permanganate* and add an equal volume of *dilute hydrochloric acid*, close the tank and allow to stand for 10 minutes. Place the plate whilst still hot in the tank, avoiding contact of the stationary phase with the solution, and close the tank. Leave the plate in contact with the chlorine vapour for 20 minutes. Withdraw the plate and place it in a current of cold air until the excess of chlorine is removed (about 20 minutes) and an area of coating below the points of application does not give a blue colour with a drop of *potassium iodide and starch solution*. Avoid prolonged exposure to cold air. Immerse the plate in a 0.1 per cent w/v solution of *tetramethylbenzidine* in *ethanol (95 per cent)* for 5 seconds. Allow the plate to dry and examine. In the chromatogram obtained with the test solution, any spot corresponding to ifosfamide impurity E or impurity F is not more intense than the corresponding spot in the chromatogram obtained with reference solution (a) (0.25 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

Water (2.3.43). Not more than 0.5 per cent w/w, determined on 1.0 g.

Bacterial endotoxins (2.2.3). Not more than 0.125 Endotoxin Unit per mg of ifosfamide.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve a quantity of contents of the sealed container in the mobile phase to obtain a solution containing 0.06 per cent w/v of Ifosfamide.

Reference solution. A 0.06 per cent w/v solution of *ifosfamide IPRS* in the mobile phase.

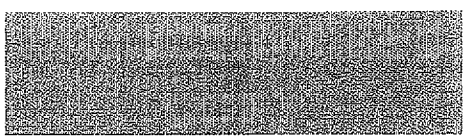
Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Zorbax SB-C18),
- mobile phase: a mixture of 30 volumes of *acetonitrile* and 70 volumes of *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 195 nm,
- injection volume: 20 µl.

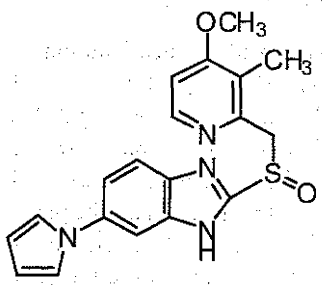
Inject the reference solution and the test solution.

Calculate the content of $C_7H_{15}Cl_2N_2O_2P$ in the injection.

Storage. Store protected from light.



Ilaprazole



$C_{19}H_{18}N_4O_2S$ Mol Wt. 366.4

Ilaprazole is 2-[(4-Methoxy-3-methylpyridin-2-yl) methylsulfinyl]-6-pyrrol-1-yl-1*H*-benzimidazole.

Ilaprazole contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{19}H_{18}N_4O_2S$, calculated on the dried basis.

Category. Antacid.

Description. A white to brown powder.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in *acetonitrile* and dilute to 25.0 ml with *acetonitrile*.

Reference solution. A 0.1 per cent w/v solution of *ilaprazole IPRS* in *acetonitrile*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) .
- mobile phase: a mixture of 60 volumes of buffer solution prepared by dissolving 1.42 g of *disodium hydrogen orthophosphate* in 1000 ml of *water* adjusted to pH 5.5 and 40 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 305 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution. In the chromatogram obtained with test solution the area of any secondary peak is not more than 0.5 per cent and the area of sum of the areas of all the secondary peaks is not more than 1.5 per cent, calculated by area normalization.

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 60° for 3 hours under vacuum.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in *acetonitrile* and dilute to 50.0 ml with *acetonitrile*. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.1 per cent w/v solution of *ilaprazole IPRS* in *acetonitrile*. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

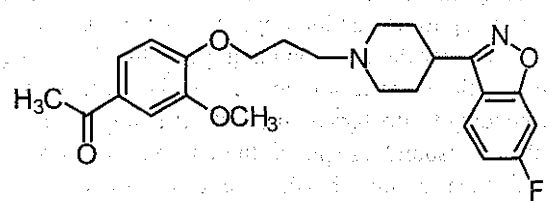
Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and test solution.

Calculate the content of $C_{19}H_{18}N_4O_2S$.

Iloperidone



$C_{24}H_{27}FN_2O_4$ Mol Wt. 426.5

Iloperidone is 1-(4-{3-{4-(6-Fluoro-1,2-benzoxazol-3-yl)piperidino]-propoxy}-3-methoxyphenyl)ethanone.

Iloperidone contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{24}H_{27}FN_2O_4$, calculated on the dried basis.

Category. Antipsychotic

Description. A white to off white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *iloperidone IPRS* or with the reference spectrum of iloperidone.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of 0.1 per cent v/v of *orthophosphoric acid* in *water* and *acetonitrile.*

Test solution. Dissolve 10 mg of the substance under examination in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution. A 0.1 per cent w/v solution of *iloperidone IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 20°,
- mobile phase: A. *0.02 M sodium perchlorate*, adjusted to pH 3.0 with *perchloric acid,*
  B. a mixture of 80 volumes of *acetonitrile* and 20 volumes of *methanol,*
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 275 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	65	35
5	65	35
18	48	52
28	48	52
35	30	70
40	30	70
40.5	65	35
48	65	35

Inject the reference solution .The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution. The area of any secondary peak is not more than 0.5 per cent and the sum of areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalisation.

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 60° for 3 hours.

Assay. Dissolve 0.4 g in 50.0 ml of *glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04265g of $C_{24}H_{27}FN_2O_4$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Iloperidone Tablets

Iloperidone Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of $C_{24}H_{27}FN_2O_4$.

Usual strengths. 1 mg; 2 mg; 4 mg; 6 mg; 8 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.01 M hydrochloric acid,*
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium.

Determine by liquid chromatography (2.4.14).

Use solvent mixture as given under Related substances.

Test solution. Centrifuge the medium at 3000 rpm for 10 minutes. Dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *iloperidone IPRS* in the solvent mixture with the aid of ultrasound and futher dilute with dissolution medium to obtain a solution of the same concentration as that of the test solution.

Use chromatographic system as described under Assay using injection volume 100 µl.

Inject the reference solution and the test solution.

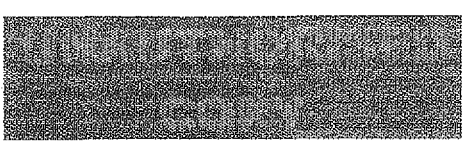
Calculate the content of $C_{24}H_{27}FN_2O_4$ in the medium.

Q. Not less than 70.0 per cent of the stated amount of $C_{24}H_{27}FN_2O_4$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of buffer solution prepared by dissolving 3.4g of *potassium dihydrogen phosphate* in 1000 ml of *water*, add 1.0 ml of *triethylamine*, adjusted to pH 3.0 with *orthophosphoric acid* and 50 volumes of *acetonitrile.*

Test solution. Disperse a quantity of powdered tablets containing 10 mg of Iloperidone in 15 ml of the solvent mixture



with the aid of ultrasound for 45 minutes and dilute to 25.0 ml with the solvent mixture, filter.

Reference solution. A 0.0002 per cent w/v solution of *iloperidone IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: a mixture of 64 volumes of buffer solution prepared by dissolving 3.4 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, add 1.0 ml of *triethylamine*, adjusted to pH 5.0 with *orthophosphoric acid*, 21 volumes of *acetonitrile* and 15 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 229 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of areas of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14) as described under Assay with the following modification.

Test solution. Disperse 1 intact tablet in the solvent mixture with the aid of ultrasound for 45 minutes and dilute to obtain a solution containing 0.008 per cent w/v solution of Iloperidone with the solvent mixture, filter.

Inject the reference solution and the test solution.

Calculate the content of $C_{24}H_{27}FN_2O_4$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of buffer solution prepared by dissolving 3.4 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, add 1.0 ml of *triethylamine*, adjusted to pH 3.0 with *orthophosphoric acid* and 50 volumes of *acetonitrile*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 8 mg of Iloperidone in 70 ml of the solvent mixture with the aid of ultrasound for 45 minutes with intermittent shaking and dilute to 100.0 ml with the solvent mixture, filter.

Reference solution. A 0.008 per cent w/v solution of *iloperidone IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature 45°,
- mobile phase: a mixture of 64 volumes of buffer solution prepared by dissolving 3.4 g of *potassium dihydrogen phosphate* in 1000 ml in *water*, add 1.0 ml of *triethylamine*, adjusted to pH 5.0 with *orthophosphoric acid*, 21 volumes of *acetonitrile* and 15 volumes of *methanol*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 229 nm,
- injection volume: 20 µl.

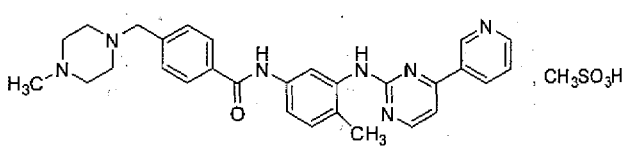
Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{24}H_{27}FN_2O_4$ in the tablets.

Storage. Store protected from light and moisture.

Imatinib Mesylate



$C_{30}H_{35}N_7SO_4$ Mol. Wt. 589.7

Imatinib Mesylate is 4-[(4-Methylpiperazin-1-yl)methyl]-*N*-[4-methyl-3-[[4-(pyridine.-3-yl)pyrimidin-2-yl]amino]phenyl]benzamide methanesulfonate.

Imatinib Mesylate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{30}H_{35}N_7SO_4$, calculated on the anhydrous basis.

Category. Cytotoxic

Description. A white or almost white, slightly brownish or yellowish powder, yellow or pale yellow, very hygroscopic, for the amorphous form. It shows polymorphism (2.5.11).

Identification

Determine by infrared adsorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *imatinib mesylate IPRS* or with the reference spectrum of imatinib mesylate.

Tests

Impurity F. Determine by liquid chromatography (2.4.14) coupled with mass spectrometry.

Solvent mixture. 30 volumes of *acetonitrile* and 70 volumes of *water.*

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution. A 0.0001 per cent w/v solution of *imatinib impurity F IPRS* in the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 3.0mm, end-capped packed with octadecylsilane bonded to amorphous organosilica (3.5 µm),
- column temperature: 40°,
- mobile phase: A. a buffer solution prepared by dissolving 1.26 g of *ammonium formate* in 1000 ml of *water,* adjusted to pH 3.4 with *anhydrous formic acid,*
  B. a 0.05 per cent v/v solution of *anhydrous formic acid* in *acetonitrile,*
- flow rate: 0.5 ml per minute,
- detection. mass detector.

The following settings have been found to be suitable and are given as examples; if the detector has different setting parameters, adjust the detector settings so as to comply with system suitability criterion,

- Ionisation. ESI-positive,
- Detection m/z (SIM): 278.2,
- Gas temperature: 350°,
- Drying gas flow: 12 litre per minute,
- Nebuliser pressure: 414 kpa;
- Capillary voltage (V cap): 3 Kv,
- Injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
6	80	0
10	20	80
15	20	80
15.1	80	20
20	80	20

NOTE — MS acquisition can be started at 3.5 minutes and stopped at 6 minutes,during non acquisition the eluent is directed to waste.

Inject the reference solution. The test is not valid unless the signal-to-noise ratio of the principal peak is not less than 20 and the relative standard deviation for replicate injections is not more than 10 per cent.

Inject the reference solution and the test solution. The area of any peak corresponding to imatinib impurity F is not more than the area of the principal peak in a chromatogram obtained with the reference solution (0.002 per cent).

Impurity H. Determine by liquid chromatography (2.4.14).

Solvent mixture. 30 volumes of *acetonitrile* and 70 volumes of *water.*

Test solution. Dissolve 75mg of the substance under examination in the solvent mixture and dilute to 5.0 ml with the solvent mixture.

Reference solution (a). Dissolve the contents of a vial of *imatinib impurity A IPRS* in 1.0 ml of the solvent mixture.

Reference solution (b). A 0.003 per cent w/v solution of *imatinib impurity H IPRS* in the solvent mixture.

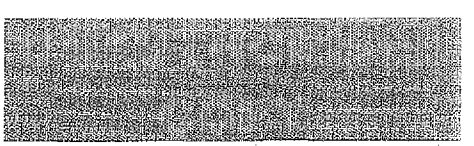
Reference solution (c). Dilute 5.0 ml of reference solution (b) to 50.0 ml with the solvent mixture.

Reference solution (d). Dissolve 0.15 g of the substance under examination in the solvent mixture, add 1.0 ml of each, reference solution (a) and (b) and dilute to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, endcapped packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: A. a mixture of 70 volumes of a buffer solution prepared by dissolving 2.3 g of *sodium octane sulphonate monohydrate* in 700 ml of *water,* 30 volumes of *acetonitrile* and 0.12 volume of *dilute orthophosphoric acid,*
  B. a mixture of 10 volumes of a buffer solution, prepared by dissolving 2.3 *g sodium octane sulphonate monohydrate* in 100 ml of *water,* 90 volumes of *acetonitrile* and add 0.12 volume of *dilute orthophosphoric acid,*
  a gradient programme using the condition given below,
- flow rate: 2.3 ml per minute,
- spectrophotometer set at 227nm,
- injection volume:10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	98	2
6	98	2
8	20	80
10	20	80
10.1	98	2
15	98	2



Name	Relative retention time
Imatinib impurity A[1]	0.17
Imatinib impurity H[2]	0.2
Imatinib (Retention time: about 8 minutes)	1.0

[1](2*E*)-3-(dimethylamino)-1-(pyridine-3-yl)prop-2-en-1-one,

[2]1-(pyridine-3-yl)ethan-1-one.

Inject reference solution (d). The test is not valid unless the resolution between the peaks due to imatinib impurity A and H is not less than 1.5.

Inject reference solution (c) and the test solution. The area of any peak corresponding to imatinib impurity H is not more than the area of principal peak in a chromatogram obtained with reference solution (c) (0.02 per cent).

Related substances. Determine by liquid chromatography (2.4.14), as described under Impurity H with the following modifications.

Test solution. Dissolve 25 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution (b). Dissolve 1 mg of *imatinib system suitability IPRS* (containing impurities A, B, C, D and J) in the solvent mixture and dilute to 2 ml with the solvent mixture.

Reference solution (c). A 0.05 per cent w/v solution of *imatinib mesylate IPRS* in the solvent mixture.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	98	2
16	98	2
30	50	50
30.1	98	2
35	98	2

Name	Relative retention time	Correction factor
Imatinib impurity A[1]	0.2	2.2
Imatinib impurity B[2]	0.6	2.0
Imatinib impurity J[3]	0.9	—
Imatinib (Retention time: about 11 minutes)	1.0	—
Imatinib impurity C[4]	1.2	—
Imatinib impurity D[5]	2.3	—

[1](2E)-3-(dimethylamino)-1-(pyridine-3-yl)prop-2-en-1-one,

[2]*N*-(3-carbamimidamido-4-methylphenyl)-4-[(4-methylpiperazin-1-yl)methyl]benzamide,

[3]4-[(4-methyl-4-oxidopiperazin-1-yl)methyl]-*N*-[4-methyl-3-[[4-(pyridine-3-yl)pyrimidin-2-yl]amino]phenyl] benzamide,

[4]*N*-[4-methyl-3-[[4-(pyridine-3-yl)pyrimidin-2-yl]amino]phenyl]-4-(piperazin-1-ylmethyl)benzamide(desmethylimatinib),

[5]1-methyl-1,4-bis[4-[[4-methyl-3-[[4-(pyridine-3-yl)pyrimidin-2-yl]amino]phenyl]carbamoyl]benzyl]piperazin-1-ium(imatinib dimer).

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to imatinib and imatinib impurity C is not less than 3.0, the peak-to-valley ratio between the peaks due to imatinib impurity J and imatinib is not less than 1.3. Where *Hp* is height above the baseline of the peak due to imatinib impurity J and *Hv* is height above the baseline of the lowest point of the curve separating this peak from the peak due to imatinib in the chromatogram obtained with reference solution (b) and signal-to-noise ratio for the principal peak is not less than 45 in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to imatinib impurity C is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent), the area of any peak corresponding to imatinib impurity D is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any peak corresponding to imatinib impurity A and B, each of, is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution(a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 8 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.8 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.12).1.0 gm complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18).Not more than 0.1 per cent.

Water (2.3.43). Not more than 3.0 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances.

Inject reference solution (c) and the test solution.

Calculate the content of $C_{30}H_{35}N_7SO_4$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Imatinib Capsules

Imatinib Mesylate Capsules

Imatinib Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of stated amount of imatinib, $C_{29}H_{31}N_7O$.

Usual strength. 100 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of mixed contents of 20 capsules containing about 20 mg of imatinib with 100.0 ml of the mobile phase.

Reference solution. A 0.024 per cent w/v solution of *imatinib mesylate IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of 1 per cent *ammonium acetate* and 60 volumes of *acetonitrile,*
- flow rate: 0.7 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{29}H_{31}N_7O$ in the capsules.

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of equivalent amount of Imatinib.

Imatinib Tablets

Imatinib Mesylate Tablets

Imatinib Mesylate Tablets contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of imatinib, $C_{29}H_{31}N_7O$.

Usual strengths. 100 mg; 400 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle) with sinkers,
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 75 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A 0.011 per cent w/v solution of *imatinib mesylate IPRS* prepared by dissolving in minimum amount of *water* and diluting with the dissolution medium.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: a mixture of 65 volumes of buffer solution prepared by dissolving 3.12 g of *sodium dihydrogen orthophosphate dihydrate* in 1000 ml of *water*, adding 1 ml of *triethylamine*, adjusted to pH 3.5 with *orthophosphoric acid* and 35 volumes of a mixture of 50 volumes of *methanol* and 50 volumes of *acetonitrile,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{29}H_{31}N_7O$ in the medium.

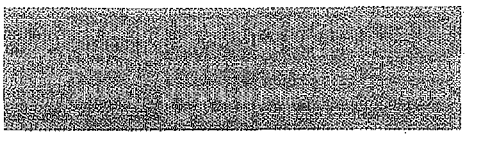
Q. Not less than 75 per cent of the stated amount of $C_{29}H_{31}N_7O$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing 125 mg of imatinib in 70 ml of the mobile phase with the aid of ultrasound for 15 minutes and dilute to 250.0 ml with the mobile phase.

Reference solution. A 0.0006 per cent w/v solution of *imatinib mesylate IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,



- mobile phase: a mixture of 75 volumes of buffer solution prepared by dissolving 1.0 g of *ammonium acetate* in 1000 ml *water* and 25 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogarm obtained with the reference solution (1.0 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 125 mg of imatinib in 100 ml of *methanol* with the aid of ultrasound for 20 minutes and dilute to 250.0 ml with *methanol*, centrifuge. Dilute 10.0 ml of the solution to 100.0 ml with *water*.

Reference solution. A 0.006 per cent w/v solution of *imatinib mesylate IPRS* prepared by dissolving in *methanol* and diluted with *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: a mixture of 55 volumes of buffer solution prepared by dissolving 3.12 g of *sodium dihydrogen orthophosphate dihydrate* in 1000 ml *water*, adding 1 ml of *triethylamine*, adjusted to pH 3.5 with *orthophosphoric acid* and 45 volumes of a mixture of equal volumes of *methanol* and *acetonitrile*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

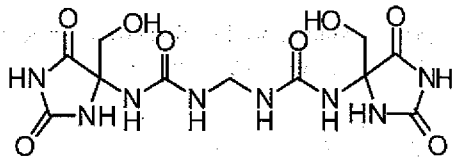
Inject the reference solution and the test solution.

Calculate the content of $C_{29}H_{31}N_7O$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of Imatinib.

Imidurea



$C_{11}H_{16}N_8O_8$ Mol. Wt. 388.3

Imidurea is Methylenebis[3-(4-hydroxymethyl-2,5-dioxoimidazolidin-4-yl)urea].

Imidurea contains not less than 26.0 per cent and not more than 28.0 per cent of nitrogen, N, calculated on the dried basis.

Description. A white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *imidurea IPRS* or with the reference spectrum of imidurea.

Tests

Appearance of solution. Dissolve 3.0 g in 7.0 ml of *water* in a test tube; the solution is clear (2.4.1) and colourless (2.4.1).

pH (2.4.24). 6.0 to 7.5, determined in a 1.0 per cent w/v solution.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

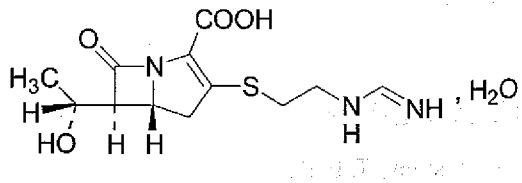
Sulphated ash (2.3.18). Not more than 3.0 per cent.

Loss on drying (2.4.19). Not more than 3.0 per cent, determined on 1 g by drying in vacuum over *phosphorus pentoxide* for 48 hours.

Nitrogen (2.3.30). Determined on 150 mg, using method C.

Storage. Store protected from moisture.

Imipenem



$C_{12}H_{17}N_3O_4S,H_2O$ Mol. Wt. 317.4

Imipenem is (5*R*,6*S*)-6-[(*R*)-1-hydroxyethyl]-3-[[2-[(iminomethyl)amino]ethyl]sulphanyl]-7-oxo-1-azabicyclo[3.2.0]hept-2-ene-2-carboxylic acid monohydrate.

Imipenem contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{12}H_{17}N_3O_4S$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white to almost white or pale yellow powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *imipenem monohydrate IPRS* or with the reference spectrum of imipenem monohydrate.

Tests

Appearance of solution. A 1.0 per cent w/v solution in *phosphate buffer pH 7.0* is not more opalescent than opalescence standard OS2 (2.4.1) and not more intensely coloured than reference solution BYS6 (2.4.1).

pH (2.4.24). 4.5 to 7.0 determined in 0.5 per cent w/v solution in *water*.

Specific optical rotation (2.4.22). + 84.0° to + 89.0°, determined in a 0.5 per cent w/v solution in *phosphate buffer pH 7.0*.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Keep the solutions in an ice-bath and use within 8 hours of preparation.

Solvent mixture. 0.7 volume of *acetonitrile* and 99.3 volumes of a 0.0135 per cent w/v solution of *dipotassium hydrogen phosphate,* adjusted to pH 6.8 with *orthophosphoric acid.*

Test solution. Dissolve 40 mg of the substance under examination in 100.0 ml of the solvent mixture.

Reference solution (a). A 0.04 per cent w/v solution of *imipenem IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Reference solution (c). Heat 20 ml of the test solution, previously adjusted to pH 10.0 with *sodium hydroxide solution* at 80° for 5 minutes (in situ preparation of impurity A).

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 0.7 volumes of *acetonitrile* and 99.3 volumes of a 0.87 per cent w/v solution of *dipotassium hydrogen phosphate,* adjusted to pH 7.3 with *orthophosphoric acid,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (c). The relative retention time with reference to imipenem for imipenem impurity A is about 0.8 and the resolution between the peaks due to imipenem impurity A and imipenem is not less than 3.5.

Inject reference solution (b) and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of peak corresponding to imipenem impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent), the area of any other secondary peak is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent) and the sum of the areas of all the secondary peaks, other than the peak corresponding to imipenem impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Sulphated ash (2.3.18). Not more than 0.2 per cent, determined on 1.0 g.

Water (2.3.43). 5.0 per cent to 8.0 per cent, determined on 0.1 g. Use an iodosulfurous reagent containing imidazole instead of pyridine and a clean container for each determination.

Assay. Determine by liquid chromatography (2.4.14).

NOTE —Keep the solutions in an ice-bath and use within 8 hours of preparation.

Test solution. Dissolve about 40 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution. A 0.04 per cent w/v solution of *imipenem monohydrate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 30 cm × 3.9 mm, packed with octadecylsilane bonded to porous silica (10 µm) (such as Bondapak C18),
- mobile phase: a solution prepared by dissolving 54 mg of *monobasic potassium phosphate* in 360 ml of *water*, adjusted to pH 6.8 with *0.5 M sodium hydroxide or 0.5 M orthophosphoric acid*, dilute to 400 ml with *water* and filter,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 300 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 600 theoretical plates, and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{12}H_{17}N_3O_4S$.

Imipenem intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial Endotoxins (2.2.3). Not more than 0.17 Endotoxin Unit per mg of imipenem.

Imipenem intended for use in the manufacture of parenteral preparations without a further appropriate sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store in an airtight container in a refrigerator (2° to 8°).

Labelling. The label states, where applicable, that the substance is sterile and is free from bacterial endotoxins.

Imipenem and Cilastatin Injection

Imipenem and Cilastatin Injection is a sterile mixture of Imipenem, Cilastatin Sodium, and Sodium Bicarbonate.

The injection is constituted as per the labelling requirements.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Imipenem and Cilastatin Injection contains not less than 90.0 per cent and not more than 115.0 per cent of the stated amounts of imipenem, $C_{12}H_{17}N_3O_4S$ and cilastatin, $C_{16}H_{26}N_2O_5S$.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 6.5 to 8.5, when constituted as directed on the label.

Bacterial endotoxins (2.2.3). Not more than 0.17 Endotoxin Unit per mg of imipenem and not more than 0.17 Endotoxin Unit per mg of cilastatin.

Loss on drying (2.4.19). Not more than 3.5 per cent, determined on 0.1 g, by drying in an oven at 60° for 3 hours at a pressure not exceeding 0.7 kPa.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the following solutions immediately before use.

Buffer solution pH 6.8. Dissolve 0.14 g of *monobasic potassium phosphate* in 900 ml of *water*, adjusted to pH 6.8 with *0.5M sodium hydroxide* or *0.5 M orthophosphoric acid* and dilute to 1000 ml with *water* and filter.

Test solution. Reconstitute the Imipenem and Cilastatin Injection and dilute to 100.0 ml with buffer solution pH 6.8 and mix. Dilute an accurately measured volume of the solution with buffer solution pH 6.8 to obtain a solution having a concentration of 0.05 per cent of imipenem.

Reference solution. A solution containing 0.05 per cent w/v, each of, *imipenem monohydrate IPRS* and *cilastatin ammonium IPRS* in buffer solution pH 6.8.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 50°,
- mobile phase: dissolve 2.0 g of *sodium 1-hexane-sulphonate* in 800 ml of buffer solution pH 6.8, adjusted to pH 6.8 with *0.5 M sodium hydroxide* or *0.5 M orthophosphoric acid*, dilute to 1000 ml with buffer solution pH 6.8 and filter,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 600 theoretical plates, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent for each component.

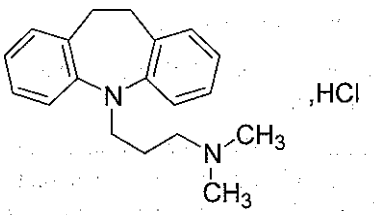
Inject the reference solution and the test solution.

Calculate the contents of $C_{12}H_{17}N_3O_4S$ and $C_{16}H_{26}N_2O_5S$ in the injection.

Storage. Store protected from moisture, in a single dose or multiple dose container.

Labelling. The label states that the constituted solution should be solubilized in a suitable parenteral fluid prior to intravenous infusion.

Imipramine Hydrochloride



$C_{19}H_{24}N_2,HCl$ Mol. Wt. 316.9

Imipramine Hydrochloride is 10,11-dihydro-5*H*-dibenz[*b*,*f*]azepine-5-(dimethylaminopropyl) hydrochloride.

Imipramine Hydrochloride contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{19}H_{24}N_2,HCl$, calculated on the dried basis.

Category. Antidepressant.

Description. A white or slightly yellow, crystalline powder.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B, C and D may be omitted if tests A and E are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *imipramine hydrochloride IPRS* or with the reference spectrum of imipramine hydrochloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.002 per cent w/v solution in *0.01 M hydrochloric acid* shows an absorption maximum only at about 250 nm and a shoulder at about 270 nm; absorbance at about 250 nm, about 0.52.

C. Dissolve 5 mg in 2 ml of *nitric acid*; an intense blue colour is produced.

D. Dissolve 50 mg in 3 ml of *water* and add 1 drop of a 2.5 per cent w/v solution of *quinhydrone* in *methanol*; no red colour is produced within 15 minutes.

E. 20 mg gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. Triturate with a glass rod 3.0 g with 20 ml of *carbon dioxide-free water* and dilute to 30 ml with the same solvent (solution A). Solution A is clear (2.4.1). Immediately after preparation dilute the solution with an equal volume of *water*. The resulting solution is not more intensely coloured than reference solution BYS6 (2.4.1).

pH (2.4.24). 3.6 to 5.0, determined in solution A immediately after preparation.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Further dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with end-capped polar-embedded octadecylsilane amorphous organosilica polymer (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 40 volumes of *acetonitrile* and 60 volumes of a 0.52 per cent w/v solution of *dipotassium hydrogen phosphate* previously adjusted to pH 7.0 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

The relative retention time with reference to imipramine (retention time: about 7 minutes) for imipramine impurity B (depramine) is about 0.7.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. Run the chromatogram 2.5 times the retention time of the principal peak. The area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with the reference solution (0.3 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.5 g, dissolve in 50 ml of *chloroform*, add 10 ml of *mercuric acetate solution* and titrate with *0.1 M perchloric acid*, using 0.5 ml of *metanil yellow solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03169 g of $C_{19}H_{24}N_2,HCl$.

Storage. Store protected from light.

Imipramine Tablets

Imipramine HydrochlorideTablets

Imipramine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of imipramine hydrochloride, $C_{19}H_{24}N_2$,HCl. The tablets are coated.

Usual strengths. 10 mg; 25 mg.

Identification

Triturate a quantity of the powdered tablets containing about 0.25 g of Imipramine Hydrochloride with 10 ml of *chloroform*, filter, evaporate the filtrate to low bulk, add *ether* until a turbidity is produced, and allow to stand. The precipitate, after recrystallisation from *acetone*, melts at about 172° (2.4.21), and complies with the following tests.

A. Dissolve 5 mg in 2 ml of *nitric acid;* an intense blue colour is produced.

B. Dissolve 50 mg in 3 ml of *water* and add 1 drop of a 2.5 per cent w/v solution of *quinhydrone* in *methanol*; no red colour is produced within 15 minutes.

C. 20 mg gives reaction (A) of chlorides (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium: 900 ml of *0.01 M hydrochloric acid*,
Speed and time. 100 rpm for 45 minutes.

Withdraw a suitable volume of the medium and filter, rejecting the first few ml of filtrate. Dilute a suitable volume of the filtrate with the medium, if necessary. Measure the absorbance of the resulting solution at the maximum at about 250 nm (2.4.7). Calculate the content imipramine hydrochloride, $C_{19}H_{24}N_2$,HCl in the medium from the absorbance obtained from a solution of known concentration of *imipramine hydrochloride IPRS* in the dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_{19}H_{24}N_2$,HCl.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 55 volumes of *ethyl acetate*, 35 volumes of *glacial acetic acid*, 5 volumes of *hydrochloric acid* and 5 volumes of *water*.

NOTE — Prepare the following solutions immediately before use.

Test solution. Shake a quantity of the powdered tablets containing 0.2 g of Imipramine Hydrochloride with three quantities, each of 10 ml, of *chloroform*, filter the combined chloroform extracts, evaporate to dryness and dissolve the residue in 10 ml of *methanol*.

Reference solution (a). Dilute 3 volumes of the test solution to 1000 volumes with *methanol*.

Reference solution (b). A 0.006 per cent w/v solution of *iminodibenzyl IPRS* in *methanol*.

Apply to the plate 10 µl of each solution. After development, remove the plate, allow the solvent to evaporate for 5 minutes, spray with a 0.5 per cent w/v solution of *potassium dichromate* in *sulphuric acid (20 per cent)* and examine immediately. In the chromatogram obtained with the test solution any spot corresponding to iminodibenzyl is not more intense than the spot in the chromatogram obtained with reference solution (b) and any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (a).

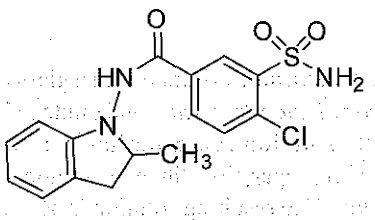
Uniformity of content. Complies with the test stated under Tablets.

Powder one tablet, shake with 25 ml of *0.1 M hydrochloric acid* for 30 minutes, add sufficient *0.1 M hydrochloric acid* to produce 100.0 ml and filter. Dilute 10.0 ml of the filtrate to 50.0 ml with *0.1 M hydrochloric acid* and measure the absorbance of the resulting solution at the maximum at about 250 nm (2.4.7). Calculate the content of $C_{19}H_{24}N_2$,HCl in the tablet taking 264 as the specific absorbance at 250 nm.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 25 mg of Imipramine Hydrochloride, shake with 75 ml of *0.1 M hydrochloric acid* for 30 minutes, dilute to 100.0 ml with the same solvent and filter through a sintered-glass filter. Dilute 10.0 ml to 100.0 ml with *0.1 M hydrochloric acid* and measure the absorbance of the resulting solution at the maximum at about 250 nm (2.4.7). Calculate the content of $C_{19}H_{24}N_2$, HCl taking 264 as the specific absorbance at 250 nm.

Indapamide



$C_{16}H_{16}ClN_3O_3S$ Mol. Wt. 365.8

Indapamide is 4-chloro-*N*-(2-methyl-1-indolinyl)-3-sulphamoylbenzamide.

Indapamide contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{16}H_{16}ClN_3O_3S$, calculated on the dried basis.

Category. Diuretic.

Description. A white to off-white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *indapamide IPRS* or with the reference spectrum of indapamide.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Carry out the test protected from light and prepare the solutions immediately before use or maintain them at 4 °.

Solvent mixture. Equal volumes of *acetonitrile* and *methanol.*

Test solution. Dissolve 20 mg of the substance under examination in 7 ml of the solvent mixture and dilute to 20.0 ml with a 0.02 per cent w/v solution of *sodium edetate.*

Reference solution (a). Dissolve 3 mg of *indapamide impurity B IPRS (4-chloro-N-(2-methyl-1H-indol-1-yl)-3-sulphamoyl benzamide IPRS)* in 3.5 ml of the solvent mixture and dilute to 10.0 ml with a 0.02 per cent w/v solution of *sodium edetate.* To 1.0 ml of the solution, add 35 ml of the solvent mixture and dilute to 100.0 ml with 0.02 per cent w/v solution of *sodium edetate.*

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with a mixture of 17.5 volumes of *acetonitrile*, 17.5 volumes of *methanol* and 65 volumes of a 0.02 per cent w/v solution of *sodium edetate.* Dilute 1.0 ml of the solution to 20.0 ml with a mixture of 17.5 volumes of *acetonitrile*, 17.5 volumes of *methanol* and 65 volumes of a 0.02 per cent w/v solution of *sodium edetate.*

Reference solution (c). Dissolve 25 mg of *indapamide IPRS* and 45 mg of *methylnitrosoindoline IPRS* in 17.5 ml of the solvent mixture and dilute to 50.0 ml with 0.02 per cent w/v solution of *sodium edetate.*

Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 0.1 volume of *glacial acetic acid*, 17.5 volumes of *acetonitrile*, 17.5 volumes of *methanol*, 65 volumes of 0.02 per cent w/v solution of *sodium edetate*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

The retention time of indapamide peak is about 11 minutes.

Inject reference solution (b) and (c). The test is not valid unless the resolution between the peaks due to indapamide and indapamide impurity A is not less than 4.0 in the chromatogram obtained with reference solution (c) and signal-to-noise ratio is not less than 6.0 for the principal peak in the chromatogram obtained with reference solution (b).

Inject reference solution (a), (b) and the test solution. Run the chromatogram 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak due to indapamide impurity B is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Impurity A. Determine by liquid chromatography (2.4.14).

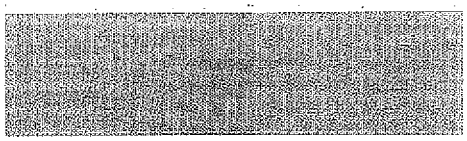
NOTE — Carry out the test protected from light.

Test solution. Dissolve 25 mg of the substance under examination in 1 ml of *acetonitrile* and dilute to 10.0 ml with *water.* Shake for 15 minutes and allow to stand at 4° for 1 hour and filter.

Reference solution. Dissolve 25 mg of the substance under examination in 1.0 ml of a 0.0000125 per cent w/v solution of *indapamide impurity A IPRS (methylnitrosoindoline IPRS)* in *acetonitrile* and dilute to 10.0 ml with *water.* Shake for 15 minutes and allow to stand at 4° for 1 hour and filter.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 7 volumes of *acetonitrile*, 20 volumes of *tetrahydrofuran* and 73 volumes of a 0.15 per cent w/v solution of *triethylamine*, adjusted to pH 2.8 with *orthophosphoric acid*,
- flow rate: 1.4 ml per minute,
- spectrophotometer set at 305 nm,
- injection volume: 100 µl.

Inject the reference solution. The test is not valid unless the signal-to-noise ratio is not less than 3.0 for the peak due to indapamide impurity A appearing just before the peak due to indapamide and the peak-to-valley-ratio is not less than 6.7, where H_p is the height above the baseline of the peak due to



indapamide impurity A and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to indapamide.

Inject the reference solution and the test solution. The area of the peak due to indapamide impurity A is not more than the difference between the areas of the peaks due to indapamide impurity A in the chromatograms obtained with the reference solution and the test solution (5 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 3.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14).

Internal standard solution. A 0.5 per cent w/v solution of *4-chloroacetanilide* in *methanol*.

Test solution. Dissolve about 0.1 g of the substance under examination in 5.0 ml of *internal standard solution* and dilute to 100.0 ml with the mobile phase.

Reference solution. A solution containing 0.1 per cent w/v of *indapamide IPRS* and 0.025 per cent w/v of *4'-chloroacetanilide* in the mobile phase.

Chromatographic system
- a stainless steel column 30 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of *water*, 17.5 volumes of *acetonitrile*, 17.5 volumes of *methanol* and 0.1 volume of *glacial acetic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 5 µl.

The relative retention time with reference to indapamide for *4'*- chloroacetanilide is about 0.65.

Inject the reference solution. The test is not valid unless the resolution between the principal peak and any adjacent peak is not less than 2.0, the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0 per cent for the principal peak.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{16}ClN_3O_3S$.

Storage. Store protected from moisture.

Indapamide Prolonged-release Tablets

Indapamide Sustained-release Tablets; Indapamide Extended-release Tablets

Indapamide Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Indapamide Prolonged-release Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of indapamide, $C_{16}H_{16}ClN_3O_3S$.

Usual strengths. 1.5 mg; 2.5 mg.

Identification

A. Determine by thin layer chromatography (2.4.17), using the plate coated with *silica gel GF 254*.

Mobile phase. A mixture of 20 volumes of *acetone* and 80 volumes of *toluene*.

Test solution. Shake a quantity of the powdered tablets containing 50 mg of Indapamide with 10 ml of *acetone*, mix for 15 minutes and filter.

Reference solution. A 0.5 per cent w/v solution of *indapamide IPRS* in *acetone*.

Apply to the plate 20 µl of each solution. Allow the mobile phase to raise 12 cm. Dry the plate in air and examine under the ultraviolet light at 254 nm. Spray the plate with a solution prepared by mixing 10 volumes of *potassium iodobismuthate solution* and 20 volumes of *glacial acetic acid* and diluting to 100 volumes with *water* and examine again. Finally, spray the plate with a 5.0 per cent w/v solution of *sodium nitrite* in a mixture of equal volume of *water* and *ethanol (95 per cent)* and examine again.The principal spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution. Complies with the tests stated under tablets.

Uniformity of content. Complies with the tests stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay using following modification.

Test solution. Disperse one tablet in 20 ml of ethanol (95 per cent). Mix with the aid of ultrasound for 15 minutes. Cool and dilute to 25 ml with ethanol (95 per cent). Dilute as necessary to obtain a solution containing 0.005 per cent w/v of indapamide in ethanol (95 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing 25 mg of indapamide in 70 ml of *ethanol (95 per*

cent) mix with the aid of ultrasound, dilute to 100.0 ml with *ethanol (95 per cent)*, mix and centrifuge. Dilute 5.0 ml of the supernatant liquid to 25.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of a 0.00025 per cent w/v solution of *indapamide impurity B IPRS* in *ethanol (95 per cent)* to 10.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of a 0.00025 per cent w/v solution of *4-chloro-3-sulphamoyl benzoic acid* in *ethanol (95 per cent)* to 10.0 ml with the mobile phase.

Reference solution (d). Mix 1.0 ml of the test solution, 1.0 ml of 0.00025 per cent w/v solution of *indapamide impurity B IPRS* in *ethanol (95 per cent)* and 1.0 ml of 0.00025 per cent w/v solution of *4-chloro-3-sulphamoyl benzoic acid* in *ethanol (95 per cent)* and dilute to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 6 volumes of a solution containing 5.0 per cent w/v solution of *sodium lauryl sulphate* and 3.0 per cent v/v solution of *glacial acetic acid*, 10 volumes of *triethylamine*, 20 volumes of *butan-2-ol*, 310 volumes of *acetonitrile* and 690 volumes of *water*, adjusted to pH 3.0 using *orthophosphoric acid*,
- flow rate: 1.6 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject reference solution (d). The test is not valid unless the relative retention time with reference to indapamide for 4-chloro-N-(2-methyl-1H-indol-1-yl)-3-sulphamoylbenzamide (indapamide impurity B) is about 1.7; for 4-chloro-3-sulphamoylbenzoic acid is about 0.3.

Inject reference solution (a), (b), (c) and the test solution. In the chromatogram obtained with test solution, the area of any peak corresponding to indapamide impurity B is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent), the area of any peak corresponding to 4-chloro-3-sulphamoylbenzoic acid is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent). The area of any other secondary peak is not more than five times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of all the impurities is not more than 15 times the area of the principal peak in the chromatograms obtained with reference solution (a) (1.5 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Other tests. Complies with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modifications.

Reference solution. Dilute 5.0 ml of 0.025 per cent w/v solution of *indapamide IPRS* in *ethanol (95 per cent)* to 25.0 ml with the mobile phase.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{16}ClN_3O_3S$ in the tablets.

Storage. Store protected from light and moisture at a temperature not exceed 30°.

Indapamide Tablets

Indapamide Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of indapamide, $C_{16}H_{16}ClN_3O_3S$.

Usual Strengths. 1.5 mg; 2.5 mg.

Identification

A. Shake a quantity of powdered tablets containing about 15 mg of Indapamide with 30.0 ml of *0.2 M sodium hydroxide* in a centrifuge tube for 10 minutes. Centrifuge and transfer the supernatant in a 250 ml separator, add 12 ml of *dilute hydrochloric acid*. Extract the solution twice with 4.0 ml *ether*, filter the extracts through *anhydrous sodium sulphate* and evaporate the ether on a water-bath and dry the crystals at 105° for 1 hour.

Determine by infrared absorption spectrophotometry (2.4.6) of the residue. Compare the spectrum with that obtained with *indapamide IPRS* or with the reference spectrum of indapamide.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),

Medium. 900 ml of phosphate buffer pH 6.8, prepared by dissolving 27.22 g of *potassium dihydrogen phosphate* in about 800 ml of *water*, adjusted to pH 6.8 with 0.2 *M sodium hydroxide*, and diluted to 1000 ml with *water*.

Speed and time. 100 rpm and 45 minutes.

Determine by liquid chromatography (2.4.14),

Test solution. Use the filtrate, dilute if necessary with the dissolution medium.

Reference solution. Dissolve a weighted quantity of *indapamide IPRS* in *methanol* and dilute with dissolution medium to obtain a solution having a known concentration similar to the expected concentration of test solution.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: 70 volumes of 0.154 per cent w/v solution of *sodium 1- octanesullphonate*, 1 volume of *glacial acetic acid* and 30 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 242 nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and test solution.

Calculate the content of $C_{16}H_{16}ClN_3O_3S$.

Q. Not less than 75.0 per cent of the stated amount of $C_{16}H_{16}ClN_3O_3S$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Carry out the test protected from light.

Test solution. Disperse 10 intact tablets with 70 ml of *ethanol (95 per cent)* mechanically until the tablets have disintegrated and continue mixing for 2 hours and dilute to 100.0 ml with *ethanol (95 per cent)* and centrifuge. Dilute the supernatant liquid with the mobile phase to obtain a solution containing 0.005 per cent w/v of Indapamide.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase. Further dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of a 0.00025 per cent w/v solution of *indapamide impurity B IPRS* in *ethanol (95 per cent)* to 10.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of a 0.00025 per cent w/v solution of *4-chloro-3-sulphamoylbenzoic acid* in *ethanol (95 per cent)* to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Nucleosil C18),
- mobile phase: a mixture of 6 volumes of a solution containing 5 per cent w/v of *sodium dodecyl sulphate* and 3 per cent v/v of *glacial acetic acid*, 10 volumes of *triethylamine*, 20 volumes of *butan-2-ol*, 310 volumes of *acetonitrile* and 690 volumes of *water*, adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate: 1.6 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 10 µl.

Name	Relative retention time
4-chloro-3-sulphamoylbenzoic acid	0.3
Indapamide	1.0
Indapamide impurity B[1]	1.7

[1]4-chloro-N-(2-methyl-1H-indol-1-yl)-3-sulphamoylbenzamide.

Inject reference solution (a), (b), (c) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to indapamide impurity B is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any peak corresponding to 4-chloro-3-sulphamoylbenzoic acid is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent) and the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks other than indapamide impurity B is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay, using the following solution as the test solution.

Test solution. Disperse one tablet in 1 to 2 ml of *water* and add 25 ml *acetonitrile* with the aid of ultrasound for 20 minutes and dilute to 50 ml with *acetonitrile*. Transfer this solution to centrifuge tube, and centrifuge at 2000 rpm for about 10 minutes. Transfer 10ml of supernatant to a 50 ml volumetric flask, add 3.0 ml of internal standard solution, dilute with *water* to volume and mix.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Internal standard solution.A 0.025 per cent w/v solution of *2- chloroacetophenone* in *acetonitrile*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 2.5 mg of Indapamide, disperse in 25 ml *acetonitrile* with the aid of ultrasound for 20 minutes and dilute to 50.0 ml with *acetonitrile*. Transfer this solution to centrifuge tube, and centrifuge at 2000 rpm for about 10 minutes. Transfer 10 ml of supernatant to a 50-ml volumetric flask, add 3.0 ml of internal standard solution, dilute with *water* to volume and mix.

Reference solution. A 0.01 per cent w/v solution of *indapamide IPRS* in *acetonitrile*. Dilute 5.0 ml of the solution, add 3.0 ml of internal standard solution to 50.0 ml with *water*.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: 70 volumes of 0.154 per cent w/v solution of *sodium 1- octanesulphonate*, 1 volume of *glacial acetic acid* and 30 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 242 nm,
- injection volume: 20 µl.

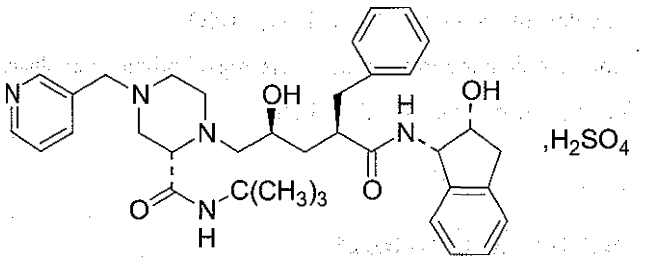
The relative retention time with reference to indapamide for 2- chloroacetophenone is about 1.18.

Inject the reference solution. The test is not valid unless the resolution between the principal peak and the internal standard peak is not less than 3.0, and the relative standard deviation for replicate injections is not more than 2.0 per cent for the principal peak.

Calculate the content of $C_{16}H_{16}ClN_3O_3S$ in the tablets.

Storage. Store protected from light.

Indinavir Sulphate



$C_{36}H_{47}N_5O_4, H_2SO_4$ Mol. Wt. 711.9

Indinavir Sulphate is [1-(1*S*,2*R*),5-(2*S*)]-2,3,5-trideoxy-*N*-(2,3-dihydro-2-hydroxy-1*H*-inden-1-yl)-5-[2-[{1,1-dimethylethyl)amino}carbonyl]-4-(3-pyridinylmethyl)-1-piperazinyl]-2-(phenylmethyl)-D-*erythro*-pentonamide sulphate.

Indinavir Sulphate contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{36}H_{47}N_5O_4,H_2SO_4$, calculated on the anhydrous and ethanol-free basis.

Category. Antiretroviral.

Description. A white or almost white powder; hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *indinavir IPRS* or with the reference spectrum of indinavir sulphate.

B. When examined in the range 200 nm to 300 nm (2.4.7), a 0.005 per cent w/v solution in *water* shows an absorption maximum at about 260 nm.

C. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to indinavir in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 2.8 to 3.2, determined in a 1.0 per cent w/v solution in *carbon dioxide-free water*.

Specific optical rotation (2.4.22). +122° to +129°, determined at about 365 nm in a 1.0 per cent w/v solution in *water*, calculated on the anhydrous and ethanol-free basis.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disolve 0.1 g of the substance under exmination in 100.0 ml of the mobile phase.

Reference solution (a). A 0.0086 per cent w/v solution of *indinavir IPRS* in the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). Transfer 15 mg of *indinavir IPRS* to a 50-ml volumetric flask and add 0.1 ml of *5 M hydrochloric acid*. Keep this solution for about 1 hour at room temperature and make up to volume with the mobile phase.

Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with base deactivated octylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 40 volumes of *acetonitrile* and 60 volumes of a solution containing 0.37 per cent w/v of *sodium citrate* and 0.16 per cent w/v of *citric acid*, the pH of which has been adjusted to 5.0 with *1 M sodium hydroxide* or *1 M orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 50 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to indinavir and any impurity at a relative retention time of about 1.4 is not less than 2.

Inject reference solution (a). The test is not valid unless the capacity factor for indinavir peak is not less than 2.0, the

tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5 per cent.

Inject the test solution. Calculate the content of each impurity in the chromatogram obtained with the test solution by comparing with the area of the principal peak obtained with reference solution (a). The content of any individual impurity is not more than 0.1 per cent and the sum of all impurities is not more than 0.5 per cent.

Ethanol. 5.0 to 8.0 per cent.

Determine by gas chromatography (2.4.13).

Internal standard solution. A 0.5 per cent v/v solution of *1-propanol* in *water*.

Test solution. Dissolve 0.4 g of the substance under examination in 50 ml of *water*, add 8.0 ml of the internal standard solution and dilute to 100.0 ml with *water*.

Reference solution. Dilute 1.0 ml of *anhydrous ethanol* to 200.0 ml with *water*. To 2.0 ml of the solution, add 2.0 ml of the internal standard solution and dilute to 25.0 ml with *water*.

Chromatographic system
- a capillary column 30 m × 0.53 mm, packed with fused silica coated with macrogol 20000 (film thickness 1.0 µm),
- temperature:
  column: 35°,
  inlet port at 140° and detector port at 220°,
- flame ionization detector,
- split ratio: 1:10,
- flow rate: 10 ml per minute, using helium as the carrier gas,
- injection volume: 1 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to ethanol and 1- propanol is not less than 5.0.

Inject the reference solution and the test solution.

Calculate the content of ethanol using the ratio of the area of the peak due to ethanol to that of the internal standard. The density of ethanol is 0.79 g per ml.

Sulphate.13.2 to 14.4 per cent w/w, calculated on the anhydrous and ethanol-free basis, determined by the following method. Weigh 0.5 g, dissolve in 50 ml of *dimethylformamide* and titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.0048 g of sulphate.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.5 per cent, determined on 0.2 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh 60 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution. A 0.05 per cent w/v solution of *indinavir IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with base deactivated octylsilane bonded to porous silica (5 µm),
- column temperature. 40°,
- mobile phase: a filtered and degassed mixture of 45 volumes of *acetonitrile* and 55 volumes of a buffer prepared by dissolving 3 g of *phosphoric acid* and 1.7 ml of *dibutylamine* in 900 ml of *water*, adjusted to pH 6.5 with *1 M sodium hydroxide* and making up the volume to 1000.0 ml with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency determined from the indinavir peak is not less than 4000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{36}H_{47}N_5O_4, H_2SO_4$.

1 mg of indinavir corresponds to 1.16 mg of indinavir sulphate.

Storage. Store protected from light.

Indinavir Capsules

Indinavir Sulphate Capsules

Indinavir Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of indinavir, $C_{36}H_{47}N_5O_4$.

Usual strength. The equivalent of 400 mg of indinavir.

Identification

A. Shake a quantity of the contents of the capsules containing 0.1 g of Indinavir Sulphate with 80 ml of *water*, dilute to 100 ml with *water* and filter. Dilute 5.0 ml of the filtrate to 100.0 ml with *water*. When examined in the range 200 nm to 300 nm (2.4.7), the resulting solution shows an absorption maximum at about 260 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to indinavir in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle with sinkers),

Medium. 900 ml of a buffer solution prepared by dissolving 21 g of *citric acid* in 880 ml of *water,* adjusted to pH 3.8 with 50 per cent w/v solution of *sodium hydroxide* and dilute to 1000 ml with *water,*

Speed and time. 50 rpm and 30 minutes. .

Withdraw a suitable volume of the medium and filter through a membrane filter disc with an average pore diameter not greater than 1.0 µm. Measure the absorbance of the filtrate, dilute suitably if necessary with the medium, at the maximum at about 260 nm (2.4.7). Calculate the content of indinavir $C_{36}H_{47}N_5O_4$, in the medium from the absorbance obtained from a solution of known concentration of *indinavir IPRS* in the dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_{36}H_{47}N_5O_4$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 40 volumes of *acetonitrile* and 60 volumes of mobile phase A.

Test solution. Disperse a quantity of the mixed powered content of the capsules containing 50 mg of indinavir in 60 ml of the solvent mixture, with the aid of ultrasound for 10 minutes and dilute to 100.0 ml with the solvent mixture, filter.

Reference solution (a). A 0.0005 per cent w/v solution of *indinavir IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.05 per cent w/v of *indinavir IPRS* and 0.005 per cent w/v of *indinavir 4-epimer IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. *0.05 M dipotassium hydrogen phosphate,* adjusted to pH 7.5 with *dilute orthophosphoric acid,*
  B. *acetonitrile,*
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
3	80	20
5	65	35
11	65	35
17	30	70
20	30	70
21	80	20
25	80	20

Inject reference solution (a) and (b). The test is not valid unless the resolution between indinavir and indinavir 4-epimer peaks is not less than 1.5, the column efficiency for indinavir peak is not less than 10,000 theoretical plates, the tailing factor is not more than 1.5 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent) and the sum of the areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (2.5 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Mix the content of 20 capsules. Disperse a quantity of the mixed powered content of the capsules containing 200 mg of indinavir in 60 ml of the mobile phase, with the aid of ultrasound for 10 minutes and dilute to 100.0 ml with the mobile phase, filter. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution. A 0.02 per cent w/v solution of *indinavir IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with base deactivated octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of *0.05 M dipotassium hydrogen phosphate,* adjusted to pH 7.5 with *dilute orthophosphoric acid* and 45 volumes of *acetonitrile,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 6000 theoretical

plates, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

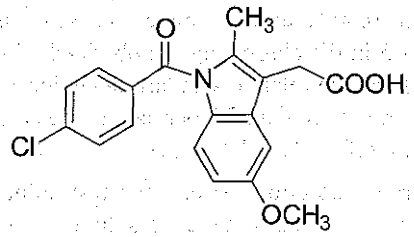
Inject the reference solution and the test solution.

Calculate the content of $C_{36}H_{47}N_5O_4$ in the capsules.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Indomethacin

Indometacin



$C_{19}H_{16}ClNO_4$ Mol. Wt. 357.8

Indomethacin is 1-(4-chlorobenzoyl)-5-methoxy-2-methyl-indol-3-ylacetic acid.

Indomethacin contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{19}H_{16}ClNO_4$, calculated on the dried basis.

Category. Antiinflammatory; analgesic.

Description. A white to pale yellow, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *indomethacin IPRS* or with the reference spectrum of indomethacin. Examine the substances in the solid state without recrystallisation.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.0025 per cent w/v solution in a mixture of 90 volumes of *methanol* and 10 volumes of *1 M hydrochloric acid* shows an absorption maximum only at about 320 nm; absorbance at about 320 nm, about 0.45.

C. Dissolve 0.1 g in 10 ml of *ethanol (95 per cent)*, heating gently if necessary. To 0.1 ml add 2 ml of a freshly prepared mixture of 1 volume of a 25 per cent w/v solution of *hydroxylamine hydrochloride* and 3 volumes of *2 M sodium hydroxide*. Add 2 ml of *2 M hydrochloric acid* and 1 ml of *ferric chloride solution* and mix; a violet-pink colour develops.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with a suspension of *silica gel HF254* in a 4.68 per cent w/v solution of *sodium dihydrogen phosphate*.

Mobile phase. A mixture of 70 volumes of *ether* and 30 volumes of *light petroleum (50° to 70°)*.

NOTE—Prepare the following solutions immediately before use.

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of *methanol*.

Reference solution. A 0.01 per cent w/v solution of the substance under examination in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.45 g in 75 ml of *acetone* and titrate under nitrogen with carbonate-free *0.1 M sodium hydroxide* using 0.2 ml of *phenolphthalein solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.03578 g of $C_{19}H_{16}ClNO_4$.

Storage. Store protected from light.

Indomethacin Capsules

Indomethacin Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of indomethacin, $C_{19}H_{16}ClNO_4$.

Usual strength. 25 mg.

Identification

A. Shake a quantity of the contents of the capsules containing 0.1 g of Indomethacin with 5 ml of *chloroform*, filter and evaporate the filtrate to dryness. Dry the residue at 60° at a pressure not exceeding 0.7 kPa for 1 hour. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *indomethacin IPRS* or with the reference spectrum of indomethacin.

B. When examined in the range 230 nm to 360 nm (2.4.7), the final solution obtained in the Assay shows an absorption maximum only at about 320 nm.

C. Mix a quantity of the contents of the capsules containing 25 mg of Indomethacin with 2 ml of *water* and add 2 ml of *2 M sodium hydroxide*; a bright yellow colour is produced which fades rapidly.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with a suspension of *silica gel HF254* in a 4.68 per cent w/v solution of *sodium dihydrogen phosphate*.

Mobile phase. A mixture of 70 volumes of *ether* and 30 volumes of *light petroleum (50° to 70°)*.

NOTE—Prepare the following solutions immediately before use.

Test solution. Shake a quantity of the contents of the capsules containing 0.1 g of Indomethacin with 5 ml of *chloroform*, filter and use the filtrate.

Reference solution. Dilute 1.0 ml of the test solution to 200.0 ml with *chloroform*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 750 ml of a freshly prepared mixture of 1 volume of *phosphate buffer pH 7.2* and 4 volumes of *water*,
Speed and time. 100 rpm and 20 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc having an average pore diameter not greater than 1.0 µm, rejecting the first few ml of the filtrate. Dilute the filtrate suitably with the medium and measure the absorbance of the resulting solution at the maximum at about 320 nm (2.4.7). Calculate the content of $C_{19}H_{16}ClNO_4$ in the medium from the absorbance obtained from a solution of known concentration of *indomethacin IPRS* in the same medium.

Q. Not less than 80 per cent of the stated amount of $C_{19}H_{16}ClNO_4$.

Other tests. Comply with the tests stated under Capsules.

Assay. Weigh a quantity of the mixed contents of 20 capsules containing about 50 mg of Indomethacin, add 10 ml of *water* and allow to stand for 10 minutes, with occasional swirling. Add 75 ml of *methanol*, shake well, add sufficient *methanol* to produce 100.0 ml and filter if necessary. To 5.0 ml of the filtrate add sufficient of a mixture of equal volumes of *methanol* and *phosphate buffer pH 7.2* to produce 100.0 ml. Measure the absorbance of the resulting solution at the maximum at about 320 nm (2.4.7). Calculate the content of $C_{19}H_{16}ClNO_4$ taking 193 as the specific absorbance at 320 nm.

Storage. Store protected from moisture.

Indomethacin Suppositories

Indomethacin Suppositories contain Indomethacin in a suitable suppository base.

Indomethacin Suppositories contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of indomethacin, $C_{19}H_{16}ClNO_4$.

Usual strength. 100 mg.

Identification

A. Dissolve a quantity of the powdered suppositories containing 0.1 g of Indomethacin as completely as possible in 50 ml of hot *water*, filter, wash the residue with hot *water* and allow to dry in air. Dissolve the residue in 5 ml of *chloroform* and evaporate to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *indomethacin IPRS* or with the reference spectrum of indomethacin.

B. Shake a quantity containing 25 mg of Indomethacin with 5 ml of *water* until the base dissolves; a white suspension is produced. Add 2 ml of *2 M sodium hydroxide*; a bright yellow colour is produced which fades rapidly.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the following solutions freshly.

Test solution (a). Powder or cut into small pieces a suitable number of suppositories, dissolve a quantity containing 0.1 g of Indomethacin in sufficient *methanol* to produce 50 ml.

Reference solution (a). Dilute 3 .0 ml of test solution (a) to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 30 cm x 4 mm, packed with octadecylsilane bonded to porous silica (10 µm) (such as Bondapack C18),
- mobile phase: a mixture of 60 volumes of *methanol* and 40 volumes of 0.2 per cent v/v solution of *orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 320 nm,
- injection volume: 20 µl.

The sum of the areas of any secondary peaks that elute before the principal peak in the chromatogram obtained with test solution (a) is not greater than the area of the peak in the chromatogram obtained with reference solution (a).

Repeat the procedure but using the following freshly prepared solutions and a detection wavelength of about 240 nm.

Test solution (b). Dilute 10.0 ml of test solution (a) to 20.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.001 per cent w/v of *4-chlorobenzoic acid* in the mobile phase.

In the chromatogram obtained with test solution (b) the sum of the areas of any secondary peaks that elute before the principal peak, other than those determined in test solution (a), is not greater than the area of the peak in the chromatogram obtained with reference solution (b).

The column efficiency, determined using the principal peak in the chromatogram obtained with reference solution (a), should be not less than 7500 theoretical plates per metre.

Disintegration (2.5.1). Use a weighed suppository and *phosphate buffer pH 6.8* in place of *water* and operate the apparatus for 90 minutes. At the end of this period remove the suppository, dry with filter paper and weigh. Repeat the operation with two further weighed suppositories. Not less than 75 per cent of each suppository is dissolved.

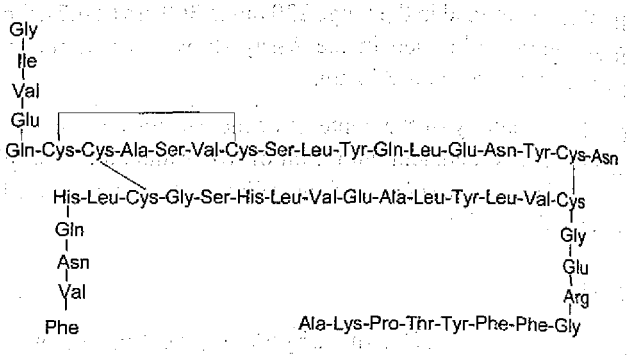
Other tests. Comply with the tests stated under Suppositories.

Assay. Weigh 10 suppositories and powder or cut into small pieces. Disperse a quantity of the powder or small pieces containing about 0.1 g of Indomethacin, add 50 ml of *methanol*, shake until the dispersion is complete and, if necessary, filter. To 2.0 ml add sufficient of a mixture of equal volumes of *methanol* and *phosphate buffer pH 7.2* to produce 100.0 ml. Measure the absorbance of the resulting solution at the maximum at about 320 nm (2.4.7). Calculate the content of $C_{19}H_{16}ClNO_4$ taking 193 as the specific absorbance at 320 nm.

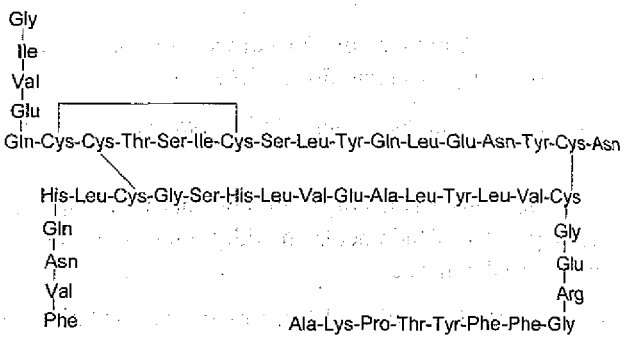
Storage. Store protected from moisture at a temperature not exceeding 30°.

Insulin

Crystalline Insulin



$C_{256}H_{381}N_{65}O_{76}S_6$ (porcine) Mol. Wt. 5777.6



$C_{254}H_{377}N_{65}O_{75}S_6$ (bovine) Mol. Wt. 5733.5

Insulin is the specific natural antidiabetic principle obtained from the pancreas of either the pig or the ox and purified.

Insulin contains not less than 26.5 IU per mg of porcine insulin, $C_{256}H_{381}N_{65}O_{76}S_6$, or of bovine insulin, $C_{254}H_{377}N_{65}O_{75}S_6$, as appropriate, calculated on the dried basis.

Category. Hypoglycaemic.

Description. A white or almost white powder.

Identification

A. In the Assay, the principal peak due to insulin in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the appropriate reference solution.

B. Determine by liquid chromatography (2.4.14), the peptide fragments, using the following peptide mapping procedure.

Test solution. Prepare a 0.2 per cent w/v solution of the substance under examination in *0.01M hydrochloric acid* and transfer 500 µl of the solution to a stoppered clean tube. Add 2.0 ml of *HEPES buffer solution pH 7.5* and 400 µl of a 0.1 per cent w/v solution of *Staphylococcus aureus strain V8*

protease. Close the tube and incubate at 25° for 6 hours. Stop the reaction by adding 2.9 ml of *sulphate buffer solution pH 2.0*.

Reference solution. Prepare in the same manner as for the test solution but using as appropriate, *porcine insulin IPRS* or *bovine insulin IPRS* or *human insulin IPRS* in place of the substance under examination.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane silica gel (3 µm) with a pore size of 8 nm,
- column temperature: 40°,
- mobile phase: A. a mixture of 100 ml of *acetonitrile*, 200 ml of *sulphate buffer solution pH 2.0* and 700 ml of *water*,

  B. a mixture of 200 ml of *sulphate buffer solution pH 2.0*, 400 ml of *acetonitrile* and 400 ml of *water*,
- a gradient programme using the conditions given below
- flow rate: 1 ml per minute,
- spectrophotometer set at 214 nm,
- injection volume: 50 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
60	30	70
65	0	100
70	0	100
71	90	10
80	90	10

At initial conditions equilibrate the column for at least 15 minutes. Carry out a blank run using the above-mentioned gradient.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.5 for the chromatograms obtained with the reference solution for the peaks due to fragments II and III and the resolution factor between the peaks due to fragments II and III is not less than 1.9 for porcine and bovine insulin.

Inject the reference solution and the test solution. The chromatograms obtained with the test and reference solution are qualitatively similar. In the chromatogram obtained with the reference solution identify the peaks due to digest fragments I, II and III.

The profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

NOTE —The retention time of fragment III is the same for bovine insulin and for porcine insulin. The retention times of fragments II and IV are the same for all insulins.

Tests

Light absorption (2.4.7). Absorbance of a 0.05 per cent w/v solution in *0.01 M hydrochloric acid* at the maximum at about 276 nm, 0.48 to 0.56.

Other tests. Comply with the tests for Impurities with molecular masses greater than that of insulin, Related proteins and Total zinc stated under Insulin Preparations.

Sulphated ash (2.3.18). Not more than 2.5 per cent, calculated on the dried basis, determined on 0.2 g.

Loss on drying (2.4.19). Not more than 10.0 per cent, determined on 0.2 g by drying in an oven at 60° at a pressure not exceeding 0.7 kPa.

Assay. Determine as described under Assay of Insulins (2.3.46).

Test solution. Dissolve a suitable quantity of the substance under examination in *0.01 M hydrochloric acid* to obtain a concentration of 4.0 mg per ml.

Insulin intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 20 Endotoxin Units per mg.

Storage. Store protected from light, at a temperature not exceeding –20° until released by the manufacturer. When thawed, it should be stored in a refrigerator (2° to 8°) and used for the manufacture of preparations within a short period of time.

Labelling. The label states (1) the animal source or sources of the insulin; (2) where applicable, that the material is free from bacterial endotoxins; (3) the storage conditions.

NOTE — 0.0345 mg of porcine or 0.0342 mg of bovine insulin is equivalent to 1 Unit of insulin.

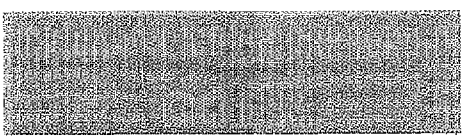
Biphasic Insulin Injection

Biphasic Insulin Injection is a sterile suspension of crystals containing bovine insulin in a solution of porcine insulin.

Biphasic Insulin Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated number of IU of Insulin.

Usual strength. 40 IU per ml (30: 70).

Description. A white suspension. When examined under a microscope, the majority of the particles appear as rhombohedral crystals, with a maximum dimension of the crystals greater than 10 µm but rarely exceeding 40 µm.



Identification

In the chromatograms obtained in the Assay the position of the peaks due to the two insulins in the chromatogram obtained with the test solution correspond to those of the principal peaks in the chromatogram obtained with the appropriate reference solution.

Tests

pH (2.4.24). 6.6 to 7.2.

Total zinc. 26.0 µg to 37.5 µg per 100 IU of insulin, determined by either of the methods stated under Insulin Preparations.

Insulin in the supernatant. 22.0 per cent to 28.0 per cent of insulin in solution, determined as stated under Insulin Preparations.

Other tests. Comply with the tests stated under Insulin Preparations.

Assay. Determine as described under Assay of Insulins (2.3.46).

Test solution. To 10 ml of the preparation under examination add 40 µl of *5 M hydrochloric acid*, mix well, allow to stand for 1 hour to ensure solution of the sediment and dilute with *0.03 M hydrochloric acid* to obtain a solution containing 40 IU per ml.

Insulin Zinc Suspension

I.Z.S; Insulin Zinc Suspension (Mixed); I.Z.S (Mixed); Insulin Lente

Insulin Zinc Suspension is a sterile, buffered suspension of Insulin in the form of a complex obtained by the addition of zinc chloride to insulin in a manner such that the insulin is in a form insoluble in *water*. It may be prepared by mixing aseptically about 3 volumes of Insulin Zinc Suspension (Amorphous) and about 7 volumes of Insulin Zinc Suspension (Crystalline) and distributing the mixture aseptically into sterile containers which are then sealed so as to exclude micro-organisms.

Insulin Zinc Suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated number of IU of Insulin.

Usual strengths. 40 IU per ml; 80 IU per ml.

Description. A white suspension which on standing deposits a white sediment and leaves an almost colourless supernatant liquid. The sediment is readily resuspended on gentle shaking. When examined under a microscope, the majority of the particles in the suspension are seen as rhombohedral crystals, with a maximum dimension greater than 10 µm but rarely exceeding 40 µm; a considerable number of particles have no uniform shape and do not exceed 2 µm in maximum dimension.

Identification

In the Assay, the principal peak due to insulin in the chromatogram obtained with test solution has a retention time similar to that of the principal peak in the chromatogram obtained with reference solution (a), (b) or (c) as appropriate.

Tests

pH (2.4.24). 6.9 to 7.5.

Total zinc. Not more than 0.0095 per cent w/v (for preparations containing 40 IU per ml) and not more than 0.014 per cent w/v (for preparations containing 80 IU per ml), determined by the following method. Take a volume of the well-shaken suspension containing 200 IU of insulin and add 1 ml of *0.1M hydrochloric acid*, 10 ml of *alkaline borate buffer pH 9.0*, 1 ml of *0.1M sodium hydroxide*, 2 ml of a 0.0009 per cent w/v solution of *trypsin* in *0.01M hydrochloric acid*. Mix, allow to stand for 10 minutes and add 3 ml of *zincon solution* and sufficient *water* to produce 50 ml. Allow to stand for 1 hour and measure the absorbance of the resulting solution at about 620 nm (2.4.7), using as the blank a solution prepared by treating 5 ml of *water* instead of the substance under examination in a similar manner. Calculate the content of zinc from the absorbance obtained by repeating the procedure using a suitable aliquot of a mixture of 4 volumes of *zinc sulphate solution* and 6 volumes of *water*.

Zinc in solution. Not more than 70 per cent of the total zinc (for preparations containing 40 IU per ml) and not more than 55 per cent of the total zinc (for preparations containing 80 IU per ml), determined by the method described in the test for Total zinc, using 1 ml of the clear supernatant liquid obtained by centrifuging and beginning at the words "add 1 ml of *0.1M hydrochloric acid,.....*".

Insulin extractable with buffered acetone solution. 27 per cent to 40 per cent, determined by the following method. Centrifuge a volume containing 400 IU and reject the supernatant liquid. Suspend the residue in 3.3 ml of *water*, add 6.6 ml of *buffered acetone solution*, stir for 3 minutes and again centrifuge. Transfer the supernatant liquid as completely as possible to a long-necked, round-bottomed flask, add 0.3 g of *nitrogen-free mercuric oxide*, 3 g of *anhydrous sodium sulphate*, and 6 ml of *nitrogen-free sulphuric acid*, heat over a low flame until the liquid is colourless and boil for a further 30 minutes. Allow to cool, dilute carefully with *water*, add 1 g of *zinc powder*, shake and allow to stand for 10 minutes. Add an excess of *sodium hydroxide solution*, immediately connect the flask to an ammonia distillation apparatus, mix the contents and distil the liberated ammonia into 20 ml of *0.005 M sulphuric acid* prepared with *carbon dioxide-free water*. Rinse the condenser

tube into the flask containing the distillate, add sufficient *carbon dioxide-free water* to produce a total volume of about 50 ml and titrate the excess of *sulphuric acid* with *0.01 M sodium hydroxide* to pH 6.0, using a glass electrode. Centrifuge a further volume containing 400 IU and reject the supernatant liquid. Dissolve the residue in 10 ml of a 5 per cent w/v solution of *nitrogen-free sulphuric acid*, transfer to a long-necked, round-bottomed flask, and repeat the procedure described above beginning at the words "add 0.3 g of *nitrogen-free mercuric oxide*,....". Calculate the percentage of insulin extractable with the buffered acetone solution from the formula $100A/B$, where A is the volume of *0.005 M sulphuric acid* used in the first determination and B is the volume used in the second determination.

The result of the test is not valid unless in carrying out the first determination omitting the insulin preparation, not more than 0.2 ml of *0.005 M sulphuric acid* is required.

Insulin in solution. Determine by liquid chromatography (2.4.14).

Test solution. For preparations containing 100 IU per ml Centrifuge a well-shaken suspension of the preparation under examination, transfer 2.0 ml of the supernatant liquid to a 5 ml volumetric flask, dilute to volume with *0.03 M hydrochloric acid* and mix well.

Reference solution (a). Prepare as test solution but using 2.5 ml of the supernatant liquid in place of 2.0 ml.

Reference solution (b). Use 5 ml of the supernatant liquid.

Reference solution (c). Weigh 4.5 mg of *bovine insulin IPRS* into a 100-ml volumetric flask containing 50 ml of *0.025 M hydrochloric acid*, dissolve by shaking for 5 minutes, dilute to volume with *0.025 M hydrochloric acid* and mix to obtain a solution containing approximately 1 Unit per ml.

Use the chromatographic system as described under Assay.

The area of the peak due to insulin in the chromatogram obtained with test solution, reference solution (a) or reference (b), as the case may be, is not more than that of the principal peak in the chromatogram obtained with reference solution (c).

Bacterial endotoxins (2.2.3). Not more than 80 Endotoxin Units per 100 Units of insulin.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. To 10 ml of the preparation under examination add 40 ml of *5 M hydrochloric acid*, mix well, allow to stand for 1 hour to ensure solution of the sediment and dilute with *0.03 M hydrochloric acid* to obtain a solution containing 20 IU per ml.

Reference solution (a). A 0.08 per cent w/v of *bovine insulin IPRS* in *0.025 M hydrochloric acid*.

Reference solution (b). A 0.08 per cent w/v of *porcine insulin IPRS* in *0.025 M hydrochloric acid*.

Reference solution (c). A solution containing 0.04 per cent w/v of *bovine insulin IPRS* and 0.04 per cent w/v of *porcine insulin IPRS* in *0.025 M hydrochloric acid* for a preparation containing both bovine and pork insulin.

Reference solution (d). A 0.04 per cent w/v each of *human insulin IPRS* and *porcine insulin IPRS* in *0.025 M hydrochloric acid*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Ultrasphere ODS),
- column temperature. 45°,
- mobile phase. a mixture of 72.5 volumes of *0.1 M sodium dihydrogen phosphate* adjusted to pH 2.0 with *orthophosphoric acid* and 27.5 volumes of *acetonitrile*,
- flow rate 1 ml per minute,
- spectrophotometer set at 214 nm,
- injection volume: 50 µl.

The test is not valid unless the resolution factor between the peaks corresponding to human insulin and porcine insulin is at least 1.2 in the chromatogram obtained with reference solution (d). If necessary, adjust the concentration of *acetonitrile* in the mobile phase by slight decrease or increase until the required resolution is obtained. In the chromatogram obtained with reference solution (d) the two principal peaks, in order of emergence, are due to human insulin and porcine insulin and any smaller peaks appearing immediately following each of the principal peaks are due to the corresponding monodesamido derivatives.

Inject either of reference solution (a), (b) and (c). The test is not valid unless the relative standard deviation of the area of the principal peak is not more than 2.0 per cent.

Inject the test solution. If necessary, make further adjustments in the composition of the mobile phase so that the antimicrobial preservatives present in test solution are well separated from insulin and show shorter retention times. A small reduction in the concentration of *acetonitrile* increases the retention time of insulin peak relatively more than those of the preservatives. If necessary, after having carried out the chromatography of a solution, wash the column with a mixture of equal volumes of *acetonitrile* and *water* for a sufficient time in order to elute any interfering substances before injecting the next solution.

Calculate the content of insulin from the area of the peaks due to the bovine, porcine or human insulin and that of any peak due to the monodesamido derivative of the insulin from the

declared content of insulin in *bovine insulin IPRS, porcine insulin IPRS* or *human insulin IPRS*, as appropriate. For preparations containing both bovine and porcine insulin use the sum of the areas of both the bovine and porcine insulin peaks and of any peak due to the desamido derivative of either insulin.

Storage. Store in multiple dose containers at a temperature between 2° and 8°. It should not be allowed to freeze.

Labelling. The label states (1) the strength in terms of the number of IU per ml; (2) the animal source or sources of the insulin; (3) that the preparation should not be allowed to freeze; (4) that the container should be gently shaken before a dose is withdrawn; (5) the storage conditions.

Insulin Zinc Suspension (Amorphous)

Amorph. I.Z.S.; Prompt Insulin Zinc Suspension

Insulin Zinc Suspension (Amorphous) is a sterile, buffered suspension of Insulin in the form of a complex obtained by the addition of zinc chloride to insulin in a manner such that the solid phase of the suspension is amorphous. It may be prepared by adding aseptically to crystalline insulin having a potency not less than 23 IU per mg, calculated on the dried basis, a suitable quantity of zinc chloride, an appropriate amount of a suitable substance to render the preparation isotonic with blood and a sufficient quantity of a suitable bactericide. It is distributed aseptically into sterile containers which are then sealed so as to exclude micro-organisms.

Insulin Zinc Suspension (Amorphous) contains not less than 90.0 per cent and not more than 110.0 per cent of the stated number of IU of Insulin.

Category. Hypoglycaemic.

Usual strengths. 40 IU per ml; 80 IU per ml.

Description. A white suspension which on standing deposits a white sediment and leaves an almost colourless supernatant liquid. The sediment is readily resuspended on gentle shaking. When examined under a microscope, the particles in the suspension are seen to have no uniform shape and rarely exceed 2 µm in maximum dimension.

Identification

In the Assay, the principal peak due to insulin in the chromatogram obtained with test solution has a retention time similar to that of the principal peak in the chromatogram obtained with reference solution (a), (b) or (c) as appropriate.

Tests

pH (2.4.24). 6.9 to 7.5.

Total zinc. Not more than 0.0095 per cent w/v (for preparations containing 40 IU per ml) and not more than 0.014 per cent w/v (for preparations containing 80 IU per ml), determined by the following method. Take a volume of the well-shaken suspension containing 200 IU of insulin and add 1 ml of *0.1 M hydrochloric acid*, 10 ml of *alkaline borate buffer pH 9.0*, 1 ml of *0.1 M sodium hydroxide*, 2 ml of a 0.0009 per cent w/v solution of *trypsin* in *0.01 M hydrochloric acid*. Mix, allow to stand for 10 minutes and add 3 ml of *zincon solution* and sufficient *water* to produce 50 ml. Allow to stand for 1 hour and measure the absorbance of the resulting solution at about 620 nm (2.4.7), using as the blank a solution prepared by treating 5 ml of *water* instead of the substance under examination in a similar manner. Calculate the content of zinc from the absorbance obtained by repeating the procedure using a suitable aliquot of a mixture of 4 volumes of *zinc sulphate solution* and 6 volumes of *water*.

Zinc in solution. Not more than 70 per cent of the total zinc (for preparations containing 40 IU per ml) and not more than 55 per cent of the total zinc (for preparations containing 80 IU per ml), determined by the method described in the test for Total zinc, using 1 ml of the clear supernatant liquid obtained by centrifuging and beginning at the words "add 1 ml of *0.1 M hydrochloric acid*,.....".

Insulin in solution. Determine by liquid chromatography (2.4.14).

Test solution. (for preparations containing 100 IU per ml) centrifuge a well-shaken suspension of the preparation under examination, transfer 2.0 ml of the supernatant liquid to a 5 ml volumetric flask, dilute to volume with *0.03 M hydrochloric acid* and mix well.

Reference solution (a). Prepare as test solution but using 2.5 ml of the supernatant liquid in place of 2.0 ml.

Reference solution (b). Use 5 ml of the supernatant liquid.

Reference solution (c). Weigh 4.5 mg of *bovine insulin IPRS* into a 100-ml volumetric flask containing 50 ml of *0.025 M hydrochloric acid*, dissolve by shaking for 5 minutes, dilute to volume with *0.025 M hydrochloric acid* and mix to obtain a solution containing approximately 1 Unit per ml.

Use the chromatographic system as described under Assay.

The area of the peak due to insulin in the chromatogram obtained with test solution, reference solution (a) or (b), as the case may be, is not more than that of the principal peak in the chromatogram obtained with reference solution (c).

Bacterial endotoxins (2.2.3). Not more than 80 Endotoxin Units per 100 Units of insulin.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. To 10 ml of the preparation under examination add 40 ml of *5 M hydrochloric acid*, mix well, allow to stand for 1 hour to ensure solution of the sediment and dilute with *0.03 M hydrochloric acid* to obtain a solution containing 20 IU per ml.

Reference solution (a). A 0.08 per cent w/v of *bovine insulin IPRS* in *0.025 M hydrochloric acid*.

Reference solution (b). A 0.08 per cent w/v of *porcine insulin IPRS* in *0.025 M hydrochloric acid*.

Reference solution (c). A solution containing 0.04 per cent w/v of *bovine insulin IPRS* and 0.04 per cent w/v of *porcine insulin IPRS* in *0.025 M hydrochloric acid* for a preparation containing both bovine and pork insulin.

Reference solution (d). A 0.04 per cent w/v each of *human insulin IPRS* and *porcine insulin IPRS* in *0.025 M hydrochloric acid*.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- column. temperature 45°,
- mobile phase. a mixture of 72.5 volumes of *0.1 M sodium dihydrogen phosphate* adjusted to pH 2.0 with *phosphoric acid* and 27.5 volumes of *acetonitrile*,
- flow rate 1 ml per minute.
- spectrophotometer set at 214 nm,
- injection volume: 50 µl.

The test is not valid unless the resolution factor between the peaks corresponding to human insulin and porcine insulin is at least 1.2 in the chromatogram obtained with reference solution (d). If necessary, adjust the concentration of *acetonitrile* in the mobile phase by slight decrease or increase until the required resolution is obtained. In the chromatogram obtained with reference solution (d) the two principal peaks, in order of emergence, are due to human insulin and porcine insulin and any smaller peaks appearing immediately following each of the principal peaks are due to the corresponding monodesamido derivatives.

Inject either of reference solution (a), (b) and (c). The test is not valid unless the relative standard deviation of the area of the principal peak is not more than 2.0 per cent.

Inject the test solution. If necessary, make further adjustments in the composition of the mobile phase so that the antimicrobial preservatives present in test solution are well separated from insulin and show shorter retention times. A small reduction in the concentration of acetonitrile increases the retention time of insulin peak relatively more than those of the preservatives. If necessary, after having carried out the chromatography of a solution, wash the column with a mixture of equal volumes of *acetonitrile* and *water* for a sufficient time in order to elute any interfering substances before injecting the next solution.

Calculate the content of insulin from the area of the peaks due to the bovine, porcine or human insulin and that of any peak due to the monodesamido derivative of the insulin from the declared content of insulin in *bovine insulin IPRS, porcine insulin IPRS* or *human insulin IPRS*, as appropriate. For preparations containing both bovine and porcine insulin use the sum of the areas of both the bovine and porcine insulin peaks and of any peak due to the desamido derivative of either insulin.

Storage. Store in multiple dose containers at a temperature between 2° and 8°. It should not be allowed to freeze.

Labelling. The label states (1) the strength in terms of the number of IU per ml; (2) the animal source or sources of the insulin; (3) that the preparation should not be allowed to freeze; (4) that the container should be gently shaken before a dose is withdrawn; (5) the storage conditions.

Insulin Zinc Suspension (Crystalline)

Cryst. I.Z.S.; Extended Insulin Zinc Suspension

Insulin Zinc Suspension (Crystalline) is a sterile, buffered suspension of Insulin in the form of a complex obtained by the addition of zinc chloride to insulin in a manner such that the insulin is in the form of crystals insoluble in *water*. It may be prepared by adding aseptically to crystalline insulin having a potency not less than 23 IU per mg, calculated with reference to the dried substance, a suitable quantity of zinc chloride, an appropriate amount of a suitable substance to render the preparation isotonic with blood and a sufficient quantity of a suitable bactericide. The solution is partially neutralised to allow crystallisation to occur and the pH of the crystalline suspension is adjusted to about 7.2. The suspension is distributed aseptically into sterile containers which are then sealed so as to exclude micro-organisms.

Insulin Zinc Suspension (Crystalline) contains not less than 90.0 per cent and not more than 110.0 per cent of the stated number of IU of Insulin.

Category. Hypoglycaemic.

Usual strengths. 40 IU per ml; 80 IU per ml.

Description. A white suspension which on standing deposits a white sediment and leaves an almost colourless supernatant liquid. The sediment is readily resuspended on gentle shaking. When examined under a microscope, the particles in the suspension are seen to be rhombohedral crystals, the majority

having a maximum dimension greater than 10 µm but rarely exceeding 40 µm.

Identification

In the Assay, the principal peak due to insulin in the chromatogram obtained with test solution has a retention time similar to that of the principal peak in the chromatogram obtained with reference solution (a), (b) or (c) as appropriate.

Tests

pH (2.4.24). 6.9 to 7.5.

Total zinc. Not more than 0.0095 per cent w/v (for preparations containing 40 IU per ml) and not more than 0.014 per cent w/v (for preparations containing 80 IU per ml), determined by the following method. Take a volume of the well-shaken suspension containing 200 IU of insulin and add 1 ml of *0.1 M hydrochloric acid*, 10 ml of *alkaline borate buffer pH 9.0*, 1 ml of *0.1 M sodium hydroxide*, 2 ml of a 0.0009 per cent w/v solution of *trypsin* in *0.01 M hydrochloric acid*. Mix, allow to stand for 10 minutes and add 3 ml of *zincon solution* and sufficient *water* to produce 50 ml. Allow to stand for 1 hour and measure the absorbance of the resulting solution at about 620 nm (2.4.7), using as the blank a solution prepared by treating 5 ml of *water* instead of the substance under examination in a similar manner. Calculate the content of zinc from the absorbance obtained by repeating the procedure using a suitable aliquot of a mixture of 4 volumes of *zinc sulphate solution* and 6 volumes of *water*.

Zinc in solution. Not more than 70 per cent of the total zinc (for preparations containing 40 IU per ml) and not more than 55 per cent of the total zinc (for preparations containing 80 IU per ml), determined by the method described in the test for Total zinc, using 1 ml of the clear supernatant liquid obtained by centrifuging and beginning at the words "add 1 ml of *0.1 M hydrochloric acid*,.....".

Insulin extractable with buffered acetone solution. Not more than 15 per cent, determined by the following method. Centrifuge a volume containing 400 IU and reject the supernatant liquid. Suspend the residue in 3.3 ml of *water*, add 6.6 ml of *buffered acetone solution*, stir for 3 minutes and again centrifuge. Transfer the supernatant liquid as completely as possible to a long-necked, round-bottomed flask, add 0.3 g of *nitrogen-free mercuric oxide*, 3 g of *anhydrous sodium sulphate*, and 6 ml of *nitrogen-free sulphuric acid*, heat over a low flame until the liquid is colourless and boil for a further 30 minutes. Allow to cool, dilute carefully with *water*, add 1 g of *zinc powder*, shake and allow to stand for 10 minutes. Add an excess of *sodium hydroxide solution*, immediately connect the flask to an ammonia distillation apparatus, mix the contents and distil the liberated ammonia into 20 ml of *0.005 M sulphuric acid* prepared with *carbon dioxide-free water*. Rinse the condenser tube into the flask containing the distillate, add sufficient *carbon dioxide-free water* to produce a total volume of about 50 ml and titrate the excess of sulphuric acid with *0.01 M sodium hydroxide* to pH 6.0, using a glass electrode. Centrifuge a further volume containing 400 IU and reject the supernatant liquid. Dissolve the residue in 10 ml of a 5 per cent w/v solution of *nitrogen-free sulphuric acid*, transfer to a long-necked, round-bottomed flask, and repeat the procedure described above beginning at the words "add 0.3 g of *nitrogen-free mercuric oxide*,.....". Calculate the percentage of insulin extractable with the buffered acetone solution from the formula $100A/B$, where A is the volume of *0.005 M sulphuric acid* used in the first determination and B is the volume used in the second determination.

The result of the test is not valid unless in carrying out the first determination omitting the insulin preparation, not more than 0.2 ml of *0.005 M sulphuric acid* is required.

Insulin in solution. Determine by liquid chromatography (2.4.14).

Test solution. For preparations containing 100 IU per ml. Centrifuge a well-shaken suspension of the preparation under examination, transfer 2.0 ml of the supernatant liquid to a 5 ml volumetric flask, dilute to volume with *0.03 M hydrochloric acid* and mix well.

Reference solution (a). Prepare as the test solution but using 2.5 ml of the supernatant liquid in place of 2.0 ml.

Reference solution (b). Use 5 ml of the supernatant liquid.

Reference solution (c). Weigh 4.5 mg of *bovine insulin IPRS* into a 100-ml volumetric flask containing 50 ml of *0.025 M hydrochloric acid*, dissolve by shaking for 5 minutes, dilute to volume with *0.025 M hydrochloric acid* and mix to obtain a solution containing approximately 1 Unit per ml.

Use the chromatographic system as described under Assay.

The area of the peak due to insulin in the chromatogram obtained with test solution, reference solution (a) or reference (b), as the case may be, is not more than that of the principal peak in the chromatogram obtained with reference solution (c).

Bacterial endotoxins (2.2.3). Not more than 80 Endotoxin Units per 100 Units of insulin.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. To 10 ml of the preparation under examination add 40 ml of *5 M hydrochloric acid*, mix well, allow to stand for 1 hour to ensure solution of the sediment and dilute with *0.03 M hydrochloric acid* to obtain a solution containing 20 IU per ml.

Reference solution (a). A 0.08 per cent w/v of *bovine insulin IPRS* in *0.025 M hydrochloric acid*.

Reference solution (b). A 0.08 per cent w/v of *porcine insulin IPRS* in *0.025 M hydrochloric acid*.

Reference solution (c). A solution containing 0.04 per cent w/v of *bovine insulin IPRS* and 0.04 per cent w/v of *porcine insulin IPRS* in *0.025 M hydrochloric acid* for a preparation containing both bovine and pork insulin.

Reference solution (d). A 0.04 per cent w/v each of *human insulin IPRS* and *porcine insulin IPRS* in *0.025 M hydrochloric acid*.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm packed with octadecylsilane chemically bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase. a mixture of 72.5 volumes of *0.1 M sodium dihydrogen phosphate* adjusted to pH 2.0 with *orthophosphoric acid* and 27.5 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 214 nm,
- injection volume: 50 µl.

The test is not valid unless the resolution factor between the peaks corresponding to human insulin and porcine insulin is at least 1.2 in the chromatogram obtained with reference solution (d). If necessary, adjust the concentration of *acetonitrile* in the mobile phase by slight decrease or increase until the required resolution is obtained. In the chromatogram obtained with reference solution (d) the two principal peaks, in order of emergence, are due to human insulin and porcine insulin and any smaller peaks appearing immediately following each of the principal peaks are due to the corresponding monodesamido derivatives.

Inject either of reference solution (a), (b) and (c). The test is not valid unless the relative standard deviation of the area of the principal peak is not more than 2.0 per cent.

Inject the test solution. If necessary, make further adjustments in the composition of the mobile phase so that the antimicrobial preservatives present in test solution are well separated from insulin and show shorter retention times. A small reduction in the concentration of *acetonitrile* increases the retention time of insulin peak relatively more than those of the preservatives. If necessary, after having carried out the chromatography of a solution, wash the column with a mixture of equal volumes of *acetonitrile* and *water* for a sufficient time in order to elute any interfering substances before injecting the next solution.

Calculate the content of insulin from the area of the peaks due to the bovine, porcine or human insulin and that of any peak due to the monodesamido derivative of the insulin from the declared content of insulin in *bovine insulin IPRS*, *porcine insulin IPRS* or *human insulin IPRS*, as appropriate. For preparations containing both bovine and porcine insulin use the sum of the areas of both the bovine and porcine insulin peaks and of any peak due to the desamido derivative of either insulin.

Storage. Store in multiple dose containers at a temperature between 2° and 8°. It should not be allowed to freeze.

Labelling. The label states (1) the strength in terms of the number of IU per ml; (2) the animal source or sources of the insulin; (3) that the preparation should not be allowed to freeze; (4) that the container should be gently shaken before a dose is withdrawn; (5) the storage conditions.

Invert Sugar Injection

Invert Sugar Injection is a sterile solution of a mixture of equal amounts of Dextrose and Fructose in Water for Injections, or an equivalent sterile solution produced by the hydrolysis of Sucrose in Water for Injections. It contains no antimicrobial agent.

Invert Sugar Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the labelled amount of $C_6H_{12}O_6$.

Usual strengths. 5, 10, and 20 per cent w/v.

Description. A clear, colourless or faintly straw-coloured solution.

Identification

To 1 ml add 0.05 ml of *potassium cupri-tartrate solution*; the solution remains blue and clear. Heat to boiling, a copious red precipitate is formed.

Tests

pH (2.4.24). 3.0 to 6.5.

5-Hydroxymethylfurfural and Related substances. Dilute a volume containing 1.0 g of invert sugar to 500.0 ml with *water* and measure the absorbance (2.4.7) of the resulting solution at the maximum at about 284 nm; absorbance at about 284 nm, not more than 0.25.

Heavy metals (2.3.13). A solution prepared by evaporating a volume containing 4.0 g of invert sugar to 10 ml and adding 2 ml of *dilute acetic acid* and sufficient *water* to produce 25 ml complies with the limit test for heavy metals, Method A (5 ppm).

Chlorides (2.3.12). 2 ml of the injection complies with the limit test for chlorides (125 ppm).

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Completeness of inversion

NOTE — Invert Sugar Injection that is produced by mixing Dextrose and Fructose is exempt from this test.

Determine by liquid chromatography (2.4.14).

Test solution. Transfer a measured volume of the preparation under examination containing about 2.5 g of invert sugar to a 100-ml volumetric flask, dilute to volume with *water* and mix.

Reference solution. Prepare a solution in *water* containing known concentrations of about 0.25 mg of sucrose and about 12.5 mg of dextrose per ml.

Chromatographic system

- a stainless steel column 30 cm x 7.8 mm, packed with a strong cation-exchange resin consisting of sulphonated cross-linked styrene-divinylbenzene copolymer in the calcium form (9 µm),
- column temperature: 40°,
- mobile phase: *water*,
- flow rate: 1 ml per minute,
- refractive index detector,
- injection volume: 20 µl.

Inject the reference solution. The sucrose elutes first and the peak is baseline separated from the dextrose peak. The relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution and measure the responses for the sucrose peak. Calculate the content of sucrose in the volume taken of the preparation under examination. Not more than 1.5 per cent of the quantity of invert sugar in the volume taken of the preparation under examination, based on the value stated on the label, is found.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Transfer 50.0 ml of *cupri-tartaric solution* into a 400 ml beaker, add 48 ml of *water*, mix and add 2.0 ml of the preparation under examination that has been diluted quantitatively with *water*, if necessary, to a 5.0 per cent concentration. Cover the beaker with a watch glass, heat the solution, regulating the heat so that boiling begins in 4 minutes and continue boiling for 2 minutes. Filter the hot solution at once through a tared porcelain filtering crucible, wash the precipitate with water maintained at 60°, then with 10 ml of *ethanol (95 per cent)*. Dry at 105° to constant weight. Carry out a blank determination and make any necessary correction. The corrected weight of the precipitate so obtained is not less than 204.0 mg and not more than 224.4 mg.

Storage. Store in single dose containers at a temperature not exceeding 30°.

Labelling. The label states (1) whether it is produced by hydrolysis of Sucrose or by mixing Dextrose and Fructose; (2) the strength as the percentage w/v of invert sugar; (3) total osmolar concentration in mOsmol per litre; (4) that the injection should not be used if it contains visible particles.

Invert Sugar and Sodium Chloride Injection

Sodium Chloride and Invert Sugar Intravenous Infusion

Invert Sugar and Sodium Chloride Injection is a sterile solution of a mixture of equal amounts of Dextrose and Fructose in Water for Injections to which the required amount of Sodium Chloride is added. Invert sugar may be prepared by acid hydrolysis of Sucrose.

Invert Sugar and Sodium Chloride Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amounts of sodium chloride, NaCl, and invert sugar, $C_6H_{12}O_6$. It contains no antimicrobial agent.

Usual strengths. Injections containing the following amounts of Sodium Chloride, NaCl, and invert sugar, $C_6H_{12}O_6$.

Sodium Chloride (NaCl) (per cent w/v)	Invert Sugar ($C_6H_{12}O_6$) (per cent w/v)
0.45	5
0.45	10
0.90	5
0.90	10

Description. A clear, colourless or faintly straw-coloured solution.

Identification

A. To 1 ml add 0.05 ml of *potassium cupri-tartrate solution*; the solution remains blue and clear. Heat to boiling, a copious red precipitate is formed.

B. It gives reaction (A) of chlorides and reaction (B) of sodium salts (2.3.1).

Tests

pH (2.4.24). 3.0 to 6.5.

5-Hydroxymethylfurfural and Related substances. Dilute a volume containing 1.0 g of invert sugar to 500.0 ml with *water*

and measure the absorbance (2.4.7) of the resulting solution at the maximum at about 284 nm; absorbance at about 284 nm, not more than 0.25.

Completeness of inversion

NOTE — Invert Sugar and Sodium Chloride Injection that is produced by mixing Dextrose and Fructose is exempt from this test.

Determine by liquid chromatography (2.4.14).

Test solution. Transfer a measured volume of the preparation under examination containing about 2.5 g of invert sugar to a 100-ml volumetric flask, dilute to volume with *water* and mix.

Reference solution. Prepare a solution in *water* containing known concentrations of 0.25 mg of sucrose and 12.5 mg of dextrose per ml.

Chromatographic system

- a stainless steel column 30 cm x 7.8 mm, packed with a strong cation-exchange resin consisting of sulphonated cross-linked styrene-divinylbenzene copolymer in the calcium form (9 µm),
- column temperature: 40°,
- mobile phase: *water*,
- flow rate: 1 ml per minute,
- refractive index detector,
- injection volume: 20 µl.

Inject the reference solution. The sucrose elutes first and the peak is baseline separated from the dextrose peak. The relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution and measure the responses for the sucrose peak. Calculate the content of sucrose in the volume taken of the preparation under examination. Not more than 1.5 per cent of the quantity of invert sugar in the volume taken of the preparation under examination, based on the value stated on the label, is found.

Heavy metals (2.3.13). A solution prepared by evaporating a volume containing 4.0 g of invert sugar to 10 ml and adding 2 ml of *dilute acetic acid* and sufficient *water* to produce 25 ml complies with the limit test for heavy metals, Method A (5 ppm).

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. *For sodium chloride* — Titrate a measured volume containing about 0.1 g of Sodium Chloride with *0.1 M silver nitrate* using *potassium chromate solution* as indicator. 1 ml of *0.1 M silver nitrate* is equivalent to 0.005844 g of NaCl.

For invert sugar — Transfer 50.0 ml of *cupri-tartaric solution* into a 400-ml beaker, add 48 ml of *water*, mix and add 2.0 ml of the preparation under examination that has been diluted quantitatively with *water*, if necessary, to a 5.0 per cent concentration. Cover the beaker with a watch glass, heat the solution, regulating the heat so that boiling begins in 4 minutes and continue boiling for 2 minutes. Filter the hot solution at once through a tared porcelain filtering crucible, wash the precipitate with water maintained at 60°, then with 10 ml of *ethanol (95 per cent)*. Dry at 105° to constant weight. Carry out a blank determination and make any necessary correction. The corrected weight of the precipitate so obtained is not less than 204.0 mg and not more than 224.4 mg.

Storage. Store in single dose containers at a temperature not exceeding 30°.

Labelling. The label states (1) whether it is produced by hydrolysis of Sucrose or by mixing Dextrose and Fructose; .(2) the strength as the percentage w/v of sodium chloride and invert sugar; (3) total osmolar concentration in mOsmol per litre; (4) approximate concentrations, in millimoles per litre, of the sodium and chloride ions; (5) that the injection should not be used if it contains visible particles.

Invert Syrup

Invert Syrup is a mixture of glucose and fructose prepared by hydrolysing a 66.7 per cent w/w solution of Sucrose with a suitable mineral acid, such as hydrochloric acid and neutralising the resulting solution using calcium carbonate or sodium carbonate. The degree of inversion is at least 95 per cent.

Invert Syrup contains not less than 67.0 per cent w/w of the stated amount of reducing sugars, expressed as invert sugar.

Category. Sweetener.

Description. A clear, colourless to pale straw-coloured syrupy liquid. Miscible with *water*, producing a clear solution; it dissolves in *ethanol (95 per cent)* with the formation of an insoluble residue.

Identification

A. Heat 1 g with 10 ml of *water* and 5 ml of *cupri-tartaric solution*, a red precipitate is formed.

B. A solution in *water* is laevorotatory.

Tests

pH (2.4.24). 5.0 to 6.0.

Arsenic (2.3.10). To 4.0 g, add 50 ml of *water* and 10 ml of *brominated hydrochloric acid*, allow to stand for 5 minutes and remove the excess of bromine by adding *tin(II) chloride solution AsT* and dilute to 100 ml with *water*. 25 ml of the solution complies with the limit test for arsenic (1 ppm), using 1 ml of arsenic standard solution (1 ppm).

Lead (2.3.15). Prepare two solutions as follows. For solution (a) add 5 ml of *6 M acetic acid* to 12 g of the syrup. For solution (b) add 5 ml of *6 M acetic acid* and 2 ml of *lead standard solution (10 ppm Pb)* to 2.0 g of the syrup. Make solution (a) and (b) alkaline with *5 M ammonia*, if necessary, and to each add 1 ml of *potassium cyanide solution PbT*. The solutions should not be more than faintly opalescent. If the colours of the solutions differ, equalise by the addition of a few drops of a highly diluted solution of burnt sugar or other non-reactive substance. Dilute each solution to 50 ml with *water*, add 0.1 ml of a 10 per cent w/v solution of *sodium sulphide* to each and mix thoroughly. When viewed against a white background, the colour produced in solution (a) is not more intense than that produced in solution (b) (2 ppm).

Refractive index (2.4.27). 1.4608 to 1.4630.

Sulphur dioxide (2.3.40). Not more than 70 ppm.

Weight per ml (2.4.29). 1.338 to 1.344 g.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Dilute the syrup so that the volume of the diluted solution required in the following method is between 15 to 50 ml. Add 10.0 ml of *cupri-tartaric solution* to a 300-ml conical flask, add from a burette 15 ml of the diluted solution, heat to boiling over wire gauze covered with insulating material and continue adding the diluted solution in quantities of about 5 ml at 15-second intervals until the colour of the mixture indicates that the reduction appears to be almost complete. Boil for 2 minutes, add 0.2 ml of a 1 per cent w/v solution of *methylene blue* and continue the titration until the blue colour is discharged. Repeat the operation, but, before heating, add almost the full quantity of the diluted solution required to reduce all the copper and then boil moderately for 2 minutes. Without removing the flask from either the gauze or the flame during the remainder of the titration, add 0.2 ml of the *methylene blue* solution and continue the titration so that it is just complete in a total boiling time of exactly 3 minutes, the end point is indicated by the disappearance of the blue colour, the solution becoming orange.

Calculate the content of reducing sugar expressed as invert sugar in 100 ml of the diluted solution from the table.

Quantity of prepared solution required ml	Invert sugar factor*	Quantity of invert sugar per 100 ml mg
15	50.5	336.0

50	52.5	105.1

* mg of invert sugar corresponding to 10.0 ml of *cupri-tartaric solution*.

Storage. Store at a temperature between 35° to 45°.

Iodine

I_2 Mol. Wt. 253.8

Iodine contains not less than 99.5 per cent and not more than 100.5 per cent of I_2.

Category. Antiseptic; used in the treatment of thyroid deficiency.

Description. Greyish violet brittle plates or small crystals with a metallic sheen. It volatalises slowly at room temperature.

Identification

A. When heated gently it gives violet vapours which condense forming a bluish-black crystalline sublimate.

B. A saturated solution yields a blue colour in the presence of *starch solution* which disappears when the solution is heated and reappears when it is cooled.

Tests

Bromides and chlorides. Not more than 250 ppm, determined by the following method. Triturate 3.0 g with 20 ml of *water*, filter, wash the filter, dilute the filtrate to 30 ml with *water* and add 1 g of *zinc powder*. When the solution is decolorised, filter and wash the filter with sufficient *water* to produce 40 ml of filtrate. To 10 ml of the solution add 3 ml of *10 M ammonia* and 6 ml of *silver nitrate solution*, filter, wash the filter with *water* and dilute to 20 ml with *water*. To 10 ml of the filtrate add 1.5 ml of *nitric acid*. After 1 minute any opalescence produced is not more intense than that produced in a solution prepared at the same time by mixing 10.75 ml of *water*, 0.25 ml of *0.01 M hydrochloric acid*, 0.2 ml of *2 M nitric acid* and 0.3 ml of *silver nitrate solution*.

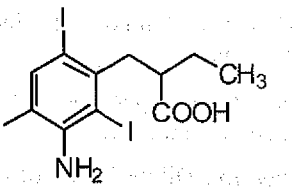
Non-volatile matter. Not more than 0.1 per cent, determined by heating 1.0 g in a porcelain dish on a water-bath until the iodine has volatilised and drying the residue at 105°.

Assay. Weigh 0.2 g, transfer to a flask containing 1 g of *potassium iodide* and 2 ml of *water*, add 1 ml of *2 M acetic acid*, dissolve completely and add 50 ml of *water*. Titrate with *0.1 M sodium thiosulphate* using *starch solution* as indicator.

1 ml of *0.1 M sodium thiosulphate* is equivalent to 0.01269 g of I.

Storage. Store in ground-glass-stoppered containers or in earthenware containers with waxed bungs.

Iopanoic Acid



$C_{11}H_{12}I_3NO_2$ Mol. Wt. 570.9

Iopanoic Acid is (*RS*)-2-(3-amino-2,4,6-tri-iodobenzyl)butanoic acid.

Iopanoic Acid contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{11}H_{12}I_3NO_2$, calculated on the dried basis.

Category. Antihyperthyroidism.

Description. A white or yellowish-white powder.

Identification

Tests B and C may be omitted if tests A is carried out. Tests A may be omitted if tests B and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *iopanoic acid IPRS* or with the reference spectrum of iopanoic acid.

B. Spray the plate obtained in the test for Related substances with a 0.1 per cent w/v solution of *4-dimethylamino-cinnamaldehyde* in a mixture of 1 volume of *hydrochloric acid* and 99 volumes of *ethanol (95 per cent)*. The principal spot in the chromatogram obtained with test solution (b) corresponds to the spot in the chromatogram obtained with reference solution (a).

C. Heat 50 mg carefully in a small porcelain dish over a flame; violet vapour is evolved.

Tests

Appearance of solution. A 5.0 per cent w/v solution in *1 M sodium hydroxide* is clear (2.4.1) and not more intensely coloured than reference solution YS3 (2.4.1).

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 10 volumes of *concentrated ammonia*, 20 volumes of *methanol*, 20 volumes of *toluene* and 50 volumes of *dioxan*.

Solvent mixture. 3 volumes of *ammonia* and 97 volumes of *methanol*.

Test solution (a). Dissolve 1.0 g of the substance under examination in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with the solvent mixture.

Reference solution (a). A 1.0 per cent w/v solution of *iopanoic acid IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of test solution (b) to 50.0 ml with the solvent mixture.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 10 cm and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent).

Chlorides (2.3.12). To 1.38 g, add 10 ml of *nitric acid* and 5 ml of *water*, shake for 5 minutes and filter. The solution complies with the limit test for chlorides (180 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 1 hour.

Assay. To 0.15 g in a 250 ml round-bottomed flask, add 5 ml of *strong sodium hydroxide solution*, 20 ml of *water*, 1 g of *zinc powder* and a few glass beads. Boil under a reflux condenser for 60 minutes. Allow to cool and rinse the condenser with 20 ml of *water*, adding the rinsings to the flask. Filter through a sintered-glass filter and wash the filter with several quantities of *water*. Collect the filtrate and washings. Add 40 ml of *dilute sulphuric acid* and titrate immediately with *0.1 M silver nitrate*. Determine the end-point potentiometrically (2.4.25), using a suitable electrode system such as silver-mercurous sulphate.

1 ml of *0.1 M silver nitrate* is equivalent to 0.01903 g of $C_{11}H_{12}I_3NO_2$.

Storage. Store protected from light.

Iopanoic Acid Tablets

Iopanoic Acid Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of iopanoic acid, $C_{11}H_{12}I_3NO_2$.

Usual strength. 500 mg.

Identification

A. Shake a quantity of the powdered tablets containing 30 mg of Iopanoic Acid with 10 ml of *ethanol (95 per cent)*, filter, evaporate the filtrate to dryness and dry the residue at 105°. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *iopanoic acid IPRS* or with the reference spectrum of iopanoic acid.

B. Spray the chromatograms obtained in the test for Related substances with a 0.1 per cent w/v solution of *dimethylamino-cinnamaldehyde* in a mixture of 1 volume of *hydrochloric acid* and 99 volumes of *ethanol (95 per cent)*. The principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (b).

Tests

Chlorides (2.3.12). To a quantity of the powdered tablets containing 2.3 g of Iopanoic Acid, add just sufficient *0.2 M sodium hydroxide* to dissolve the iopanoic acid, dilute to 15 ml with *water*, add sufficient *2 M nitric acid* dropwise to ensure complete precipitation of the iodinated acid and add 3 ml in excess. Filter, wash the precipitate with 5 ml of *water* and combine the solutions and dilute to 25 ml with *water*. 15 ml of the solution complies with the limit test for chlorides (180 ppm).

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 10 volumes of *13.5 M ammonia*, 20 volumes of *methanol*, 20 volumes of *toluene* and 50 volumes of *1,4-dioxan*.

Solvent mixture. 3 volumes of *10 M ammonia* and 97 volumes of *methanol*.

Test solution (a). Extract a quantity of the powdered tablets containing 1.0 g of Iopanoic Acid with five 10-ml quantities of *ethanol (95 per cent)*, filter, evaporate the combined filtrates to dryness using a rotary evaporator and dissolve the residue in 10 ml of the solvent mixture.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of test solution (a) to 500.0 ml with the solvent mixture.

Reference solution (b). A 1.0 per cent w/v solution of *iopanoic acid IPRS* in the solvent mixture.

Apply to the plate 5 µl of each solution. Allow the plate to rise 10 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.2 per cent).

Other tests. Comply with the tests stated under Tablets.

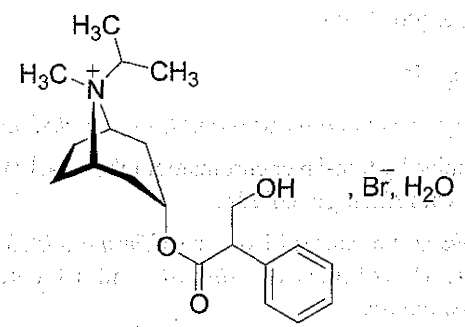
Assay. Weigh and powder 20 tablets. Triturate a quantity of the powder containing 0.4 g of Iopanoic Acid with five 10-ml

quantities of *ethanol (95 per cent)*, decanting and filtering each extract through the same filter. Evaporate the combined filtrates almost to dryness on a water-bath, cool, add 20 ml of *water*, 12 ml of *5 M sodium hydroxide* and 1 g of *zinc powder* and boil under a reflux condenser for 30 minutes. Cool, rinse the condenser with 30 ml of *water*, filter through absorbent cotton and wash the flask and filter with two 20-ml quantities of *water*. To the combined filtrate and washings, add 80 ml of *hydrochloric acid*, cool and titrate with *0.05 M potassium iodate* until the dark brown solution becomes light brown. Add 5 ml of *chloroform* and continue the titration, shaking well after each addition, until the chloroform becomes colourless.

1 ml of *0.05 M potassium iodate* is equivalent to 0.01903 g of $C_{11}H_{12}I_3NO_2$.

Storage. Store protected from light.

Ipratropium Bromide



$C_{20}H_{30}BrNO_3,H_2O$ Mol. Wt. 430.4

Ipratropium Bromide is 3α-Hydroxy-8-isopropyl-1α*H*,5α*H*-tropanium bromide (*RS*)-tropate monohydrate.

Ipratropium Bromide contains not less than 99.0 per cent and not more than 100.5 per cent of $C_{20}H_{30}BrNO_3$, calculated on the anhydrous basis.

Category. Anticholinergic; bronchodilator.

Description. A white or almost white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ipratropium bromide IPRS* or with the reference spectrum of ipratropium bromide.

B. It gives reaction (A) of bromides (2.3.1).

Tests

pH (2.4.24). 5.0 to 7.5, determined in a 1.0 per cent w/v solution in *carbon dioxide-free water*.

Impurity A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 1 volume of *formic acid*, 3 volumes of *water*, 18 volumes of *ethanol (95 per cent)* and 18 volumes of *dichloromethane*.

Test solution. Dissolve 20 mg of the substance under examination in *methanol* and dilute to 1.0 ml with *methanol*.

Reference solution (a). Dissolve 20 mg of *ipratropium bromide IPRS* in *methanol* and dilute to 1.0 ml with *methanol*.

Reference solution (b). Dissolve 20 mg of *methylatropine bromide IPRS* in 1.0 ml of reference solution (a).

Reference solution (c). Dissolve 5 mg of *ipratropium impurity A IPRS {(1R,3r,5S,8r)-3-hydroxy-8-methyl-8-(1-methylethyl)-8-azoniabicyclo [3.2.1]octane IPRS}* in 100.0 ml of *methanol*. Dilute 2.0 ml of the solution to 5.0 ml with *methanol*.

Apply to the plate 1 µl of each solution. After development, dry the plate at 60° for 15 minutes, spray with *potassium iodobismuthate solution*, dry briefly in a current of air and spray with a 5.0 per cent w/v solution of *sodium nitrite*. The chromatogram obtained with reference solution (b) shows two clearly separated principal spots. In the chromatogram obtained with the test solution any spot corresponding to ipratropium impurity A is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.1 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 100 mg of the substance under examination in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). A 0.001 per cent w/v solution of *ipratropium bromide IPRS* in the mobile phase.

Reference solution (b). Dissolve 5 mg each of *ipratropium bromide IPRS* and *ipratropium impurity B IPRS (1R,3r,5S,8s)-3-[[(2RS)-3-hydroxy-2-phenylpropanoyl]oxy]-8-methyl-8-(1-methylethyl)-8-azoniabicyclo[3.2.1]octane IPRS)* in 1 ml of *methanol* and dilute to 25.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 87 volumes of buffer solution prepared by dissolving 1.24 g of *sodium dihydrogen phosphate* and 0.17 g of *tetrapropylammonium chloride* in 87 ml of *water* and adjusted to pH 5.5 with 18 per cent w/v solution of *disodium hydrogen phosphate*, and 13 volumes of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Bromide ion	0.15	---
Ipratropium impurity C[1]	0.7	0.3
Ipratropium (Retention time: about 4.9 minutes)	1.0	---
Ipratropium impurity B[2]	1.2	---
Ipratropium impurity D[3]	1.8	0.2
Ipratropium impurity E[4]	2.3	---
Ipratropium impurity F[5]	5.1	0.5

[1](2*RS*)-3-hydroxy-2-phenylpropanoic acid (dl-tropic acid),

[2](1*R*,3*r*,5*S*,8*s*)-3-[[(2*RS*)-3-hydroxy-2-phenylpropanoyl]oxy]-8-methyl-8-(1-methylethyl)-8-azoniabicyclo[3.2.1]octane,

[3]2-phenylpropenoic acid,

[4](1*R*,3*r*,5*S*)-8-(1-methylethyl)-8-azabicyclo[3.2.1]oct-3-yl (2*RS*)-3-hydroxy-2-phenylpropanoate,

[5](1*R*,3*r*,5*S*,8*r*)-8-methyl-8-(1-methylethyl)-3-[(2-phenylpropenoyl) oxy]-8-azoniabicyclo[3.2.1]octane.

Inject reference solution (b). The test is not valid unless the resolution between ipratropium and ipratropium impurity B is not less than 3.0 and the tailing factor is not more than 2.5 for the principal peak.

Inject reference solution (a) and the test solution. Run the chromatogram 6 times the retention times of the ipratropium peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to ipratropium impurity D is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent), the area of any peak corresponding to ipratropium impurity B and ipratropium impurity C is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent). Ignore any peak with an area less than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.03 per cent), disregard the peak due to the bromide ion.

Water (2.3.43). 3.9 per cent to 4.4 per cent, determined on 0.5 g.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Weigh 0.35 g of the substance under examination, dissolve in 50 ml of *water* and add 3 ml of *dilute nitric acid*. Titrate with *0.1 M silver nitrate*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.04124 g of $C_{20}H_{30}BrNO_3$.

Storage. Store protected from light and moisture.

Ipratropium Powder for Inhalation

Ipratropium Bromide Powder for Inhalation

Ipratropium Powder for Inhalation consists of hard gelatin capsules containing Ipratropium Bromide in microfine powder either alone or admixed with glucose in a pre-metered unit for use in a suitable powder inhaler.

The powder for inhalation complies with the requirements stated under Inhalation Preparation and the contents of the capsules comply with the following requirements.

Ipratropium Powder for Inhalation contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ipratropium bromide, $C_{20}H_{30}NO_3Br,H_2O$ per unit dose.

Usual strength. 40 µg.

Identification

Test A may be omitted if test B and C are carried out.

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 1 volume of *formic acid*, 3 volumes of *water*, 18 volumes of *ethanol* and 18 volumes of *dichloromethane*.

Test solution. Shake vigorously a quantity of the contents of the capsules containing about 1.84 mg of Ipratropium Bromide with 1 ml of *methanol* for 2 minutes, centrifuge and use the supernatant.

Reference solution (a). A 0.1 per cent w/v solution of *ipratropium bromide IPRS* in a saturated solution of *glucose*.

Reference solution (b). A 0.005 per cent w/v solution each of *(1R,3r,5S,8s)-3-[[(2RS)-3-hydroxy-2-phenylpropanoyl] oxy]-8-methyl-8-(1-methylethyl)-8- azoniabicyclo[3.2.1] octane IPRS (ipratropium bromide impurity B)* and *ipratropium bromide IPRS* in *0.001M hydrochloric acid*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 5 cm. Dry the plate for 15 minutes at 60°, spray with *potassium iodobismuthate solution*, dry in a current of air and spray with a 5.0 per cent w/v solution of *sodium nitrite*. The principal spot in the chromatogram obtained with the test solution corresponds to the spot in the chromatogram obtained with the reference solution.

B. Disperse a quantity of the contents of the capsules containing about 0.3 mg of bromide ion in 0.5 ml of *water*, add

75 mg of *lead dioxide* and 0.25 ml of *acetic acid*, shake and allow to stand for 5 minutes. Add one drop to a strip of filter paper previously impregnated with *decolorised fuchsin solution*, a violet colour develops.

C. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Related substances. A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF 254*.

Mobile phase. A mixture of 1 volume of *formic acid*, 3 volumes of *water*, 18 volumes of *ethanol* and 18 volumes of *dichloromethane*.

Test solution. Shake a quantity of the contents of the capsules containing about 0.1 g of Ipratropium Bromide with 1 ml of *methanol* for 2 minutes, centrifuge and use the supernatant.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with a saturated solution of *glucose*.

Reference solution (b). A 0.0005 per cent w/v solution of *tropic acid* in a saturated solution of *glucose*.

Apply to the plate 10 µl of each solution. After development, dry the plate at 60° for 15 minutes, spray with *potassium iodobismuthate solution*, dry briefly in a current of air and spray with a 5.0 per cent w/v solution of *sodium nitrite*. In the chromatogram obtained with the test solution any spot corresponding to tropic acid is not more intense than the spot in the chromatogram obtained with reference solution (a) 0.5 per cent); any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent).

B. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the content of capsules containing about 20 mg of Ipratropium Bromide with mobile phase and dilute to 100.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Reference solution (b). A 0.005 per cent w/v solution each of *(1R,3r,5S,8s)-3-[[(2RS)-3-hydroxy-2-phenylpropanoyl] oxy]-8-methyl-8-(1-methylethyl)-8- azoniabicyclo[3.2.1] octane IPRS* (*ipratropium bromide impurity B IPRS*) and *ipratropium bromide IPRS* in *0.001M hydrochloric acid*.

Chromatographic system

- a stainless steel column 12.5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Lichrospher 60 RP-select B),
- mobile phase: a mixture of 3 volumes of *acetonitrile* and 25 volumes of a 0.1 per cent w/v solution of *sodium methanesulphonate* in *0.05 M orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 1.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Inhalation Preparations (Powders for Inhalation).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the contents of the capsules with sufficient *0.01 M hydrochloric acid* to produce a solution containing 0.004 per cent w/v of Ipratropium Bromide.

Reference solution (a). A 0.004 per cent w/v solution of *ipratropium bromide IPRS* in *0.01 M hydrochloric acid*.

Reference solution (b). A 0.005 per cent w/v solution each of *(1R,3r,5S,8s)-3-[[(2RS)-3-hydroxy-2-phenylpropanoyl] oxy]-8-methyl-8-(1-methylethyl)-8- azoniabicyclo[3.2.1] octane IPRS* (*ipratropium bromide impurity B IPRS*) and *ipratropium bromide IPRS* in *0.001M hydrochloric acid*.

Chromatographic system

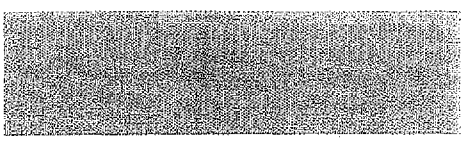
- a stainless steel column 12.5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Lichrospher RP8 select B),
- mobile phase: a mixture of 27 volumes of *acetonitrile* and 100 volumes of a 0.2 per cent w/v solution of *sodium heptanesulphonate monohydrate* in *water*, adjusted to pH 3.2 with *0.05 M orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 1.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{20}H_{30}NO_3Br,H_2O$ in the powder for inhalation.

Labelling. The label states the quantity of Ipratropium Bromide contained in each capsule.



Ipratropium Inhalation

Ipratropium Bromide Inhalation

Ipratropium Inhalation is a solution or suspension of Ipratropium Bromide in a suitable liquid in a suitable pressurised container.

The pressurised inhalation complies with the requirements stated under Inhalation Preparation and with the following requirements.

Ipratropium Inhalation delivers not less than 85.0 per cent and not more than 115.0 per cent of the stated amount of ipratropium bromide, $C_{20}H_{30}NO_3Br,H_2O$, per inhalation by actuation of the valve.

Usual strengths. 20 µg per metered dose; 40 µg per metered dose.

Identification

A. In the test for Related substances, the principal spot in the chromatogram obtained with reference solution (a) corresponds to that in the chromatogram obtained with reference solution (e).

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. 5 volumes of *water*, 8 volumes of *anhydrous formic acid*, 28 volumes of *methanol* and 70 volumes of *dichloromethane*.

Test solution. Punch a small hole in the ferrule of each of three cooled containers, allow the propellant to evaporate for about 1 minute and transfer the contents of the containers, through the punched holes, to a beaker. Stir, using a magnetic stirrer, for about 10 minutes, add 3.5 ml of *0.01M hydrochloric acid* and continue stirring for about 1 hour, until the propellant has completely evaporated, filter, add 10 ml of *chloroform* to the filtrate and shake vigorously for 1 minute. Allow the phases to separate and use the upper layer.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with *0.01 M hydrochloric acid*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 4.0 ml with *0.01 M hydrochloric acid*.

Reference solution (c). Dilute 2.0 ml of reference solution (b) to 5.0 ml with *0.01 M hydrochloric acid*.

Reference solution (d). A 0.008 per cent w/v solution of *8s-isopropyl-3b-hydroxytropanium bromide IPRS (ipratropium impurity A IPRS)* in *0.01 M hydrochloric acid*.

Reference solution (e). A 0.008 per cent w/v solution of *ipratropium bromide IPRS* in *0.01 M hydrochloric acid*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 6 cm. Dry the plate in a current of warm air for about 30 minutes. Spray the plate with a mixture of 1 volume of *potassium iodobismuthate solution*, 2 volumes of *glacial acetic acid* and 10 volumes of *water*, allow to dry, spray with a 5 per cent w/v solution of *sodium nitrite* and immediately examine the plate. In the chromatogram obtained with the test solution, any spot corresponding to *8s*-isopropyl-3b-hydroxytropanium bromide is not more intense than the spot in the chromatogram obtained with reference solution (a) (2.0 per cent). Any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent) and not more than two such spots are more intense than the spot in the chromatogram obtained with reference solution (c) (0.2 per cent).

Other tests. Comply with the tests stated under Inhalation Preparations (Pressurised Metered-dose Preparations).

Follow the procedure described under Assay with suitable dilution of the reference solution wherever the amount of active substance is to be determined in any test.

Assay. Carry out the test for Content of active ingredient delivered per actuation stated under Inhalation Preparations (Pressurised Metered-dose Preparations).

Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *0.001 M hydrochloric acid* and *methanol*.

Test solution. Prepare using the solvent mixture as described under the test for Content of active ingredient delivered per actuation stated under Inhalation Preparations (Pressurised Metered-dose Preparations).

Reference solution. A 0.0004 per cent w/v solution of *ipratropium bromide IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 12.5 cm x 4.0 mm, packed with octylsilane bonded to porous silica (Such as Lichrospher RP8 select B) (5 µm),
- mobile phase: a mixture of 34.5 volumes of *acetonitrile* and 75 volumes of 0.012 M *sodium heptanesulphonate*, adjusted to pH 3.2 with *0.05 M orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

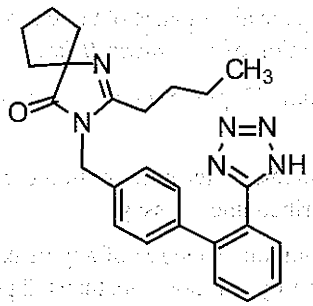
Inject the reference solution. The test is not valid unless the tailing factor is not less than 3.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{30}BrNO_3,H_2O$ delivered per actuation of the valve.

Determine the content of active ingredient a second and third time by repeating the procedure on the middle ten and on the last ten successive combined actuations of the valve. For each of the three determinations the average content of $C_{20}H_{30}BrNO_3,H_2O$ delivered per actuation of the valve meets the requirements.

Irbesartan



$C_{25}H_{28}N_6O$ Mol. Wt. 428.5

Irbesartan is 2-butyl-3-{4-[2-(1*H*-tetrazol-5-yl)phenyl]benzyl}-1,3-diazaspiro[4.4]non-1-en-4-one.

Irbesartan contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{25}H_{28}N_6O$, calculated on the anhydrous basis.

Category. Antihypertensive.

Production

As Nitrosamines are classified as probable human carcinogens, their presence in irbesartan should be avoided or limited as much as possible. For this reason, manufacturers of irbesartan for human use are expected to perform an assessment of the risk of *N*-nitrosamine formation and contamination during their manufacturing process; if this assessment identifies a potential risk, the manufacturing process should be modified to minimise contamination and a control strategy implemented to detect and control *N*-nitrosamine impurities in irbesartan. The general chapter 5.11. Nitrosamine Impurities is available to assist manufacturers.

Description. A white or almost white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *irbesartan IPRS* or with the reference spectrum of irbesartan.

Tests

Appearance of solution. A 5.0 per cent w/v solution in 1 volume of *2 M sodium hydroxide* and 9 volumes of *methanol* is clear (2.4.1) and not more intensely coloured than reference solution BS7 (2.4.1).

Impurity B. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in the mobile phase, dilute to 5.0 ml with the mobile phase.

Reference solution. A 0.00003 per cent w/v solution of *sodium azide* (sodium salt of irbesartan impurity B) in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm, packed with strongly basic anion-exchange resin (8.5 µm),
- mobile phase: a 0.42 per cent w/v solution of *sodium hydroxide* in *carbon dioxide-free water*,
- flow rate: 1 ml per minute,
- conductivity detector with a sensitivity of 3 µS,
- injection volume: 200 µl.

Inject the reference solution. The test is not valid unless, the signal to noise ratio for the principal peak is not less than 10.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to irbesartan impurity B is not more than the area of the principal peak in the chromatogram obtained with the reference solution (10 ppm).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in *methanol*, dilute to 50.0 ml with *methanol*.

Reference *solution (a)*. Dilute 1.0 ml of the test solution to 20.0 ml with *methanol*. Dilute 1.0 ml of the solution to 50.0 ml with *methanol*.

Reference solution (b). A solution containing 0.005 per cent w/v each of *irbesartan IPRS* and *irbesartan impurity A IPRS (1-(pentanoylamino)-N-[[2'-(1H-tetrazol-5-yl)biphenyl-4-yl]methyl]cyclopentane-carboxamide IPRS)* in *methanol*.

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 67 volumes of buffer solution prepared by diluting 5.5 ml of *orthophosphoric acid* in 950 ml of *water*, adjusted to pH 3.2 with *triethylamine* and 33 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl

The relative retention time with reference to irbesartan (retention time: about 23 minutes) for irbesartan impurity A is about 0.7.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to irbesartan impurity A and irbesartan is not less than 3.0.

Inject reference solution (a) and the test solution. Run the chromatogram 1.4 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding irbesartan impurity A is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent), the areas of any other secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peak is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13.). 1 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 1.0 g.

Assay. Dissolve 0.3 g in 50 ml of *anhydrous acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04285 g of $C_{25}H_{28}N_6O$.

Irbesartan Tablets

Irbesartan Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of irbesartan, $C_{25}H_{28}N_6O$.

Usual strengths. 150 mg; 300 mg.

Identification

A. Transfer one tablet into a suitable vial, add 10 ml of *methanol*, sonicate for 10 minutes, filter and evaporate to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *irbesartan IPRS* or with the reference spectrum of irbesartan.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 1000 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 20 minutes.

Withdraw a suitable volume of the medium and filter. Dilute the filtrate, if necessary with the dissolution medium. Measure the absorbance of the resulting solution at the maximum at about 244 nm (2.4.7). Calculate the content of $C_{25}H_{28}N_6O$ in the medium from the absorbance obtained from a solution of known concentration of *irbesartan IPRS*.

Q. Not less than 75 per cent of the stated amount of $C_{25}H_{28}N_6O$.

Related substances. Determine by liquid chromatography (2.4.14) as described under Assay.

Inject the test solution. The area of any peak corresponding to irbesartan impurity A is not more than 0.2 per cent, the area of any other secondary peak is not more than 0.2 per cent and the sum of areas of all the secondary peaks is not more than 0.5 per cent, calculated by area normalization.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 Tablets. Disperse a quantity of the powder containing 15 mg of irbesartan in 75 ml of *methanol* with the aid of ultrasound and dilute to 100.0 ml with *methanol*.

Reference solution (a). A 0.015 per cent w/v solution of *irbesartan IPRS* in *methanol*.

Reference solution (b). A solution containing 0.01 per cent w/v of *irbesartan IPRS* and *irbesartan impurity A IPRS (1-pentanoylamino-cyclopentanecarboxylic acid [2'-(1H-tetrazol-5-yl)-byphenyl-4-ylmethyl]-amide IPRS)* in *methanol*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of buffer solution prepared by diluting 5.5 ml of *orthophosphoric acid* in 950 ml of *water*, adjusted to pH 3.0 with *triethylamine* and dilute to 1000 ml with *water* and 40 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 15 µl.

Inject reference solution (b). The test is not valid unless the resolution between the irbesartan and irbesartan impurity A is not less than 2.0

Inject reference solution (a) and the test solution.

Calculate the content of $C_{25}H_{28}N_6O$ in the tablets.

Storage. Store protected from moisture.

Irbesartan and Hydrochlorothiazide Tablets

Irbesartan and Hydrochlorothiazide Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of irbesartan, $C_{25}H_{28}N_6O$ and hydrochlorothiazide, $C_7H_8ClN_3O_4S_2$.

Usual strength. 150 mg of irbesartan and 12.5 mg of hydrochlorothiazide.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution corresponds to the peaks in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2)

Apparatus No. 2 (Paddle),

Medium. 1000 ml of *0.1 M hydrochloric acid*,

Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary with the dissolution medium.

Reference solution. Dissolve a quantity of *irbesartan IPRS* and *hydrochlorothiazide IPRS* in sufficient *methanol* and dilute with dissolution medium to obtain a solution having a known concentration similar to the expected concentration of test solution.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with nitrile group chemically bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 45 volumes of a buffer solution prepared by dissolving 1.36 g of *monobasic potassium phosphate* in 1000 ml of *water*, 35 volumes of *methanol* and 20 volumes of *acetonitrile*,
- flow rate: 1.4 ml per minute,
- spectrophotometer set at 272 nm,
- injection volume: 25 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{25}H_{28}N_6O$ and $C_7H_8ClN_3O_4S_2$ in the tablet.

Q. Not less than 80 per cent of the stated amount of $C_{25}H_{28}N_6O$ and $C_7H_8ClN_3O_4S_2$.

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Name	Relative retention time
Benzothiadiazine impurity A[1]	0.15
Hydrochlorothiazide	0.18
Irbesartan impurity A[2]	0.86
Irbesartan	1.0

[1]4-amino-6-chloro-1,3-benzenedisulfonamide,

[2]1-pentanoylamino-cyclopentanecarboxylic acid [2'-(*1H*-tetrazol-5-yl)-biphenyl-4-ylmethyl]-amide.

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to irbesartan impurity A is not more than 0.3 times the area of the peak due to irbesartan in the chromatogram obtained with reference solution (c) (0.3 per cent), the area of any peak corresponding to benzothiadiazine impurity A, multiplied by correction factor of 0.77, is not more than 0.94 times the area of the peak due to hydrochlorothiazide in the chromatogram obtained with reference solution (c) (1.0 per cent), the area of any other secondary peak is not more than 0.2 times the area of the peak due to irbesartan in the chromatogram obtained with reference solution (c) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 1.5 times the area of the peak due to irbesartan in the chromatogram obtained with reference solution (c) (1.5 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 70 volumes of *methanol* and 30 volumes of acidified *water* previously adjusted to pH 2.0 with *orthophosphoric acid* or *sodium hydroxide*.

Test solution. Disperse a quantity of powdered tablets containing 22.5 mg of Irbesartan in 100.0 ml of the solvent mixture.

Reference solution (a). A solution containing 0.024 per cent w/v of *irbesartan IPRS* and 0.002 per cent w/v of *hydrochlorothiazide IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.005 per cent w/v of *irbesartan IPRS*, 0.0005 per cent of wv of *hydrochlorothiazide IPRS*, 0.0001 per cent w/v of *irbesartan impurity A IPRS* and 0.0003 per cent w/v of *benzothiadiazine impurity A IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with nitrile groups chemically bonded to porous silica (5 µm),
- mobile phase: a mixture of 67 volumes of the buffer solution, prepared by dissolving 1.36 g of *monobasic potassium phosphate* in 900 ml of *water*, add 2 ml of *triethylamine*, adjusted to pH 3.0 with *orthophosphoric acid*, dilute to 1000 ml with *water*, 13 volumes of *acetonitrile* and 20 volumes of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

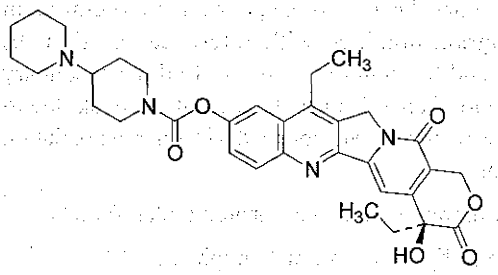
Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to irbesartan and irbesart impurity A is not less than 1.7, between the peaks corresponding to hydrochlorothiazide and benzothiadiazine impurity A is not less than 1.7. The relative standard deviation for replicate injections for irbesartan and hydrochlorothiazide peak is not more than 1.5 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{25}H_{28}N_6O$ and $C_7H_8ClN_3O_4S_2$ in the tablets.

Storage. Store protected from moisture.

Irinotecan Hydrochloride Trihydrate



$C_{33}H_{38}N_4O_6.HCl,3H_2O$ Mol. Wt. 677.2

Irinotecan Hydrochloride Trihydrate is (4*S*)-4,11-diethyl-3,4,12,14-tetrahydro-4-hydroxy-3,14-dioxo-1*H*-pyrano [3',4' :6,7]indolizino[1 ,2-*b*]quinolin-9-yl [1 ,4'-bipiperidine]- 1'-carboxylate hydrochloride trihydrate.

Irinotecan Hydrochloride Trihydrate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{33}H_{38}N_4O_6$, HCl, calculated on the anhydrous basis.

Category. Anticancer

Description. A pale yellow to yellow crystalline powder.

CAUTION — Irinotecan Hydrochloride Trihydrate is potentially cytotoxic. Great care should be taken in handling the powder and preparing solutions.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *irinotecan hydrochloride trihydrate IPRS* or with the reference spectrum of irinotecan hydrochloride trihydrate.

B. In the Enantiomeric purity test, the principal peak in the chromatogram obtained with the test solution corresponds to the irinotecan (S-enantiomer) peak in the chromatogram obtained with reference solution (b).

C. A 0.2 per cent w/v solution gives reaction (A) of chlorides (2.3.1).

Tests

Enantiomeric purity. Determine by liquid chromatography (2.4.14).

Solvent mixture. 25 volumes of *ethanol* and 0.1 volume of *diethylamine*.

Test solution. Dissolve 10 mg of the substance under examination in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution (a). A solution containing 0.01 per cent w/v, each of, *irinotecan hydrochloride trihydrate IPRS* and *irinotecan related compound D IPRS* in the solvent mixture.

Reference solution (b). A 0.1 per cent w/v solution of *irinotecan hydrochloride trihydrate IPRS* in the solvent mixture.

Reference solution (c). A 0.00015 per cent w/v solution of *irinotecan related compound D IPRS* in the solvent mixture.

Reference solution (d). Dilute 5.0 ml of reference solution (c) to 15.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with cellulose tris-3,5-dimethylphenylcarbamate coated porous silica (10 µm) (Such as chiralcel OD-H),
- mobile phase: a mixture of 25 volumes of *hexane*, 25 volumes of *ethanol*, 0.1 volume of *diethylamine*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 370 nm,
- injection volume: 20 µl.

Inject reference solution (a), (b), (c) and (d). The test is not valid unless the resolution between the peaks due to irinotecan related compound D and irinotecan hydrochloride trihydrate is not less than 2.5 in the chromatogram obtained with reference solution (a), the relative standard deviation for replicate injections is not more than 5.0 in the chromatogram obtained with reference solution (c) and the irinotecan hydrochloride related compound D peak should be visible in the chromatogram obtained with reference solution (d).

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution the area of the peak due to irinotecan related compound D (R-enantiomer) is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.15 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

A. *For material labelled as produced by a synthetic process—*

Buffer solution. Dissolve 2.8 g of *monobasic sodium phosphate monohydrate* and 1.8 g of *octanesulphonic acid sodium salt monohydrate* in 1000 ml of *water*.

Solvent mixture. 59 volumes of buffer solution, 24 volumes of *methanol* and 17 volumes of *acetonitrile*, adjusted to pH *3.65* with *dilute hydrochloric acid*.

Test solution. Dissolve 25 mg of the substance under examination in 25.0 ml of the solvent mixture.

Reference solution (a). A solution containing 0.0001 per cent w/v, each of, *irinotecan related compound B IPRS* and *irinotecan related compound C IPRS* in *methanol*.

Reference solution (b). A 0.0002 per cent w/v solution of *irinotecan hydrochloride trihydrate IPRS* in the solvent mixture.

Reference solution (c). Dilute 5.0 ml of reference solution (b) to 20.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 59 volumes of buffer solution, 24 volumes of *methanol* and 17 volumes of *acetonitrile*,
- a gradient programme using the conditions below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 255 nm,
- injection volume: 15 µl.

Name	Relative retention time
Irinotecan related compound B[1]	0.55
Irinotecan related compound C[2]	0.6
Irinotecan hydrochloride	1.0

[1] *(S)*-4,11-Diethyl-4,9-dihydroxy-1*H*-pyrano[3',4':6,7]indolizino[1,2-*b*]quinoline-3,14(4*H*,12*H*)-dione,

[2] 11-Ethyl-4-hydroxy-4-methyl-3,14-dioxo-3,4,12,14-tetrahydro-1*H*-pyrano[3',4':6,7]indolizino[1,2-*b*]quinoline-9-yl(1,4'-bipiperidine)-1'-carboxylate hydrochloride.

Inject reference solution (a), (b) and (c). The test is not valid unless the resolution between the peaks due to irinotecan related compound B and irinotecan related compound C is not less than 1.1 in the chromatogram obtained with reference solution (a), the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (b) and the signal-to-noise ratio is not less than 10 in the chromatogram obtained with reference solution (c).

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to irinotecan related compound B is not more than 0.75 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent), the area of any peak corresponding to irinotecan related compound C is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

B. *For material labelled as produced by a semi-synthetic process—*

Solvent mixture. 10 volumes of *acetonitrile*, 10 volumes of *methanol* and 20 volumes of mobile phase A

Test solution. Dissolve 25 mg of the substance under examination in 25.0 ml of the solvent mixture.

Reference solution (a). A 0.0001 per cent w/v solution of *irinotecan hydrochloride trihydrate IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v, each of, *irinotecan hydrochloride trihydrate IPRS* and *irinotecan related compound A IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a buffer solution prepared by dissolving 2.72 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 3.5 with *dilute orthophosphoric acid*,
  B. a mixture 60 volumes of *acetonitrile* and 40 volumes of *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
40	30	70
45	30	70
50	80	20
55	80	20

Name	Relative retention time	Correction factor
7-Desethyl Irionotecan[1]	0.82	1.3
Irinotecan	1.00	—

Irinotecan related compound B[5]	1.50	0.77
7-Ethylcamptothecin[6]	1.76	0.83
7,11-Diethyl-10-hydroxy camptothecin[7]	2.05	1.54

[1]*(S)*-4-Ethyl-4-hydroxy-1*H*-pyrano[3',4':6,7]indolizino[1,2-*b*] quinoline-3,14(4H,12H)-dione-9-yl (1,4'-bipiperidine)- 1'-carboxylate,

[2]*(S)*-4-Ethyl-4,9-hydroxy-1*H*-pyrano[3',4':6,7]indolizino[1,2-*b*] quinoline-3,14(4H,12H)-dione,

[3]*(S)*-4,8,11-Triethyl-4-hydroxy-1*H*-pyrano[3',4':6,7]indolizino[1,2-*b*] quinoline-3,14(4H,12H)-dione-9-yl (1,4'-bipiperidine)- 1'-carboxylate,

[4]*(S)*-4-Ethyl-4-hydroxy-1*H*-pyrano[3',4':6,7]indolizino[1,2-*b*] quinoline-3,14(4H,12H)-dione,

[5]*(S)*-4,11-Diethyl-4,9-dihydroxy-1*H*-pyrano[3',4':6,7]indolizino[1,2-*b*]quinoline-3,14(4H,12H)-dione,

[6]*(S)*-4,11-Diethyl-4-hydroxy-1*H*-pyrano[3',4':6,7]indolizino[1,2-*b*] quinoline-3,14(4H,12H)-dione,

[7]*(S)*-4,8,11-Triethyl-4,9-dihydroxy-1*H*-pyrano[3',4':6,7]indolizino [1,2-*b*]quinoline-3,14(4H,12H)-dione.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to irinotecan and irinotecan related compound A is not less than 3.0 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to 7-desethyl irinotecan, irinotecan related compound A, 11-ethyl irinotecan, camptothecin, irinotecan related compound B, 7-ethylcamptothecin, 7,11-diethyl-10-hydroxy camptothecin, each of, is not more than 1.5 times the area of the peak in the chromatogram obtained with reference solution (a) (0.15 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than the 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 1 .0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 7.0 per cent to 9.0 per cent, determined on 0.1 g.

Microbial contamination (2.2.9). Total aerobic viable count is not more than 10^2 CFU per g. 1 g is free from *Escherichia coli*, *Staphylococcus aureus* and *Pseudomonas aeruginosa*. 10 g is free from *Salmonella* and *Shigella*.

Bacterial endotoxins (2.2.3). Not more than 0.275 Endotoxin Unit per mg of irinotecan hydrochloride trihydrate.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances A with the following modifications.

Reference solution. A 0.1 per cent w/v solution of *irinotecan hydrochloride trihydrate IPRS* in the solvent mixture.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{33}H_{38}N_4O_6,HCl$.

Storage. Store protected from light, at a temperature not exceeding 25°.

Irinotecan Injection

Irinotecan Hydrochloride Injection

Irinotecan Injection is a sterile solution of Irinotecan Hydrochloride Trihydrate in *water*.

Irinotecan Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of irinotecan hydrochloride trihydrate, $C_{33}H_{38}N_4O_6,HCl,3H_2O$.

Usual strength. 20 mg per ml.

Description. A light yellow coloured solution, free from visible particles.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. It gives the reaction of chlorides (2.3.1).

Tests

Appearance of solution. Prepare a solution equivalent to 1.0 per cent of the substance in *water*. The solution is clear or not more intensely coloured than the reference solution *GYS3* (2.4.1).

pH (2.4.24). 3.0 to 3.8.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a measured volume containing 40 mg of Irinotecan Hydrochloride Trihydrate to 100 ml with mobile phase.

Reference solution (a). A 0.04 per cent w/v solution of *irinotecan hydrochloride trihydrate IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with mobile phase.

Reference solution (c). Dissolve 20 mg of *irinotecan hydrochloride trihydrate IPRS* in 10 ml of 0.04 per cent w/v solution of *7-ethyl-10-hydroxycamptothecin IPRS* in *N,N,dimethyl-formamide* and dilute to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 72 volumes of *buffer solution* prepared by dissolving 1.1 g of *1-heptane sulphonic acid sodium monohydrate* and 7.1 g of *disodium hydrogen orthophosphate anhydrous* in 1000 ml *water*, adjusted to pH 3.0 with *orthophosphoric acid* and 28 volumes of *acetonitrile*, filter.
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject reference solution (c). The test is not valid unless the resolution between 7-ethyl-10-hydroxycamptothecin and irinotecan hydrochloride trihydrate is not less than 3.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.2 times the area of the peak in the chromatogram obtained with the reference solution (b) (0.2 per cent) and the sum of areas of all the secondary peaks is not more than 1.2 times the area of the peak in the chromatogram obtained with the reference solution (b) (1.2 per cent).

Bacterial endotoxins (2.2.3). Not more than 0.556 Endotoxin Unit per mg of irinotecan hydrochloride trihydrate.

Sterility (2.2.11). Complies with the test for sterility.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Measured volume of the injection containing 40 mg of *irinotecan hydrochloride trihydrate*, diluted to 100.0 ml with mobile phase.

Reference solution. A 0.04 per cent w/v solution of *irinotecan hydrochloride trihydrate IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.4. The relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{33}H_{38}N_4O_6.HCl, 3H_2O$ in the injection.

Storage. Store protected from light, at a temperature not exceeding 25°.

Iron Dextran Injection

Iron Dextran Injection is a sterile colloidal solution containing a complex of ferric hydroxide with practically hydrolised dextrans of average molecular weight about 1000.

Iron Dextran Injection contains not less than 95.0 per cent and not more than 105.0 per cent w/v of the stated amount of iron and not more than 0.5 per cent of phenol as a preservative.

Category. Haematinic.

Description. A dark brown slightly viscous liquid.

Identification

To 1 ml of Injection on a watch glass, add 2 drops of *ammonium hydroxide*. No precipitate is formed. Add 2 ml of *hydrochloric acid*, and 2 ml of *ammonium hydroxide*. A brown precipitate is formed.

Tests

pH (2.4.24). 4.5 to 7.0.

Chloride content. For products labelled to contain 50 mg per ml of iron: 0.48 per cent to 0.68 per cent; for products labeled to contain 75 or 100 mg per ml of iron: 0.8 per cent to 1.1 per cent.

To 10.0 ml of injection, add 50 ml of *water* and 2 ml of *nitric acid* and titrate immediately with *0.1 M silver nitrate*, determining the end-point potentiometrically (2.4.25).

1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of Cl.

Phenol. Not more than 0.5 per cent,

Determine by gas chromatography (2.4.13).

Internal standard solution. A 0.2 per cent w/v soluion of *benzyl alcohol* in *methanol.*

Test solution. Mix 5.0 ml of injection and 10.0 ml of the internal standard solution and dilute to 50.0 ml with *water.*

Reference solution (a). A 0.4 per cent w/v soluion of *phenol.*

Reference solution (b). Mix 5.0 ml of reference solution (a) and 10.0 ml of the internal standard solution and dilute to 50.0 ml with *water.*

Chromatographic system

- a fused silica capillary column 30 m x 0.32 mm, packed with macrogol 20000 (film thickness 0.5 µm),
- temperature:
  column. - 150° for 5 minutes, 150° to 230° @ 10° per minute and hold at 230° for 7 minutes,
- inlet port: 200° and detector. 310°,
- flame ionization detector,
- flow rate: 2 ml per minute,using nitrogen as the carrier gas,
- injection volume: 1 µl,
- split ratio: 10:1,
- run time: 20 minutes.

The relative retention time of benzyl alcohol with respect to phenol is about 0.85.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to benzyl alcohol and phenol is not less than 2.0, the tailing factor not more than 2.0 for the phenol peak and the relative standard deviation for replicate injections is not more than 1.0 per cent for the peak response ratio of phenol to benzyl alcohol.

Calculate the content of phenol (C_6H_6O) in the injection.

Non-volatile Residue. For products labeled to contain 50 mg per ml of iron: 28.0 per cent to 32.0 per cent; 75 mg per ml of iron: 35.0 per cent to 40.0 per cent; 100 mg per ml of iron: 37.0 per cent to 43.0 per cent.

Transfer 1.0 ml of injection onto 3 to 5 g of sand spread in a shallow layer in a stainless steel dish, the dish and sand having been previously dried and weighed. Rinse the pipet, with several small portions of *water*, onto the sand. Evaporate on a steam bath to dryness, continue the drying in an oven at 105° for 15 hours, and weigh.

Absorption from Injection Site. Prepare a site over the semitendinosus muscle of one leg of each of two rabbits, each weighing between 1.5 and 2.5 kg, by clipping the fur and disinfecting the exposed skin. Inject each site with a dose of 0.4 ml per kg of body weight in the following manner. Place the needle in the distal end of the semitendinosus muscle at an angle such as to ensure that the full length of the needle is used, then pass it through the sartorius and vastus medialis muscles. House the rabbits separately. Sacrifice the rabbits after 7 days and remove the legs into which the injections were made. Carefully dissect the muscles and examine the site of injection. The muscle is only lightly stained and no heavy black deposit of unabsorbed iron compounds or leakage along fascial planes is observed.

Skin the leg, dissect the flesh from the bone and cut into small pieces. Transfer the pieces to a 1000-ml beaker, add 75 ml of *2 M sodium hydroxide* and sufficient *water* to submerge them, cover the beaker with a watch glass and boil until most of the solid matter has disintegrated. Cool cautiously, add 50 ml of *sulphuric acid,* heat the mixture almost to boiling and add carefully 10 ml of *fuming nitric acid* about 1 ml at a time, until no charring occurs when the excess of nitric acid has been boiled off. Cool, add 175 ml of *water,* boil until solution is complete, cool and dilute to 250.0 ml with *water*. To 5.0 ml of the solution add 3 ml of *sulphuric acid,* heat to fuming and complete the oxidation by adding small quantities of *nitric acid* until the solution is colourless. Cool, add 20 ml of *water,* boil for 3 minutes and add 10 ml of *ammonium citrate solution,* 10 ml of *ammonium thioglycollate solution* followed by *dilute ammonia solution* dropwise until the iron colour is fully developed. Add 1 ml excess of *dilute ammonia solution* and sufficient *water* to produce 100.0 ml. Measure the absorbance of the resulting solution at about 530 nm (2.4.7). For the reference solution, add 10 ml of *ammonium citrate solution,* 10 ml of *ammonium thioglycollate solution* and the same quantities of *dilute ammonia solution* as used above to 20 ml of *water*, and dilute to 100.0 ml. Measure the absorbance of the solution at about 530 nm (2.4.7). From the difference between the absorbances, calculate the amount of Fe present in the legs from a reference curve prepared by treating suitable aliquots of a solution of *ferricammonium sulphate* containing 0.01 per cent w/v of Fe by the above procedure beginning at the words "add 10 ml of *ammonium citrate solution,.....*".

Repeat the determination of Fe on the corresponding legs into which injection was not made beginning at the words "Carefully dissect the muscles....". From the difference between the two amounts of Fe, calculate the proportion of injected iron, as Fe, remaining in the leg tissues. Not more than 20 per cent of the injected iron remains.

Abnormal toxicity. Not less than 500 mg of iron per kg of body weight.

Select five mice, each weighing 18 to 25 g, maintained on an adequately balanced diet. Inject a dose of Injection, equivalent to 200 mg of iron per kg of body weight, into a tail vein at a rate of not more than 0.1 ml per second. Keep the mice under observation for 48 hours after the injection. If none of the mice show outward symptoms of toxicity, the requirements of the test are met. If any of the mice die within the observation

period, select four groups of 10 mice, each weighing 18 to 25 g. Inject, intravenously, all mice of one group with one of the following doses of Injection: 375, 500, 750, or 1000 mg of iron per kg of body weight. Observe the mice for 7 days, and record the number of deaths in each group. If more than 16 mice die, calculate the LD with log-doses and probits. The four doses of Injection, in mg of iron per kg of body weight, are transformed to $x_1 = 2.574$, $x_2 = 2.699$, $x_3 = 2.875$, and $x_4 = 3.000$. The probits corresponding to the number of deaths observed in each group of 10 mice are designated y_1, y_2, y_3 and y_4, respectively, and are given in Table 1 for mortalities from 10 per cent to 90 per cent. For observed deaths of 0 and 10 adjacent to doses giving an intermediate mortality, use the approximate probits 3.02 and 6.98, respectively; omit the end value (at x_1 or x_4) if not adjacent to an intermediate mortality. Since the information in a probit varies with its expectation, assign each probit an approximate relative weight (w) for computing the LD_{50} of the Injection, as shown in Table 2.

Table 2

No. of Deaths	0 or 10	1 or 9	2 or 8	3 or 7	4 to 6
Weight (w)	0.3	0.7	1.0	1.2	1.3

Calculate the weighted means:

$$\bar{x} = \frac{\Sigma(wx)}{\Sigma w}$$

and

$$\bar{y} = \frac{\Sigma(wy)}{\Sigma w}$$

from the sum of the weights, Σw, of the four (or three) acceptable responses and the corresponding weighted sums of the log-doses, $\Sigma(wx)$, and of the probits, $\Sigma(wy)$. From the sums of the weighted products, $\Sigma(wxy)$, and of the weighted squares, $\Sigma(wx^2)$, compute the slope b of the log-dose-probit line as:

$$b = \frac{[\Sigma(wxy) - \bar{x}\Sigma(wy)]}{[\Sigma(wx^2 - \bar{x}\Sigma(wx)]}$$

The LD_{50} for this safety test, in mg of iron per kg of body weight, is calculated as:

$$LD_{50} = \text{antilog}\left[\bar{x} + \frac{(5 - \bar{y})}{b}\right]$$

Bacterial endotoxins (2.2.3). Not more than 0.50 Endotoxin Unit per mg of iron.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay.

For iron — Determine by atomic absorption spectrophotometry (2.4.2), Method B.

Solvent mixture. Dissolve 2.64 g of *calcium chloride dihydrate* in 500 ml of *water*, add 5 ml of *hydrochloric acid* and dilute to 1000.0 ml with *water*.

Test solution. Dilute a volume of injection containing 100 mg of Iron to 200.0 ml with the solvent mixture. Dilute 2.0 ml of the solution to 250.0 ml with the solvent mixture.

Reference solution. A solution of 50 µg per ml of iron prepared by dissolving 350 mg of *ferrous ammonium sulphate hexahydrate* in 1000.0 ml of *water*. Dilute the solution to obtain the concentrations of 1 µg per ml, 2 µg per ml, 3 µg per ml, 4 µg per ml and 5 µg per ml of iron in the solvent mixture.

Set the zero of the instrument using solvent mixture as blank. Measure the absorbance at 248.3 nm using a iron hollow-cathode lamp as source of radiation and an air-acetylene flame.

Table 1

	Probits (normal deviates + 5) Corresponding to Percentages in the Margins									
	0	1	2	3	4	5	6	7	8	9

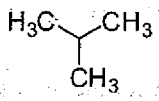
99	7.33	7.37	7.41	7.46	7.51	7.58	7.65	7.75	7.88	8.09

Calculate the content of Iron, (Fe) in the injection.

Storage. Store at a temperature not exceeding 30°, preserve in single dose and multi dose containers, preferably of Type I or Type II glass.

Labelling. The label states the strength in terms of the equivalent amount of iron, Fe, in a suitable dose-volume per cent.

Isobutane



C_4H_{10} Mol. Wt. 58.1

Isobutane is 2-methylpropane.

Isobutane contains not less than 95.0 per cent of C_4H_{10}.

Category. Pharmaceutical aid.

CAUTION—Isobutane is highly flammable and explosive.

Identification

Determine by infrared absorption spectrophotometry (2.4.6), the solution shows absorption maxima at wavelength of 3.4 µm, 6.8 µm, 7.2 µm, 8.5 µm and 10.9 µm.

Tests

Water (2.3.43). Not more than 0.001 per cent with the following modifications (a) provide the closed-system titrating vessel with an opening through which passes a coarse-porosity gas dispersion tube connected to a sample cylinder; (b) dilute the reagent with *anhydrous methanol* to give a water equivalence factor of between 0.2 and 1.0 mg per ml, age this diluted solution for not less than 16 hours before sanitation; (c) obtain a 100 g sample as directed under inhalation preparation, and introduce the sample into the titration vessel through the gas dispersion tube at a rate of about 100 ml of gas per minute.

High-boiling residues. Not more than 5 µg per ml.

Prepare a cooling coil from copper tubing (about 6 mm outside diameter × about 6.1 m long) to fit into a vacuum-jacketed flask. Immerse the cooling coil in a mixture of dry ice and *acetone* in a vacuum-jacketed flask, and connect one end of the tubing to the propellant sample cylinder. Carefully open the sample cylinder valve, flush the cooling coil with about 50 ml of the propellant, and discard this portion of liquefied propellant. Continue delivering liquefied propellant from the cooling coil, and collect it in a previously chilled 1000-ml sedimentation cone until the cone is filled to the 1000-ml mark. Allow the propellant to evaporate, using a warm water-bath maintained at about 40° to reduce evaporating time. When all of the liquid has evaporated, rinse the sedimentation cone with two 50-ml portions of *pentane*, and combine the rinsings in a tared 150-ml evaporating dish. Transfer 100 ml of the *pentane* solvent to a second tared 150-ml evaporating dish, place both evaporating dishes on a water-bath, evaporate to dryness, and heat the dishes in an oven at 100° for 60 minutes. Cool the dishes in a desiccator, and weigh. Repeat the heating for 15-minute periods until successive weighings are within 0.1 mg, and calculate the weight of the residue obtained from the propellant as the difference between the weights of the residues in the two evaporating dishes.

Acidity of residue. Add 10 ml of *water* to the residue obtained in the test for High boiling residues, mix by swirling for about 30 seconds, add 2 drops of *methyl orange solution*, insert the stopper in the tube, and shake vigorously; no pink or red color appears in the aqueous layer.

Assay. Determine by gas chromatography (2.4.13).

Test solution. Connect one Isobutane cylinder to the chromatograph through a suitable sampling valve and a flow control valve downstream from the sampling valve. Flush the liquid sample through the sampling valve, taking care to avoid entrapment of gas or air in the sampling valve.

Chromatographic system

- an aluminum column 6 m x 3 mm, packed with 10 per cent of liquid phase G30 (Tetraethylene glycol dimethyle ether) on non-acid-washed support S1C (A support prepared from crushed firebrick and calcined or burned with a clay binder above 900° with subsequent acid-wash. It may be silanized),
- temperature:
  column.33°,
- a thermal-conductivity detector,
- flow rate: 50 ml per minute, using nitrogen as the carrier gas.

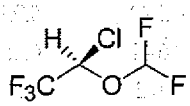
Inject the test solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 1.0.

Inject 2 µl of the reference solution and the test solution.

Calculate the percentage purity by dividing 100 times the Isobutane response by the sum of all of the responses in the chromatogram.

Storage. Store protected from moisture and prevent exposure to excessive heat.

Isoflurane



and enantiomer

$C_3H_2ClF_5O$ Mol. Wt. 184.5

Isoflurane is (2RS)-2-Chloro-2-(difluoromethoxy)-1,1,1-trifluoroethane.

Category. General anaesthetic.

Description. A clear, colourless, mobile and heavy liquid.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *isoflurane IPRS* or with the reference spectrum of isoflurane.

Tests

Acidity or alkalinity. Shake 20 ml of the sample with 20 ml of *carbon dioxide free water* for 3 minutes and allow to stand. Collect the upper layer and add *0.2 ml of bromocresol* purple solution. Not more than 0.1 ml of *0.01M sodium hydroxide or 0.6 ml of 0.01M hydrochloric acid* is required to change the colour of the indicator.

Related substances. Determine by gas chromatography (2.4.13).

Test solution. The substance under examination.

Reference solution. To 80 ml of *dehydrated alcohol*, add 1.0 ml of the *isoflurane IPRS* and 1.0 ml of *acetone*, avoiding loss by evaporation, dilute to 100.0 ml with *dehydrated alcohol*. Dilute 1.0 ml of the solution to 100.0 ml with the same solvent.

Chromatographic system

- a capillary column 30 m x 0.32 mm, packed with fused silica coated with macrogol 20000 (film thickness 0.25 µm),
- temperature:
  column 35°,
  injector port: 150° and detector port at 250°,
- split ratio: 1:25,
- flame ionization detector,
- flow rate: 1 ml per minute, using helium/ nitrogen as the carrier gas,
- Run time: Untill elution of the *ethanol* peak in the chromatogram obtained with the reference solution.

Inject the 1.0 µl of each solution and 1.0 µl of *dehydrated alcohol* as a blank. The relative retention times with reference to isoflurane (retention time is about 3.8 minutes), for acetone is about 0.75 minute. The test is not valid unless the resolution between the peak due to acetone and the peak due to isoflurane is not less than 5.0 in the chromatogram obtained with reference solution.

Inject the reference solution.The test is not valid unless the relative standard deviation for replicate injections is not more than 15.0 per cent for the peak due to isoflurane.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of the peak corresponding to the acetone is not more than the area of the principal peak in the chromatogram obtained with reference solution (0.01 per cent); the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (0.01 per cent) ; the sum of the areas of all the secondary peaks is not more than 3.0 times the area of the principal peak in the chromatogram obtained with reference solution (0.03 per cent). Ignore any peak due to isoflurane with an area less than 0.1 times of the area of the principal peak in the chromatogram obtained with reference solution (0.001 per cent).

Chlorides (2.3.12). To 50.0 ml of the sample add 10 ml of *0.01 M sodium hydroxide* and shake for 3 minutes. 5.0 ml of the upper layer complies with the limit test for chloride (10 ppm).

Fluoride. Not more than 10 ppm.

Buffer solution. Dissolve 58.5 g of *sodium chloride*, 57.0 ml of *glacial acetic acid* , 61.5 g of *sodium acetate* and 5.0 g of *cyclohexylene-dinitrilotetra-acetic acid* in *water* and dilute to 500.0 ml with the same solvent. Adjusted the pH 5.0 to 5.5 with a 33.5 per cent w/v solution of *sodium hydroxide* and dilute to 1000.0 ml with *distilled water*.

Determining the end point potentiometrically (2.4.25) for fluoride ion, using a fluoride-selective indicator electrode and a silver-silver chloride reference electrode.

Test solution.Take 10.0 ml of the sample in a separating funnel, add 10 ml of a mixture of 30.0 ml of *dilute ammonia* and 70.0 ml of *water*. Shake for 1 minute and collect the upper layer. Repeat the extraction procedure twice, collecting the upper layer each time. Adjust the combined upper layers to pH 5.2 using *dilute hydrochloric acid* . Add 5.0 ml of *fluoride standard solution (1 ppm)* and dilute to 50.0 ml with *water*. To 20.0 ml of the solution add 20.0 ml of *buffer solution* and dilute to 50.0 ml with *water*.

Reference solutions. To each of 5.0 ml, 4.0 ml, 3.0 ml, 2.0 ml and 1.0 ml of *fluoride standard solution (10 ppm)* add 20.0 ml of a buffer solution and dilute to 50.0 ml with *water*.

Carry out the measurements on 20 ml of each solution.

Calculate the concentration of fluorides using the calibration curve, taking into account the addition of fluoride to the test solution.

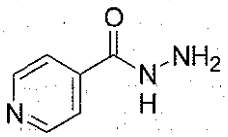
Non-volatile matter. Evaporate 10.0 ml of the sample in a small dish on a water-bath and dry at 50° for 2 hours; the residue weighs not more than 2 mg (0.02 per cent w/v).

Water (2.3.43). Not more than 0.1 per cent w/v, determined on 10.0 ml.

Storage. Store in airtight containers and protected from light, at a temperature below 30°.

Isoniazid

Isonicotinylhydrazid; INH



$C_6H_7N_3O$ Mol. Wt. 137.1

Isoniazid is isonicotinic acid hydrazide.

Isoniazid contains not less than 98.0 per cent and not more than 101.0 per cent of $C_6H_7N_3O$, calculated on the dried basis.

Category. Antituberculosis.

Description. Colourless crystals or a white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Test B may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *isoniazid IPRS* or with the reference spectrum of isoniazid.

B. Dissolve 0.1 g in 2 ml of *water*, add a warm solution of 0.1 g of *vanillin* in 10 ml of *water*, allow to stand and scratch the inside of the container with a glass rod; a yellow precipitate is produced. The precipitate after recrystallisation from 5 ml of *ethanol (70 per cent)* and drying at 105° melts at 226° to 231° (2.4.21).

C. Melts at 170° to 174° (2.4.21).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and not more intensely coloured than reference solution BYS7 (2.4.1).

pH (2.4.24). 6.0 to 8.0, determined in a 5.0 per cent w/v solution.

Hydrazine. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 50 volumes of *ethyl acetate*, 20 volumes of *acetone*, 20 volumes of *methanol* and 10 volumes of *water*.

Test solution. Dissolve 1 g of the substance under examination in sufficient of a mixture of equal volumes of *acetone* and *water* to produce 10 ml.

Reference solution. Dissolve 50 mg of *hydrazine sulphate* in 50 ml of *water* and dilute to 100 ml with *acetone*; to 10 ml of the solution add 0.2 ml of the test solution and dilute to 100.0 ml with a mixture of equal volumes of *acetone* and *water*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution. Spray with *dimethylaminobenzaldehyde solution* and examine in daylight. The additional spot (due to hydrazine) in the chromatogram obtained with the reference solution is more intense than any corresponding spot in the chromatogram obtained with the test solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 100 ml of *water*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 96 volumes of a solution prepared by dissolving 1.4 g *disodium hydrogen phosphate* and 1 ml of *triethylamine* to 1000 ml with *water*, adjusted to pH 6.0 with *orthophosphoric acid* and 4 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 20 µl.

Inject the test solution. Any individual impurity is not more than 0.2 per cent and the sum of all impurities found is not more than 1.0 per cent.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 25.0 mg of the substance under examination in 50.0 ml of *water*. Dilute 5.0 ml of the solution to 25.0 ml with *water*.

Reference solution. Dissolve 25.0 mg of the *isoniazid IPRS* in 50.0 ml of *water*. Dilute 5.0 ml of the solution to 25.0 ml with *water*.

Use the chromatographic system described under the test for Related substances.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_6H_7N_3O$.

Storage. Store protected from light.

Isoniazid Tablets

Isonicotinylhydrazid Tablets; INH Tablets

Isoniazid Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of isoniazid, $C_6H_7N_3O$.

Usual strengths. 50 mg; 100 mg; 300 mg.

Identification

A. Shake a quantity of the powdered tablets containing 0.1 g of Isoniazid with 10 ml of *ethanol (95 per cent)* for 15 minutes, centrifuge and decant the supernatant liquid. Extract the residue with two further quantities, each of 10 ml, of *ethanol (95 per cent)* and evaporate the combined extracts to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *isoniazid IPRS* or with the reference spectrum of isoniazid.

B. Shake a quantity of the powdered tablets containing 0.1 g of Isoniazid with 50 ml of *ethanol (95 per cent)* and filter. To 5 ml of the filtrate add 0.1 g of *borax* and 5 ml of a 5 per cent w/v solution of *1-chloro-2,4-dinitrobenzene* in *ethanol (95 per cent)*, evaporate to dryness on a water-bath and continue heating for a further 10 minutes. To the residue add 10 ml of *methanol* and mix; a reddish purple colour is produced.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powdered tablets containing 50 mg of Isoniazid, dissolve in 100.0 ml of the mobile phase.

Use the chromatographic system described under Assay.

Inject the test solution. Any individual impurity is not more than 1.0 per cent and the sum of all impurities found is not more than 2.0 per cent.

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc having an average pore diameter not greater than 1.0 µm, rejecting the first 1 ml of the filtrate. Dilute suitably with *water* and measure the absorbance of the resulting solution at the maximum at about 263 nm (2.4.7). Calculate the content of $C_6H_7N_3O$ taking 307 as the specific absorbance at 263 nm.

Q. Not less than 80 per cent of the stated amount of $C_6H_7N_3O$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 25.0 mg of Isoniazid and dissolve in 50.0 ml of the mobile phase. Dilute 5.0 ml of the solution to 25.0 ml with the mobile phase.

Reference solution. A 0.01 per cent w/v solution of the *isoniazid IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (such as Intersil ODS-3),
- mobile phase: mix 96 volumes of a solution prepared by dissolving 1.4 g *disodium hydrogen orthophosphate anhydrous* and 1.0 ml of *triethylamine* to 1000 ml with *water* and adjusted to pH 6.0 with *orthophosphoric acid*, and 4 volumes of *acetonitrile* and filter,
- flow rate: 1 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the column efficiency is not less than 2000 theoretical plates. The relative standard deviation for replicate injections is not more than 2.0 per cent.

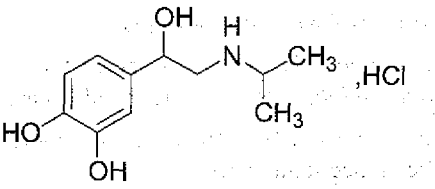
Inject the reference solution and the test solution.

Calculate the content of $C_6H_7N_3O$ in the tablets.

Storage. Store protected from light.

Isoprenaline Hydrochloride

Isoproterenol Hydrochloride



$C_{11}H_{17}NO_3$,HCl Mol. Wt. 247.7

Isoprenaline Hydrochloride is (*RS*)-1-(3,4-dihydroxyphenyl)-2-isopropylaminoethanol hydrochloride.

Isoprenaline Hydrochloride contains not less than 98.0 per cent and not more than 101.5 per cent of $C_{11}H_{17}NO_3$,HCl, calculated on the dried basis.

Category. Sympathomimetic.

Description. A white or almost white, crystalline powder. Gradually darkens on exposure to air and light; even in the absence of light, it is gradually degraded on exposure to a humid atmosphere, the decomposition being faster at higher temperatures. Aqueous solutions become pink to brownish on standing exposed to air and almost immediately after being made alkaline.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *isoprenaline hydrochloride IPRS* or with the reference spectrum of isoprenaline hydrochloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.005 per cent w/v solution shows an absorption maximum only at about 280 nm; absorbance at about 280 nm, about 0.5.

C. To 2 ml of a freshly prepared 1 per cent w/v solution add 0.1 ml of *ferric chloride test solution*; an emerald-green colour is produced which, on the gradual addition of *sodium bicarbonate solution*, changes first to blue and then to red.

D. It gives the reactions of chlorides (2.3.1).

Tests

Sulphates (2.3.17). Dissolve 0.5 g in 100 ml of *water*; 15 ml of the resulting solution complies with the limit test for sulphates (0.2 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Further dilute 5.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). A 0.0025 per cent w/v solution of *orciprenaline sulphate IPRS* in the mobile phase.

Reference solution (c). To 5.0 ml of reference solution (a), add 5.0 ml of reference solution (b).

Chromatographic system

- a stainless steel column 12.5 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 5 volumes of *methanol* and 95 volumes of 1.15 per cent w/v solution of *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Name	Relative retention time
Isoprenaline	1.0
Orciprenaline	1.5
Isoprenaline impurity A[1]	1.8

[1]1-(3,4-dihydroxyphenyl)-2-[(1-methylethyl)amino]ethanone.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to isoprenaline and orciprenaline is not less than 3.0.

Inject reference solution (a) and the test solution. Run the chromatogram 7 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of peak corresponding to isoprenaline impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent), the area of any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa for 4 hours.

Assay. Weigh 0.5 g, dissolve in 50 ml of *anhydrous glacial acetic acid* with the aid of the minimum heat, cool and add 15 ml of *mercuric acetate solution* and titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02477 g of $C_{11}H_{17}NO_3,HCl$.

Storage. Store protected from light.

Isoprenaline Injection

Isoprenaline Hydrochloride Injection; Isoproterenol Injection; Isoproterenol Hydrochloride Injection

Isoprenaline Injection is a sterile solution of Isoprenaline Hydrochloride in Water for Injections. It may contain suitable stabilising agents.

Isoprenaline Hydrochloride Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of isoprenaline hydrochloride, $C_{11}H_{17}NO_3,HCl$.

Usual strength. 200 µg per ml.

Description. A colourless or very pale yellow solution.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 50 volumes of *ethyl acetate*, 30 volumes of *2-propanol*, 16 volumes of *water* and 4 volumes of *strong ammonia solution*.

Test solution. Use the injection, diluted if necessary with sufficient *methanol (80 per cent)* to produce a solution containing 0.02 per cent w/v of isoprenaline hydrochloride.

Reference solution. A solution containing 0.02 per cent w/v of *isoprenaline hydrochloride IPRS* in *methanol (80 per cent)*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air until the odour of the solvent is no longer detectable, place it for a few minutes in an atmosphere saturated with *diethylamine* and spray with *diazotised nitroaniline solution*. The chromatogram obtained with the test solution exhibits an elongated zone corresponding to that obtained with the reference solution.

B. To 2 ml add 0.1 ml of *ferric chloride test solution*; an emerald-green colour develops which, on gradual addition of *sodium bicarbonate solution*, changes to blue and then to red.

Tests

pH (2.4.24). 2.5 to 3.0.

Bacterial endotoxins (2.2.3). Not more than 1250.0 Endotoxin Units per mg of isoprenaline hydrochloride.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of injection containing 2 mg of Isoprenaline Hydrochloride to 100.0 ml with 0.1 per cent w/v of *sodium metabisulphite*.

Reference solution (a). A 0.002 per cent w/v solution of *isoprenaline hydrochloride IPRS* in a 0.1 per cent w/v of *sodium metabisulphite*.

Reference solution (b). A mixture of 1 volume of a 0.02 per cent w/v solution of *adrenaline acid tartrate* in the mobile phase containing 1.0 per cent w/v of *sodium metabisulphite* and 18 volumes of reference solution (a).

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (3 to 10 µm) (Such as Nucleosil C18),
- mobile phase: dissolve 1.76 g of *sodium heptanesulphonate* in 800 ml of *water*, add 200 ml of *methanol* and adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 3.5.

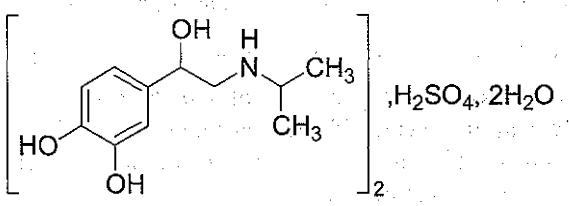
Inject reference solution (a) and the test solution.

Calculate the content of $C_{11}H_{17}NO_3$,HCl in the injection.

Storage. Store protected from light at a temperature not exceeding 30°.

Isoprenaline Sulphate

Isoproterenol Sulphate



$(C_{11}H_{17}NO_3)_2,H_2SO_4,2H_2O$ Mol. Wt. 556.6

Isoprenaline Sulphate is (*RS*)-1-(3,4-dihydroxyphenyl)-2-isopropylaminoethanol sulphate dihydrate.

Isoprenaline Sulphate contains not less than 98.0 per cent and not more than 102.0 per cent of $(C_{11}H_{17}NO_3)_2,H_2SO_4$, calculated on the anhydrous basis.

Category. Sympathomimetic.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Dissolve 0.5 g in 1.5 ml of *water*, add 3.5 ml of *2-propanol* scratch the walls of the container with a glass rod to induce crystallisation, collect the crystals and dry over *phosphorus pentoxide* at 60° at a pressure of 1.5 to 2.5 kPa. The crystals comply with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *isoprenaline sulphate IPRS* treated in the same manner or or with the reference spectrum of isoprenaline.

B. To 1 ml of a 1 per cent w/v solution add 0.1 ml of *ferric chloride test solution*; an emerald-green colour is produced which, on gradual addition of *sodium bicarbonate solution*, changes first to blue and then to red.

C. To 5 ml of a freshly prepared 1 per cent w/v solution add 0.15 ml of *silver nitrate solution*; a greyish precipitate is produced on standing for 10 minutes and the solution becomes pink.

D. A 10 per cent w/v solution gives the reaction of sulphates (2.3.1).

Tests

Appearance of solution. A freshly prepared 10.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and not more intensely coloured than reference solution YS6 (2.4.1).

pH (2.4.24). 4.0 to 5.5, determined in a freshly prepared 1.0 per cent w/v solution in *carbon dioxide-free water*.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method A (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 5.0 to 7.5 per cent determined on 0.2 g.

Assay. Dissolve 0.8 g in 40 ml of *anhydrous glacial acetic acid*, warming gently if necessary and titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.05206 g of $(C_{11}H_{17}NO_3)_2,H_2SO_4$.

Storage. Store protected from light.

Isoprenaline Tablets

Isoprenaline Sulphate Tablets; Isoproterenol Tablets; Isoproterenol Sulphate Tablets

Isoprenaline Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of isoprenaline sulphate, $(C_{11}H_{17}NO_3)_2,H_2SO_4,2H_2O$.

Usual strength. 10 mg.

Identification

A. Extract a quantity of the powdered tablets containing about 50 mg of Isoprenaline Sulphate with 5 ml of *water* and filter. Reserve the filtrate for test C. To 1 ml of the filtrate add 0.1 ml of *ferric chloride test solution*; an emerald-green colour is produced which, on gradual addition of *sodium bicarbonate solution*, changes first to blue and then to red.

B. Extract a quantity of the powdered tablets containing about 50 mg of Isoprenaline Sulphate with 5 ml of *water* and filter. To the filtrate add 0.15 ml of *silver nitrate solution*; a greyish precipitate is produced on standing for 10 minutes and the solution becomes pink.

C. To 2 ml of the filtrate reserved from test A add 0.5 ml of *dilute hydrochloric acid* and 0.5 ml of *barium chloride solution*; a white precipitate is formed.

Tests

Uniformity of content. Complies with the test stated under Tablets.

Crush one tablet and shake with 50 ml of *water* for 15 minutes. Add sufficient *water* to produce 100.0 ml, mix and filter. To 20.0 ml of the filtrate add 0.5 ml of *ferrous sulphate-citrate solution* and 2 ml of *glycine buffer solution* and allow to stand for 20 minutes. Dilute to 25.0 ml with *water* and mix. Measure the absorbance of the resulting solution at the maximum at about 540 nm (2.4.7). Calculate the content of $(C_{11}H_{17}NO_3)_2,H_2SO_4,2H_2O$ in the tablet from the absorbance obtained by repeating the determination using 2.0 ml of a 0.1 per cent w/v solution of *isoprenaline sulphate IPRS* in place of the substance under examination.

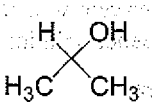
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.1 g of Isoprenaline Sulphate and shake with 50 ml of *water* for 15 minutes. Add sufficient *water* to produce 100.0 ml, mix and filter. Dilute 20.0 ml of the filtrate to 200.0 ml with *water*. To 20.0 ml of the resulting solution add 0.5 ml of *ferrous sulphate-citrate solution* and 2 ml of *glycine buffer solution* and allow to stand for 20 minutes. Dilute to 25.0 ml with *water* and mix. Measure the absorbance of the resulting solution at the maximum at about 540 nm (2.4.7). Calculate the content of $(C_{11}H_{17}NO_3)_2,H_2SO_4,2H_2O$ from the absorbance obtained by repeating the determination using 2.0 ml of a 0.1 per cent w/v solution of *isoprenaline sulphate IPRS* in place of the substance under examination.

Storage. Store protected from light.

Isopropyl Alcohol

Propan-2-ol



C_3H_8O Mol. Wt. 60.1

Isopropyl Alcohol is propan-2-ol.

Isopropyl Alcohol contains not less than 99.0 per cent v/v of C_3H_8O.

Category. Pharmaceutical aid (solvent).

Description. A clear and colourless liquid.

Identification

Tests A and D may be omitted if tests B and C are carried out. Test C may be omitted if tests A, B and D are carried out.

A. Relative density (See test).

B. Refractive index (See test).

C. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *isopropyl alcohol IPRS* or with the reference spectrum of isopropyl alcohol.

D. To 1ml, add 4 ml of *water* and mix. Carefully add 2 ml of 1 per cent w/v solution of *dimethylaminobenzaldehyde* in *sulphuric acid*, ensuring that the liquids do not mix; a bright reddish-violet ring forms immediately at the junction of the 2 liquids. After 2 to 5 minutes, the entire *sulphuric acid* layer turns violet.

Tests

Appearance of solution. Isopropyl Alcohol is clear (2.4.1) and colourless (2.4.1). A 5 per cent v/v solution of Isopropyl Alcohol in *water* remains clear (2.4.1) after 5 minute.

Acidity or alkalinity. Gently boil 25 ml of Isopropyl Alcohol for 5 minutes with 25 ml of *carbon dioxide-free water* and cool, protected from carbon-dioxide in the air. Add 0.1 ml of *phenolphthalein solution*. The solution is colourless. Not more than 0.6 ml of *0.01M sodium hydroxide* is required to change the colour of the solution to pale pink.

Absorbance (2.4.7). When examined at the wavelength 230 nm, 250 nm, 270 nm, 290 nm and 310 nm, Isopropyl Alcohol shows an absorption maximum 0.30, 0.10, 0.03, 0.02 and 0.01 respectively.

The absorbance is measured between 230 nm and 310 nm using *water* as the compensation liquid. The spectrum shows a steadily descending curve with no observable peaks or shoulders.

Refractive index (2.4.27). 1.376 to 1.379, determined at 20°.

Relative density (2.4.29). 0.785 to 0.789, determined at 20°.

Peroxides. Place 8 ml of *potassium iodide* and *starch solution* in a 12-ml glass-stoppered cylinder of about 1.5 cm diameter. Fill completely with Isopropyl Alcohol, insert the stopper, shake vigorously and allow to stand in the dark for 30 minutes, no colouration is produced.

Benzene and related substances. Determine by gas chromatography (2.4.13).

Test solution (a). Isopropyl Alcohol.

Test solution (b). A 0.1 per cent v/v solution of *2-butanol* in test solution (a).

Reference solution (a). A solution containing 0.1 per cent, v/v each, of *2-butanol* and *1 -propanol* in test solution (a).

Reference solution (b). Dilute 0.1 ml of *benzene* to 100.0 ml with test solution (a). Dilute 0.2 ml of the solution to 100.0 ml with test solution (a).

Chromatographic system

- a fused silica column 30 m × 0.32 mm, packed with 6.0 per cent cyanopropylphenyl and 94 per cent dimethylpolysiloxane (film thickness 1.8 µm) (Such as DB-624),
- temperature:
  column. 40° hold for 12 minutes, 40° to 240° @ 10° per minute and hold at 240° for 10 minutes,
  inlet port 280° and detector at 280°,
- split ratio: 1:5,
- flame ionization detector,
- linear velocity: 35 cm per second using nitrogen as the carrier gas,
- injection volume: 1 µl.

The retention time of benzene is about 10 minutes.

Inject reference solution (a). The test is not valid unless the resolution between the peak due to *1-propanol* and *2-butanol* is not less than 10.

Inject reference solution (b) and test solution (a). In the chromatogram obtained with test solution (a) the area of any peak corresponding to benzene is not more than 0.5 times the area of the benzene peak obtained with reference solution (b) (2 ppm). Record the chromatogram adjusting the sensitivity so that the height of the peak due to benzene represents at least 10 per cent of full-scale deflection.

Inject reference solution (a) and test solution (b). In the chromatogram obtained with test solution (b), the area of all secondary peaks other than 2-butanol is not more than 3 times the area of the peak due to 2- butanol in the chromatogram obtained with reference solution (a) (0.3 per cent). Record the chromatogram adjusting the sensitivity so that the height of the 2 peaks following the principal peak in the chromatogram obtained with reference solution (a) represents at least 50 per cent of full-scale deflection.

Non-volatile substances. Not more than 20 ppm.

Evaporate 100 g on a water-bath after having verified that it complies with the test for peroxides and dry the residue at 105°. The residue weigh is not more than 2.0 mg.

Water (2.3.43). Not more than 0.5 per cent, determined on 5.0 g.

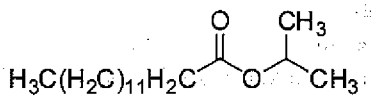
Assay. Determine by gas chromatography (2.4.13), as described under Benzene and related substances.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to 1-propanol and 2-butanol is not less than 10.

Inject test solution (a). Calculate the content of C_3H_8O by area normalization.

Storage. Store protected from light.

Isopropyl Myristate



$C_{17}H_{34}O_2$ Mol. Wt. 270.5

Isopropyl Myristate is isopropyl tetradecanoate.

Isopropyl Myristate contains not less than 90.0 per cent of $C_{17}H_{34}O_2$.

Category. Pharmaceutical aid.

Description. A clear, colourless, oily liquid.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. Superpose 2 ml of a 0.1 per cent w/v solution in *ethanol (95 per cent)* on a freshly prepared solution of 20 mg of *dimethylaminobenzaldehyde* in 2.0 ml of *sulphuric acid*. After 2 minutes, a yellowish-red colour appears at the junction of the 2 liquids and gradually becomes red.

C. Complies with the test for saponification value (2.3.37).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *methanol* is clear (2.4.1), and not more intensely coloured than reference solution YS7 (2.4.1).

Refractive index (2.4.27). 1.434 to 1.437.

Relative density (2.4.29). About 0.853.

Acid value (2.3.23). Not more than 1.0.

Saponification value (2.3.37). 202 to 212.

Iodine value (2.3.28). Not more than 1.0.

Total ash (2.3.19). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.1 per cent, determined on 5.0 g.

Assay. Determine by gas chromatography (2.4.13).

Internal standard solution. Dissolve about 50 mg of *tricosane* in 250.0 ml of *heptane*.

Test solution. Dissolve about 20 mg of the substance under examination in 100.0 ml of the internal standard solution.

Reference solution. A 0.02 per cent w/v solution of *isopropyl tetradecanoate IPRS* in internal standard solution.

Chromatographic system

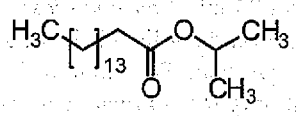
- a fused silica column 50 m x 0.2 mm, packed with poly(cyanopropyl) siloxane (film thickness 0.2 µm),
- temperature:
  column. 185°,
  inlet port and detector at 250°,
- flame ionization detector,
- flow rate: 1 ml per minute, using nitrogen as the carrier gas.

Inject 2 µl of the reference solution and the test solution.

Calculate the content of $C_{17}H_{34}O_2$.

Storage. Store protected from light.

Isopropyl Palmitate



$C_{19}H_{38}O_2$ Mol. Wt. 298.5

Isopropyl Palmitate is Isopropyl hexadecanoate.

Isopropyl Palmitate contains not less than 90.0 per cent of $C_{19}H_{38}O_2$.

Category. Excipient.

Description. A clear, colourless, oily liquid.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. Superpose 2 ml of a 0.1 per cent w/v solution in *ethanol (95 per cent)* on a freshly prepared solution of 20 mg of *dimethylaminobenzaldehyde* in 2 ml of *sulphuric acid*. After 2 minutes, a yellowish-red colour appears at the junction of the 2 liquids which gradually becomes red.

Tests

Appearance of solution. A 10.0 per cent w/v solution in *methanol* is clear (2.4.1) and not more intensely coloured than reference solution YS7 (2.4.1).

Refractive index (2.4.27). 1.436 to 1.440.

Viscosity (2.4.28). 5 mPas to 10 mPas.

Relative density (2.4.29). About 0.854.

Total ash (2.3.19). Not more than 0.1 per cent.

Acid value (2.3.23). Not more than 1.0.

Iodine value (2.3.28). Not more than 1.0.

Saponification value (2.3.37). 183 to 193.

Water (2.3.43). Not more than 0.1 per cent, determined on 5.0 g.

Assay. Determine by gas chromatography (2.4.13).

Internal standard solution. Dissolve 50 mg of *tricosane* in *heptane* and dilute to 250.0 ml with *heptane*.

Test solution. Dissolve 20 mg of the substance under examination in the internal standard solution and dilute to 100.0 ml with the same solution.

Reference solution. A 0.02 per cent w/v solution of *isopropyl hexadecanoate IPRS* in the internal standard solution.

Chromatographic system
- a capillary column 50 m x 0. 2 mm, packed with *poly(cyanopropyl)siloxane* (film thickness 0.2 µm),
- temperature:

column	time (min)	temperature (°)
	0-6	125→185
	6-16	185

- Inlet port and detector at 250°,
- flame ionization detector,
- split ratio: 1:40,
- flow rate: 1 ml per minute, using nitrogen as the carrier gas.

Inject 2 µl of the reference solution and the test solution.

Calculate the content of $C_{19}H_{38}O_2$.

Storage. Store protected from light.

Isopropyl Rubbing Alcohol

Isopropyl Rubbing Alcohol contains not less than 68.0 per cent v/v and not more than 72.0 per cent v/v of isopropyl alcohol, C_3H_8O with the remainder consisting of *water*, with or without suitable stabilizers, perfume oil and colour permitted for the use in drugs.

Category. Skin disinfectant.

Tests

Specific gravity (2.4.29). 0.872 to 0.883 at 20°.

Acidity. Transfer 50 ml to a suitable flask and add about 75 ml of *carbon dioxide-free water* and titrate with *0.02 M sodium hydroxide* potentiometrically (2.4.25) to a pH of 8.5; not more than 1.0 ml of *0.02 M sodium hydroxide* is used.

Limit of nonvolatile residue. Not more than 5 mg (0.01 per cent). Evaporate 50 ml to dryness in a tared porcelain dish on a steam-bath and dry at 105° for 1 hour.

Assay. Determine by gas chromatography (2.4.13).

Internal standard solution. A 0.7 per cent v/v solution of *1-propanol* in *water*.

Test solution. Dilute 1.0 ml of the solution under examination to 100.0 ml with the internal standard solution.

Reference solution. A 0.7 per cent v/v solution of *isopropyl alcohol* in the internal standard solution.

Chromatographic system
- a capillary column 30 m × 0.25 mm, packed with 6.0 per cent cyanopropylphenyl and 94 per cent dimethylpolysiloxane (film thickness 1.4 µm) (Such as DB-624),
- temperature:
  column 50° for 2 minutes, 50° to 240° @ 20° per minute and hold at 240° for 2 minutes,
- inlet port 180° and detector at 280°,
- flame ionization detector,
- split ratio: 25:1;
- flow rate 0.5 ml per minute, using nitrogen as the carrier gas,
- injection volume: 1 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to isopropyl alcohol and the internal standard is not less than 2.0 and the relative standard deviation of peak area ratio due to isopropyl alcohol and the internal standard for the replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

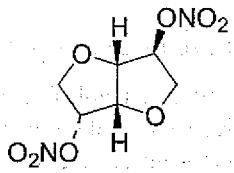
Calculate the content of C_3H_8O using ratio of the peak area of isopropyl alcohol to that of peak area of the internal standard.

Storage. Store protected from heat and preserve in tight containers.

Labelling. Label it to indicate that it is flammable.

Diluted Isosorbide Dinitrate

Diluted Sorbide Dinitrate; Diluted Sorbide Nitrate



$C_6H_8N_2O_8$ Mol. Wt. 236.1

Diluted Isosorbide Dinitrate is a dry mixture of 1,4:3, 6-dianhydro-D-glucitol 2,5-dinitrate with Lactose, Mannitol or other suitable inert diluent. It may contain a suitable stabilising agent.

Diluted Isosorbide Dinitrate contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of isosorbide dinitrate, $C_6H_8N_2O_8$ and usually contains 20 per cent to 50 per cent of isosorbide dinitrate.

Category. Antianginal.

Description. A fine, white, crystalline powder.

CAUTION — Undiluted isosorbide dinitrate is a powerful explosive and can be exploded with percussion or excessive heat. Proper precautions must be taken in handling it and only exceedingly small amounts should be isolated.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution (b) corresponds to the peak in the chromatogram obtained with the reference solution (b).

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G.*

Mobile phase. Toluene.

Test solution. Extract a quantity containing 2 mg of isosorbide dinitrate with 1 ml of *ether* and centrifuge.

Reference solution. Prepare in the same manner as the test solution but using *diluted isosorbide dinitrate IPRS* in place of the substance under examination.

Apply to the plate 20 µl of each solution. After development, dry the plate in a current of air, spray with a 1 per cent w/v solution of *diphenylamine* in *methanol* and expose for 15 minutes to ultraviolet light at 254 and 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

C. Extract a quantity containing 10 mg of isosorbide dinitrate with 10 ml of *ether* and filter. Evaporate the filtrate to dryness at a temperature not exceeding 35° and dissolve the residue in 0.15 ml of *sulphuric acid (50 per cent)* containing a trace of *diphenylamine*; an intense blue colour is produced.

Tests

Inorganic nitrates. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H.*

Mobile phase. A mixture of 60 volumes of *toluene*, 30 volumes of *acetone* and 15 volumes of *glacial acetic acid.*

Test solution. A solution of the substance under examination in *ethanol (95 per cent)* containing the equivalent of 2.0 per cent w/v of isosorbide dinitrate.

Reference solution. Prepare freshly a 0.01 per cent w/v solution of *potassium nitrate* in *ethanol (90 per cent).*

Apply to the plate 10 µl of each solution. After development, dry the plate in a current of air until the acetic acid is completely removed. Spray copiously with freshly prepared *potassium iodide* and *starch solution.* Expose the plate to ultraviolet light at 254 nm for 15 minutes. Examine in daylight. Any spot corresponding to potassium nitrate in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay, changing the detector setting to 210 to 215 nm and using injection volume of 10 µl.

Under the stated conditions, the retention times are: isosorbide dinitrate, about 5 minutes; isosorbide 2-nitrate, about 8 minutes; isosorbide 5-nitrate, about 11 minutes.

Inject reference solution (c). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with reference solution (c) is not less than 20 per cent of the full scale of the recorder.

Inject reference solution (e). The test is not valid unless in the chromatogram obtained with reference solution (e), the resolution between the peaks corresponding to isosorbide dinitrate and isosorbide 2-nitrate is at least 6.0.

Inject test solution (a), reference solution (c) and reference solution (d). In the chromatogram obtained with test solution (a) the area of any peak corresponding to isosorbide 2-nitrate is not greater than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent); the area of any peak corresponding to isosorbide 5-nitrate is not greater than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.5 per cent).

Assay. Determine by liquid chromatography (2.4.14).

Test solution (a). Mix a weighed quantity of the substance under examination containing about 25 mg of isosorbide dinitrate with 20 ml of the mobile phase with the aid of ultrasound for 15 minutes and dilute to 25.0 ml with the mobile phase. Filter the solution through a suitable membrane filter.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with the mobile phase.

Reference solution (a). Mix a quantity of *diluted isosorbide dinitrate IPRS* containing 25.0 mg of isosorbide dinitrate with 20 ml of the mobile phase with the aid of ultrasound for 15 minutes and dilute to 25.0 ml with the mobile phase. Filter the solution through a suitable membrane filter.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the mobile phase.

Reference solution (c). Dissolve 10.0 mg of *isosorbide 2-nitrate IPRS* in the mobile phase and dilute to 10.0 ml with the mobile phase. Dilute 0.1 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (d). Dissolve 10.0 mg of *isosorbide mononitrate IPRS (isosorbide-5-nitrate RS)* in the mobile phase and dilute to 10.0 ml with the mobile phase. Dilute 0.1 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (e). Dissolve 5 mg of *isosorbide 2-nitrate IPRS* in the mobile phase and dilute to 10 ml with the mobile phase. To 1 ml of the solution add 0.5 ml of reference solution (a) and dilute to 10.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with aminopropylmethylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 15 volumes of *ethanol* and 85 volumes of *trimethylpentane*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is not less than 50 per cent of the full scale of the recorder. If the areas of the peaks from two successive injections do not agree to within 1.0 per cent, then inject a further four times and calculate, for the six injections, the relative standard deviation. The assay is not valid unless the relative standard deviation for the six injections is at most 2.0 per cent.

Inject alternately test solution (b) and reference solution (b).

Calculate the content of isosorbide dinitrate as a percentage of the declared content.

Storage. Store protected from light, at a temperature not exceeding 15°.

Labelling. The label states the percentage content of isosorbide dinitrate.

Isosorbide Dinitrate Tablets

Sorbide Dinitrate Tablets; Sorbide Nitrate Tablets

Isosorbide Dinitrate Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of isosorbide dinitrate, $C_6H_8N_2O_8$.

Usual strengths. The equivalent of 5 mg and 10 mg of isosorbide dinitrate.

Identification

CAUTION — Undiluted isosorbide dinitrate is a powerful explosive and can be exploded with percussion or excessive heat. Proper precautions must be taken in handling it and only exceedingly small amounts should be isolated.

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. Toluene.

Test solution. Extract a quantity of the powdered tablets containing 2 mg of isosorbide dinitrate with 1 ml of *ether* and centrifuge.

Reference solution. Dissolve 2 mg of *diluted isosorbide dinitrate IPRS* in 1 ml of *ether*.

Apply to the plate 20 µl of each solution. After development, dry the plate in a current of air, spray with a 1 per cent w/v solution of *diphenylamine* in *methanol* and expose for 15 minutes to ultraviolet light at 254 nm and 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution

B. Extract a quantity of the powdered tablets containing 10 mg of isosorbide dinitrate with 10 ml of *ether* and filter. Evaporate the filtrate to dryness at a temperature not exceeding 35° and dissolve the residue in 0.15 ml of *sulphuric acid (50 per cent)* containing a trace of *diphenyl-amine*; an intense blue colour is produced.

Tests

Dissolution (2.5.2). (for tablets intended to be swallowed whole).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 30 minutes.

Withdraw 10 ml of the medium and filter promptly through a membrane filter disc having an average pore diameter not greater than 1.0 µm, rejecting the first 1 ml of the filtrate.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A solution of *diluted isosorbide dinitrate IPRS* in the dissolution medium containing the same concentration of isosorbide dinitrate as that expected in the dissolution medium in the vessel.

Chromatographic system
- a stainless steel column 20 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- mobile phase: a mixture of equal volumes of *methanol* and *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 222 nm.
- injection volume: 100 µl.

Calculate the content of $C_6H_8N_2O_8$.

Q. Not less than 80 per cent of the stated amount of $C_6H_8N_2O_8$.

Inorganic nitrates. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H*.

Mobile phase. A mixture of 60 volumes of *toluene*, 30 volumes of *acetone* and 15 volumes of *glacial acetic acid*.

Test solution. Shake a quantity of the powdered tablets containing 0.1 g of isosorbide nitrate with 5 ml of *ethanol (95 per cent)* and filter.

Reference solution. Prepare freshly a 0.01 per cent w/v solution of *potassium nitrate* in *ethanol (90 per cent)*.

Apply to the plate 10 µl of each solution. After development, dry the plate in a current of air until the acetic acid is completely removed. Spray copiously with freshly prepared *potassium iodide* and *starch solution*. Expose the plate to ultraviolet light at 254 nm for 15 minutes. Examine in daylight. Any spot corresponding to potassium nitrate in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Add 20 ml of the mobile phase to a quantity of the powdered tablets containing 25 mg of isosorbide dinitrate, mix with the aid of ultrasound for 15 minutes and dilute to 25 ml with the same solvent. Filter through a glass-fibre filter (such as Whatman GF/C) and use the filtrate.

Reference solution (a). A solution containing 0.0005 per cent w/v of *isosorbide 2-nitrate IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.0005 per cent w/v of *isosorbide mononitrate IPRS* in the mobile phase.

Reference solution (c). A solution containing 0.005 per cent w/v, each of, *diluted isosorbide dinitrate IPRS* and *isosorbide 2-nitrate IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with aminopropylmethylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 15 volumes of *ethanol* and 85 volumes of *2,2,4-trimethylpentane*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless, in the chromatogram obtained, the resolution between the peaks corresponding to isosorbide dinitrate and isosorbide 2-nitrate is at least 6.0.

In the chromatogram obtained with the test solution the area of any peak corresponding to isosorbide 2-nitrate is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the area of any peak corresponding to isosorbide 5-nitrate is not greater than the area of the principal peak obtained with reference solution (b) (0.5 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay using following modifications.

Test solution. Disperse 1 tablet in 20 ml of the mobile phase and dilute to obtain a concentration equivalent to 0.01 per cent w/v of isosorbide dinitrate in the same solvent.

Reference solution. A solution *diluted isosorbide dinitrate IPRS* equivalent to 0.01 per cent w/v of isosorbide dinitrate in the mobile phase.

Inject the reference solution and the test solution.

Calculate the content of $C_6H_8N_2O_8$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Add 20 ml of the mobile phase to a weighed quantity of the powdered tablets containing about 25 mg of isosorbide dinitrate, mix with the aid of ultrasound for 15 minutes and dilute to 25.0 ml with the same solvent. Filter through a glass-fibre filter (such as Whatman GF/C) and dilute 1 volume to 10 volumes with the mobile phase.

Reference solution (a). Add 20 ml of the mobile phase to a quantity of *diluted isosorbide dinitrate IPRS* containing

25 mg of isosorbide dinitrate, mix with the aid of ultrasound for 15 minutes and dilute to 25 ml with the mobile phase. Filter through a glass-fibre filter (such as Whatman GF/C) and dilute 1.0 ml to 10.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.005 per cent w/v, each of, *diluted isosorbide dinitrate IPRS* and *isosorbide 2-nitrate IPRS* in the mobile phase.

Use chromatographic system as described under Related substances, using a detection wavelength of 230 nm.

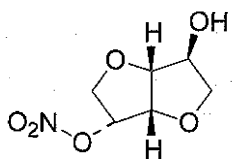
The test is not valid unless, in the chromatogram obtained with reference solution (b), the resolution between the peaks corresponding to isosorbide dinitrate and isosorbide 2-nitrate is at least 6.0.

Calculate the content of $C_6H_8N_2O_8$ in the tablets.

Storage Store at a temperature not exceeding 30°.

Labelling. The label states whether the tablets are to be swallowed whole, chewed before swallowing or allowed to dissolve in the mouth.

Diluted Isosorbide Mononitrate



$C_6H_9NO_6$ Mol. Wt. 191.1

Diluted Isosorbide Mononitrate is a dry mixture of isosorbide mononitrate and lactose monohydrate or mannitol.

Diluted Isosorbide Mononitrate is 1,4:3,6-dianhydro-D-glucitol 5-nitrate.

Diluted Isosorbide Mononitrate contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of $C_6H_9NO_6$.

Category. Antianginal.

Description. Undiluted isosorbide mononitrate is a white, crystalline powder.

Identification

A. Shake a quantity containing 25 mg of isosorbide mononitrate with 15 ml of *acetone* for 2 minutes. Filter, evaporate the filtrate to dryness at a temperature not exceeding 35° and dry the residue over *phosphorus pentoxide* at a pressure of 0.7 kPa for 16 hours. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *isosorbide mononitrate IPRS* treated in the same manner or with the reference spectrum of isosorbide mononitrate.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 5 volumes of *methanol* and 95 volumes of *dichloromethane*.

Test solution. Shake a quantity of the substance under examination containing 10 mg of isosorbide mononitrate with 10 ml of *ethanol (95 per cent)* and filter.

Reference solution. A 0.1 per cent w/v solution of *isosorbide mononitrate IPRS* in *ethanol (95 per cent)*.

Apply to the plate 10 µl of each solution. After development, dry the plate in a current of air, spray with a freshly prepared *potassium iodide* and *starch solution* and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with the reference solution.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 10 volumes of *water*, 15 volumes of *methanol*, 25 volumes of *anhydrous acetic acid* and 50 volumes of *dichloroethane*.

Test solution. Shake a quantity of the substance under examination containing 0.1 g of *lactose* or *mannitol* with 10 ml of *water*.

Reference solution (a). Dissolve 0.1 g of *lactose* in 10 ml of *water*.

Reference solution (b). Dissolve 0.1 g of *mannitol* in 10 ml of *water*.

Reference solution (c). Mix equal volumes of reference solution (a) and (b).

Apply to the plate 1 µl of each solution. After development, dry the plate in a current of warm air. Repeat immediately the development after renewing the mobile phase. Dry the plate in a current of warm air. Spray with *4-aminobenzoic acid solution*. Dry the plate in a cold air until the *acetone* is removed. Heat the plate at 100° for 15 minutes. Allow to cool and spray with a 0.2 per cent w/v solution of *sodium periodate*. Dry the plate in a current of cold air. Heat the plate at 100° for 15 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with reference solution (a) for lactose or to the principal spot in the chromatogram obtained with reference solution (b) for mannitol. The identification is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Tests

Inorganic nitrates. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H*.

Mobile phase. A mixture of 15 volumes of *glacial acetic acid*, 30 volumes of *acetone* and 60 volumes of *toluene*.

Test solution. Shake a quantity of the substance under examination containing 0.1 g of isosorbide mononitrate with 5 ml of *ethanol (95 per cent)* and filter.

Reference solution. Dissolve 10 mg of *potassium nitrate* in 1 ml of *water* and dilute to 100 ml with *ethanol (95 per cent)*.

Apply to the plate 10 µl of each solution. After development, dry the plate in a current of air until the acetic acid is completely removed. Spray with a freshly prepared *potassium iodide* and *starch solution* and examine under ultraviolet light at 254 nm. Any spot corresponding to nitrate ion in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent, calculated as potassium nitrate).

Isosorbide dinitrate and isosorbide 2-nitrate. Determine by liquid chromatography (2.4.14) as described under Assay, changing the detection to 210 nm to 215 nm and using injection volume of 10 µl.

Under the stated conditions, the retention times are: isosorbide dinitrate about 5 minutes, isosorbide-2-nitrate about 8 minutes and isosorbide 5-nitrate about 11 minutes.

Inject reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with reference solution (b) is at least 20 per cent of the full scale of the recorder.

Inject reference solution (d). The test is not valid unless in the chromatogram obtained, the resolution between the peaks corresponding to isosorbide 2-nitrate and isosorbide 5-nitrate is at least 4.0.

Inject test solution (a), reference solution (b) and reference solution (c). In the chromatogram obtained with test solution (a), the area of any peak corresponding to isosorbide 2-nitrate is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any peak corresponding to isosorbide dinitrate is not greater than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent).

Assay. Determine by liquid chromatography (2.4.14).

Test solution (a). Weigh a quantity of the substance under examination containing 25 mg of isosorbide mononitrate, dissolve in 25.0 ml of the mobile phase and filter.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with the mobile phase.

Reference solution (a). A 0.01 per cent w/v solution of *isosorbide mononitrate IPRS* in the mobile phase.

Reference solution (b). A 0.0005 per cent w/v solution of *isosorbide-2-nitrate IPRS* in the mobile phase.

Reference solution (c). A 0.0005 per cent w/v solution of *isosorbide dinitrate IPRS* in the mobile phase.

Reference solution (d). A solution containing 0.005 per cent w/v, each of, *isosorbide mononitrate IPRS (isosorbide-5-nitrate IPRS)* and *isosorbide-2-nitrate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with aminopropylmethylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 15 volumes of *ethanol* and 85 volumes of *trimethylpentane*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and test solution (b).

Calculate the content of $C_6H_9NO_6$.

Storage. Store protected from light.

Labelling. The label states the percentage content of isosorbide mononitrate.

Isosorbide Mononitrate Tablets

Sorbide Mononitrate Tablets

Isosorbide Mononitrate Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of $C_6H_9NO_6$.

Usual strengths. 10 mg; 20 mg; 40 mg; 60 mg.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 5 volumes of *methanol* and 95 volumes of *dichloromethane*.

Test solution. Extract a quantity of the powdered tablets containing 10 mg of isosorbide mononitrate with 10 ml of *ethanol (95 per cent)* and centrifuge.

Reference solution. Dissolve 10 mg of *isosorbide mononitrate IPRS* in 10 ml of *ethanol (95 per cent)*.

Apply to the plate 10 µl of each solution. After development, dry the plate in a current of air, spray with a 1 per cent w/v solution of *diphenylamine* in *methanol* and expose for 15 minutes to ultraviolet at 254 nm and 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 30 minutes.

Withdraw 10 ml of the medium and filter promptly, rejecting the first few ml of the filtrate.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A solution of *isosorbide mononitrate IPRS* in the dissolution medium containing the same concentration of isosorbide mononitrate as that expected in the dissolution medium in the vessel.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with endcapped octyldecylsilane bonded to porous silica (5 µm) (such as Spherisorb ODS 2),
- mobile phase: a mixture of equal volumes of *methanol* and *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 100 µl.

Calculate the content of $C_6H_9NO_6$.

Q. Not less than 80 per cent of the stated amount of $C_6H_9NO_6$.

Inorganic Nitrates. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H*.

Mobile phase. A mixture of 60 volumes of *toluene*, 30 volumes of *acetone* and 15 volumes of *glacial acetic acid*.

Test solution. Shake a quantity of the powdered tablets containing 0.1 g of isosorbide mononitrate with 5 ml of *ethanol (95 per cent)* and filter.

Reference solution. Prepare freshly a 0.01 per cent w/v solution of *potassium nitrate* in *ethanol (95 per cent)*.

Apply to the plate 10 µl of each solution. After development, dry the plate in a current of air until the acetic acid is completely removed. Spray copiously with freshly prepared *potassium iodide and starch solution*. Expose the plate to ultraviolet light at 254 nm for 15 minutes and examine in daylight. Any spot corresponding to *potassium nitrate* in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the powdered tablets containing 50 mg of isosorbide mononitrate with 15 ml of the mobile phase with the aid of ultrasound for 15 minutes and dilute to 25.0 ml with the same solvent and filter through a membrane filter with a nominal pore size not exceeding 0.45 µm.

Reference solution (a). A solution containing 0.001 per cent w/v of *isosorbide 2-nitrate IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.001 per cent w/v of *isosorbide dinitrate IPRS* in the mobile phase.

Reference solution (c). A solution containing 0.001 per cent, each of, *isosorbide 2-nitrate IPRS* and *isosorbide mononitrate IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with endcapped octyldecylsilane bonded to porous silica (5 µm) (such as Spherisorb ODS 2),
- mobile phase: 30 volumes of *methanol* and 70 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless, in the chromatogram obtained, the resolution between isosorbide mononitrate and isosorbide 2-nitrate is at least 2.4.

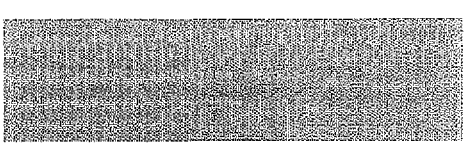
In the chromatogram obtained with the test solution the area of any peak corresponding to isosorbide 2-nitrate is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the area of any peak corresponding to isosorbide dinitrate is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay using following modification.

Test solution. Disperse 1 tablet in 20 ml of the mobile phase and dilute to obtain a concentration of 0.005 per cent w/v of isosorbide mononitrate in the same solvent.

Reference solution. A 0.005 per cent w/v solution of *isosorbide mononitrate IPRS* in the mobile phase.



Inject the reference solution and the test solution.

Calculate the content of $C_6H_9NO_6$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg of isosorbide mononitrate, add 70 ml of the mobile phase, mix with the aid of ultrasound for 15 minutes and dilute to 100.0 ml with the mobile phase. Centrifuge. Mix 1 volume of the supernatant liquid with 5 volumes of the mobile phase and filter through a membrane filter with a nominal pore size not greater than 0.45 µm.

Reference solution (a). Add 20 ml of the mobile phase to a weighed quantity of *isosorbide mononitrate IPRS* containing 25 mg of isosorbide mononitrate, mix with the aid of ultrasound for 15 minutes, dilute to 25.0 ml with the mobile phase, mix and centrifuge. Dilute 1.0 ml of the clear supernatant liquid to 10.0 ml with the mobile phase and filter through a membrane filter with a nominal pore size not greater than 0.45 µm.

Reference solution (b). A solution containing 0.001 per cent w/v, each of, *isosorbide mononitrate IPRS* and *isosorbide 2-nitrate IPRS* in the mobile phase.

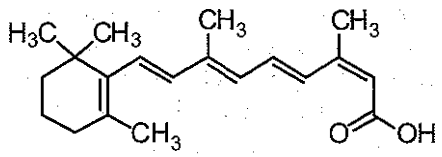
Use the chromatographic system described under test for Related substances.

The test is not valid unless in the chromatogram obtained with reference solution (b), the resolution between the peaks corresponding to isosorbide mononitrate and isosorbide 2-nitrate is at least 2.4.

Calculate the content of $C_6H_9NO_6$ in the tablets.

Storage. Store at a temperature not exceeding 30°.

Isotretinoin



$C_{20}H_{28}O_2$ Mol. Wt. 300.4

Isotretinoin is (2*Z*,4*E*,6*E*,8*E*)-3,7-dimethyl-9-(2,6,6-trimethylcyclohex-1-enyl)nona-2,4,6,8-tetraenoic acid.

Isotretinoin contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{20}H_{28}O_2$, calculated on the dried basis.

Description. A yellow or light orange, crystalline powder.

Category. Antiacne.

NOTE — It is sensitive to air, heat and light, especially in solution. Carry out all operations as rapidly as possible and avoid exposure to actinic light; use freshly prepared solutions.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *isotretinoin IPRS* or with the reference spectrum of isotretinoin.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture 2 volumes of *glacial acetic acid*, 4 volumes of *acetone*, 40 volumes of *peroxide-free ether* and 54 volumes of *cyclohexane.*

Test solution. Dissolve 10 mg of the substance under examination in *dichloromethane* and dilute to 10.0 ml with *dichloromethane.*

Reference solution (a). A 0.1 per cent w/v solution of *isotretinoin IPRS* in *dichloromethane.*

Reference solution (b). A solution containing 0.1 per cent w/v, each of, *isotretinoin IPRS* and *tretinoin IPRS* in *dichloromethane.*

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless, the chromatogram obtained with reference solution (b) shows two clearly separated principal spots.

C. Dissolve 5 mg in 2 ml of *antimony trichloride solution*; intense red colour develops and later becomes violet.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in *methanol* and dilute to 50.0 ml with *methanol.*

Reference solution (a). A 0.1 per cent w/v solution of *isotretinoin impurity A IPRS* (*tretinoin IPRS*) in *methanol.*

Reference solution (b). Mix 1.0 ml of reference solution (a) with 0.5 ml of the test solution and dilute to 25.0 ml with *methanol.*

Reference solution (c). Dilute 0.5 ml of the test solution to 100.0 ml with *methanol.*

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: a mixture of 0.5 volume of *glacial acetic acid*, 22.5 volumes of *water* and 77 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 355 nm,
- injection volume: 10 µl.

Name	Relative retention time
Isotretinoin impurity H[1]	0.2
Isotretinoin impurity I[2]	0.3
Isotretinoin (Retention time: about 26 minutes)	
Isotretinoin impurity A[3]	1.34

[1](2*Z*,4*E*,6*E*,8*E*)-3,7-dimethyl-9-(2,6,6-trimethyl-3-oxocyclohex-1-en-1-yl)nona-2,4,6,8-tetraenoic acid (13-*cis*-4-oxoretinoic acid),

[2](2*Z*,4*E*,6*E*,8*E*)-9-[(3*RS*)-3-hydroxy-2,6,6-trimethylcyclohex-1-en-1-yl]-3,7-dimethylnona-2,4,6,8-tetraenoic acid (13-*cis*-4-hydroxyretinoic acid),

[3](2*E*,4*E*,6*E*,8*E*)-3,7-dimethyl-9-(2,6,6-trimethylcyclohex-1-enyl)nona-2,4,6,8-tetraenoic acid (tretinoin).

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to isotretinoin and isotretinoin impurity A is not less than 5.0.

Inject reference solution (c) and the test solution. Run the chromatogram 1.6 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to isotretinoin impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent), the area of any peaks corresponding to isotretinoin impurities H and I is not more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.3 per cent), the area of any other secondary peak is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent) and the sum of the areas of all the secondary peaks eluting before the principal peak is not more than 1.4 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.7 per cent), the sum of areas of all the secondary peaks eluting after the principal peak is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in vaccum for 16 hours.

Assay. Dissolve 0.2 g in 70 ml of *acetone*. Titrate with *0.1 M tetrabutylammonium hydroxide* in *2-propanol*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* in *2-propanol* is equivalent to 0.03004 g of $C_{20}H_{28}O_2$.

Storage. Store protected from light and moisture, under an inert gas.

Labelling. Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

Isotretinoin Capsules

Isotretinoin Capsules contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of isotretinoin, $C_{20}H_{28}O_2$.

Usual strengths. 5 mg; 10 mg; 20 mg; 30 mg; 40 mg.

Identification

A. In the test for Related substances, the principal peak in the chromatogram obtained with test solution (b) corresponds to the peak in the chromatogram obtained with reference solution (b).

B. When examined in the range 300 nm to 400 nm (2.4.7), the final solution obtained in the Assay, exhibits a maximum at 356 nm.

Tests

Dissolution (2.5.2).

NOTE — Protect the apparatus from light throughout the determination and flush the apparatus with nitrogen before use.

Apparatus. Used for disintegration test for tablets and capsules (2.5.1),
Medium. 900 ml of *0.1M sodium hydroxide*,
Time. 60 minutes.

Withdraw a suitable volume of the medium and filter immediately through a 0.2 µm filter, discarding the first 5 ml of filtrate, and dilute the filtrate with *0.1 M sodium hydroxide*. Measure the absorbance of the filtrate, suitably diluted if necessary to obtain a solution containing 0.00025 per cent w/v of Isotretinoin, at the maximum at about 343 nm (2.4.7). Calculate the content of $C_{20}H_{28}O_2$ in the medium taking 1490

as the specific absorbance at 343 nm and divide the result by 6 to obtain the amount per capsule.

Q. Not less than 85 per cent of the stated amount of $C_{20}H_{28}O_2$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Carry out the test protected from light.

Test solution (a). Disperse a quantity of the contents of the capsules containing 10 mg of Isotretinoin with 10 ml of a mixture of 20 volumes of *0.1 M sodium hydroxide* and 80 volumes of *ethanol* for 10 minutes with the aid of ultrasound for 15 minutes and centrifuge for 5 minutes. Mix 5 ml of the supernatant liquid with 7.5 ml of *0.1 M hydrochloric acid* and extract with two 20 ml quantities of *dichloromethane*. Filter the combined extracts through phase separating paper (Whatman 1PS is suitable) and wash the filter with 5 ml of *dichloromethane*. Evaporate the combined filtrate and washing to dryness at 30° under reduced pressure and dissolve the residue in 5 ml of *methanol*.

Test solution (b). Dilute 1.0 ml of test solution (a) to 100.0 ml with *methanol*.

Reference solution (a). A 0.002 per cent w/v solution of *tretinoin IPRS* in *methanol*.

Reference solution (b). A 0.001 per cent w/v solution of *isotretinoin IPRS* in *methanol*.

Reference solution (c). A solution containing 0.001 per cent w/v, each of, *tretinoin IPRS* and *isotretinoin IPRS* in *methanol*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm) (Such as Spherisorb ODS 2),
- mobile phase: a 0.5 per cent w/v solution of *glacial acetic acid* in a mixture of 23 volumes of *water* and 77 volumes of *methanol*,
- flow rate:1.4 ml per minute,
- spectrophotometer set at 353 nm,
- injection volume: 10 µl.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to tretinoin and isotretinoin is not less than 2.0.

Inject reference solution (a), test solution (a) and (b). In the chromatogram obtained with test solution (a), the area of any peak corresponding to tretinoin is not more than twice the area of the peak in the chromatogram obtained with reference solution (a) (4.0 per cent). The area of any other secondary peak is not more than the area of the peak in the chromatogram obtained with test solution (b) (1.0 per cent) and the sum of the areas of any such peaks is not more than 1.5 times the area of the peak in the chromatogram obtained with test solution (b) (1.5 per cent).

Uniformity of content. Complies with the test stated under Capsules.

NOTE — Carry out the test in sub dued light.

Disperse the content of one capsule in 25 ml of *dichloromethane* with the aid of ultrasound for 15 minutes. Add sufficient *dichloromethane* to produce 50 ml, shake for 2 minutes. Dilute a suitable volume of the resulting solution with a solution prepared by diluting 5 ml of *0.1 M hydrochloric acid* to 250 ml with *ethanol (95 per cent)* to produce a solution containing 0.0008 per cent w/v of Isotretinoin. Measure the absorbance of the solution at the maximum at 356 nm (2.4.7), using the *ethanolic hydrochloric acid solution* as blank.

Calculate the content of $C_{20}H_{28}O_2$ in the capsules taking 1350 as the specific absorbance at 356 nm.

Other tests. Comply with the tests stated under Capsules.

Assay. *NOTE — Carry out the test in subdued light.*

Disperse the content of 10 capsules with 25 ml *dichloromethane* per capsule with the aid of ultrasound for 15 minutes. Add sufficient *dichloromethane* to produce 500 ml, shake for 2 minutes. Dilute a suitable volume of the resulting solution with a solution prepared by diluting 5 ml of *0.1 M hydrochloric acid* to 250 ml with *ethanol (95 per cent)* to produce a solution containing 0.0008 per cent w/v of Isotretinoin. Measure the absorbance of the solution at the maximum at 356 nm (2.4.7), using the *ethanolic hydrochloric acid solution* as blank. Calculate the content of $C_{20}H_{28}O_2$ in the Capsules taking 1350 as the specific absorbance at 356 nm.

Storage. Store protected from light.

Isotretinoin Gel

Isotretinoin Gel is a solution of Isotretinoin in a suitable alcoholic basis.

Isotretinoin Gel contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of isotretinoin, $C_{20}H_{28}O_2$.

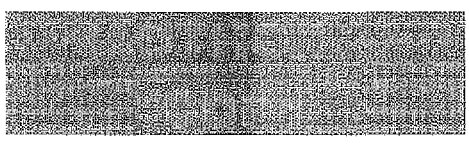
Usual strengths. 0.012 per cent w/w; 0.025 per cent w/w; 0.05 per cent w/w.

NOTE — Carry out all the operations as rapidly as possible and protected from light.

Identification

A. When examined in the range 300nm to 400nm (2.4.7), the solution obtained in the assay, shows an absorption maxima at about 356 nm.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.



Mobile phase. A mixture of 2 volumes of *glacial acetic acid,* 4 volumes of *acetone,* 40 volumes of *peroxide-free ether* and 54 volumes of *cyclohexane.*

Test solution. Shake to disperse a quantity of the gel containing 1 mg of Isotretinoin as completely as possible in a mixture of 5.0 ml of *dichloromethane reagent* and 10.0 ml of *dichloromethane*, dilute to 100 ml with *n-hexane* and shake the mixture vigorously; filter, evaporate the filtrate to dryness using a rotary evaporator at a temperature not exceeding 60° and dissolve the residue in 1.0 ml of *dichloromethane.*

Reference solution. 0.1 per cent w/v solution of *isotretinoin IPRS* in *dichloromethane.*

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. After development, remove the plate, dry in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14)

NOTE — Carry out the test protected from light.

Test solution. Shake to disperse a quantity of the gel containing 2.5 mg of Isotretinoin as completely as possible in a mixture of 5.0 ml of *dichloromethane reagent* and 10.0 ml of *dichloromethane*, dilute to 50.0 ml with *n-hexane*, shake and filter.

Reference solution(a). A 0.0002 per cent w/v solution of *tretinoin IPRS* in *n-hexane.*

Reference solution(b). Dilute 1.0 ml of the test solution to 100.0 ml with *n-hexane.*

Reference solution(c). A 0.0002 per cent w/v solution, each of, *isotretinoin IPRS* and *tretinoin IPRS* in *n-hexane.*

Reference solution(d). Dilute 1.0 ml of reference solution (b) to 10.0 ml with *n-hexane.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with silica gel for chromatography (5 µm) (Lichrosorb Si60 is suitable),
- mobile phase: a mixture of 1 volume of *glacial acetic acid* , 30 volumes of *ethyl acetate* and 970 volumes of *n-hexane,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 365 nm,
- injection volume: 50 µl.

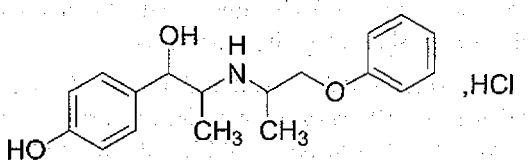
Inject reference solution (c) and (d). The test is not valid unless the resolution between the peaks corresponding to isotretinoin and tretinoin is not less than 3.0 obtained with reference solution (c) and the signal-to-noise ratio of the peak corresponding to isotretinoin is not more than 10 obtained with reference solution (d).

Inject reference solution (a), (b), (d) and the test solution. In the chromatogram obtained with the test solution, the area of the peak due to tretinoin is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (4.0 per cent) and the sum of the area of all other secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.1 per cent).

Other tests. Comply with the tests stated under Gels.

Assay. To a quantity of the gel containing 0.5 mg of Isotretinoin, add 10 ml of *dichloromethane*, shake until all the gel has dispersed and dilute the solution to 100.0 ml with *ethanolic hydrochloric acid solution* prepared by diluting 5 ml of *0.1M hydrochloric acid* to 250 ml with *ethanol (95 per cent).* Measure the absorbance of the resulting solution at the maximum at 356 nm, using the *ethanolic hydrochloric acid solution* as blank (2.4.7). Calculate the content of $C_{20}H_{28}O_2$ in the gel taking 1350 as specific absorbance at the maximum at 356 nm.

Isoxsuprine Hydrochloride



$C_{18}H_{23}NO_3,HCl$ Mol. Wt. 337.8

Isoxsuprine Hydrochloride is (1*RS*,2*SR*)-1-(4-hydroxy-phenyl)-2-[(1*RS*)-1-methyl-2-phenoxyethylamino]propan-1-ol hydrochloride.

Isoxsuprine Hydrochloride contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{18}H_{23}NO_3,HCl$, calculated on the dried basis.

Category. Vasodilator; uterine relaxant.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *isoxsuprine hydrochloride IPRS* or with the reference spectrum of isoxsuprine hydrochloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.01 per cent w/v solution in *0.1 M hydrochloric acid* shows absorption maxima at about 269 nm and 274 nm; absorbance at about 269 nm, about 0.73 and at about 274 nm, about 0.72.

C. Dissolve 10 mg in 1 ml of *water* and add 0.05 ml of *copper sulphate solution* and 1 ml of *5 M sodium hydroxide*; a blue colour is produced. Add 1 ml of *ether* and shake; the ether layer remains colourless.

D. It gives the reactions of chlorides (2.3.1).

Tests

pH (2.4.24). 4.5 to 6.0, determined in a 1.0 per cent w/v solution, prepared with gentle warming if necessary.

Appearence of solution. A 1.0 per cent w/v solution is clear (2.4.1) and colourless (2.4.1).

Optical rotation (2.4.22). – 0.05° to + 0.05°, determined in a 1.0 per cent w/v solution, prepared with gentle warming, if necessary.

Related substances. Determine by gas chromatography (2.4.13).

NOTE— Prepare the solutions immediately before use.

Internal standard solution (a). Dissolve 0.1 g of *hexacosane* in 20.0 ml of *trimethylpentane.*

Internal standard solution (b). Dilute 1.0 ml of internal standard solution (a) to 50.0 ml with *trimethylpentane.*

Test solution. Add 0.5 ml of *N-trimethylsilylimidazole* to 10 mg of the substance under examination. Heat to 65° for 10 minutes, cool. Add 2.0 ml of internal standard solution (b) and 2.0 ml of *water*, shake. Use the upper layer.

Reference solution (a). Add 0.5 ml of *N-trimethylsilylimidazole* to 10 mg of the substance under examination. Heat to 65° for 10 minutes, cool. Add 2.0 ml of internal standard solution (a) and 2.0 ml of *water*, shake. Dilute 1.0 ml of the upper layer to 50.0 ml with *trimethylpentane.*

Reference solution (b). Add 0.5 ml of *N-trimethylsilylimidazole* to 10 mg of the substance under examination. Heat to 65° for 10.0 min, cool. Add 2.0 ml of *trimethylpentane* and 2.0 ml of *water*, shake. Use the upper layer.

Chromatographic system

- a glass column 1.5 m x 4 mm, packed with diatomaceous support (125 to 135 µm) coated with 3 per cent w/w of poly(dimethyl)siloxane,
- temperature:

Column	time (min)	temperature (°)
	0-25	195
	25-29	195-215
	29-39	215

- inlet and detector port 225°,
- flame ionization detector,
- flow rate: 30 ml per minute, nitrogen as the carrier gas.

Inject 1 µl of the test solution and reference solution (a). The test is not valid unless the resolution between the peaks due to isoxsurpine and hexacosane is not less than 5.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, calculate the ratio of the area of the peak due to the trimethylsilyl derivative of isoxsuprine to the area of the peak due to hexacosane from the chromatogram obtained with reference solution (a). The ratio of the sum of the areas of peaks, other than the principal peak and the peak due to hexacosane to the area of the peak due to the hexacosane is not more than 2.0 per cent.

Phenones. Absorbance of a 0.01 per cent w/v solution at about 310 nm, not more than 0.20 (2.4.7).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.6 g, dissolve in 150 ml of *anhydrous glacial acetic acid*, heating on a water-bath to effect dissolution. Cool and add 15 ml of *mercuric acetate solution.* Titrate with *0.1 M perchloric acid*, using *naphtholbenzein* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03378 g of $C_{18}H_{23}NO_3$,HCl.

Storage. Store protected from light.

Isoxsuprine Injection

Isoxsuprine Hydrochloride Injection

Isoxsuprine Injection is a sterile solution of Isoxsuprine Hydrochloride in Water for Injections.

Isoxsuprine Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of isoxsuprine hydrochloride, $C_{18}H_{23}NO_3$,HCl.

Usual strength. 5 mg per ml.

Identification

A. To a volume containing 50 mg of Isoxsuprine Hydrochloride add 20 ml of *water* and 10 ml of *ammonia buffer pH 10.0* and extract with three quantities, each of 15 ml, of *dichloromethane.* Shake the combined extracts with 5 g of *anhydrous sodium sulphate*, filter, evaporate the filtrate to dryness, dissolve the residue in 5 ml of *0.1 M methanolic hydrochloric acid* and

evaporate to dryness. Dissolve the residue in 5 ml of *methanol*, evaporate to dryness, redissolve the residue in 2 ml of *methanol*, add 15 ml of *dichloromethane*, again evaporate to dryness and dry the residue at 60° at a pressure of 2 kPa for 1 hour. On the residue determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *isoxsuprine hydrochloride IPRS* treated in the same manner or with the reference spectrum of isoxsuprine hydrochloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), the final solution obtained in the Assay shows absorption maxima at about 269 nm and 274 nm.

Tests

pH (2.4.24). 4.9 to 6.0.

Bacterial endotoxins (2.2.3). Not more than 35.7 Endotoxin Units per mg of isoxsuprine hydrochloride.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. To a measured volume containing about 50 mg of Isoxsuprine Hydrochloride add sufficient *0.1 M hydrochloric acid* to produce 100.0 ml. Dilute 10.0 ml to 100.0 ml with the same solvent and measure the absorbance of the resulting solution at the maximum at about 274 nm (2.4.7). Calculate the content of $C_{18}H_{23}NO_3$,HCl taking 73 as the specific absorbance at 274 nm.

Isoxsuprine Tablets

Isoxsuprine Hydrochloride Tablets

Isoxsuprine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of isoxsuprine hydrochloride, $C_{18}H_{23}NO_3$,HCl.

Usual strength. 20 mg.

Identification

A. To a quantity of the powdered tablets containing 50 mg of Isoxsuprine Hydrochloride add 50 ml of *0.1 M hydrochloric acid* and heat on a water-bath for 30 minutes. Cool, filter, add 10 ml of *ammonia buffer pH 10.0* and extract with three quantities, each of 15 ml, of *dichloromethane*. Shake the combined extracts with 5 g of *anhydrous sodium sulphate*, filter, evaporate the filtrate to dryness, dissolve the residue in 5 ml of *0.1 M methanolic hydrochloric acid* and evaporate to dryness. Dissolve the residue in 5 ml of *methanol*, evaporate to dryness, redissolve the residue in 2 ml of *methanol*, add 15 ml of *dichloromethane*, again evaporate to dryness and dry the residue at 60° at a pressure of 2 kPa for 1 hour. On the residue determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *isoxsuprine hydrochloride IPRS* treated in the same manner or with the reference spectrum of isoxsuprine hydrochloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), the final solution obtained in the Assay shows absorption maxima at about 269 nm and 274 nm.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium: 900 ml of *water*,
Speed and time. 100 rpm for 45 minutes.

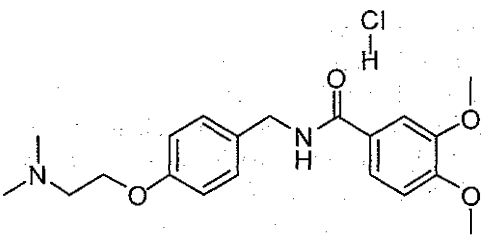
Withdraw a suitable volume of the medium and filter, rejecting the first few ml of filtrate. Dilute a suitable volume of the filtrate with the medium, if necessary. Measure the absorbance of the resulting solution at the maximum at about 269 nm (2.4.7). Calculate the content of isoxsuprine hydrochloride, $C_{18}H_{23}NO_3$, HCl in the medium from the absorbance obtained from a solution of known concentration of *isoxsuprine hydrochloride IPRS* in the dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_{18}H_{23}NO_3$, HCl.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 20 mg of Isoxsuprine Hydrochloride, add 50 ml of *0.1 M hydrochloric acid* and boil on a water-bath for 30 minutes. Cool, add sufficient *0.1 M hydrochloric acid* to produce 100 0 ml, mix and filter. Dilute 25.0 ml of the filtrate to 100.0 ml with *0.1 M hydrochloric acid* and measure the absorbance of the resulting solution at the maximum at about 274 nm (2.4.7). Calculate the content of $C_{18}H_{23}NO_3$,HCl taking 73 as the specific absorbance at 274 nm.

Itopride Hydrochloride



$C_{20}H_{26}N_2O_4$, HCl Mol. Wt. 394.9

Itopride Hydrochloride is N-[[4-[2-(dimethylamino)ethoxy] phenyl]methyl]-3,4-dimethoxybenzamide; hydrochloride.

Itopride Hydrochloride contains not less than 98.5 per cent and not more than 101.0 per cent $C_{20}H_{26}N_2O_4$, HCl, calculated on the dried basis.

Category. Gastroprokinetic Agent, Propulsives.

Description. A white to off-white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *itopride hydrochloride IPRS* or with the reference spectrum of itopride hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. It gives reaction (A) of chlorides (2.3.1).

Tests

pH (2.4.24). 3.5 to 5.5, determined in a 10 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay.

Inject the test solution. The area of any secondary peak is not more than 0.5 per cent and the sum of the areas of all secondary peaks is not more than 1.0 per cent, calculated by area normalisation.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the same solvent.

Reference solution. A 0.025 per cent w/v solution of *itopride hydrochloride IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5µm),
- mobile phase: a mixture of 55 volumes of *0.05 M citric acid*, adjusted to pH 3.0 with *sodium hydroxide solution* and 45 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 258 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{26}N_2O_4$, HCl.

Itopride Tablets

Itopride Hydrochloride Tablets

Itopride Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of itopride hydrochloride, $C_{20}H_{26}N_2O_4$, HCl.

Usual strength. 50 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Dilute a suitable volume of the filtrate with the dissolution medium, if necessary, measure the absorbance of the resulting solution at the maxima at about 257 nm (2.4.7). Calculate the content of $C_{20}H_{26}N_2O_4$, HCl in the medium from the absorbance obtained from a solution of known concentration of *itopride hydrochloride IPRS* in the same medium.

Q. Not less than 70 per cent of the stated amount of $C_{20}H_{26}N_2O_4$, HCl.

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay with the following modification.

Test solution. Disperse 5 intact tablets in 300 ml of the solvent mixture with the aid of ultrasound for about 15 minutes and dilute to 500.0 ml with the solvent mixture and filter.

Inject the test solution. The area of any secondary peak is not more than 1.0 per cent and the sum of the areas of all secondary peaks is not more than 2.0 per cent, calculated by area normalisation.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 70 volumes of *water* and 30 volumes of *methanol*.

Test solution. Disperse 5 intact tablets in 300 ml of the solvent mixture with the aid of ultrasound for about 15 minutes and dilute to 500.0 ml with the solvent mixture and filter. Dilute 5.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution. A 0.0025 per cent w/v solution of *itopride hydrochloride IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 55 volumes of *0.05 M citric acid*, adjusted to pH 3.0 with *sodium hydroxide solution* and 45 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 258 nm,
- injection volume: 20 µl.

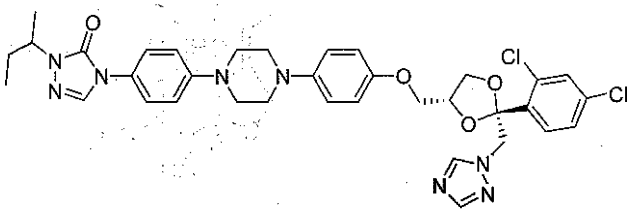
Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{26}N_2O_4$, HCl in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Itraconazole



$C_{35}H_{38}Cl_2N_8O_4$ Mol. Wt. 706.0

Itraconazole is 4-[4-[4-[4-[[*cis*-2-(2,4-Dichlorophenyl)-2-(1*H*-1,2,4-triazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]piperazin-1-yl]phenyl]-2-[(1*RS*)-1-methylpropyl]-2,4-dihydro-3*H*-1,2,4-triazol-3-one.

Itraconazole contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{35}H_{38}Cl_2N_8O_4$, calculated on the dried basis.

Category. Antifungal

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *itraconazole IPRS* or with the reference spectrum of itraconazole.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Appearance of solution. A 10.0 per cent w/v solution in *dichloromethane* is clear (2.4.1) and not more intensely coloured than reference solution RS6 or BS6 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Dissolve 0.1 g of the substance under examination in *methanolic hydrochloric acid* and dilute to 10.0 ml with *methanolic hydrochloric acid.*

Reference solution (a). A 0.001 per cent w/v solution of *itraconazole IPRS* in *methanolic hydrochloric acid.*

Reference solution (b). Dissolve 10 mg of *itraconazole system suitability IPRS* (containing impurities B, C, D, E, F and G) in 1.0 ml of *methanolic hydrochloric acid.*

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with base deactivated end-capped octadecylsilane bonded to porous silica (3 µm),
- mobile phase: A. a 2.72 per cent w/v solution of *tetrabutylammonium hydrogen sulphate* in *water*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
2	80	20
22	50	50
27	50	50
30	80	20

Name	Relative retention time
Itraconazole impurity B[1]	0.7
Itraconazole impurity C[2] and D[3]	0.8
Itraconazole impurity E[4]	0.9
Itraconazole (retention time: about 14 minutes)	1.0
Itraconazole impurity F[5]	1.05
Itraconazole impurity G[6]	1.3

[1]4-[4-[4-[4-[[*cis*-2-(2,4-dichlorophenyl)-2-(4*H*-1,2,4-triazol-4-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]piperazin-1-yl]phenyl]-2-[(1*RS*)-1-methylpropyl]-2,4-dihydro-3*H*-1,2,4-triazol-3-one,

[2]4-[4-[4-[4-[[*cis*-2-(2,4-dichlorophenyl)-2-(1*H*-1,2,4-triazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]piperazin-1-yl]phenyl]-2-propyl-2,4-dihydro-3*H*-1,2,4-triazol-3-one,

[3]4-[4-[4-[4-[[cis-2-(2,4-dichlorophenyl)-2-(1H-1,2,4-triazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]piperazin-1-yl]phenyl]-2-(1-methylethyl)-2,4-dihydro-3H-1,2,4-triazol-3-one,

[4]4-[4-[4-[4-[[trans-2-(2,4-dichlorophenyl)-2-(1H-1,2,4-triazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]piperazin-1-yl]phenyl]-2-[(1RS)-1-methylpropyl]-2,4-dihydro-3H-1,2,4-triazol- 3-one,

[5]2-butyl-4-[4-[4-[4-[[cis-2-(2,4-dichlorophenyl)-2-(1H-1,2,4-triazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]piperazin-1-yl]phenyl]-2,4-dihydro-3H-1,2,4-triazol-3-one,

[6]4-[4-[4-[4-[[cis-2-(2,4-dichlorophenyl)-2-(1H-1,2,4-triazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]piperazin-1-yl]phenyl]-2-[[cis 2-(2,4-dichlorophenyl)-2-(1H-1,2,4-triazol-1-ylmethyl)-1,3-dioxolan-4-yl]methyl]-2,4-dihydro-3H-1,2,4-triazol-3-one.

Inject reference solution (b). The test is not valid unless the peak-to-valley ratio is not less than 1.5, where Hp is the height above the baseline of the peak due to itraconazole impurity F and Hv is the height above the baseline of the lowest point of the curve separating this peak from the peak due to itraconazole.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to itraconazole impurity B and impurity G, each of, is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent), the area of any peak corresponding to itraconazole impurity E is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the sum of areas of the peaks corresponding to itraconazole impurity C and impurity D is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 8 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.8 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1g by drying in an oven at 105° for 4 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of substance under examination in 50 ml of *methanolic hydrochloric acid* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 10.0 ml with *methanolic hydrochloric acid*.

Reference solution. A 0.01 per cent w/v solution of *itraconazole IPRS* in *methanolic hydrochloric acid*. Use Chromatographic system as described under Related substances.

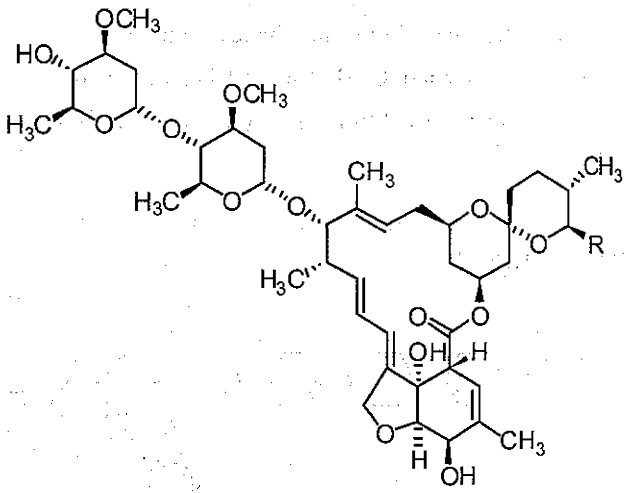
Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{35}H_{38}Cl_2N_8O_4$.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Ivermectin



$C_{48}H_{74}O_{14}$, H_2B_{1a} Mol.Wt. 875.1

$C_{47}H_{72}O_{14}$, H_2B_{1b} Mol.Wt. 861.1

Ivermectin is (10*E*,14*E*,16*E*,22*Z*)-(1*R*,4*S*,5'*S*,6*R*,6'*R*,8*R*,12*S*,13*S*,20*R*,21*R*,24*S*)-6'-[alkyl]-21,24-dihydroxy-5',11,13,22-tetramethyl-2-oxo-(3,7,19-trioxatetracyclo[15.6.1.1^{4,8}.0^{20,24}]pentocsa-10,14,16,22-tetraene)-6-spiro-2'-(perhydropyran)-12-yl-2,6-dideoxy-4-*O*-(2,6-dideoxy-3-*O*-methyl-α-*L*-arabino-hexopyranosy)-3-*O*-methyl-α-*L*-arabinohexopyranoside.

Ivermectin contains not less than 95.0 per cent and not more than 102.0 per cent of H_2B_{1a}+ H_2B_{1b}, calculated on the anhydrous and solvent free basis.

The ratio $H_2B_{1a}/(H_2B_{1a}+ H_2B_{1b})$, determined by liquid chromatography is not less than 90.0 per cent.

Category.Anthelmintic.

Description. A white or yellowish-white crystalline powder, slightly hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometery (2.4.6). Compare the spectrum with that obtained with *ivermectin IPRS* or with the reference spectrum of ivermectin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Appearance of solution. A 2.0 per cent w/v solution in *toluene* is clear (2.4.1) and not more intensely coloured than reference solution BYS7 (2.4.1).

Specific optical rotation (2.4.22). –20.0° to –17.0°, determined on a 2.5 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 40 mg of the substance under examination in *methanol* and dilute to 50.0 ml with *methanol*.

Reference solution (a). A 0.08 per cent w/v solution of *ivermectin IPRS* in *methanol*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with *methanol*.

Reference solution (c). Dilute 5.0 ml of reference solution (b) to 100.0 ml with *methanol*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 15 volumes of *water*, 34 volumes of *methanol* and 51 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (a) and (c). The test is not valid unless in the chromatogram obtained with reference solution (a), the resolution between the component H_2B_{1b} (first peak) and component H_2B_{1a} (second peak) is not less than 3.0 and in the chromatogram obtained with reference solution (c), the signal to noise ratio is not less than 10 for the principal peak.

Inject the test solution and reference solution (b) and (c). In the chromatogram obtained with the test solution the impurity with a relative retention of 1.3 to 1.5 with reference to the principal peak is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.5 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (5.0 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Ethanol and formamide. Not more than 5.0 per cent ethanol and not more than 3.0 per cent formamide.

Determine by gas chromatography (2.4.13).

Internal standard solution. Dilute 0.5 ml of *propanol* to 100.0 ml with *water*.

Test solution. Dissolve 0.120 g of the substance under examination in 2.0 ml of *m-xylene* by heating on a water-bath at 40 to 50°, add 2.0 ml of *water*, mix thoroughly and centrifuge. Remove the upper layer and extract it with 2.0 ml of *water*. Discard the upper layer and combine the aqueous layers. Add 1.0 ml of the internal standard solution. Centrifuge and discard any remaining *m-xylene*.

Reference solution (a). Dilute 3.0 g of *ethanol* to 100 ml with *water*.

Reference solution (b). Dilute 1.0 g of *formamide* to 100.0 ml with *water*.

Reference solution (c). Dilute 5.0 ml of reference solution (a) and 5 ml of reference solution (b) to 50.0 ml with *water*. Transfer 2.0 ml of the solution to a centrifuge tube, add 2 ml of *m-xylene*, mix thoroughly and centrifuge. Remove the upper layer and extract it with 2.0 ml of *water*. Discard the upper layer and combine the aqueous layers. Add 1.0 ml of the internal standard solution. Centrifuge and discard any remaining *m-xylene*.

Reference solution (d). Dilute 10.0 ml of reference solution (a) and 10.0 ml of reference solution (b) to 50.0 ml with *water*. Transfer 2.0 ml of the solution to a centrifuge tube, add 2 ml of *m-xylene*, mix thoroughly and centrifuge. Remove the upper layer and extract it with 2.0 ml of *water*. Discard the upper layer and combine the aqueous layers. Add 1.0 ml of the internal standard solution. Centrifuge and discard any remaining *m-xylene*.

Chromatographic system
- a capillary column 30 m x 0.53 mm, packed with fused silica with macrogol 20,000 with film thickness 1 µm,
- temperature

column	time (min)	temperature (°)
	0-2	50 → 80
	2-8	80 → 240

- injection port 220° and detector at 280°,
- flame ionization detector,
- flow rate: 7.5 ml per minute using nitrogen as the carrier gas.

Inject 1 µl of reference solution (c), (d) and the test solution.

Calculate the content of *ethanol* and *formamide*.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method C (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography(2.4.14), as described under Related substances.

Inject reference solution (a) and the test solution.

Calculate the contents of ivermectin (H_2B_{1a} + H_2B_{1b}) and the ratio $H_2B_{1a}/(H_2B_{1a}+H_2B_{1b})$.

Storage. Store protected from moisture.

Ivermectin Injection

Ivermectin Injection is a sterile solution of Ivermectin in a suitable non-aqueous vehicle.

Ivermectin contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of sum of H_2B_{1a} ($C_{48}H_{74}O_{14}$) and H_2B_{1b}($C_{47}H_{72}O_{14}$).

The ratio of $H_2B_{1a}/(H_2B_{1a}+H_2B_{1b})$ is not less than 90.0 per cent.

Usual strength. 10 mg per ml.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 1 volume of *ammonia*, 9 volumes of *methanol* and 90 volumes of *dichloromethane*.

Test solution. Dissolve a volume of the injection in *methanol* to obtain a solution containing 0.05 per cent w/v of Ivermectin.

Reference solution. A 0.05 per cent w/v solution of *ivermectin IPRS* in *methanol*.

Apply to the plate 2 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm and 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the two principal peaks in the chromatogram obtained with the test solution corresponds to the principal peaks in the chromatogram obtained with reference solution.

Tests

Appearance of solution. The injection is clear (2.4.1) and not more intensely coloured than reference solution YS4 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve a volume of injection in *methanol* to obtain a solution containing 0.04 per cent w/v of Ivermectin.

Reference solution(a). A 0.04 per cent w/v solution of *ivermectin IPRS* in *methanol*.

Reference solution (b). A 0.0004 per cent w/v solution of *ivermectin IPRS* in *methanol*.

Reference solution (c). A 0.00002 per cent w/v solution of *ivermectin IPRS* in *methanol*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 39 volumes of *water*, 55 volumes of *methanol* and 106 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless in the chromatogram obtained with reference solution (a), the resolution between the component H_2B_{1b} (first peak) and component H_2B_{1a} (second peak) is not less than 3.0.

Inject reference solution (b), (c) and the test solution. In the chromatogram obtained with the test solution the area of any peak with a relative retention of 1.3 to 1.5 with reference to the principal peak is not more than 2.7 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.7 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (6.0 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Bacterial endotoxins (2.2.3). Not more than 0.016 Endotoxin Unit per µg of ivermectin.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve a volume of the injection in *methanol* to obtain a solution containing 0.04 per cent w/v of Ivermectin.

Reference solution. A 0.04 per cent w/v solution of *ivermectin IPRS* in *methanol*.

Use chromatographic conditions as described under Related substances.

Inject the reference solution and the test solution.

Calculate the content of ivermectin (H_2B_{1a} + H_2B_{1b}) in the injection and the ratio H_2B_{1a} / (H_2B_{1a} + H_2B_{1b}).

Ivermectin Tablets

Ivermectin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ivermectin calculated as sum of ivermectin components H_2B_{1a} ($C_{48}H_{74}O_{14}$) and H_2B_{1b} ($C_{47}H_{72}O_{14}$). This may contain suitable antioxidants.

Usual strengths. 3 mg; 6 mg; 12 mg.

Identification

In the Assay, the retention times of the H_2B_{1a} and H_2B_{1b} peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of a buffer solution prepared by dissolving 5 g of *sodium dodecyl sulphate* in 900 ml of *water*, add 10 ml of *1 M monobasic sodium phosphate monohydrate*, adjusted to pH 7.0 with *sodium hydroxide solution,* and dilute to 1000 ml with *water.*

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a weighed quantity of *ivermectn IPRS* in minimum amount of *methanol* and dilute with the dissolution medium to obtain a solution of similar concentration as that of the test solution.

Chromatographic system

- a stainless steel column 10 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 53 volumes of *acetonitrile*, 35 volumes of *methanol* and 12 volumes *water,*
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume:100 µl.

The relative retention time with reference to H_2B_{1a} for H_2B_{1b} is about 0.8.

Inject the reference solution. The test is not valid unless the resolution between H_2B_{1a} and H_2B_{1b} peaks is not less than1.5, the capacity factor for the H_2B_{1a} peak is not less than 4.0, column efficiency determine from both H_2B_{1a} and H_2B_{1b} peaks is not less than 1500 theoretical plates, the tailing factor for the H_2B_{1a} is not more than 2.0 and the relative standard deviation for replicate injections for the H_2B_{1a} is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the combined content of H_2B_{1a} and H_2B_{1b} in the medium.

Q. Not less than 80 per cent of the stated amount of ivermectin calculated as sum of H_2B_{1a} ($C_{48}H_{74}O_{14}$) and H_2B_{1b} ($C_{47}H_{72}O_{14}$) in the medium.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modification.

Test solution. Disperse one tablet in 5 ml of *water* with the aid of ultrasound for 10 minutes. Add 15 ml of *methanol,* sonicate for 5 minutes and mix. Allow the solution cool to room temperature and dilute to 25.0 ml with *methanol.*

Reference solution. Dissolve a weighed quantity of *ivermectn IPRS* with *methanol* to obtain a solution of similar concentration as that of the test solution.

Inject the reference solution and the test solution.

Calculate the content of ivermectin calculated as sum of H_2B_{1a} ($C_{48}H_{74}O_{14}$) and H_2B_{1b} ($C_{47}H_{72}O_{14}$) in the tablets.

Limit of 8a-oxo- H_2B_{1a}. Not more than 2 per cent.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modification.

- spectrophotometer set at 280 nm,

Reference solution. A 0.000096 per cent w/v solution of *3-tert-Butyl-4-hydroxyanisole (BHA) IPRS* in *methanol.*

The relative retention time with reference to H_2B_{1a} for BHA and 8a-oxo- H_2B_{1a} are about 0.24 and 0.77 respectively.

Inject the reference solution and the test solution.

Calculate the percentage of 8a-oxo-H_2B_{1a} as a percentage of the label claim of ivermectin in the portion of Tablets by using the following formula

$$\frac{r_u}{r_s} \times \frac{W_S}{W_U} \times \frac{D_U}{D_S} \times \frac{C_F}{f} \times \frac{P}{L} \times 100$$

in which r_u and r_s is the peak area of 8a-oxo-H_2B_{1a} obtained from the test solution and peak area of BHA obtained from the reference solution, W_S is the weight in mg of *BHA IPRS*, P is the purity of *BHA IPRS,* expressed as a decimal, D_U and D_S is dilution factor of test solution and reference solution, C_F is

the correction factor (equal to 0. 98) used to convert mg of 8a-oxo-H_2B_{1a} to mg of ivermectin, W_U is the number of tablets taken to prepare the test solution, L is the label claim in mg per tablet of ivermectin and 'f' is the correction factor (equal to 1.0).

$$\text{Correction factor (CF)} = \frac{0.90\ (\text{molecular weight of } H_2B_{1a}) + 0.10\ (\text{molecular weight of } H_2B_{1b})}{\text{molecular weight of } 8a - \text{oxo} - H_2B_{1a}}$$

$$CF = \frac{873.10}{889.10} = 0.98$$

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 60 mg of Ivermectin in 25 ml of *water,* with the aid of ultrasound for 10 minutes and dilute to 250.0 ml with *methanol.*

Reference solution (a). A 0.025 per cent w/v solution of *ivermectin IPRS* in *methanol.*

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with *methanol.* Dilute 1.0 ml of the solution to 5.0 ml with *methanol.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 53 volumes of *acetonitrile,* 35 volumes of *methanol* and 12 volumes *water,*
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume:10 µl.

The relative retention time with reference to H_2B_{1a} for H_2B_{1b} is about 0.8.

Inject reference solution (a) and (b). The test is not valid unless the column efficiency for H_2B_{1a} is not less than 1500 theoretical plates, the capacity factor for H_2B_{1b} is not less than 3.0, the tailing factor for H_2B_{1a} is not more than 2.0 and relative standard deviation for the area response of total ivermectin (H_2B_{1a} and H_2B_{1b}) for replicate injections is not more than 2.0 per cent in reference solution (a) and the signal-to-noise ratio of the principal peak is not less than 10.0 in reference solution (b).

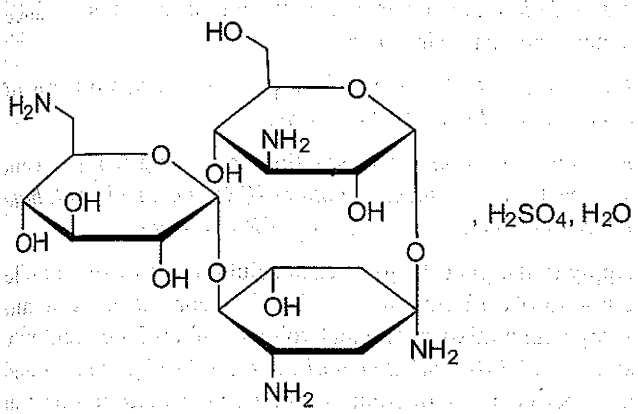
Inject reference solution (a) and the test solution, measure sum of the peak areas for content H_2B_{1a} and H_2B_{1b}.

Calculate the content of ivermectin calculated as sum of H_2B_{1a} ($C_{48}H_{74}O_{14}$) and H_2B_{1b} ($C_{47}H_{72}O_{14}$) in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

K

Kanamycin Sulphate



, H_2SO_4, H_2O

$C_{18}H_{36}N_4O_{11},H_2SO_4,H_2O$ Mol. Wt. 600.6

Kanamycin Sulphate is 6-*O*-(3-amino-3-deoxy-α-D-glucopyranosyl)-4-*O*-(6-amino-6-deoxy-α-D-glucopyranosyl)-2-deoxy-D-streptamine sulphate monohydrate, an antimicrobial substance produced by the growth of certain strains of *Streptomyces kanamyceticus*.

Kanamycin Sulphate has a potency of not less than 750 Units per mg, calculated on the dried basis.

Category. Antibacterial.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with a 0.75-mm layer of the following mixture. Mix 0.3 g of *carbomer* (Such as Carbopol 934) with 240 ml of *water* and allow to stand, with moderate shaking, for 1 hour; adjusted to pH 7.0 by the gradual addition, with continuous shaking, of *2 M sodium hydroxide* and add 30 g of *silica gel H*. Heat the plate at 110° for 1 hour, allow to cool and use immediately.

Mobile phase. A 7.0 per cent w/v solution of *potassium dihydrogen phosphate*.

Test solution. A 0.1 per cent w/v solution of the substance under examination in *water*.

Reference solution (a). A 0.1 per cent w/v solution of *kanamycin sulphate IPRS* in *water*.

Reference solution (b). A solution containing 0.1 per cent w/v, each of, *kanamycin sulphate IPRS*, *neomycin sulphate IPRS* and *streptomycin sulphate IPRS* in *water*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, spray with a mixture of equal volumes of a 0.2 per cent w/v solution of *1,3-napthalenediol* in *ethanol (95 per cent)* and a 45 per cent w/v solution of *sulphuric acid* and heat at 150° for 5 to 10 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.

B. Dissolve 0.5 g in 10 ml of *water* and add 10 ml of a 1 per cent w/v solution of *picric acid*. If necessary initiate crystallisation by scratching the walls of the container with a glass rod, allow to stand and filter. The crystals, after washing with 20 ml of *water* and drying at 105°, melt at about 235°, with decomposition (2.4.21).

C. Dissolve 50 mg in 2 ml of *water*, add 1 ml of a 1 per cent w/v solution of *ninhydrin* and heat for a few minutes on a water-bath; a violet colour is produced.

D. It gives the reactions of sulphates (2.3.1).

Tests

pH (2.4.24). 6.5 to 8.5, determined in a 1.0 per cent w/v solution.

Specific optical rotation (2.4.22). +112° to +123°, determined at 20° in a 1.0 per cent w/v solution.

Kanamycin B. Determine by thin-layer chromatography (2.4.17), coating the plate with a 0.75-mm layer of the following mixture. Mix 0.3 g of *carbomer* (Such as Carbopol 934) with 240 ml of *water* and allow to stand, with moderate shaking, for 1 hour; adjusted to pH 7.0 by the gradual addition, with continuous shaking, of *2 M sodium hydroxide* and add 30 g of *silica gel H*. Heat the plate at 110° for 1 hour, allow to cool and use immediately.

Mobile phase. A 7 per cent w/v solution of *potassium dihydrogen phosphate*.

Test solution. A 0.5 per cent w/v solution of the substance under examination in *water*.

Reference solution. A 0.02 per cent w/v solution of *kanamycin B sulphate IPRS* in *water*.

Apply to the plate 4 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, spray with *ninhydrin and stannous chloride reagent* and heat at 110° for 15 minutes. Any spot corresponding to kanamycin B in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Sulphates. 15.0 to 17.0 per cent of SO_4, calculated on the dried basis and determined by the following method. Dissolve 0.25 g in 100 ml of *water* and adjusted to pH 11 using *strong ammonia solution*. Add 10.0 ml of *0.1 M barium chloride* and 0.5 mg of *metalphthalein*. Titrate with *0.1 M disodium edetate*; when the colour of the solution begins to change,

add 50 ml of *ethanol (95 per cent)* and continue the titration until the blue colour disappears.

1 ml of *0.1 M barium chloride* is equivalent to 0.009606 g of SO_4.

Sulphated ash (2.3.18). Not more than 0.5 per cent.

Loss on drying (2.4.19). Not more than 1.5 per cent, determined on 1.0 g by drying in an oven at 60° at a pressure not exceeding 0.7 kPa for 3 hours.

Assay. Determine by the microbiological assay of antibiotics, Method A or B (2.2.10).

Kanamycin Sulphate intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.67 Endotoxin Unit per mg of kanamycin.

Kanamycin Sulphate intended for use in the manufacture of parenteral preparations without a further appropriate sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from light and moisture. If the contents are intended for use in the manufacture of parenteral preparations, the container should be sterile and sealed so as to exclude micro-organisms.

Labelling. The label states (1) the number of Units per mg; (2) whether or not the material is intended for use in the manufacture of parenteral preparations.

Kanamycin Acid Sulphate

Kanamycin Acid Sulphate is a form of kanamycin sulphate prepared by adding Sulphuric Acid to a solution of Kanamycin Sulphate and subsequent drying.

Kanamycin Acid Sulphate has a potency of not less than 650 Units per mg, calculated on the dried basis.

Category. Antibacterial.

Description. A white or almost white powder; hygroscopic.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with a 0.75-mm layer of the following mixture. Mix 0.3 g of *carbomer* (Such as Carbopol 934) with 240 ml of *water* and allow to stand, with moderate shaking, for 1 hour; adjusted to pH 7.0 by the gradual addition, with continuous shaking, of *2 M sodium hydroxide* and add 30 g of *silica gel H*. Heat the plate at 110° for 1 hour, allow to cool and use immediately.

Mobile phase. A 7 per cent w/v solution of *potassium dihydrogen phosphate*.

Test solution. A 0.1 per cent w/v solution of the substance under examination in *water*.

Reference solution (a). A 0.1 per cent w/v solution of *kanamycin sulphate IPRS* in *water*.

Reference solution (b). A solution containing 0.1 per cent w/v, each of, *kanamycin sulphate IPRS*, *neomycin sulphate IPRS* and *streptomycin sulphate IPRS* in *water*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, spray with a mixture of equal volumes of a 0.2 per cent w/v solution of *1,3-napthalenediol* in *ethanol (95 per cent)* and a 45 per cent w/v of solution of *sulphuric acid* and heat at 150° for 5 to 10 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.

B. Dissolve 0.5 g in 10 ml of *water* and add 10 ml of a 1 per cent w/v solution of *picric acid*. If necessary initiate crystallisation by scratching the walls of the container with a glass rod, allow to stand and filter. The melting point of the crystals, after washing with 20 ml of *water* and drying at 105°, is about 235°, with decomposition (2.4.21).

C. Dissolve 50 mg in 2 ml of *water*, add 1 ml of a 1 per cent w/v solution of *ninhydrin* and heat for a few minutes on a water-bath; a violet colour is produced.

D. It gives the reactions of sulphates (2.3.1).

Tests

pH (2.4.24). 5.5 to 7.5, determined in a 1.0 per cent w/v solution.

Specific optical rotation (2.4.22). +103° to +115°, determined at 20° in a 1.0 per cent w/v solution.

Kanamycin B. Determine by thin-layer chromatography (2.4.17), coating the plate with a 0.75-mm layer of the following mixture. Mix 0.3 g of *carbomer* (Such as Carbopol 934) with 240 ml of *water* and allow to stand, with moderate shaking, for 1 hour; adjusted to pH 7.0 by the gradual addition, with continuous shaking, of *2 M sodium hydroxide* and add 30 g of *silica gel H*. Heat the plate at 110° for 1 hour, allow to cool and use immediately.

Mobile phase. A 7 per cent w/v solution of *potassium dihydrogen phosphate*.

Test solution. A 0.5 per cent w/v solution of the substance under examination in *water*.

Reference solution. A 0.02 per cent w/v solution of *kanamycin B sulphate IPRS* in *water*.

Apply to the plate 4 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, spray with *ninhydrin and stannous chloride reagent* and heat at 110° for 15 minutes. Any spot corresponding to kanamycin B in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Sulphates. 23.0 to 26.0 per cent of SO_4, calculated on the dried basis and determined by the following method. Dissolve 0.25 g in 100 ml of *water* and adjusted to pH 11 using *strong ammonia solution*. Add 10.0 ml of *0.1 M barium chloride* and 0.5 mg of *metalphthalein*. Titrate with *0.1 M disodium edetate*; when the colour of the solution begins to change, add 50 ml of *ethanol (95 per cent)* and continue the titration until the blue colour disappears.

1 ml of *0.1 M barium chloride* is equivalent to 0.009606 g of SO_4.

Sulphated ash (2.3.18). Not more than 0.5 per cent.

Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 1.0 g by drying in an oven at 60° at a pressure not exceeding 0.7 kPa for 3 hours.

Assay. Determine by the microbiological assay of antibiotics, Method A or B (2.2.10).

Kanamycin Acid Sulphate intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.67 Endotoxin Unit per mg of kanamycin.

Kanamycin Acid Sulphate intended for use in the manufacture of parenteral preparations without a further appropriate sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from light and moisture. If the material is intended for use in the manufacture of parenteral preparations, the container should be sterile and sealed so as to exclude micro-organisms.

Labelling. The label states (1) the number of Units per mg; (2) whether or not the material is intended for use in the manufacture of parenteral preparations.

Kanamycin Injection

Kanamycin Injection is either a sterile solution of Kanamycin Sulphate in Water for Injections containing Sulphuric Acid and suitable buffering and stabilising agents or, is a sterile material consisting of Kanamycin Acid Sulphate with buffering agents and other excipients. It is filled in a sealed container.

A. *Kanamycin Injection (Solution)*

Kanamycin Injection contains Kanamycin Sulphate equivalent to not less than 97.0 per cent and not more than 110.0 per cent of the stated number of Units of kanamycin.

Usual strengths. The equivalent of 250 mg (250,000 Units) of kanamycin per ml or per sealed container.

Description. A colourless to pale yellow solution.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with a 0.75-mm layer of the following mixture. Mix 0.3 g of *carbomer* (Such as Carbopol 934) with 240 ml of *water* and allow to stand, with moderate shaking, for 1 hour; adjusted to pH 7.0 by the gradual addition, with continuous shaking, of *2 M sodium hydroxide* and add 30 g of *silica gel H*. Heat the plate at 110° for 1 hour, allow to cool and use immediately.

Mobile phase. A 7 per cent w/v solution of *potassium dihydrogen phosphate*.

Test solution. A suitable volume diluted with *water* to contain 800 Units per ml.

Reference solution (a). A 0.1 per cent w/v solution of *kanamycin sulphate IPRS* in *water*.

Reference solution (b). A solution containing 0.1 per cent w/v, each of, *kanamycin sulphate IPRS*, *neomycin sulphate IPRS* and *streptomycin sulphate IPRS* in *water*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, spray with a mixture of equal volumes of a 0.2 per cent w/v solution of *1,3-napthalenediol* in *ethanol (95 per cent)* and a 45 per cent w/v of solution of *sulphuric acid* and heat at 150° for 5 to 10 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.

Tests

pH (2.4.24). 4.0 to 6.0.

Kanamycin B. Determine by thin-layer chromatography (2.4.17), coating the plate with a 0.75-mm layer of the following mixture. Mix 0.3 g of *carbomer* (Such as Carbopol 934) with 240 ml of *water* and allow to stand, with moderate shaking, for 1 hour; adjusted to pH 7.0 by the gradual addition, with continuous shaking, of *2 M sodium hydroxide* and add 130 g of *silica gel H*. Heat the plate at 110° for 1 hour, allow to cool and use immediately.

Mobile phase. A 7.0 per cent w/v solution of *potassium dihydrogen phosphate.*

Test solution. A suitable volume diluted with *water* to contain 3750 Units per ml.

Reference solution. A 0.02 per cent w/v solution of *kanamycin B sulphate IPRS* in *water.*

Apply to the plate 4 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, spray with *ninhydrin* and *stannous chloride reagent* and heat at 110° for 15 minutes. Any spot corresponding to kanamycin B in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Bacterial endotoxins (2.2.3). Not more than 0.67 Endotoxin Unit per mg of kanamycin.

Assay. Determine by the microbiological assay of antibiotics, Method A or B (2.2.10).

The upper fiducial limit of error is not less than 97.0 per cent and the lower fiducial limit of error is not more than 110.0 per cent of the stated number of Units.

B. *Kanamycin Injection (Powder)*

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Kanamycin Injection contains not less than 95.0 per cent and not more than 115.0 per cent of the stated number of Units of kanamycin

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with a 0.75-mm layer of the following mixture. Mix 0.3 g of *carbomer* (Such as Carbopol 934) with 240 ml of *water* and allow to stand, with moderate shaking, for 1 hour; adjusted to pH 7.0 by the gradual addition, with continuous shaking, of *2 M sodium hydroxide* and add 30 g of *silica gel H.* Heat the plate at 110° for 1 hour, allow to cool and use immediately.

Mobile phase. A 7.0 per cent w/v solution of *potassium dihydrogen phosphate.*

Test solution. A suitable volume diluted with *water* to contain 800 Units per ml.

Reference solution (a). A 0.1 per cent w/v solution of *kanamycin sulphate IPRS* in *water.*

Reference solution (b). A solution containing 0.1 per cent w/v, each of, *kanamycin sulphate IPRS, neomycin sulphate IPRS* and *streptomycin sulphate IPRS* in *water.*

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, spray with a mixture of equal volumes of a 0.2 per cent w/v solution of *1,3-napthalenediol* in *ethanol (95 per cent)* and a 45 per cent w/v of solution of *sulphuric acid* and heat at 150° for 5 to 10 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.

Tests

pH (2.4.24). 5.5 to 7.5, determined in a 1.0 per cent w/v solution.

Kanamycin B. Determine by thin-layer chromatography (2.4.17), coating the plate with a 0.75-mm layer of the following mixture. Mix 0.3 g of *carbomer* (Such as Carbopol 934) with 240 ml of *water* and allow to stand, with moderate shaking, for 1 hour; adjusted to pH 7.0 by the gradual addition, with continuous shaking, of *2 M sodium hydroxide* and add 30 g of *silica gel H.* Heat the plate at 110° for 1 hour, allow to cool and use immediately.

Mobile phase. A 7 per cent w/v solution of *potassium dihydrogen phosphate.*

Test solution. A suitable volume diluted with *water* to contain 3750 Units per ml.

Reference solution. A 0.02 per cent w/v solution of *kanamycin B sulphate IPRS* in *water.*

Apply to the plate 4 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, spray with *ninhydrin and stannous chloride reagent* and heat at 110° for 15 minutes. Any spot corresponding to kanamycin B in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Bacterial endotoxins (2.2.3). Not more than 0.67 Endotoxin Unit per mg of kanamycin.

Assay. Determine the weight of the contents of 10 containers. Using the mixed contents of the 10 containers determine by

the microbiological assay of antibiotics, Method A or Method B (2.2.10).

For a container of average content weight, the upper fiducial limit of error is not less than 95.0 per cent and the lower fiducial limit of error is not more than 115.0 per cent of the stated number of Units.

Storage. Store in single dose containers protected from light and moisture.

Labelling. The label states (1) the strength in terms of the number of Units or the equivalent weight of kanamycin in a suitable dose-volume or in the sealed container; (2) the volume of Water for Injections for constituting the solution (for contents of a sealed container).

Heavy Kaolin

Heavy Kaolin is a purified, natural, hydrated aluminium silicate of variable composition.

Category. Pharmaceutical aid.

Description. Fine, white or greyish white, soft powder.

Identification

A. To 0.5 g in a metal crucible add 1 g of *potassium nitrate* and 3 g of *anhydrous sodium carbonate*, heat until the mixture has melted and allow to cool. To the residue add 20 ml of boiling *water*, mix, filter and wash the residue with 50 ml of *water*. To the residue add 1 ml of *hydrochloric acid* and 5 ml of *water* and filter. To the filtrate add 1 ml of *10 M sodium hydroxide* and filter. To the filtrate add 3 ml of *ammonium chloride solution*; a gelatinous, white precipitate is produced.

B. 0.25 g gives the reaction of silicates (2.3.1).

Tests

Acidity or alkalinity. To 1.0 g add 20 ml of *carbon dioxide-free water*, shake for 2 minutes and filter. To 10 ml of the filtrate add 0.1 ml of *phenolphthalein solution*. The solution is colourless and not more than 0.25 ml of *0.01 M sodium hydroxide* is required to change the colour of the solution to pink.

Arsenic (2.3.10). Disperse 5.0 g in 50 ml of *water* and add 10 ml of *stannated hydrochloric acid*. The resulting solution complies with the limit test for arsenic (2 ppm).

Heavy metals (2.3.13). Boil 5.0 g with 7.5 ml of *2 M hydrochloric acid* and 27.5 ml of *water* for 5 minutes, filter, wash the residue with *water* and dilute the combined filtrate and washings to 50 ml with *water* (solution A). To 5 ml of solution A add 5 ml of *water*, 10 ml of *hydrochloric acid* and 25 ml of *4-methylpentan-2-one*, shake for 2 minutes, allow the layers to separate and evaporate the aqueous layer to dryness on a water-bath. Dissolve the residue in 1 ml of *5 M acetic acid*, dilute to 25 ml with *water* and filter. 12 ml of the resulting solution complies with the limit test for heavy metals, Method D (50 ppm). Use *lead standard solution (1 ppm Pb)* to prepare the standard.

Chlorides (2.3.12). Shake 4.0 g with a mixture of 34 ml of *distilled water* and 6 ml of *5 M acetic acid* for 1 minute and filter. 10 ml of the filtrate complies with the limit test for chlorides (250 ppm).

Sulphates (2.3.17). 2 ml of the filtrate obtained in the test for chlorides diluted to 15 ml complies with the limit test for sulphates (750 ppm).

Substances soluble in mineral acids. Not more than 1 per cent, determined by the following method. To 10 ml of solution A add 1.5 ml of *1 M sulphuric acid*, evaporate to dryness on a water-bath, ignite, cool and weigh.

Organic impurities. Heat 0.3 g to redness in a calcination tube. The residue is only slightly more coloured than the original substance.

Adsorption power. In a ground-glass-stoppered test-tube shake 1.0 g with 10 ml of a 0.37 per cent w/v solution of *methylene blue* for 2 minutes and allow to settle. Centrifuge and dilute 1 volume of the solution to 100 volumes with *water*. The solution is not more intensely coloured than a 0.003 per cent w/v solution of *methylene blue*.

Swelling power. Triturate 2 g with 2 ml of *water*; the mixture does not flow.

Loss on ignition (2.4.20). Not more than 15.0 per cent, determined on 1.0 g.

Light Kaolin

Light Kaolin is a native hydrated aluminium silicate, freed from most of its impurities by elutriation and dried. It may contain a suitable dispersing agent.

Category. Pharmaceutical aid.

Description. Light, white powder free from gritty particles; unctuous to the touch.

Identification

A. Fuse 1 g with 2 g of *anhydrous sodium carbonate*, warm the residue with 10 ml of *water*, filter, wash the filter with 5 ml of *water* and reserve the residue. To the combined filtrate and washings add 3 ml of *hydrochloric acid*; a gelatinous precipitate is produced.

B. Dissolve the residue reserved in test A in 10 ml of *2 M hydrochloric acid*; the solution gives reaction (B) of aluminium salts (2.3.1).

C. Triturate 2 g with 2 ml of *water*; the resulting mixture flows.

Coarse particles. Transfer 5 g to a stoppered cylinder (16 cm × 35 mm), add 60 ml of a 1 per cent w/v solution of *sodium pyrophosphate*, shake thoroughly and allow to stand for 5 minutes. Using a pipette, withdraw 50 ml from a point about 5 cm below the surface of the liquid. To the remaining liquid add 50 ml of *water*, shake, allow to stand for 5 minutes and withdraw 50 ml in the same manner as before. Repeat the operation until a total of 400 ml of suspension has been withdrawn under the prescribed conditions. Transfer the remainder to an evaporating dish and evaporate to dryness on a water-bath. The residue, after drying at 105°, weighs not more than 25 mg.

Fine particles. Disperse 5 g in 250 ml of *water* by shaking vigorously for 2 minutes in a stoppered flask, pour immediately into a glass cylinder, 5 cm in diameter, and transfer 20 ml to a glass dish using a pipette. Evaporate to dryness and dry to constant weight at 105°. Allow the remainder of the suspension to stand for 4 hours at 20° and withdraw a second 20-ml portion using a pipette with its tip exactly 5 cm below the surface and without disturbing the sediment. Transfer the second portion to a glass dish, evaporate to dryness and dry to constant weight at 105°. The weight of the residue from the second portion is not less than 70 per cent of the weight of the residue from the first portion.

Tests

Arsenic (2.3.10). Disperse 5 g in 50 ml of *water* and add 10 ml of *stannated hydrochloric acid*; the resulting solution complies with the limit test for arsenic (2 ppm).

Heavy metals (2.3.13). Heat 6.0 g for 15 minutes under a reflux condenser on a water-bath with a mixture of 70 ml of *water* and 10 ml of *hydrochloric acid* and filter. To 40 ml of the filtrate add 0.5 ml of *nitric acid* and evaporate to a low bulk. Add 20 ml of *water*, 2 g of *ammonium chloride* and 2 g of *ammonium thiocyanate* and extract with two quantities, each of 10 ml, of a mixture of equal volumes of *amyl alcohol* and *ether*. To the aqueous layer add 2 g of *citric acid* and sufficient *water* to produce 60 ml. 12 ml of the solution complies with the limit test for heavy metals, Method D (20 ppm), using 10 ml of *lead standard solution (1 ppm pb)*.

Chlorides (2.3.12). Boil 1.5 g with 40 ml of *water* and 20 ml of *2 M nitric acid* under a reflux condenser for 5 minutes, cool and filter. 30 ml of the filtrate complies with the limit test for chlorides (330 ppm).

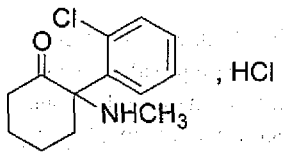
Soluble matter. Boil 2 g with 100 ml of *0.2 M hydrochloric acid* under a reflux condenser for 5 minutes, cool, filter and evaporate 50 ml to dryness. The residue, after ignition at about 600° for 30 minutes, weighs not more than 10 mg.

Loss on drying (2.4.19). Not more than 1.5 per cent, determined on 1 g by drying in an oven at 105°.

Loss on ignition (2.4.20). Not more than 15.0 per cent, determined on 1 g by igniting at 600°.

Storage. Store protected from moisture.

Ketamine Hydrochloride



$C_{13}H_{16}ClNO,HCl$ Mol. Wt. 274.2

Ketamine Hydrochloride is (*RS*)-2-(2-chlorophenyl)-2-methylaminocyclohexanone hydrochloride.

Ketamine Hydrochloride contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{13}H_{16}ClNO,HCl$.

Category. General anaesthetic.

Description. A white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ketamine hydrochloride IPRS* or with the reference spectrum of ketamine hydrochloride.

B. A 10 per cent w/v solution gives the reactions of chlorides (2.3.1).

C. Melting range (2.4.21). 258° to 261°.

Tests

Appearance of solution. A 20.0 per cent w/v solution is clear (2.4.1), and colourless (2.4.1).

pH (2.4.24). 3.5 to 4.1, determined in a 10.0 per cent w/v solution.

Optical rotation (2.4.22). – 0.2° to + 0.2°, determined in 2.0 per cent w/v solution in *water*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 50 ml of the mobile phase.

Reference solution. Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Chromatographic system

– a stainless steel column 12.5 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),

- mobile phase: dissolve 0.95 g of *sodium hexanesulphonate* in 1000 ml of a mixture of 25 volumes of *acetonitrile* and 75 volumes of *water*, add 4 ml of *acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution. Run the chromatogram 10 times the retention time of the principal peak. In the chromatogram obtained with the test solution the sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent). Ignore any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent).

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method A (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Weigh 0.5 g and dissolve in 1 ml of *anhydrous formic acid*. Add 50 ml of *anhydrous glacial acetic acid* and 10 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02742 g of $C_{13}H_{16}ClNO,HCl$.

Storage. Store protected from moisture.

Ketamine Injection

Ketamine Hydrochloride Injection

Ketamine Injection is a sterile solution of Ketamine Hydrochloride in Water for Injections.

Ketamine Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of ketamine, $C_{13}H_{16}ClNO$.

Usual strengths. The equivalent of 10 mg per ml; 50 mg per ml; 100 mg per ml (11.54 mg of ketamine hydrochloride is approximately equivalent to 10 mg of ketamine).

Identification

A. Dilute a suitable volume with *0.1 M hydrochloric acid* to produce a solution containing 0.03 per cent w/v of ketamine. When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows absorption maxima at about 269 nm and 276 nm.

B. Dilute a suitable volume with a mixture of 49 volumes of *methanol* and 1 volume of *1 M sodium hydroxide* to produce a solution containing 0.07 per cent w/v of ketamine. When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows an absorption maximum at about 301 nm.

Tests

pH (2.4.24). 3.0 to 5.5.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use.

Test solution. Dilute a quantity of injection containing about 0.12 g of Ketamine in 100.0 ml of the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 2.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 12.5 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Lichrosorb RP18),
- mobile phase: a solution prepared by dissolving 0.95 g of *sodium hexanesulphonate* in 1000 ml of a mixture of 25 volumes of *acetonitrile* and 75 volumes of *water* and add 4 ml of *6 M acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 10 times the retention time of the principal peak. The retention time is about 3 to 4.5 minutes for ketamine. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent), and the area of not more than one such peak is more than the area of the principal peak in the chromatogram obtained with reference solution (b) 0.25 per cent). Ignore any peak with an area less than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Bacterial endotoxins (2.2.3). Not more than 0.40 Endotoxin Unit per mg of ketamine hydrochloride.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. To a volume of injection containing 0.5 g of ketamine add sufficient *water* to produce 200.0 ml and mix. To 20.0 ml of the resulting solution add 3 ml of *0.1 M sodium hydroxide* and extract with three quantities, each of 15 ml, of *chloroform*.

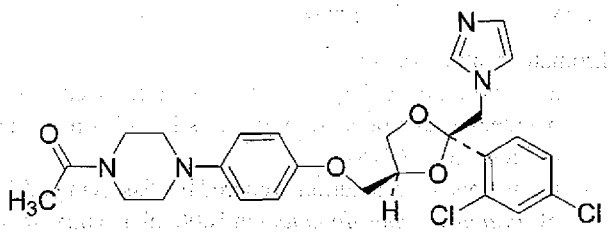
Combine the *chloroform* extracts and shake successively with three quantities, each of 30 ml, of *0.05 M sulphuric acid*. Dilute the combined acid extracts to 200.0 ml with *0.05 M sulphuric acid* (saturated with *chloroform*), and measure the absorbance of the resulting solution at the maximum at about 269 nm (2.4.7).

Calculate the content of $C_{13}H_{16}ClNO$ from the absorbance obtained from a solution of known concentration of *ketamine hydrochloride IPRS* in the same medium.

Storage. Store protected from light at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of ketamine in a suitable dose-volume.

Ketoconazole



$C_{26}H_{28}Cl_2N_4O_4$ Mol. Wt. 531.4

Ketoconazole is *cis*-1-acetyl-4-[[(2*RS*,4*RS*)-2-(2,4-dichlorophenyl)-2-(1*H*-imidazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxyl]phenylpiperazine.

Ketoconazole contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{26}H_{28}Cl_2N_4O_4$, calculated on the dried basis.

Category. Antifungal.

Description. A white to off-white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ketoconazole IPRS* or with the reference spectrum of ketoconazole.

B. Melting range (2.4.21). 148° to 152°.

Tests

Specific optical rotation (2.4.22). –1.0° to +1.0°, determined in a 4.0 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in 10.0 ml of *methanol*.

Reference solution (a). Dissolve 2.5 mg, each of, *ketoconazole IPRS* and *loperamide hydrochloride IPRS* in 50 ml of *methanol*.

Reference solution (b). Dilute 5.0 ml of the test solution to 100.0 ml with *methanol*. Dilute 1.0 ml of the solution to 10.0 ml with *methanol*.

Chromatographic system

- stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: A. a mixture of 5 volumes of *acetonitrile* and 95 volumes of 0.34 per cent w/v solution of *tetrabutylammonium hydrogen sulphate*,
  B. a mixture of 50 volumes of *acetonitrile* and 50 volumes of 0.34 per cent w/v solution of *tetrabutylammonium hydrogen sulphate*,
- a gradient programme using the conditions given below,
- flow rate: 2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Time (min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
10	0	100
15	0	100
16	100	0
20	100	0

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to ketoconazole and loperamide is not less than 15.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution the sum of the areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.1 times that of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 80° at a pressure not exceeding 2.7 kPa for 4 hours.

Assay. Weigh 0.2 g, dissolve in 40 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02657 g of $C_{26}H_{28}Cl_2N_4O_4$.

Storage. Store protected from light.

Ketoconazole Tablets

Ketoconazole Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ketoconazole, $C_{26}H_{28}Cl_2N_4O_4$.

Usual strength. 200 mg.

Identification

Determine by thin- layer chromatography (2.4.17), coating the plate with *silica gel G.*

Mobile phase. A mixture of 42 volumes of *hexane*, 40 volumes of *ethyl acetate,* 15 volumes of *methanol*, 2 volumes of *water* and 1 volume of *glacial acetic acid.*

Test solution. Disperse a quantity of powdered tablets containing 200 mg of Ketoconazole with 10 ml of *chloroform*, dilute to 20 ml with *chloroform* and filter.

Reference solution. A 1.0 per cent w/v solution of *ketoconazole IPRS* in *chloroform.*

Apply to the plate 10 µl of each solution. After development, dry the plate in air and expose to iodine vapour. The principal spot in the chromatogram obtained with the test solution corresponds to that obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1M hydrochloric acid,*
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted if necessary with the dissolution medium at 270 nm (2.4.7). Calculate the content of $C_{26}H_{28}Cl_2N_4O_4$, in the medium from the absorbances obtained from a solution of *ketoconazole IPRS.*

Q. Not less than 80 per cent of the stated amount of $C_{26}H_{28}Cl_2N_4O_4$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *methanol* and *dichloromethane.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 200 mg of Ketoconazole, shake with 50.0 ml of the solvent mixture and centrifuge. To 5.0 ml of the solution, add 5.0 ml of a 0.5 per cent w/v solution of *terconazole IPRS* (internal standard) in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

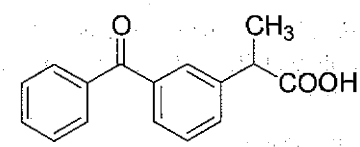
Reference solution. Dissolve 20 mg of *ketoconazole IPRS* in 20 ml of the solvent mixture, add 5.0 ml of the internal standard solution and dilute to 50.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 7 volumes of 0.2 per cent w/v of *di-isopropylamine* in *methanol* and 3 volumes of a 0.5 per cent w/v solution of *ammonium acetate,*
- flow rate: 3 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution. The relative retention times are about 0.6 for ketoconazole and 1.0 for terconazole.

Calculate the content of $C_{26}H_{28}Cl_2N_4O_4$ in the tablets.

Ketoprofen



$C_{16}H_{14}O_3$ Mol. Wt. 254.3

Ketoprofen is (*RS*)-2-(3-benzoylphenyl)propionic acid.

Ketoprofen contains not less than 98.5 per cent and not more than 100.5 per cent of $C_{16}H_{14}O_3$, calculated on the dried basis.

Category. Anti-inflammatory; analgesic.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ketoprofen IPRS* or with the reference spectrum of ketoprofen.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *methanol (75 per cent)* shows an absorption maximum only at about 258 nm; absorbance at about 258 nm, about 0.66.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 50 volumes of *acetone*, 49 volumes of *dichloromethane* and 1 volume of *glacial acetic acid.*

Test solution. Dissolve 0.1 g of the substance under examination in 100 ml of *acetone.*

Reference solution (a). A 0.1 per cent w/v solution of *ketoprofen IPRS* in *acetone*.

Reference solution (b). A mixture of equal volumes of 1.0 per cent w/v solution of *indomethacin IPRS* and refererence solution (a) in *acetone*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use.

Test solution. Dissolve 20 mg of the substance under examination in 20.0 ml of the mobile phase .

Reference solution. Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 2 volumes of freshly prepared *phosphate buffer pH 3.5*, 43 volumes of *acetonitrile* and 55 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 233 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution. Run the chromatogram 7 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (0.2 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the peak due to impurity in the chromatogram obtained with the reference solution (0.4 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.02 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 60° at a pressure not exceeding 0.7 kPa.

Assay. Weigh 0.5 g, dissolve in 25 ml of *ethanol (95 per cent)* previously neutralised to *phenolphthalein solution*, add 25 ml of *water* Titrate with *0.1 M sodium hydroxide* using *phenolphthalein solution* as indicator.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.02543 g of $C_{16}H_{14}O_3$.

Storage. Store protected from moisture.

Ketoprofen Capsules

Ketoprofen Capsules contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of ketoprofen, $C_{16}H_{14}O_3$.

Usual strengths. 50 mg; 100 mg.

Identification

A. Shake a quantity of the contents of the capsules containing 0.5 g of Ketoprofen with 50 ml of *chloroform* for 5 minutes, filter, evaporate to dryness using a rotary evaporator, induce crystallisation by prolonged scratching of the inside wall of the container with a glass rod and separate the crystals by centrifugation or filtration.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ketoprofen IPRS* or with the reference spectrum of ketoprofen.

B. When examined in the range 230 nm to 360 nm (2.4.7), the final solution obtained in the Assay shows an absorption maximum only at about 258 nm.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of phosphate buffer prepared by dissolving 1.46 g of *potassium dihydrogen orthophosphate* and 20.06 g of *disodium hydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 7.5 with *orthophosphoric acid*,

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted if necessary with the dissolution medium to prepare a solution containing about 0.001 per cent w/v of ketoprofen at 260 nm (2.4.7). Calculate the content of $C_{16}H_{14}O_3$, in the medium from the absorbances obtained from a solution of *ketoprofen IPRS* .

Q. Not less than 80 per cent of the stated amount of $C_{16}H_{14}O_3$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use.

Solvent mixture. 40 volumes of *acetonitrile* and 60 volumes of *water*.

Test solution. Shake a quantity of the contents of capsules containing about 100 mg of Ketoprofen in 100 ml with the solvent mixture.

Reference solution. Dilute 1.0 ml of the test solution to 50.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 2 volumes of freshly prepared *phosphate buffer pH 3.5*, 43 volumes of *acetonitrile* and 55 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 233 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution. The area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.02 per cent).

Other tests. Comply with the tests stated under Capsules.

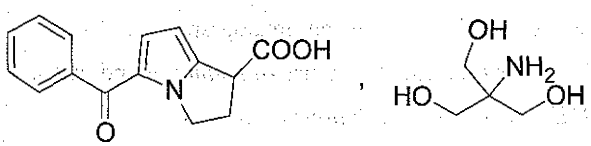
Assay. Weigh a quantity of the mixed contents of 20 capsules containing about 25 mg of Ketoprofen, shake for 10 minutes with 150 ml of *methanol (75 per cent)*, mix and dilute to 250.0 ml with *methanol (75 per cent)*. Allow to stand, dilute 10.0 ml of the supernatant liquid to 100.0 ml with *methanol (75 per cent)* and measure the absorbance of the resulting solution at the maximum at about 258 nm (2.4.7).

Calculate the content of $C_{16}H_{14}O_3$ taking 662 as the specific absorbance at 258 nm.

Storage. Store protected from moisture.

Ketorolac Tromethamine

Ketorolac Trometamol



$C_{15}H_{13}NO_3,C_4H_{11}NO_3$ Mol. Wt. 376.4

Ketorolac Tromethamine is salt of (*RS*)-5-benzoyl-2,3-dihydro-1*H*-pyrrolizine-1-carboxylate with 2-amino-2-(hydroxymethyl) propane-1,3-diol.

Ketorolac Tromethamine contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{15}H_{13}NO_3,C_4H_{11}NO_3$, calculated on the dried basis.

Category. Non-steroidal Anti-inflammatory.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ketorolac tromethamine IPRS* or with the reference spectrum of ketorolac tromethamine.

B. Determine by thin layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 95 volumes of *dichloromethane*, 5 volumes of *acetone* and 2 volumes of *glacial acetic acid*.

Test solution. A 0.5 per cent w/v solution of the substance under examination in a mixture of 2 volumes of *dichloromethane* and 1 volume of *methanol*.

Reference solution. A 0.5 per cent w/v solution of *ketorolac tromethamine IPRS* in the same solvent.

Apply to the plate 40 µl of each solution. After development, dry the plate in air, spray with a freshly prepared alcoholic solution containing 30 mg of *ninhydrin* per ml, dry at 150° for 2 to 5 minutes and examine. The yellow spots with pink to purple borders obtained with the test solution corresponds to the spots obtained with the reference solution.

Tests

Appearance of solution. A 3.0 per cent w/v solution in *carbon dioxide-free water* (solution A) is clear (2.4.1.).

pH (2.4.24). 5.7 to 6.7 determined on a solution prepared by diluting 5 ml of solution A to 15 ml with *carbon dioxide-free water*.

Light absorption (2.4.7). Absorbance of solution A at 430 nm, not more than 0.10.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light.

Solvent mixture. 30 volumes of *tetrahydrofuran* and 70 volumes of *water*.

Test solution. Dissolve 20 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). A 0.04 per cent w/v solution of *ketorolac tromethamine IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture. Dilute 1.0 ml to 10.0 ml with the solvent mixture

Reference solution (c). Place in a 250-ml separating funnel, 100 ml of *water*, 100 ml of *dichloromethane*, 30 mg of *ketorolac tromethamine IPRS* and 1 ml of *1M hydrochloric acid*. Insert the stopper, shake, and allow the layers to separate. Transfer the lower dichloromethane layer to a stoppered borosilicate glass flask. Insert the stopper and expose to daylight for 10-15 minutes. Evaporate 1.0 ml of the solution to dryness in a current of air, or in a stream of nitrogen. Dissolve the residue in 1.0 ml of the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature. 40°,
- mobile phase: a mixture of 30 volumes of *tetrahydrofuran* and 70 volumes of buffer solution prepared by dissolving 5.75 g of *ammonium dihydrogen phosphate* in 900 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and diluting to 1000 ml with *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 313 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Unknown impurity[1]	0.54	2.2
Unknown impurity[2]	0.66	0.91
ketorolac 1-hydroxy analog	0.63	0.67
ketorolac 1-keto analog	0.89	0.52
ketorolac	1.0	—

[1]Unknown structure,

[2]Unknown structure.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to ketorolac 1-keto analog and ketorolac is not less than 1.5.

Inject reference solution (b) and the test solution. Run the chromatogram three times the retention time of the principal peak in the chromatogram obtained with the test solution the area of peak obtained with ketorolac 1-keto analog and ketorolac 1-hydroxy analog is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent), the area of any other secondary peak is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in vacuum at 60° for 3 hours.

Assay. Determine by liquid chromatography as described under Related substances.

Inject reference solution (c) and (a). The test is not valid unless the resolution between ketorolac 1-keto analog and ketorolac is not less than 1.5 in the chromatogram obtained with reference solution (c), the column efficiency is not less than 5000 theoretical plates and the relative standard deviation for replicate injections is not more than 1.5 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_{15}H_{13}NO_3$,$C_4H_{11}NO_3$.

Ketorolac Tromethamine Injection

Ketorolac Trometamol Injection

Ketorolac Tromethamine Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ketorolac tromethamine $C_{15}H_{13}NO_3$,$C_4H_{11}NO_3$.

Usual strengths. 15 mg per ml; 30 mg per ml.

Identification

Prepare a mixture of equal volumes of the test solution and reference solution (b) and chromatograph the mixture as directed in the Assay. The chromatogram thus obtained exhibits two main peaks corresponding to ketorolac and naproxen.

Tests

pH (2.4.24). 6.9 to 7.9.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Bacterial endotoxins (2.2.3). Not more than 5.8 Endotoxin units per mg of ketorolac tromethamine.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *methanol* and *water*.

NOTE — Protect the solutions from light.

Test solution. Dilute a measured volume containing 12 mg of Ketorolac Tromethamine to 50.0 ml with *methanol*. To 5.0 ml

of the solution add 5.0 ml of reference solution (b) and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). A 0.024 per cent w/v solution of *ketorolac tromethamine IPRS* in *methanol*. To 5.0 ml of the solution, add 5.0 ml of reference solution (b) and dilute to 50.0 ml with the solvent mixture.

Reference solution (b). A 0.03 per cent w/v solution of *naproxen IPRS* in *methanol*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 55 volumes of *methanol*, 44 volumes of *water* and 1 volume of *glacial acetic acid*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 100 µl.

The relative retention times are about 0.7 for ketorolac and 1.0 for naproxen.

Inject reference solution (a). The resolution between the peaks due to ketorolac and naproxen is not less than 5.4, the column efficiency determined from the ketorolac peak is not less than 2700 theoretical plates, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 1.5 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{15}H_{13}NO_3,C_4H_{11}NO_3$ in the injection.

Storage. Store protected from light, at a temperature not exceeding 30°.

Ketorolac Tromethamine Tablets

Ketorolac Trometamol Tablets

Ketorolac Tromethamine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ketorolac tromethamine $C_{15}H_{13}NO_3,C_4H_{11}NO_3$.

Usual strength. 10 mg.

Identification

Prepare a mixture of equal volumes of the test solution and reference solution (a) and determine by liquid chromatography (2.4.14) as described under Assay, using the mixture. The chromatogram obtained exhibits two main peaks corresponding to ketorolac and naproxen.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 600 ml of *water*,

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance (2.4.7) of the filtrate, suitably diluted with the medium if necessary, at the maximum at about 322 nm.

Calculate the content of $C_{15}H_{13}NO_3,C_4H_{11}NO_3$ in the medium from the absorbance obtained from a solution of known concentration of *ketorolac tromethamine IPRS* in the same medium.

Q. Not less than 75 per cent of the stated amount of $C_{15}H_{13}NO_3,C_4H_{11}NO_3$.

Uniformity of content. Complies with the test stated under Tablets.

Powder 1 tablet and transfer to volumetric flask that will provide a final concentration of about 0.1 mg of ketorolac tromethamine per ml. Add a quantity of *water* equivalent to about 10 per cent of the volume of the flask and mix with the aid of ultrasound. Add a quantity of *methanol* equivalent to about 40 per cent of the volume of the flask and mix with the aid of ultrasound for about 10 minutes to dissolve the ketorolac tromethamine. Cool, dilute to volume with *methanol*, mix and centrifuge. Dilute 5.0 ml of the clear supernatant to 50.0 ml with *methanol* and mix. Measure the absorbance of the resulting solution at the maximum at about 322 nm using *methanol* as blank. Calculate the content of $C_{15}H_{13}NO_3,C_4H_{11}NO_3$ from the absorbance obtained from a solution of known concentration of *ketorolac tromethamine IPRS*.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *methanol* and *water*.

NOTE— Protect the solutions from light.

Test solution. Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 20 mg of Ketorolac Tromethamine, add 10 ml of *water* and shake well. Add 40 ml of *methanol* and mix with the aid of ultrasound for about 10 minutes to dissolve the ketorolac tromethamine. Cool, dilute to 100.0 ml with *methanol* and mix. Centrifuge 5.0 ml of the clear supernatant liquid add 5.0 ml of reference solution (b), add sufficient solvent mixture to produce 50.0 ml and mix.

Reference solution (a). A 0.024 per cent w/v solution of *ketorolac tromethamine IPRS* in *methanol*. To 5.0 ml of the solution, add 5.0 ml of reference solution (b) and dilute to 50.0 ml with the solvent mixture.

Reference solution (b). A 0.03 per cent w/v solution of *naproxen IPRS* in *methanol*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),

- mobile phase : a mixture of 55 volumes of *methanol*, 44 volumes of *water* and 1 volume of *glacial acetic acid*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 100 µl.

The relative retention times are about 0.7 for ketorolac and 1.0 for naproxen.

Inject reference solution (a). The resolution between the peaks due to ketorolac and naproxen is not less than 5.4, the column efficiency determined from the ketorolac peak is not less than 2700 theoretical plates, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 1.5 per cent.

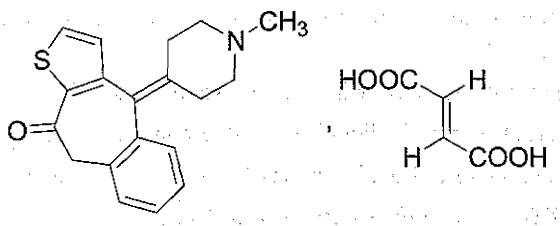
Inject reference solution (a) and the test solution.

Calculate the content of $C_{15}H_{13}NO_3$,$C_4H_{11}NO_3$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Ketotifen Fumarate

Ketotifen Hydrogen Fumarate



$C_{19}H_{19}NOS$,$C_4H_4O_4$ Mol. Wt. 425.5

Ketotifen Fumarate is 4,9-dihydro-4-(1-methylpiperidin-4-ylidene)-10*H*-benzo[4,5]cycloheptа[1,2-*b*]thiophen-10-one hydrogen fumarate.

Ketotifen Fumarate contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{19}H_{19}NOS$,$C_4H_4O_4$, calculated on the dried basis.

Category. Antihistaminic.

Description. A white to brownish-yellow crystalline powder.

Identification

A Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ketotifen hydrogen fumarate IPRS* or with the reference spectrum of ketotifen hydrogen fumarate.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 3 volumes of *water*, 7 volumes of *anhydrous formic acid* and 90 volumes of *di-isopropyl ether*.

Test solution. Dissolve 40 mg of the substance under examination in 10.0 ml of *methanol*.

Reference solution. A 0.11 per cent w/v solution of *fumaric acid IPRS* in *methanol*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 17 cm. Dry the plate in warm air and examine under ultraviolet light at 254 nm. Spray lightly with a 0.5 per cent w/v solution of *potassium permanganate* in 1.4 per cent v/v solution of *sulphuric acid*. In the chromatogram obtained with the test solution, the spot due to fumaric acid corresponds to the principal spot in the chromatogram obtained with the reference solution.

Tests

Appearance of solution. A 2.0 per cent w/v solution in *methanol* is clear (2.4.1) and not more intensely coloured than reference solution YS4, BYS4 or BS4 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

NOTE— Protect the solutions from light.

Solvent mixture. Equal volumes of *methanol* and *water*.

Test solution. Dissolve 30 mg of the substance under examination in 100.0 ml of a mixture of the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution (b). Dissolve 3.0 mg of *4-(1-methylpiperidin-4-ylidene)-4H-benzo[4,5]cyclohepta[1,2-b]thiophen-9,10-dione IPRS* (*ketotifen impurity A IPRS*) in 10 ml of *methanol* and dilute to 20.0 ml with *water*.

Reference solution (c). To 1.5 ml of reference solution (b), add 1.0 ml of the test solution and dilute to 10 ml with the solvent mixture.

Reference solution (d). Dilute 0.5 ml of reference solution (b) to 50.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature: 40°,
- mobile phase: A. a mixture of 175 µl of *triethylamine* and 500 ml of *water*,
  B. a mixture of 175 µl of *triethylamine* and 500 ml of *methanol*,

- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 297 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	40	60
12	40	60
20	10	90
25	10	90
26	40	60
31	40	60

Inject reference solution (a), (c), (d) and the test solution. The relative retention time of ketotifen impurity A with reference to ketotifen is about 0.86. In the chromatogram obtained with reference solution (c), the resolution is not less than 1.5 between the peaks due to ketotifen and to ketotifen impurity A. In the chromatogram obtained with reference solution (d), the signal-to-noise ratio is not less than 70 for the principal peak.

For the calculation of contents, multiply the area of the corresponding peak by the following correction factor: 1.36 for impurity. In the chromatogram obtained with the test solution, the area of the peak due to ketotifen impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of the peak due to any other impurity is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying at 105° for 4 hours.

Assay. Dissolve 0.35 g in a mixture of 30 ml of *anhydrous acetic acid* and 30 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04255 g of $C_{23}H_{23}NO_5S$.

Storage. Store protected from light.

Ketotifen Fumarate Tablets

Ketotifen Fumarate Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ketotifen, $C_{19}H_{19}NOS$.

Usual strength. 1 mg.

Identification

When examined in the range 200 nm to 400 nm (2.4.7). In the Assay, the solution of substance under examination shows absorption maximum at about 297 nm (2.4.7).

Tests

Uniformity of content. Complies with the test stated under Tablets, as described under Assay with the following modifications.

Test solution. Disperse 1 tablet in 50 ml *0.1 M hydrochloric acid* with the aid of ultrasound for 20 minutes and dilute to 100.0 ml with *0.1 M hydrochloric acid*, filter.

Calculate the content of $C_{19}H_{19}NOS$.

Other tests. Comply with the tests stated under Tablets.

Assay. *NOTE — Protect the solution from light.*

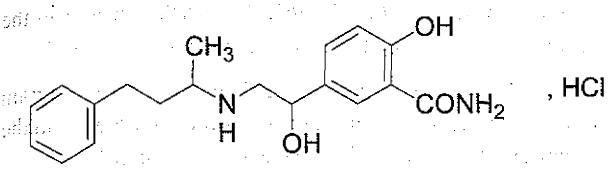
Weigh and powder 20 tablets. Disperse a quantity of powder containing 1 mg of Ketotifen in 70 ml of *0.1 M hydrochloric acid* with the aid of ultrasound for 20 minutes and dilute to 100.0 ml with *0.1 M hydrochloric acid*, filter and measure the absorbance of the resulting solution at the maximum at about 297 nm (2.4.7). Calculate the content of $C_{19}H_{19}NOS$ from the absorbance obtained by repeating the operation using *ketotifen fumarate IPRS* in place of the substance under examination.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of ketotifen.

L

Labetalol Hydrochloride



$C_{19}H_{24}N_2O_3$, HCl Mol. Wt. 364.9

Labetalol Hydrochloride is *all-rac*-2-hydroxy-5-[1-hydroxy-2-(1-methyl-3-phenylpropylamino)ethyl]benzamide hydrochloride.

Labetalol Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{19}H_{24}N_2O_3$, HCl, calculated on the dried basis.

Category. Antihypertensive.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *labetalol hydrochloride IPRS* or with the reference spectrum of labetalol hydrochloride.

B. A 1 per cent w/v solution in *carbon dioxide-free water* (Solution A) gives the reactions of chlorides (2.3.1).

Tests

Appearance of solution. Solution A is clear (2.4.1) and not more intensely coloured than reference solution YS6 (2.4.1).

pH (2.4.24). 4.0 to 5.0, for solution A.

Diasterioisomer ratio. Determine by gas chromatography (2.4.13).

Test solution. Dissolve 5 mg of the substance under examination in 1.0 ml of 1.2 per cent w/v solution of *1-butane boronic acid* in *anhydrous pyridine* and allow to stand for 20 minutes.

Chromatographic system
- a fused silica column 25 m x 0.53 mm, coated with methyl silicone polymer (film thickness 5.0 µm) (Such as DB-17),
- temperature:
  column. 290°,
  inlet port and detector at 350°,
- flame ionization detector,
- flow rate: 20 ml per minute, using nitrogen as the carrier gas.

Inject 2 µl of the test solution. Two peaks due to the two diasterioisomers appear in the chromatogram. The test is not valid unless the resolution between the two labetalol peaks is not less than 1.5 and the relative standard deviation of replicate injections for the ratio of the area of first peak to the secondary peak is not more than 2.0 per cent.

The ratio of the area of secondary peak to the sum of the areas of the two adjacent peaks is not less than 45 per cent and not more than 55 per cent.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in mobile phase A and dilute to 10.0 ml with mobile phase A.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A. Further dilute 1.0 ml of the solution to 10.0 ml with mobile phase A.

Reference solution (b). Dissolve 5 mg of *labetalol impurity A IPRS* in 50 ml of mobile phase B, add 1.0 ml of the test solution and dilute to 100.0 ml with mobile phase A.

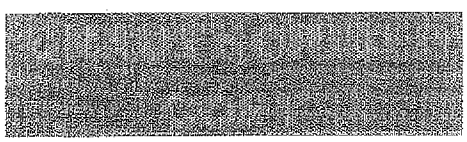
Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with end-capped ethylene-bridged octadecylsilane bonded to porous silica (3.5 µm),
- column temperature: 40°,
- mobile phase: A. 0.1 per cent v/v solution of *ortho-phosphoric acid* in *water*,
  B. a mixture of equal volumes of *acetonitrile* and mobile phase A,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
5	100	0
40	0	100
45	0	100
45.1	100	0
50	100	0

The relative retention time with reference to labetalol (retention time: about 22 minutes) for labetalol impurity A is about 1.1.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to labetalol and labetalol impurity A is not less than 4.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference



solution (a) (0.05 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). Ignore any peak with an area less than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.03 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° at a pressure not exceeding 0.7 kPa.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modifications.

Test solution. Dissolve 50 mg of the substance under examination in mobile phase A and dilute to 100.0 ml with the same solvent. Dilute to 1.0 ml of the solution to 10.0 ml with mobile phase A.

Reference solution. A 0.005 per cent w/v solution of *labetalol hydrochloride IPRS* in mobile phase A.

- mobile phase: a mixture of 45 volumes of mobile phase A and 55 volumes of mobile phase B.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{24}N_2O_3$, HCl.

Storage. Store protected from moisture, at temperature not exceeding 30°.

Labetalol Injection

Labetalol Hydrochloride injection

Labetalol Injection is a sterile solution of Labetalol Hydrochloride in Water for Injections.

Labetalol Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of labetalol hydrochloride, $C_{19}H_{24}N_2O_3$,HCl.

Usual strength. 5 mg per ml.

Description. A colorless or pale yellow solution.

Identification

A. Mix a volume containing 50 mg of Labetalol Hydrochloride with 50 ml of *0.1 M hydrochloric acid* and heat on a water-bath for 30 minutes. Cool, filter, add 10 ml of *ammonia buffer pH 10.0* and extract with three 15-ml quantities of *dichloromethane*. Shake the combined extracts with 5 g of *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *labetalol hydrochloride IPRS*, treated in the same manner or with the reference spectrum of labetalol.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.24). 3.5 to 4.5.

Free carboxylic acid and other related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel F254*.

Mobile phase. A mixture of 5 volumes of *13.5 M ammonia*, 25 volumes of *methanol* and 75 volumes of *dichloromethane*.

Test solution. Dilute a volume of the injection containing 80 mg of Labetalol Hydrochloride to 50.0 ml with *ethanol (95 per cent)*, evaporate to dryness using a rotary evaporator and dissolve the residue in 1 ml of *methanol*.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with *methanol*.

Reference solution (b). A 0.16 per cent w/v solution of *5-[1-hydroxy-2-(1-methyl-3-phenylpropylamino)ethyl] salicylic acid hydrochloride IPRS* in *methanol*.

Apply to the plate 20 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air, heat at 105° for 30 minutes, cool and examine under ultraviolet light at 254 nm. The area of any spot corresponding to 5-[1-hydroxy-2-(1-methyl-3- phenylpropylamino)ethyl]salicylic acid is not more intense that the spot in the chromatogram obtained with reference solution (b) (2.0 per cent), the area of any other secondary peak is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent).

Bacterial endotoxins (2.2.3). Not more than 1.2 Endotoxin Units per mg of labetalol hydrochloride.

Other tests. Comply with the tests stated under Parenteral Preparations.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of the injection containing 50 mg of Labetalol Hydrochloride to 100.0 ml with the mobile phase.

Reference solution (a). A 0.05 per cent w/v solution of *labetalol hydrochloride IPRS* in the mobile phase.

Reference solution (b). A 0.008 per cent w/v solution of *methylparaben IPRS* in reference solution (a).

Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Spherisorb ODS 1),
- column temperature: 60°,
- mobile phase: a mixture of 65 volumes of a buffer solution prepared by dissolving 13.8 g of *monobasic sodium phosphate* in 1000 ml of *water* and 35 volumes of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 5 µl.

The relative retention time with reference to labetalol for methylparaben is about 0.6.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to methylparaben and labetalol is not less than 2.0 in the chromatogram obtained with reference solution (b), the column efficiency in not less than 700 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.5 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_{19}H_{24}N_2O_3$, HCl in the injection.

Storage. Store protected from light, at temperature not exceeding 30°. Do not freeze.

Labetalol Tablets

Labetalol HydrochlorideTablets

Labetalol Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of labetalol hydrochloride, $C_{19}H_{24}N_2O_3$,HCl.

Usual strengths. 50 mg; 100 mg; 200 mg; 400 mg.

Identification

A. To a quantity of the powdered tablets containing 50 mg of Labetalol Hydrochloride add 50 ml of *0.1 M hydrochloricacid* and heat on a water-bath for 30 minutes. Cool, filter, add 10 ml of *ammonia buffer pH 10.0* and extract with three quantities, each of 15 ml, of *dichloromethane*. Shake the combined extracts with 5 g of *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *labetalol hydrochloride IPRS* treated in the same manner or with the reference spectrum of labetalol.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, dilute suitably if necessary with the medium, at the maximum at about 302 nm (2.4.7). Calculate the content of $C_{19}H_{24}N_2O_3$, HCl in the medium from the absorbance obtained from a solution of known concentration of *labetalol hydrochloride IPRS* in dissolution medium.

Q. Not less than 80 per cent of the stated amount of $C_{19}H_{24}N_2O_3$, HCl.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 75 volumes of *dichloromethane*, 25 volumes of *methanol* and 5 volumes of *strong ammonia solution*.

Test solution. Shake a quantity of the powdered tablets containing 0.5 g of Labetalol Hydrochloride with 10 ml of *methanol*, filter and use the filtrate.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol*.

Reference solution (b). Dilute reference solution (a) with an equal volume of *methanol*.

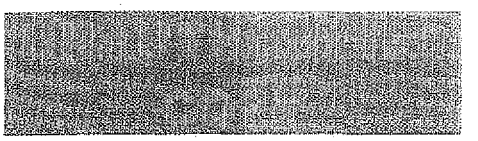
Apply to the plate 20 µl of each solution. After development, dry the plate in a current of warm air, heat at 105° for 30 minutes, cool and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) (1.0 per cent) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.4 g of Labetalol Hydrochloride in 40 ml of *water*, shake by mechanical means for 60 minutes and dilute to 100.0 ml with *water*. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.04 per cent w/v solution of *labetalol hydrochloride IPRS* in the mobile phase.



Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Spherisorb ODS1),
- column temperature: 60°,
- mobile phase: a mixture of 65 volumes of a buffer solution prepared by dissolving 13.8 g of *sodium dihydrogen phosphate* in 1000 ml of *water* and 35 volumes of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 5 µl.

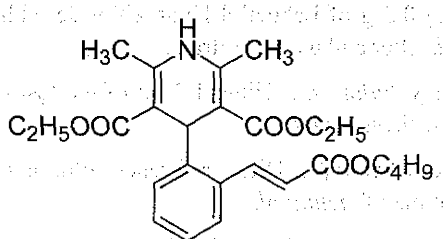
Inject the reference solution. The test is not valid unless the column efficiency is not less than 700 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.5 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{24}N_2O_3$,HCl in the tablets.

Storage. Store protected from moisture, at temperature not exceeding 30°.

Lacidipine



$C_{26}H_{33}NO_6$ Mol. Wt. 455.6

Category. Antihypertensive.

Lacidipine is diethyl (*E*)-4-2-[(*tert*-butoxycarbonyl) vinyl]phenyl-1,4-dihydro-2,6- dimethylpyridine-3,5-dicarboxylate.

Lacidipine contains not less than 97.5 per cent and not more than 102.0 per cent of $C_{26}H_{33}NO_6$, calculated on the anhydrous and propan-2-ol free basis.

Description. A white to pale yellow crystalline powder.

NOTE — Carry out all of the following procedures protected from light and prepare solutions immediately before use.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *lacidipine IPRS* or with the reference spectrum of lacidipine.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Melting point (2.4.21). It melts at about 178°.

Propan-2-ol. Not more than 0.5 per cent w/w.

Determine by gas chromatography (2.4.13).

Solution A. A 0.002 per cent v/v solution of *1,4-dioxan* (internal standard) in *dimethylacetamide*.

Test solution. A 2.0 per cent w/v solution of the substance under examination in solution A.

Reference solution. A 0.002 per cent w/v solution of *propan-2-ol* in solution A.

Chromatographic system
- a capillary column 60 m x 0.32 mm, bonded with a film of *polymethylsiloxane* (5 µm) (Such as CP-Sil 5CB),
- temperature:

column	time (min.)	temperature (°)
	0-1	60
	1-18	60-110
	18-20	110-200
	20-27	200

- inlet port. 170° and detector.250°,
- flow rate: 1.7 ml per minute, using nitrogen as the carrier gas.

Inject 1 µl of the reference solution. The test is not valid unless the chromatogram shows two clearly separated peaks.

The retention time for propan-2-ol is about 6.2 minutes and that for dioxan is about 15 minutes.

Inject 1 µl of the reference solution and the test solution.

Calculate the content of propan-2-ol.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute 1.0 ml of a 0.1 per cent w/v solution of the substance under examination in *ethanol* to 5.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 500.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of 0.1 per cent w/v solution of *lacidipine impurity standard IPRS* in *ethanol* to 5.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with cyanosilane bonded to porous silica (5 µm) (Such as Spherisorb CN),

- mobile phase: a mixture of 3 volumes of *ethanol* and 97 volumes of n-*hexane*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the chromatogram obtained resembles the chromatogram supplied with *lacidipine impurity standard IPRS*.

The retention time of lacidipine peak is about 10 minutes.

Inject reference solution (a) and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak due to lacidipine impurity B ((diethyl (*E*)-4-2-[2-(*tert*-butoxycarbonyl)vinyl]phenyl-2,6-dimethylpyridine-3,5-dicarboxylate) is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent taking into account the correction factor of 0.5), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with a relative retention time of 1.5 with respect to the peak due to lacidipine impurity B.

Water (2.3.43). Not more than 0.2 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute 5 volumes of a 0.1 per cent w/v solution of the substance under examination in *ethanol* to 100 volumes with the mobile phase.

Reference solution. Dilute 5 volumes of a 0.1 per cent w/v solution of *lacidipine IPRS* in *ethanol* to 100 volumes with the mobile phase.

Use chromatographic system as described under Related substances.

Inject the reference solution and the test solution.

Calculate the content of $C_{26}H_{33}NO_6$.

Lacidipine Tablets

Lacidipine Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of lacidipine, $C_{26}H_{33}NO_6$.

Usual strengths. 2 mg; 4 mg

NOTE — Carry out all of the following procedures protected from light and prepare solutions immediately before use.

Identification

A. Disperse a quantity of whole tablets containing 4 mg of Lacidipine with 50 ml of *ethanol* with the aid of ultrasound for 30 minutes. Dilute to 100 ml with *ethanol* and filter through a 0.45-µm membrane filter. When examined in the range 250 nm to 400 nm (2.4.7), exhibits maxima only at 284 nm and 368 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 500 ml of a solution prepared by mixing 100 ml of *water* with 10 ml of *polysorbate 20* and diluting to 1000 ml with *water*,

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter through a 0.45-µm membrane filter, having first activated the filter with 3 ml of *methanol* followed by 5 ml of a 1.0 per cent w/v solution of *polysorbate 20*. Measure the absorbance of the resulting solution at the maximum at about 284 nm (2.4.7). Calculate the content of lacidipine, $C_{26}H_{33}NO_6$ in the medium from the absorbance obtained from a solution containing 0.02 per cent w/v of *lacidipine IPRS* prepared by dissolving in minimum amount of ethanol and diluting with dissolution medium.

Q. Not less than 70 per cent of the stated amount of $C_{26}H_{33}NO_6$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 20 mg of Lacidipine with 50 ml of *ethanol* with the aid of ultrasound for 15 minutes. Cool, dilute to 100 ml with *ethanol*, filter through a 0.45-µm membrane filter. Dilute 5.0 ml of the solution to 20.0 ml with *hexane*.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of 0.1 per cent w/v solution of *lacidipine impurity standard IPRS* in *ethanol* to 5.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with cyanosilane bonded to porous silica (5 µm) (Such as Spherisorb CN),
- mobile phase: a mixture of 3 volumes of *ethanol* and 97 volumes of n-*hexane*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the chromatogram obtained resembles the chromatogram supplied with *lacidipine impurity standard IPRS*.

The retention time of lacidipine peak is about 10 minutes.

Inject reference solution (a) and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak due to lacidipine impurity B ((diethyl (*E*)-4-2-[2-(*tert*-butoxycarbonyl)vinyl]phenyl-2,6-dimethylpyridine-3,5-dicarboxylate) is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent taking into account the correction factor of 0.5), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (2.5 per cent). Ignore any peak with a relative retention time of 1.5 with respect to the peak due to lacidipine impurity B.

Uniformity of content. Complies with the test stated under Tablets.

Disperse 1 tablet in 50 ml of *ethanol* with the aid of ultrasound for 30 minutes. Cool and filter through a 0.45-µm membrane filter and dilute with *ethanol* to produce a solution containing 0.004 per cent w/v of Lacidipine. Measure the absorbance at the maximum at 368 nm (2.4.7).

Calculate the content of $C_{26}H_{33}NO_6$ in the tablet from the absorbance obtained from a 0.004 per cent w/v solution of *lacidipine IPRS* in *ethanol*.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 20 mg of lacidipine in 35 ml *ethanol* with the aid of ultrasound for 30 minutes. Cool and filter through a 0.45 µm membrane filter and dilute to 200.0 ml with mobile phase.

Reference solution (a). Dilute 5.0 ml of a 0.04 per cent w/v solution of *lacidipine IPRS* in *ethanol* to 20.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of 0.1 per cent w/v solution of *lacidipine impurity standard IPRS* in *ethanol* to 5.0 ml with the mobile phase.

Inject reference solution (b). The test is not valid unless the chromatogram obtained resembles the chromatogram supplied with *lacidipine impurity standard IPRS*.

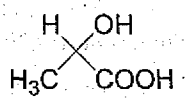
Use chromatographic system as described under Related substances.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{26}H_{33}NO_6$ in the tablets.

Storage. Store protected from light.

Lactic Acid



$C_3H_6O_3$ Mol. Wt. 90.1

Lactic Acid consists of a mixture of 2-hydroxypropionic acid, its condensation products, such as lactoyl-lactic acid and other polylactic acids and water. The equilibrium between lactic acid and polylactic acids depends on concentration and temperature.

It is usually in the form of the racemate [(*RS*)-lactic acid], but in some cases the (*S*)-isomer may predominate.

Lactic Acid contains the equivalent of not less than 88.0 per cent and not more than 92.0 per cent w/w of $C_3H_6O_3$.

Category. Pharmaceutical aid.

Description. A colourless or slightly yellow, viscous liquid; hygroscopic.

Identification

A. Warm 1 g with 0.1 g of *potassium permanganate*; acetaldehyde is evolved.

B. It gives reaction (A) of lactates (2.3.1).

C. A 10 per cent w/v solution is strongly acidic (2.4.46).

Tests

Appearance of solution. The substance under examination is not more intensely coloured than reference solution YS6 (2.4.1).

Arsenic (2.3.10). Mix 10.0 g with 50 ml of *water* and 10 ml of *stannated hydrochloric acid*. The resulting solution complies with the limit test for arsenic (1 ppm).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Citric, oxalic and phosphoric acids. To 5 ml of the solution prepared in the test for Heavy metals add *6 M ammonia* until slightly alkaline. Add 1 ml of *calcium chloride solution* and heat on a water-bath for 5 minutes. Both before and after heating, any opalescence in the solution is not more intense than that in a mixture of 5 ml of the test solution and 1 ml of *water*.

Ether-insoluble substances. Dissolve 1.0 g in 25 ml of *ether*; the solution is not more opalescent than the solvent used for the test.

Volatile fatty acids. Cautiously heat 5 g in a glass-stoppered flask at 50° for 10 minutes; no unpleasant odour resembling that of the lower fatty acids is recognisable immediately after opening the flask.

Methanol and methyl esters. Place 2.0 g in a ground-glass-stoppered round-bottom flask and add 10 ml of *water*. Cool in ice, cautiously add 30 ml of a 30 per cent w/v solution of *potassium hydroxide* and cool in ice for a further 10 to 15 minutes. Steam distil the mixture into a 10-ml graduated cylinder containing 1 ml of *ethanol*, collecting a volume of at least 9.5 ml and dilute to 10.0 ml with *water*. To 1.0 ml of the distillate add 5 ml of *potassium permanganate and phosphoric acid solution* and mix. After 15 minutes add 2 ml of *oxalic acid and sulphuric acid solution*, stir with a glass rod until the solution is colourless and then add 5 ml of *decolorised magenta solution*. After 2 hours any colour in the solution is not more intense than that of 1 ml of a reference solution containing 100 µg of *methanol* and 0.1 ml of *ethanol* treated in the same manner beginning at the words "add 5 ml of *potassium permanganate* and *phosphoric acid solution*..".

Reducing sugars. Dilute 1 g with 10 ml of *water*, neutralise with *sodium hydroxide solution*, add 5 ml of *potassium cupri-tartrate solution* and boil; no red or greenish precipitate is produced.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

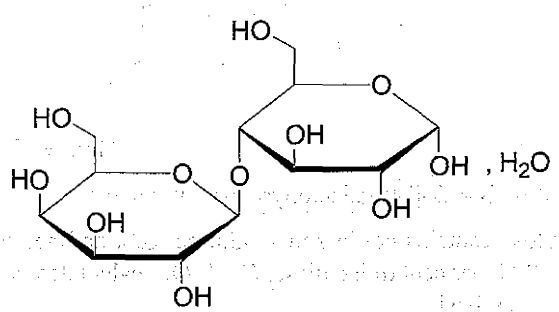
Assay. Weigh 1.0 g in a ground-glass-stoppered flask and add 10 ml of *water*. Add 20.0 ml of *1 M sodium hydroxide*, stopper the flask and allow to stand for 30 minutes. Titrate the excess of alkali with *1 M hydro-chloric acid*, using *dilute phenolphthalein solution* as indicator until the pink colour is discharged.

1 ml of *1 M sodium hydroxide* is equivalent to 0.09008 g of $C_3H_6O_3$.

Storage. Store protected from light.

Lactose

Lactose Monohydrate; Milk Sugar



$C_{12}H_{22}O_{11},H_2O$ Mol. Wt. 360.3

Lactose is *O*-β-D-galactopyranosyl-(1 → 4)-α-D-glucopyranose monohydrate.

Category. Pharmaceutical aid (excipient).

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *lactose IPRS* or with the reference spectrum of lactose.

B. To 5 ml of a saturated solution add 5 ml of *1 M sodium hydroxide* and gently warm the mixture; the liquid becomes yellow and then brownish-red. Cool to room temperature and add 0.2 ml of *potassium cupri-tartrate solution*; a red precipitate is formed.

C. Heat 5 ml of a 5 per cent w/v solution with 5 ml of *10 M ammonia* in a water-bath at 80° for 10 minutes; a red colour develops.

Tests

Appearance of solution. Dissolve 1.0 g in *water* by heating to 50°, dilute to 10 ml with *water* and allow to cool. The solution is clear (2.4.1) and not more intensely coloured than reference solution BYS7 (2.4.1).

Acidity or alkalinity. Dissolve 6 g in 25 ml of *carbon dioxide-free water* by boiling, cool and add 0.3 ml of *phenolphthalein solution*. The solution is colourless and not more than 0.4 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution to pink.

Specific optical rotation (2.4.22). + 54.4° to + 55.9°, determined in a solution obtained by dissolving 10.0 g in 80 ml of *water* by heating to 50°, allowing to cool, adding 0.2 ml of *6 M ammonia*, allowing to stand for 30 minutes and diluting to 100.0 ml with *water*.

Light absorption (2.4.7). Dissolve 1.0 g in boiling *water* and dilute to 10 ml with the same solvent (solution A). Absorbance of solution A measured at the maximum at about 400 nm, not more than 0.04.

Dilute 1 ml of solution A to 10 ml with *water*.

When examined in the range 210 nm to 300 nm, absorbance is not more than 0.25 in the range 210 nm to 220 nm and not more than 0.07 in the range 270 nm to 300 nm.

Arsenic (2.3.10). Dissolve 10.0 g in 50 ml of *water* and add 10 ml of *stannated hydrochloric acid AsT*; the resulting solution complies with the limit test for arsenic (1 ppm).

Heavy metals (2.3.13). Dissolve 4.0 g in 20 ml of warm *water*, 1.0 ml of *0.1 M hydrochloric acid* and sufficient *water* to

produce 25 ml. The solution complies with the limit test for heavy metals, Method A (5 ppm).

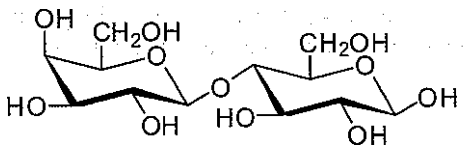
Microbial contamination (2.2.9). Total microbial count is not more than 10^2 CFU per g. 1 g is free from *Escherichia coli* and 10 g is free from *Salmonella* and *Shigella*.

Sulphated ash. Not more than 0.1 per cent, determined in the following manner. To 1.0 g add 1 ml of *sulphuric acid*, evaporate to dryness on a water-bath and ignite to constant weight.

Water (2.3.43). 4.5 to 5.5 per cent, determined on 0.5 g in a mixture of 1 volume of *formamide* and 2 volumes of *methanol*.

Storage. Store protected from moisture.

Anhydrous Lactose



$C_{12}H_{22}O_{11}$ Mol. Wt. 342.3

Anhydrous Lactose is 4-*O*-β-D-galactopyranosyl-D-glucose.

Category. Pharmaceutical aid (excipient).

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *anhydrous lactose IPRS* or with the reference spectrum of anhydrous lactose.

B. To 5 ml of a saturated solution add 5 ml of *1 M sodium hydroxide* and gently warm the mixture; the liquid becomes yellow and then brownish-red. Cool to room temperature and add 0.2 ml of *potassium cupri-tartrate solution*; a red precipitate is formed.

C. Heat 5 ml of a 5.0 per cent w/v solution with 5 ml of *10 M ammonia* in a water-bath at 80° for 10 minutes; a red colour develops.

Tests

Appearance of solution. Dissolve 1.0 g in *water* by heating to 50°, dilute to 10 ml with *water* and allow to cool. The solution is clear (2.4.1) and not more intensely coloured than reference solution BYS7 (2.4.1).

Acidity or alkalinity. Dissolve 6 g of the substance under examination in 25 ml of *carbon dioxide-free water* by boiling, cool and add 0.3 ml of *phenolphthalein solution*. The solution is colourless and not more than 0.4 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution to pink.

Specific optical rotation (2.4.22). +54.4° to +55.9°, determined in a solution prepared by dissolving 10 g in 80 ml of *water* by heating to 50°, allow to cool and add 0.2 ml of *6 M ammonia*. Allow to stand for 30 minutes and dilute to 100.0 ml with *water*.

Light absorption (2.4.7). A 10.0 per cent w/v solution in *water*, shows an absorption maxima at about 400 nm is not more than 0.04. Dilute 1.0 ml of the solution to 10.0 ml with *water*. When examined in the range 210 nm to 220 nm; absorbance is not more than 0.25 and in the range 270 nm to 300 nm, absorbance is not more than 0.07.

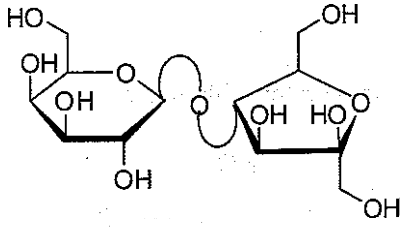
Heavy metals (2.3.13). Dissolve 4 g in 20.0 ml of *water*. 12 ml of the solution complies with the limit test for heavy metals, Method D (5 ppm) using 10 ml of *lead standard solution (1 ppm, Pb)*.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 0.5 g in a mixture of 1 volume of *formamide* and 2 volumes of *methanol*.

Microbial contamination (2.2.9). Total microbial count not more than 100 CFU per g, 1 g is free from *Escherichia coli*.

Lactulose



$C_{12}H_{22}O_{11}$ Mol. Wt. 342.3

Lactulose is 4-*O*-β-D-galactopyranosyl-D-fructose.

Lactulose contains not less than 95.0 per cent and not more than 102.0 per cent of lactulose, $C_{12}H_{22}O_{11}$, calculated on the anhydrous basis.

Category. Pharmaceutical aid.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out and test B may be omitted if tests A, C and D are carried out.

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 10 volumes of *glacial acetic acid*, 15 volumes of 5 per cent w/v solution of *boric acid*, 20 volumes of *methanol* and 55 volumes of *ethyl acetate*.

Test solution. Dissolve 50 mg of the substance under examination in 10.0 ml of *water*.

Reference solution. A 0.5 per cent w/v solution of *lactulose IPRS* in *water*.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate at 105° for 5 minutes and allow to cool. Spray with a 0.1 per cent w/v solution of *1,3-dihydroxynaphthalene* in a mixture of 10 volumes of *sulphuric acid* and 90 volumes of *methanol*. Heat at 110° for 5 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

C. Dissolve 50 mg in 10 ml of *water*. Add 3 ml of *cupri-tartaric solution* and heat. A red precipitate is formed.

D. Dissolve 0.125 g in 5 ml of *water* and add 5 ml of *ammonia*. Heat on a water-bath at 80° for 10 minutes. A red colour develops.

Tests

Solution A. Dissolve 3.0 g in 50.0 ml of *carbon dioxide-free water*.

Appearance of solution. Solution A is clear (2.4.1) and not more intensely coloured than reference solution BYS5 (2.4.1).

pH (2.4.24). 3.0 to 7.0, determined in solution A.

Specific optical rotation (2.4.22). −50.0° to −46.0°, determined in a 5 per cent w/v solution in *water*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 1 g of the substance under examination in 10 ml of *water*. Add 12.5 ml of *acetonitrile* with gentle heating and dilute to 25.0 ml with *water*.

Reference solution (a). To 3 ml of the test solution, add 47.5 ml of *acetonitrile* with gentle heating and dilute to 100.0 ml with *water*.

Reference solution (b). Dissolve 1.0 g of *lactulose IPRS* in 10 ml of *water*, add 12.5 ml of *acetonitrile* with gentle heating and dilute to 25.0 ml with *water*.

Reference solution (c). Dissolve the contents of a vial of *lactulose for system suitability IPRS* in 1 ml of a mixture of equal volumes of *acetonitrile* and *water*.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with aminopropylsilane bonded to porous silica (3 µm),
- column temperature: 38°,
- mobile phase: a mixture of 220 volumes of a solution prepared by dissolving 1.15 g of *sodium dihydrogen orthophosphate* in 1000 ml of *water* and 780 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- refractive index detector,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to lactulose and lactulose impurity A is not less than 1.3. The relative retention time with reference to lactulose for tagatose (lactulose impurity E) is about 0.38, for fructose (lactulose impurity D) is about 0.42, for galactose (lactulose impurity B) is about 0.57, for epilactose (lactulose impurity A) is about 0.9 and for lactose (lactulose impurity C) is about 1.17.

Inject reference solution (a) and the test solution. Run the chromatogram 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (3.0 per cent).

Methanol. Not more than 50 ppm.

Determine by gas chromatography (2.4.13).

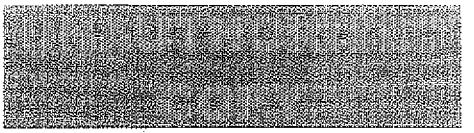
Internal standard solution. Mix 0.5 ml of *propanol* with 100.0 ml of *water*. Dilute 1.0 ml of the solution to 100.0 ml with *water*. Dilute 5.0 ml of the solution to 50.0 ml with *water*.

Test solution. To 79 mg of the substance under examination in a 20 ml vial, add 1.0 ml of the internal standard solution and 5 µl of a 0.1 per cent v/v solution of *methanol*.

Reference solution. To 1.0 ml of the internal standard solution in a 20 ml vial, add 5 µl of a 0.1 per cent v/v solution of *methanol*.

Chromatographic system
- a stainless steel column 2 m x 2 mm, packed with ethylvinylbenzene-divinylbenzene copolymer (180 µm),
- column temperature: 140°,
- inlet port at 200° and detector at 220°,
- flame ionization detector,
- flow rate: 30 ml per minute, helium as the carrier gas.

Head space conditions
- equilibration temperature: 60°,



– equilibration time 1 hour,
– pressurisation time: 1 minute.

Inject 1ml of the reference solution and the test solution.

Calculate the content of methanol, taking its density at 20° to be 0.79 g per ml.

The ratio (*R*) of the area of the peak due to methanol to the area of the peak due to the internal standard in the chromatogram obtained with the reference solution and the ratio of the area of the peak due to methanol to the area of the peak due to the internal standard in the chromatogram obtained with the test solution is not more than 2*R* (50 ppm).

Boron. Not more than 9 ppm.

NOTE—Avoid where possible the use of glassware.

Reference solution. Dissolve 50 mg of *boric acid* in 100.0 ml of *water*. Dilute 5.0 ml of the solution to 100.0 ml with *water*. *Keep in a well-closed polyethylene container.*

In first polyethylene 25-ml flask, dissolve 0.5 g of the substance under examination in 2.0 ml of *water* (solution A), in second polyethylene 25-ml flask, dissolve 0.5 g of the substance under examination dissolved in 1.0 ml of the reference solution and 1.0 ml of *water* (solution B), in third polyethylene 25 ml flask, dilute 1.0 ml of the reference solution with 1.0 ml of *water* (solution C) and in fourth polyethylene 25 ml flask, take 2.0 ml of *water* (solution D).

To each flask, add 4.0 ml of *acetate-edetate buffer solution pH 5.5*. Mix and add 4.0 ml of freshly prepared *azomethine H solution*. Mix and allow to stand for 1 hour. Measure the absorbance of solutions A, B and C at 420 nm (2.4.7), using solution D as the compensation liquid. The test is not valid unless the absorbance of solution C is not less than 0.25. The absorbance of solution B is not less than twice that of solution A.

Lead. Not more than 0.5 ppm.

Determine by atomic absorption spectrometry (2.4.2).

Solvent mixture. Equal volumes of *dilute acetic acid* and *water*.

Test solution. Dissolve 20.0 g of the substance under examination in 100 ml of the solvent mixture. Add 2.0 ml of 1 per cent w/v solution of *ammonium pyrrolidinedithiocarbamate* and 10.0 ml of *methyl isobutyl ketone*, shake for few seconds protected from bright light. Allow the layers to separate and use the methyl isobutyl ketone layer.

Reference solution (a). Dilute 0.5 ml of *lead standard solution (10 ppm Pb)* to 100 ml with the solvent mixture. Add 2.0 ml of a clear 1 per cent w/v solution of *ammonium pyrrolidinedithiocarbamate* and 10.0 ml of *methyl isobutyl ketone*, shake for few seconds and protected from bright light. Allow the layers to separate and use the methyl isobutyl ketone layer.

Reference solution (b). Dilute 1.0 ml of *lead standard solution (10 ppm Pb)* to 100 ml with the solvent mixture. Add 2.0 ml of a clear 1 per cent w/v solution of *ammonium pyrrolidinedithiocarbamate* and 10.0 ml of *methyl isobutyl ketone*, shake for few seconds and protected from bright light. Allow the layers to separate and use the methyl isobutyl ketone layer.

Reference solution (c). Dilute 1.5 ml of *lead standard solution (10 ppm Pb)* to 100 ml with the solvent mixture. Add 2.0 ml of a clear 1 per cent w/v solution of *ammonium pyrrolidinedithiocarbamate* and 10.0 ml of *methyl isobutyl ketone*, shake for few seconds and protected from bright light. Allow the layers to separate and use the methyl isobutyl ketone layer.

Set the zero of the instrument using *methyl isobutyl ketone* treated as described for the test solution without the substance under examination. Measure the absorbance at 283.3 nm using a lead hollow-cathode lamp as source of radiation and an air-acetylene flame.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 2.5 per cent, determined on 0.5 g.

Microbial contamination (2.2.9). Total aerobic viable count is not more than 10^2 CFU per g determined by plate count. 1 g is free from *Escherichia coli*.

Assay. Determine by liquid chromatography (2.4.14), as described under test for Related substances with the following modification.

Inject reference solution (b) and the test solution.

Calculate the content of $C_{12}H_{22}O_{11}$.

Lactulose Oral Powder

Lactulose Oral Powder consists of lactulose with or without lesser amounts of other sugars including lactose and galactose.

Lactulose Oral Powder contains not less than 95.0 per cent and not more than 102.0 per cent of the stated amount of lactulose, $C_{12}H_{22}O_{11}$.

Identification

A. Determine by thin-layer chromatography, (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 10 volumes of *glacial acetic acid*, 15 volumes of a 5 per cent w/v solution of *boric acid*, 20 volumes of *methanol* and 55 volumes of *ethyl acetate*.

Test solution. Dissolve 50 mg of the oral powder in *water* and dilute to 10.0 ml with *water*.

Reference solution. A 0.5 per cent w/v solution of *lactulose IPRS* in *water*.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate at 100° to 105° for 5 minutes. Spray the plate with a 0.1 per cent w/v solution of *1,3-dihydroxynaphthalene* in a mixture of 10 volumes of *sulphuric acid* and 90 volumes of *methanol*. Heat the plate at 110° for 5 minutes. The principal spot in the chromatogram obtained with test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

C. Dissolve 0.05 g in 10 ml of *water*, add 3 ml of *cupri-tartaric solution* and heat; a red precipitate is formed.

D. Dissolve 0.125 g in 5 ml of *water*, add 5 ml of *ammonia*. Heat on a water-bath at 80° for 10 minutes; a red colour develops.

E. Specific optical rotation. (See tests).

Tests

Solution A. A 6.0 per cent w/v solution of the substance under examination in *carbon dioxide-free water*.

Appearance of solution. Solution A is clear (2.4.1) and not more intensely coloured than reference solution BYS5 (2.4.1).

pH (2.4.24). 3.0 to 7.0, determined on a solution prepared by adding 0.1 ml of a saturated solution of *potassium chloride* to 10 ml of solution A.

Specific optical rotation (2.4.22). –50.0° to –46.0°, determined in a solution prepared by dissolving 1.25 g in *water*, adding 0.2 ml of *13.5 M ammonia* and diluting to 25.0 ml with *water*.

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the sum of the areas of peaks corresponding to galactose, lactose, epilactose, tagatose and fructose is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent).

Methanol. Not more than 50 ppm.

Determine by Head-space gas chromatography (2.4.13).

NOTE — Maintain each solution at 60° for 1 hour, pressurize for 1 minute and transfer on the column 1 ml of the gaseous phase.

Internal standard solution. Dilute 0.5 ml of *propan-1-ol* to 100.0 ml with *water*. Dilute 1.0 ml of the solution to 100.0 ml with *water*. Further dilute 5.0 ml of the solution to 50.0 ml with *water*.

Test solution. To 79 mg of the oral powder, add 1 ml of the internal standard solution and 5 µl of a 0.1 per cent v/v solution of *methanol*.

Reference solution. Add 5 µl of a 0.1 per cent v/v solution of *methanol* to 1 ml of the internal standard solution.

Chromatographic system

- a column 2 m x 2 mm packed with ethylvinylbenzene–divinylbenzene co-polymer (film thickness 180 µm),
- temperature:
  column: 140°,
  inlet port at 200° and detector at 220°,
- a flame ionisation detector,
- flow rate: 30 ml per minute, using nitrogen as carrier gas.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the ratio of the area of the methanol peak to that of the internal standard peak is not more than twice the corresponding ratio for the chromatogram obtained with the reference solution.

Calculate the content of methanol assuming the density of methanol to be 0.79 g per ml at 20°.

Boron. *NOTE — Avoid where possible the use of glassware.*

Dissolve 50 mg of *boric acid* in *water* and dilute to 100.0 ml with *water*. Dilute 5.0 ml of the solution to 100.0 ml with *water*. Keep in a well-closed polyethylene container. In four polyethylene 25-ml flasks, place 0.5 g of the oral powder dissolved in 2 ml of *water* (solution A), 0.5 g of the oral powder dissolved in 1 ml of the reference solution and 1 ml of *water* (solution B), 1 ml of the reference solution and 1 ml of *water* (solution C) and 2 ml of *water* (solution D). To each flask, add 4 ml of *acetate-edetate buffer solution pH 5.5*. Mix and add 4 ml of freshly prepared *azomethine solution*. Mix and allow to stand for 1 hour. Measure the absorbance (2.4.7), of solutions A, B and C at 420 nm, using solution D as the compensation liquid. The test is not valid unless the absorbance of solution C is not less than 0.25. The absorbance of solution B is not less than twice that of solution A (9 ppm).

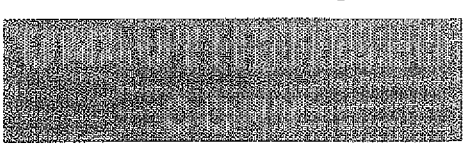
Lead. Not more than 0.5 ppm.

Determine by atomic absorption spectrometry (2.4.2).

Solvent mixture. Equal volumes of *dilute acetic acid* and *water*.

Test solution. Dissolve 20.0 g of the substance under examination in 100 ml of the solvent mixture. Add 2.0 ml of 1 per cent w/v solution of *ammonium pyrrolidinedithiocarbamate* and 10.0 ml of *methyl isobutyl ketone*, shake for few seconds protected from bright light. Allow the layers to separate and use the methyl isobutyl ketone layer.

Reference solution (a). Dilute 0.5 ml of *lead standard solution (10 ppm Pb)* to 100 ml with the solvent mixture. Add 2.0 ml of a clear 1 per cent w/v solution of *ammonium pyrrolidinedithio-*



carbamate and 10.0 ml of *methyl isobutyl ketone*, shake for few seconds and protected from bright light. Allow the layers to separate and use the methyl isobutyl ketone layer.

Reference solution (b). Dilute 1.0 ml of *lead standard solution (10 ppm Pb)* to 100 ml with the solvent mixture. Add 2.0 ml of a clear 1 per cent w/v solution of *ammonium pyrrolidinedithiocarbamate* and 10.0 ml of *methyl isobutyl ketone*, shake for few seconds and protected from bright light. Allow the layers to separate and use the methyl isobutyl ketone layer.

Reference solution (c). Dilute 1.5 ml of *lead standard solution (10 ppm Pb)* to 100 ml with the solvent mixture. Add 2.0 ml of a clear 1 per cent w/v solution of *ammonium pyrrolidinedithiocarbamate* and 10.0 ml of *methyl isobutyl ketone*, shake for few seconds and protected from bright light. Allow the layers to separate and use the methyl isobutyl ketone layer.

Set the zero of the instrument using *methyl isobutyl ketone* treated as described for the test solution without the substance under examination. Measure the absorbance at 283.3 nm using a lead hollow-cathode lamp as source of radiation and an air-acetylene flame.

Water (2.3.43). Not more than 2.5 per cent, determined on 0.5 g.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Other tests. Comply with the tests stated under Oral Powders.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 1 g of the oral powder in 10 ml of *water*, add 12.5 ml of *acetonitrile* with gentle heating and dilute to 25.0 ml with *water*.

Reference solution (a). Dissolve 1 g of *lactulose IPRS* in 10 ml of *water*, add 12.5 ml of *acetonitrile* with gentle heating and dilute to 25.0 ml with *water*.

Reference solution (b). Add 47.5 ml of *acetonitrile* to 3 ml of reference solution (a) with gentle heating and dilute to 100.0 ml with *water*.

Reference solution (c). Dissolve 20 mg of *lactulose IPRS* and 20 mg of *epilactose IPRS* in 2 ml of *water*, add 2.5 ml of *acetonitrile* with gentle heating and dilute to 5.0 ml with *water*.

Chromatographic system

- a stainless steel column 5 cm x 4.6 mm followed by a stainless steel column 15 cm x 4.6 mm, both packed with aminopropylsilane bonded to porous silica (3 µm),
- column temperature: 38°,
- mobile phase: a mixture of 0.253 g of *sodium dihydrogen orthophosphate* in 220 ml of *water* and 780 ml of *acetonitrile*,
- flow rate: 1 ml per minute,
- differencial refractometer detector maintained at a constant temperature,
- injection volume: 20 µl.

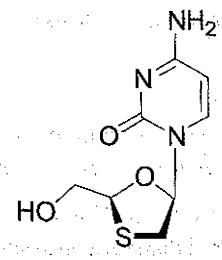
The relative retention time with reference to lactulose (retention time: about 18.3 minutes) for tagatose is about 0.38, for fructose is about 0.42, for galactose is about 0.57, for epilactose is about 0.90 and for lactose is about 1.17.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to lactulose and epilactose is not less than 1.3.

Inject reference solution (a) and the test solution. Run the chromatogram 2.5 times the retention time of the principal peak.

Calculate the content of $C_{12}H_{22}O_{11}$.

Lamivudine



$C_8H_{11}N_3O_3S$ Mol. Wt. 229.3

Lamivudine is (2*R*,5*S*)-4-amino-1-[2-(hydroxymethyl)-1,3-oxathiolan-5yl]-2(1*H*)-pyrimidinone.

Lamivudine contains not less than 98.0 per cent and not more than 102.0 per cent of $C_8H_{11}N_3O_3S$, calculated on the anhydrous basis.

Category. Antiretroviral.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *lamivudine IPRS* or with the reference spectrum of lamivudine.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to lamivudine in the chromatogram obtained with the reference solution.

C. Melting range (2.4.21). 172° to 178°.

Tests

Specific optical rotation (2.4.22). –144° to –136°, determined in a 1.0 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of substance under examination in 70 ml of the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *salicylic acid (lamivudine impurity C)* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (c). A solution containing 0.001 per cent w/v each of *lamivudine IPRS* and *salicylic acid* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: a mixture of 5 volumes of *methanol* and 95 volumes 0.19 per cent w/v of *ammonium acetate,* adjusted to pH 3.8 with *glacial acetic acid,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 277nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Lamivudine impurity E[1]	0.28	0.6
Lamivudine impurity F[2]	0.32	2.2
Lamivudine impurity A[3]	0.36	—
Lamivudine impurity B[4]	0.91	—
Lamivudine (Retention time: about 9 minutes)	—	—
Lamivudine impurity J[5]	1.45	2.2
Lamivudine impurity C[6]	2.32	—

[1]4-aminopyrimidin-2(1*H*)-one (cytosine),

[2]pyrimidine-2,4(1*H*,3*H*)-dione (uracil),

[3](2*RS*,5*SR*)-5-(4-amino-2-oxopyrimidin-1(2*H*)-yl)-1,3-oxathiolane-2-carboxylic acid,

[4]4-amino-1-[(2*RS*,5*RS*)-2-(hydroxymethyl)-1,3-oxathiolan-5-yl]pyrimidin-2(1*H*)- one ((±)-*trans*-lamivudine),

[5]1-[(2*R*,5*S*)-2-(hydroxymethyl)-1,3-oxathiolan-5-yl]pyrimidine-2,4(1*H*,3*H*)-dione,

[6]2-hydroxybenzenecarboxylic acid (salicylic acid).

Inject reference solution (c). Run the chromatogram twice the retention time of lamivudine. The order of elution is lamivudine and then, salicylic acid. The test is not valid unless the resolution between the peaks due to lamivudine and salicylic acid is not less than 10, the column efficiency is not less than 5000 theoretical plates and the tailing factor is not more than 1.5 for lamivudine peak.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any secondary peak due to lamivudine impurity A, is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent), the area of any secondary peak due to lamivudine impurity B is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the area of any secondary peak due to lamivudine impurity C is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 6 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.6 per cent). Ignore any peak with an area less than 0.5 times the peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 0.5 per cent determined on 2.0 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution. A 0.025 per cent w/v solution of *lamivudine IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the column efficiency determined from the lamivudine peak is not less than 5000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{11}N_3O_3S$.

Storage. Store protected from light and moisture.

Lamivudine Oral Solution

Lamivudine Oral Solution is a solution of Lamivudine in a suitable flavoured vehicle.

Lamivudine Oral Solution contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of lamivudine, $C_8H_{11}N_3O_3S$.

Usual strengths. 25 mg in 5 ml; 50 mg in 5 ml.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 40 volumes of *1-butanol*, 30 volumes of *heptane*, 30 volumes of *acetone* and 10 volumes of *strong ammonia solution*.

Test solution. Dilute the preparation under examination with *methanol* to obtain a solution containing 2 mg of lamivudine per ml.

Reference solution. A 0.2 per cent w/v solution of *lamivudine IPRS* in a mixture of 75 volumes *methanol* and 25 volumes of *water*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to lamivudine in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 5.0 to 7.0.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Transfer an accurately measured volume of the preparation under examination containing 50 mg of lamivudine to a 50-ml volumetric flask, add about 30 ml of a solution prepared by mixing 10 volumes of *acetonitrile* and 90 volumes of *0.1 M potassium dihydrogen phosphate*, the pH of which is adjusted to 3.0 with *dilute phosphoric acid* (solution A), mix with the aid of ultrasound for 5 minutes, dilute to volume with solution A and filter. Dilute 5 ml of the filtrate to 50 ml with solution A.

Reference solution. Weigh 25 mg of *lamivudine IPRS* and transfer to a 50-ml volumetric flask, dissolve and dilute to volume with solution A. Further dilute 5 ml of the solution to 250 ml with solution A.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane chemically bonded to porous silica (5 µm),
- mobile phase: A. *0.05 M potassium dihydrogen phosphate*, adjusted to pH 3.0 with *orthophosphoric acid*,

B. *acetonitrile*,

- a gradient programme using the conditions given below,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	98	02
10	85	15
25	30	70
35	30	70
40	98	02
50	98	02

Inject the reference solution. The test is not valid unless the column efficiency determined from the lamivudine peak is not less than 15,000 theoretical plates and the tailing factor is not more than 1.5.

Inject solution A and the test solution. Examine the chromatogram obtained with solution A for any extraneous peaks and ignore the corresponding peaks observed in the chromatogram obtained with the test solution. Ignore any peaks due to preservatives also.

Any secondary peak observed in the chromatogram obtained with the test solution should not be more than 1.0 per cent and the sum of the areas of all the secondary peaks should not be more than 2.0 per cent when calculated by percentage area normalisation.

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the preparation under examination containing about 100 mg of lamivudine in a 100-ml volumetric flask, add about 50 ml of *water*, mix with the aid of ultrasound for 10 minutes, dilute to volume with *water*, mix and filter. Dilute 5.0 ml of the filtrate to 50.0 ml with *water*.

Reference solution. Weigh 100 mg of *lamivudine IPRS* in a 100-ml volumetric flask, dissolve and dilute to volume with *water*. Dilute 5.0 ml of the solution to 50.0 ml with *water*.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane chemically bonded to porous silica (5 µm),
- mobile phase: 80 volumes of *water* and 20 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency determined from the lamivudine peak is not less than 3000 theoretical plates, the tailing factor is not more

than 2.0 and the relative standard deviation for the replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Determine the weight per ml (2.4.29) of the oral solution and calculate the content of $C_8H_{11}N_3O_3S$ weight in volume.

Lamivudine Tablets

Lamivudine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of lamivudine, $C_8H_{11}N_3O_3S$.

Usual strengths. 100 mg; 150 mg; 300 mg.

Identification

A. When examined in the range 200 nm to 400 nm (2.4.7), a 0.001 per cent w/v solution in a mixture of 50 volumes of *water* and 50 volumes of *acetonitrile,* shows an absorption maximum at about 270 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to lamivudine in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.01 M hydrochloric acid,*

Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter disc having an average pore diameter not greater than 1.0 µm, rejecting the first 1 ml of the filtrate. Measure the absorbance of the filtrate, suitably diluted if necessary, at the maximum at about 270 nm (2.4.7). Calculate the content of $C_8H_{11}N_3O_3S$, in the medium from the absorbance obtained from a solution of known concentration of *lamivudine IPRS* in *0.01 M hydrochloric acid.*

Q. Not less than 70 per cent of the stated amount of $C_8H_{11}N_3O_3S$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 600 mg of lamivudine in 20 ml of *water*, with the aid of ultrasound. Add 20 ml of *acetonitrile,* mix with the aid of ultrasound for 10 minutes and dilute to 100.0 ml with *water* and filter.

Reference solution. A 0.024 per cent w/v solution of *lamivudine IPRS* in a mixture of 80 volumes of *water* and 20 volumes of *acetonitrile.*

Chromatographic system as described under Assay.

Inject the reference solution. The test is not valid unless the column efficiency determined from the lamivudine peak is not less than 3000 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution. The area of any secondary peak is not more than 1.0 per cent and the sum of the areas of all the secondary peaks is not more than 2.0 per cent calculated by area normalisation.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of *water* and 20 volumes of *acetonitrile*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 300 mg of Lamivudine with the solvent mixture to have a final concentration of 0.024 per cent of Lamivudine. Disperse with the aid of ultrasound and filter through a membrane filter disc with an average pore diameter not greater than 1.0 µm, rejecting the first few ml of the filtrate.

Reference solution. A 0.024 per cent w/v solution of *lamivudine IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane chemically bonded to porous silica (5 µm),
- mobile phase: a degassed mixture of 5 volumes of *methanol* and 95 volumes of a buffer prepared by dissolving 1.0 g of *ammonium acetate* and 1.0 ml of *glacial acetic acid* in sufficient *water* to make 1000 ml and adjusted to pH 3.8 with *glacial acetic acid,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency determined from the lamivudine peak is not less than 3000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{11}N_3O_3S$ in the tablets.

Storage. Store protected from moisture.

Lamivudine and Tenofovir Tablets

Lamivudine and Tenofovir Disoproxil Fumarate Tablets

Lamivudine and Tenofovir Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of lamivudine, $C_8H_{11}N_3O_3S$ and tenofovir disoproxil fumarate, $C_{19}H_{30}N_5O_{10}P,C_4H_4O_4$.

Usual strengths. Lamivudine 300 mg and Tenofovir disoproxil fumarate 300 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14)

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. 5.0 ml, each of, a 0.16 per cent w/v solution of *lamivudine IPRS* and *tenofovir disoproxil fumarate IPRS* in *methanol*, diluted to 25.0 ml with the dissolution medium.

Use the chromatographic system given in the Assay.

Inject the reference solution. The resolution between the peaks due to lamivudine and tenofovir disoproxil is not less than 2.0.

Inject the reference solution and the test solution.

Calculate the contents of $C_8H_{11}N_3O_3S$ and $C_{19}H_{30}N_5O_{10}P,C_4H_4O_4$ in the medium.

Q. Not less than 75 per cent of the stated amounts of $C_8H_{11}N_3O_3S$ and $C_{19}H_{30}N_5O_{10}P,C_4H_4O_4$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Buffer solution. Dissolve 1.9 g of *ammonium acetate* in 950 ml of *water*, adjusted to pH 3.8 with *glacial acetic acid* and dilute to 1000 ml of *water*.

Solvent mixture. 80 volumes of *water* and 20 volumes of *methanol*.

Test solution. Disperse a quantity of the powdered tablets containing 100 mg of Lamivudine in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution. A solution containing 0.00025 per cent w/v each of *lamivudine IPRS* and *tenofovir disoproxil fumarate IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as YMC-pack ODS-AQ),
- column temperature: 40°,
- mobile phase: A. a mixture of 95 volumes of buffer solution and 5 volumes of *methanol*,
  B. a mixture of 30 volumes of the buffer solution, 68 volumes of *methanol* and 2 volumes of *tertiary butanol*,
- a gradient programme using the conditions given below,
- flow rate: 1ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
10	100	0
30	10	90
42	10	90
47	0	100
52	0	100
57	100	0
65	100	0

Name	Relative retention time	Correction factor
Mono ester impurity[1*]	0.75	0.81
Mono POC dimer impurity[2*]	0.9	0.76
Tenofovir disoproxil (Retention time: about 32 minutes)	1.0	—
Mix dimer impurity[3*]	1.1	0.71

Lamivudine (Retention time is about 12 minutes)	1.0	—
Carboxylic acid impurity[6#]	0.38	0.93
Lamivudine diastereomer impurity[7#]	0.94	1.19

*Relative retention time with reference to tenofovir disoproxil peak.

#Relative retention time with reference to lamivudine peak.

[1]Carbonic acid [[[[(1R)-2-(6-Amino-9*H*-purin-9-yl)-1-methylethoxy] methyl]hydroxyphosphenyl]oxy]methyl-1-methylethylester,

[2]{[(propan-2-yloxy)carbonyl]oxy}methylhydrogen(*S*)-({[(2S)-1-(6[({[9-(5-hydroxy-2,11-dimethyl-5-oxido-9-oxo-3,6,8,10-tetraoxa-5λ5-phosphadodec-1-yl]-9*H*-purin-6-yl}amino}methyl}amino]-9*H*-purin-9-yl}propan-2-yl] methyl) phosphonate,

[3]{[(propan-2-yloxy)carbonyl]oxy}methylhydrogen(R)-({[(2S)-1-(6{[({9-[2,11-dimethyl-5-oxido-9-oxo-5-({[(propan-2-yloxy) carbonyl]oxy}methoxy-3,6,8,10-tetraoxa-5λ5-phosphadodec-1-yl]-9*H*-purin-6-yl}amino}methyl}amino]-9*H*-purin-9-yl}propan-2-yl] methyl) phosphonate,

[4]Bis{[isopropoxycarbonyl)oxy]methyl}[((1R)-2-{6-isopropoxy carbonyl)amino]-9*H*-purin-9-yl}-1-methyl ethoxymethyl] phosphonate,

[5]Tetrakis{[(isopropoxycarbonyl)oxy]methyl}[methylenebis(imino-9*H*-purine-6,9-diylpropane-1,2-diylpropane-1,2-diyloxymethylene)] bis (phosphonate),

[6]4-amino-2-oxo-pyrimidinyl-1,3-oxatiolane-2-carboxylic acid

[7](2*S-cis*)-(-)-1[(2*R*,5*R*)-2-(Hydroxymethyl)-1,3-oxathiolan-5-yl] cytosisine.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 and 10000 theoretical plates for lamivudine and tenofovir disoproxil peak, respectively, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 10.0 per cent for both the peaks.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to mono ester impurity is not more than 6 times the area of the peak due to tenofovir disoproxil in the chromatogram obtained with the reference solution (1.5 per cent), the area of any peak corresponding to tenofovir disoproxil dimer impurity is not more than 0.8 times the area of the peak due to tenofovir disoproxil in the chromatogram obtained with the reference solution (0.2 per cent), the area of any peak corresponding to mono POC dimer impurity is not more than twice the area of the peak due to tenofovir disoproxil in the chromatogram obtained with the reference solution (0.5 per cent), the area of any peak corresponding to mix dimer impurity is not more than 3 times the area of the peak due to tenofovir disoproxil in the chromatogram obtained with the reference solution (0.75 per cent), the area of any peak corresponding to carboxylic acid impurity is not more than 1.2 times the area of the peak due to lamivudine in the chromatogram obtained with the reference solution (0.3 per cent), the area of any peak corresponding to lamivudine diastereomer impurity is not more than 0.8 times the area of the peak due to lamivudinein the chromatogram obtained with the reference solution (0.2 per cent), the area of any other secondary peak is not more than 0.8 times the area of the peak due to tenofovir disoproxil in the chromatogram obtained with the reference solution (0.2 per cent) and the sum of all the secondary peaks is not more than 4.0 per cent. Ignore the peak due to fumaric acid with a retention time at about 3.5 minutes and any peak with an area less than 0.2 times the area of the tenofovir disoproxil peak in the chromatogram obtained with the reference solution (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 20 mg of Lamivudine, dissolve in 100.0 ml of the mobile phase and filter.

Reference solution. A 0.1 per cent w/v solution each of *lamivudine IPRS* and *tenofovir disoproxil fumarate IPRS* in the mobile phase. Dilute 20.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: a mixture of 50 volumes of a buffer solution prepared by dissolving 7.8 g of *sodium dihydrogen orthophosphate dihydrate* in 1000 ml of *distilled water*, adding 1 ml of *triethylamine* and adjusted to pH 2.3 with *orthophosphoric acid* and 50 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency determined from the peaks due to lamivudine and tenofovir disoproxil is not less than 750 and 1500 theoretical plates respectively, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent for each component.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{11}N_3O_3S$ and $C_{19}H_{30}N_5O_{10}P,C_4H_4O_4$ in the tablets.

Storage. Store protected from moisture, at temperature not exceeding 30°.

Lamivudine and Zidovudine Tablets

Lamivudine and Zidovudine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of lamivudine, $C_8H_{11}N_3O_3S$ and zidovudine, $C_{10}H_{13}N_5O_4$.

Usual strength. Lamivudine, 150 mg and zidovudine, 300 mg.

Identification

In the Assay, the two principal peaks in the chromatogram obtained with the test solution correspond to the peaks due to lamivudine and zidovudine in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter disc having an average pore diameter not greater than 1.0 µm, rejecting the first 1 ml of the filtrate.

Determine by liquid chromatography (2.4.14).

Test solution. Dilute 5.0 ml of the filtrate to 50.0 ml with the mobile phase.

Reference solution. Dissolve an accurately weighed quantity of *lamivudine IPRS* and *zidovudine IPRS* in the mobile phase and dilute with the mobile phase to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane chemically bonded to porous silica (5 µm),
- mobile phase: a degassed mixture of 60 volumes of a buffer solution containing *0.1 M ammonium acetate* in 0.1 per cent *acetic acid* and 40 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections for each of the peaks corresponding to lamivudine and zidovudine is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the contents of $C_8H_{11}N_3O_3S$ and $C_{10}H_{13}N_5O_4$.

Q. Not less than 75 per cent of the stated amounts of $C_8H_{11}N_3O_3S$ and $C_{10}H_{13}N_5O_4$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 95 volumes of mobile phase A and 5 volumes of mobile phase B.

Test solution. Disperse a quantity of the powdered tablets containing 150 mg of Lamivudine in *water* with the aid of ultrasound for 15 minutes and dilute to 100.0 ml with *water*; filter. Dilute 1.0 ml of the filtrate to 10.0 ml with the solvent mixture.

Reference solution (a). A solution containing 0.015 per cent w/v of *lamivudine IPRS* and 0.03 per cent w/v of *zidovudine IPRS* in the solvent mixture.

Reference solution (b). A 0.017 per cent w/v solution of *lamivudine resolution mixture B IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a buffer solution prepared by dissolving 1.95 g of *ammonium acetate* in 900 ml of *water*, adjusted to pH 4.0 with *glacial acetic acid* and dilute to 1000.0 ml with *water*,

  B. *methanol*,

  C. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)	Mobile phase C (per cent v/v)

[*]These are the process related impurities, monitored in the drug substance,

[1]4-Aminopyrimidin-2(1*H*)-one,

[2]Pyrimidine-2,4(1*H*,3*H*)-dione,

[3]1-[(2*R*,3*S*,5*S*)-2-(Hydroxymethyl)-1,3-oxathiolan-5-yl]cytosine S-oxide,

[4]1-[(2*R*,3*S*,5*SS*)-2-(Hydroxymethyl)-1,3-oxathiolan-5-yl]cytosine S-oxide,

[5]5-Methylpyrimidine-2,4(1*H*,3*H*)-dione,

[6]1-[(2*S*,5*S*)-2-(Hydroxymethyl)-1,3-oxathiolan-5-yl]cytosine,

[7][1-(2-Deoxy-α-d-ribofuranosyl)]thymine,

[8](2*R*,5*S*)1-[(2*R*,5*S*)-2-(Hydroxymethyl)-1,3-oxathiolan-5-yl]uracil,

[9]2-Hydroxybenzoic acid,

[10]3'-Chloro-3'-deoxythymidine.

Inject reference solution (a) and (b). The test is not valid unless the resolution between lamivudine diastereomer and lamivudine peaks is not less than 1.5 in the chromatogram obtained with reference solution (b) and the relative standard deviation of replicate injections is not more than 2.0 per cent for each component in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the percentage of each lamivudine related impurity in the portion of tablets taken:

$$\text{Result} = \frac{r_U}{r_T} \times 100$$

where, r_U = peak response of each lamivudine related impurity from the test solution,

r_T = sum of the peak responses of lamivudine and all lamivudine related impurities from the test solution.

Calculate the percentage of each zidovudine related impurity and other impurity in the portion of tablets taken:

$$\text{Result} = \frac{r_U}{r_T} \times c \times 100$$

where, r_U = peak response of each zidovudine related impurity and other secondary impurity from the test solution,

r_T = sum of the peak responses of zidovudine, all zidovudine related impurities and other impurities from the test solution,

c = correction factor.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder equivalent to the average weight of one tablet into a 200-ml volumetric flask. Add 100 ml of the mobile phase and disperse with the aid of ultrasound for about 15 minutes with occasional shaking to obtain a uniform dispersion. Cool to room temperature and dilute to volume with the mobile phase. Filter the solution through a membrane filter disc with an average pore diameter not greater than 1.0 µm, rejecting the first few ml of the filtrate. Dilute 5.0 ml of the filtrate to 25.0 ml with the mobile phase. Further dilute 5.0 ml to 50.0 ml with the mobile phase and mix.

Reference solution. Weigh 30 mg of *lamivudine IPRS* and 60 mg of *zidovudine IPRS*, transfer to a 100 ml volumetric flask, dissolve in the mobile phase and dilute to volume with the mobile phase. Further dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane chemically bonded to porous silica (5 µm),
- mobile phase: a degassed mixture of 60 volumes of a buffer solution containing *0.1 M ammonium acetate* in 0.1 per cent *acetic acid* and 40 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections for each of the peaks corresponding to lamivudine and zidovudine is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the contents of $C_8H_{11}N_3O_3S$ and $C_{10}H_{13}N_5O_4$ in the tablets.

Storage. Store protected from moisture.

Lamivudine, Nevirapine and Stavudine Dispersible Tablets

Lamivudine, Nevirapine and Stavudine Dispersible Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of lamivudine, $C_8H_{11}N_3O_3S$, nevirapine, $C_{15}H_{14}N_4O$ and stavudine, $C_{10}H_{12}N_2O_4$.

Usual strengths. Lamivudine 30 mg, Nevirapine 50 mg and Stavudine 6 mg; Lamivudine 60 mg, Nevirapine 100 mg and Stavudine 12 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of *water* and 50 volumes of *methanol*.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A solution containing 0.02 per cent w/v of *stavudine IPRS*, 0.09 per cent w/v *lamivudine IPRS* and 0.15 per cent w/v of *nevirapine IPRS* dissolved in minimum quantity of *methanol* and makeup with solvent mixture. Dilute 5 ml of the solution to 100 ml with the dissolution medium.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of a buffer solution prepared by dissolving 1 g of *octane sulphonic acid sodium salt* and 0.68 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, adding 1 ml of *triethylamine* and adjusted to pH 2.5 with *orthophosphoric acid* and 35 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 266 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency in not less than 2000 theoretical plates for lamivudine, the tailing factor is not more than 1.5 for each component and the relative standard deviation for replicate injections is not more than 2.0 per cent for each component.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{11}N_3O_3S$, $C_{15}H_{14}N_4O$ and $C_{10}H_{12}N_2O_4$.

Q. Not less than 80 per cent of the stated amounts of $C_8H_{11}N_3O_3S$, $C_{15}H_{14}N_4O$ and $C_{10}H_{12}N_2O_4$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. 70 volumes of a solution containing 0.2 per cent v/v of *orthophosphoric acid* and 30 volumes of *methanol*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 75 mg of Lamivudine, dissolve in the solvent mixture and dilute to 100.0 ml with the solvent mixture, filter.

Reference solution. Weigh 75 mg of *lamivudine IPRS*, 130 mg of *nevirapine IPRS* and 20 mg of *stavudine IPRS*, dissolve in 20 ml of *methanol* and dilute to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. *methanol*,
  B. a buffer solution prepared by dissolving 1.925 g of *ammonium acetate* in 1000 ml of *water* and adjusted to pH 3.0 with *trifluoroacetic acid*,
- a gradient programme using the conditions given below,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 266 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	5	95
15	15	85
30	45	55
40	60	40
48	60	40
51	5	95
60	5	95

Name	Relative retention time
Carboxylic acid	0.36
Thymine	0.42
Lamivudine	0.74
Stavudine	1.0
Nevirapine	2.19

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and tailing factor is not more than 1.5 for each component.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 3 times the area of principal peak due to lamivudine in the chromatogram obtained with the reference solution (3.0 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of principal peak due to lamivudine in the chromatogram obtained with the reference solution (5.0 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14) as described under Assay using the following solution as the test solution.

Test solution. Disperse one tablet in 20 ml of *water*, add 80 ml of the solvent mixture and mix with the aid of ultrasound and dilute to 250.0 ml with the solvent mixture, filter.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *water* and *methanol*.

Test solution. Weigh accurately a quantity of the powdered tablets containing 50 mg of Lamivudine, dissolve in 100.0 ml of solvent mixture. Dilute 10.0 ml of the solution to 50.0 ml with the solvent mixture and filter.

Reference solution. A solution containing 0.10 per cent w/v of *lamivudine IPRS*, 0.175 per cent w/v *nevirapine IPRS* and 0.025 per cent w/v of *stavudine IPRS* dissolved in minimum quantity of *methanol* and makeup with solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of a buffer solution prepared by dissolving 1 g of *octane sulphonic acid* and 0.68 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, adding 1 ml of *triethylamine* and adjusted to pH 2.5 with *orthophosphoric acid* and 35 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 266 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency in not less than 2000 theoretical plates for lamivudine, the tailing factor is not more than 1.5 for each component and the relative standard deviation for replicate injections is not more than 2.0 per cent for each component.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{11}N_3O_3S$, $C_{15}H_{14}N_4O$ and $C_{10}H_{12}N_2O_4$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 25°.

Lamivudine, Nevirapine and Stavudine Tablets

Lamivudine, Nevirapine and Stavudine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of lamivudine, $C_8H_{11}N_3O_3S$, nevirapine, $C_{15}H_{14}N_4O$ and stavudine, $C_{10}H_{12}N_2O_4$.

Usual strengths. Stavudine, 30 mg, Lamivudine, 150 mg and Nevirapine, 200 mg; Stavudine, 40 mg, Lamivudine, 150 mg and Nevirapine, 200 mg.

Identification

In the Assay, the three principal peaks in the chromatogram obtained with the test solution have retention times similar to those of the peaks due to lamivudine, nevirapine and stavudine in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter disc having an average pore diameter not greater than 1.0 µm, rejecting the first few ml of the filtrate.

Determine by liquid chromatography (2.4.14).

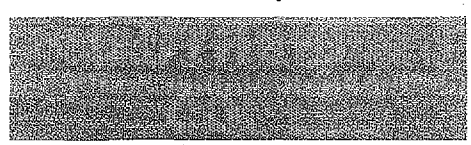
Test solution. Use the filtrate, dilute if necessary.

Reference solution. Weigh 150 mg of *lamivudine IPRS*, 200 mg of *nevirapine IPRS* and 30 mg of *stavudine IPRS* (if claim of stavudine per tablet is 30 mg) or 40 mg of *stavudine IPRS* (if claim of stavudine per tablet is 40 mg) and transfer to a 100-ml volumetric flask. Add about 20 ml of *methanol*, disperse with the aid of ultrasound to dissolve and dilute to volume with a solvent mixture of equal volumes of *methanol* and *water*. Dilute 5.0 ml of the solution to 50.0 ml with *0.01 M hydrochloric acid*.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane chemically bonded to porous silica (5 µm),
- mobile phase: a degassed mixture of 35 volumes of *methanol* and 65 volumes of a buffer solution prepared by dissolving 0.68 g of *potassium dihydrogen phosphate* and 1.0 g of *sodium octanesulphonate* in 1000.0 ml of *water* to which 1 ml of *triethylamine* is added and adjusted to pH 2.5 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 266 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency determined from the lamivudine peak is not less than 2000 theoretical plates, the tailing factor for the individual lamivudine, nevirapine and stavudine peaks is not more than 1.5 and the relative standard deviation for replicate injections of all the analyte peaks is not more than 1.0 per cent.

Inject the reference solution and the test solution.



Calculate the contents of $C_8H_{11}N_3O_3S$, $C_{15}H_{14}N_4O$ and $C_{10}H_{12}N_2O_4$ in the medium.

Q. Not less than 70 per cent of the stated amounts of $C_8H_{11}N_3O_3S$, $C_{15}H_{14}N_4O$ and $C_{10}H_{12}N_2O_4$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh accurately a quantity of the powdered tablets (a minimum of 2 tablets should be powdered) containing 100 mg of nevirapine, transfer to a 200-ml volumetric flask and add about 150 ml of *water*. Disperse with the aid of ultrasound for 10 minutes with occasional shaking to obtain a uniform dispersion, cool to room temperature, dilute to volume with *water* and mix. Filter through a membrane filter disc with an average pore diameter not greater than 1.0 µm, rejecting the first few ml of the filtrate.

Reference solution (a). A solution containing 0.15 per cent w/v of *stavudine IPRS* and 0.015 per cent w/v of *thymine IPRS* in *water*.

Reference solution (b). Weigh 75 mg of *lamivudine IPRS* and about 100 mg of *nevirapine IPRS*, transfer to a 200-ml volumetric flask, add 20 ml of *methanol* and mix with the aid of ultrasound to dissolve. Add 10 ml of the test solution to this solution and make up to volume with *water* and filter.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: A. *0.1 M ammonium acetate*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	95	05
05	95	05
25	20	80
30	20	80
31	95	05
35	95	05

Inject reference solution (a) and (b). The test is not valid unless the column efficiency for thymine, stavudine, lamivudine and nevirapine peaks is not less than 3000 theoretical plates and the tailing factor for the same peaks is not more than 2.0.

Inject the test solution and measure the peak responses of the major peaks due to lamivudine, nevirapine and stavudine. Calculate the amounts of related substances by the area normalisation method. The content of thymine is not greater than 3.0 per cent and that of any other impurity is not greater than 1.0 per cent. The sum of all the impurities is not greater than 3.5 per cent.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 150 mg of lamivudine to a 100-ml volumetric flask, add 20 ml of *methanol* and about 50 ml of a mixture of equal volumes of *water* and *methanol* and disperse with the aid of ultrasound for 5 minutes. Dilute suitably with the same solvent mixture to obtain a solution containing 0.15 mg of lamivudine per ml. Filter this solution through a membrane filter disc with an average pore diameter not greater than 1.0 µm, rejecting the first few ml of the filtrate.

Reference solution. A solution containing 0.015 per cent w/v of *lamivudine IPRS* and 0.02 per cent w/v of *nevirapine IPRS* and a concentration of *stavudine IPRS* similar to that of the concentration of stavudine in the test solution.

The chromatographic procedure may be carried out using the conditions described under Dissolution.

Inject the reference solution. The test is not valid unless the column efficiency determined from the lamivudine peak is not less than 2000 theoretical plates, the tailing factor for the individual peaks due to lamivudine, nevirapine and stavudine is not more than 1.5 and the relative standard deviation for replicate injections of all the analyte peaks is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the contents of $C_8H_{11}N_3O_3S$, $C_{15}H_{14}N_4O$ and $C_{10}H_{12}N_2O_4$ in the tablets.

Storage. Store protected from moisture.

Lamivudine, Nevirapine and Zidovudine Paediatric Dispersible Tablets

Lamivudine, Nevirapine and Zidovudine Paediatric Dispersible Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amounts of lamivudine, $C_8H_{11}N_3O_3S$, nevirapine, $C_{15}H_{14}N_4O$ and zidovudine, $C_{10}H_{13}N_5O_4$.

Usual strength. Lamivudine 30 mg, Nevirapine 50 mg, Zidovudine 60 mg.

Identification

A. In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with the reference solution.

B. Determine by thin layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 2 volumes of *triethylamine*, 20 volumes of *isopropyl alcohol* and 80 volumes of *dichloromethane*.

Test solution. Weigh a quantity of the powdered tablet containing 15 mg of lamivudine, disperse in 10.0 ml of the *methanol* and filter.

Reference solution (a). A 0.15 per cent w/v solution of *lamivudine IPRS* in *methanol*.

Reference solution (b). A 0.2 per cent w/v solution of *nevirapine IPRS* in *methanol*.

Reference solution (c). A 0.3 per cent w/v solution of *zidovudine IPRS* in *methanol*.

Reference solution (d). A mixture of 1.0 ml each of reference solution (a), (b) and (c) diluted to 10.0 ml with *methanol*.

Apply to the plate 5 µl of the test solution and reference solution (d). Allow the mobile phase to raise 12 cm. Dry the plate in air and examine under the ultraviolet light at 254 nm. The principal spots in the chromatogram obtained with the test solution correspond to that in the chromatogram obtained with reference solution (d).

Tests

Disintigration (2.5.1). Not more than 3 minutes.

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *water* and *methanol*.

Test solution. Use the filtrate, dilute if necessary.

Reference solution. Dissolve 34 mg of *lamivudine IPRS*, 55 mg of *nevirapine IPRS* and 67 mg of *zidovudine IPRS* in the solvent mixture and dilute to 50.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 100.0 ml with dissolution medium.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- sample temperature: 5°,
- mobile phase: a mixture of 35 volumes of *methanol* and 65 volumes of a buffer solution prepared by dissolving 0.68 g of *potassium dihydrogen phosphate* and 1 g of *sodium octanesulphonate* in 1000.0 ml of *water* to which 1.0 ml of *triethylamine* is added and adjusted to pH 2.5 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 266 nm,
- injection volume: 10 µl.

Inject the reference solution and the test solution.

Calculate the contents of $C_8H_{11}N_3O_3S$, $C_{15}H_{14}N_4O$ and $C_{10}H_{13}N_5O_4$ in the medium.

Q. Not less than 75 per cent of the stated amounts of $C_8H_{11}N_3O_3S$, $C_{15}H_{14}N_4O$ and $C_{10}H_{13}N_5O_4$.

Related substances. Determine by liquid chromatography (2.4.14)

Solvent mixture. 60 volumes of *water* and 40 volumes of *methanol*.

Test solution. Disperse a quantity of the powdered tablets containing 50 mg of Lamivudine, in the solvent mixture and dilute to 100.0 ml with the solvent mixture, filter.

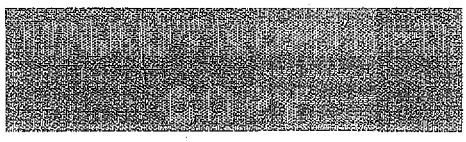
Reference solution (a). A solution containing 0.0001 per cent w/v of *lamivudine diastereomer IPRS* , 0.001 per cent w/v of *zidovudine impurity B IPRS*, 0.05 per cent w/v of *lamivudine IPRS* and 0.1 per cent w/v of *zidovudine IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.03 per cent w/v of *lamivudine IPRS*, 0.04 per cent w/v *of nevirapine IPRS* and 0.04 per cent w/v of *zidovudine IPRS* in the solvent mixture.

Reference solution (c). Dissolve 4 mg of *nevirapine impurity A IPRS* in 40 ml of *methanol* with the aid of ultrasound and dilute to 100.0 ml with *water*.

Reference solution (d). Dilute 5.0 ml of reference solution (b) and 5.0 ml of reference solution (c) to 100.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Prontosil C18H),
- sample temperature: 5°,
- mobile phase: A. a mixture of 100 volumes of 0.23 per cent w/v solution of *ammonium dihydrogen phosphate*, adjusted to pH 3.5 with *orthophosphoric acid* and 0.2 volume of *methanol*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 266 nm,
- injection volume: 20 µl.



Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)

[7]3'-chloro-3'deoxythymidine,

[8]2,4-dihydroxy-5-methy pyrimidine; thymine,

[9]1-(2-deoxy-f"-D-ribifuranosyl)-5-methyl uracil,

[10]1'-(3-azido-2,3-dideoxy-f"-D-threo-pentafuranosyl)-thymidine,

[11]1-(3-(3-(3-azido-2,3-dideoxy-pentofuranosyl))-5-methyl-2,6-dioxo-3,6-dihydropyrimidin-1-yl)-2,3-dideoxypentofuranosyl)-5methylpyrimidine-2,4-dione.

The retention time of lamivudine, zidovudine, nevirapine and nevirapine impurity A peaks are about 18.5 minutes, 31 minutes, 40.6 minutes and 45 minutes respectively.

Inject reference solution (a) and (d). The test is not valid unless the resolution between the peaks due to lamivudine diastereomer and lamivudine is not less than 1.5 and between zidovudine and zidovudine impurity B is not less than 1.5 in the chromatogram obtained with reference solution (a), the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent, for the peaks due to lamivudine, nevirapine related compound A and zidovudine in the chromatogram obtained with reference solution (d).

Inject reference solution (d) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to carboxylic acid impurity, lamivudine distereomer, each of, is not more than 1.66 times the area of the peak due to lamivudine in the chromatogram obtained with reference solution (d) (0.5 per cent), the area of any peak corresponding to nevirapine impurity A, nevirapine impurity B and nevirapine impurity C, each of, is not more than 1.25 times the area of peak due to nevirapine impurity A in the chromatogram obtained with reference solution (d) (0.5 per cent), the area of any peak corresponding to zidovudine impurity A (stavudine), zidovudine impurity B, thymidine, zidovudine threo isomers and zidovudine thymidine adduct, each of, is not more than 1.25 times the area of the peak due to zidovudine in the chromatogram obtained with reference solution (d) (0.5 per cent), the area of any peak corresponding to zidovudine impurity C (thymine) is not more than 2.5 times the area of the peak due to zidovudine in the chromatogram obtained with reference solution (d) (1.0 per cent), the area of any other secondary peak is not more than 1.66 times the area of the peak due to lamivudine in the chromatogram obtained with reference solution (d) (0.5 per cent). The sum of all the impurities is not more than 2.5 per cent.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of *0.01 M hydrochloric acid* and 50 volumes of *methanol*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 300 mg of lamivudine, disperse in the solvent mixture and dilute to 500.0 ml with the solvent mixture, filter. Dilute 5.0 ml of the solution to 20.0 ml with the solvent mixture.

Reference solution. Dissolve 75 mg of *lamivudine IPRS*, 125 mg of *nevirapine IPRS* and 150 mg of *zidovudine IPRS* in the solvent mixture and dilute to 100.0 ml with the solvent mixture. Dilute 10.0 ml of the solution to 50.0 ml with the solvent mixture.

Use chromatographic system as described under Dissolution.

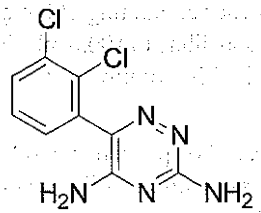
Inject the reference solution. The test is not valid unless the column efficiency is not less than 2500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent for each component.

Inject the reference solution and the test solution.

Calculate the contents of $C_8H_{11}N_3O_3S$, $C_{15}H_{14}N_4O$ and $C_{10}H_{13}N_5O_4$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Lamotrigine



$C_9H_7Cl_2N_5$ Mol. Wt. 256.1

Lamotrigine is 6-(2,3-dichlorophenyl)-1,2,4-triazine-3,5-diamine.

Lamotrigine contains not less than 98.5 per cent and not more than 101.5 per cent of $C_9H_7Cl_2N_5$, calculated on the dried basis.

Category. Anticonvulsant.

Description. A white to off - white powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *lamotrigine IPRS* or with the reference spectrum of lamotrigine.

B. When examined in the range 210 to 360 nm (2.4.7), a 0.0025 per cent w/v solution in *methanol* exhibits a maximum at about 309 nm.

C. In the Assay, the principal peak in the chromatogram obtained with test solution corresponds to the peak in the chromatogram obtained with reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of mobile phase A and 20 volumes of mobile phase B.

Test solution. Dissolve 100 mg of the substance under examination in 100 ml of solvent mixture.

Reference solution (a). A 0.05 per cent w/v solution of *lamotrigine IPRS* in solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (*5* µm),
- mobile phase: A. 0.174 per cent w/v solution of *dipotassium hydrogen phosphate*, adjusted to pH 7.5 with *orthophosphoric acid* and filter,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
5	80	20
15	25	75
30	25	75
35	80	20

Inject reference solution (b). The test is not valid unless the column efficiency is not less than 5000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than 2 times the area of the peak in the chromatogram obtained with the reference solution (b) (1.0 per cent).

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°, under vacuum, for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 100 mg of the substance under examination in 100 ml of mobile phase. Dilute 10.0 ml of the solution to 50.0 ml with mobile phase.

Reference solution. A 0.02 per cent w/v solution of *lamotrigine IPRS* in mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),

- mobile phase: a mixture of 30 volumes of *acetonitrile* and 70 volumes of 0.408 per cent w/v solution of *potassium dihydrogen orthophosphate* adjusted to pH 7.0 with *dilute potassium hydroxide solution*.
- flow rate:1.2 ml per minute,
- spectrophotometer set at 308 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_9H_7Cl_2N_5$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Lamotrigine Dispersible Tablets

Lamotrigine Dispersible Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of lamotrigine, $C_9H_7Cl_2N_5$.

Usual strengths. 25 mg; 50 mg; 100 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.1 M hydrochloric acid*,

Speed and time. 50 rpm for 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. The filtrate obtained as given above.

Reference solution. Dissolve an accurately weighed quantity of *lamotrigine IPRS* in the dissolution medium and dilute with the dissolution medium to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of a 0.408 per cent w/v solution of *potassium dihydrogen phosphate* previously adjusted to pH 7.0 with *potassium hydroxide*, 30 volumes of *acetonitrile*
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 308 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_9H_7Cl_2N_5$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_9H_7Cl_2N_5$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 200 mg of Lamotrigine in 10 ml of *methanol* and dilute to 100.0 ml with the mobile phase, filter. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution. A 0.02 per cent w/v solution of *lamotrigine IPRS*, dissolved in *methanol* and diluted with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of a 0.408 per cent w/v solution of *potassium dihydrogen phosphate* previously adjusted to pH 7.0 with *potassium hydroxide*, 30 volumes of *acetonitrile*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 308 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_9H_7Cl_2N_5$.

Storage. Store protected from light and moisture.

Labelling. The label states that the tablets should be dispersed in water immediately before use.

Lamotrigine Prolonged-release Tablets

Lamotrigine Sustained-release Tablets; Lamotrigine Extended-release Tablets

Lamotrigine Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as

the dissolution profile of the products of different manufacturers may not be the same.

Lamotrigine Prolonged-release Tablets contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of lamotrigine, $C_9H_7Cl_2N_5$.

Usual strengths. 50 mg; 100 mg; 200 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2). Complies with the test stated under tablets.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 60 volumes of *methanol* and 40 volumes of *water*.

Test solution. Weigh and transfer 5 tablets in to suitable volumetric flask, add *methanol* to 10 per cent of the volume of the flask and sonicate to disperse. Further add solvent mixture to 75 per cent of the volume of the flask and sonicate for 60 minutes in cool *water* with occasional shaking. Make up the volume with the solvent mixture. Centrifuge and dilute the supernatant liquid with the solvent mixture to prepare a 0.01per cent w/v solution.

Reference solution. A 0.0001 per cent w/v solution of *lamotrigine IPRS*, dissolved in minimum quantity of *methanol* and diluted with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane chemically bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of *water*, 40 volumes of *methanol* and 0.01 volume of *triethylamine*, adjusted to pH 7.0 with *10 per cent v/v* solution of *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 309 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the peak in the chromatogram obtained with the reference solution (0.5 per cent) and sum of the areas of all the secondary peaks is not more than 1.5 times the area of the peak in the chromatogram obtained with the reference solution (1.5 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 60 volumes of *methanol* and 40 volumes of *water*.

Test solution. Weigh and transfer 5 tablets in to suitable volumetric flask, add *methanol* to 10 per cent of the volume of the flask and sonicate to disperse. Further add solvent mixture to 75 per cent of the volume of the flask and sonicate for 60 minutes in cool *water* with ocassional shaking. Make up the volume with the solvent mixture. Centrifuge at 3500 rpm for 15 minutes. Dilute to obtain a solution of 0.01 per cent with the solvent mixture.

Reference solution. Dissolve 50 mg of *lamotrigine IPRS* in 10.0 ml of *methanol,* sonicate to dissolve and dilute to 100.0 ml with the solvent mixture. Further dilute the solution with the solvent mixture to obtain a solution of 0.01 per cent.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of *water*, 40 volumes of *methanol* and 0.01 volumes of *triethylamine*, adjusted to pH 7.0 with 10 per cent v/v solution of *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 309 nm,
- injection volume: 20 µl.

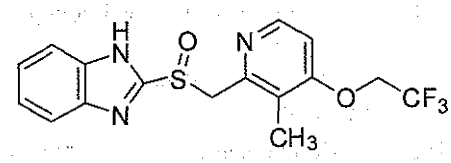
Inject the reference solution. The test is not valid unless the theoretical plates is not less than 3000 and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{38}H_{72}N_2O_{12}$ in the tablets.

Storage. Store protected from light.

Lansoprazole



$C_{16}H_{14}F_3N_3O_2S$ Mol. Wt. 369.4

Lansoprazole is (*RS*)-2-[[[3-methyl-4-(2,2,2-trifluoroethoxy)-2-pyridinyl]methyl]sulphinyl]-1*H*-benzimidazole.

Lansoprazole contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{16}H_{14}F_3N_3O_2S$, calculated on the anhydrous basis.

Category. Antiulcer.

Description. A white to brownish-white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *lansoprazole IPRS* or with the reference spectrum of lansoprazole.

B. When examined in the range of 200 nm to 400 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* shows maxima at the same wavelength obtained with the solution having same concentration of the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Use the solutions at or below 5°.

Solvent mixture. 75 volumes of *0.1 M sodium hydroxide solution* and 25 volumes of *methanol.*

Test solution. Dissolve about 125 mg of the substance under examination in 50 ml of *methanol.* Dilute 1.0 ml of the solution to 10.0 ml with solvent mixture.

Reference solution (a). A solution containing 5 mg each of *lansoprazole IPRS* and *lansoprazole impurity A IPRS* in 200 ml of *methanol.* Dilute 1 ml of the solution to 10 ml with solvent mixture.

Reference solution (b). A 0.0025 per cent w/v solution each of *lansoprazole IPRS* and *lansoprazole impurity B IPRS* in *methanol.* Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. *water,*
  B. a mixture of 80 volumes of *acetonitrile,* 20 volumes of *water* and 0.5 volume of *triethylamine,* adjusted to pH 7.0 with *orthophosphoric acid,*
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 285 nm,
- injection volume: 40 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
40	20	80
50	20	80
51	90	10
60	90	10

Name	Relative retention time	Correction factor
Lansoprazole *N*-oxide[1]	0.8	0.77
Lansoprazole	1.0	—
Lansoprazole impurity A[2]	1.1	1.22
Lansoprazole impurity B[3]	1.2	—

[1][[(1H -Benzimidazole-2-yl)sulphinyl]methyl]-3-methyl-4-(2,2,2-trifluoroethoxy)-pyridine 1-oxide,

[2]2-[[[3-Methyl-4-(2,2,2-trifluoroethoxy)-2-pyridyl]methyl] sulphonyl] benzimidazole,

[3]2-[[[3-Methyl-4-(2,2,2-trifluoroethoxy)-pyridin-2-yl]methyl] sulphanyl]-1H –benzimidazole.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to lansoprazole and lansoprazole impurity A is not less than 6 and the relative standard deviation for replicate injections is not more than 3.0 per cent.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of the peak due to lansoprazole impurity A is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent), the area of each peak due to lansoprazole *N*-oxide and lansoprazole impurity B is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent), the area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The sum of the areas of all the secondary peaks is not more than 0.6 times the area of the principal peak in the chromatogram obtained with the reference solution (b) (0.6 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.1 per cent, determined on a 1.0 g in a mixture of 90 volumes of *pyridine* and 10 volumes of *ethylene glycol.*

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 60 volumes of *water,* 40 volumes of *acetonitrile* and 1 volume of *triethylamine,* adjusted to pH 10.0 with *orthophosphoric acid.*

Internal standard solution. A 0.25 per cent w/v solution of *4-ethoxyacetophenone* in solvent mixture.
